C₂₀H₄Cl₄I₄O₅

M 973.677

Singlet-O₂ sensitiser for photooxidations. Dyestuff for cosmetics; food additive. Acid-base indicator. Insol. H₂O. Normally used as di-Na salt.

Di-K salt: [632-68-8]. *Rose Bengal B. C.I. Acid red 94*
Dyestuff for nylon, silk, cellulose materials, inks, cosmetics. Used for extraction-photometric detn. of Cu, Pb, Hg, Ni, Cd, Ag, Pd. Bright bluish pink solid. Sol. H₂O (blue-red soln., no fluor.).

▷ Possibly teratogenic in rats. Carcinogen. Toxic to freshwater organisms. Binds to and inhibits RNA polymerase.

Di-Na salt: [42352-53-4]. *Rose bengal sodium, INN. Food red colour 105*

Biological stain. Used for diagnosing corneal trauma. ¹²⁵I and ¹³¹I labelled versions are used as diagnostic aids in hepatic function detn. (Robengatrope). Red powder.

Bis Et₃NH salt: [91491-51-9].

Singlet oxygen sensitiser. Purple red powder.

Starch, 9CI, 8CI

S-00025

Amylum

C₆H₁₀O₅ M 162.142

Starch is composed of Amylose and Amylopectin.

Amylose is preponderantly a linear polymer of several thousand D-glucose units mainly α -(1 \rightarrow 4) linked.

Amylopectin is a branched polymer composed largely of α -D-(1 \rightarrow 4)-linked glucose units. The branch is α -(1 \rightarrow 6) and occurs at the 6 position every 20-25 glucose units. Pullulanase, R-enzyme and Isoamylase hydrol. the α -D-(1 \rightarrow 6) linkages. Polymeric. Minimum formula given.

Unbranched-form [9005-82-7]

Amylose

Stored in all parts of plants as insol. granules. Coml. starches come mainly from corn (maize), sorghum grains, tapioca root and potato tuber. Most starch samples contain 20 \pm 5% Amylose which can be pptd. from aq. starch soln. with, e.g., Thymol. Used in particulate form as a dusting powder, as a gelling agent in processed foods, as a flocculant and pigment retainer in paper manuf. and in dried film form for sizing paper and textiles. Pharmaceutical aid. Used in photometric detn. of I₂; as an indicator in iodometry. $[\alpha]_D$ +200° (H₂O), $[\alpha]_D$ +162° (1M NaOH), $[\alpha]_D$ +175° (DMSO). Hydrol. by acid, α -Amylase and β -Amylase. Forms inclusion complexes, gives a deep-blue colour with I₂.

Tannic acid. Gallotannic acid. Gallotannin. Chinese tannin

Chinese gallotannin is a mixt. of isomers and closely related compounds whose average composition corresponds to that of Penta-*O*-(*m*-digalloyl)- β -D-glucose. There are also some trigalloyl units. A major constit. of galls of many spp. of oak (e.g. *Quercus lusitanica*), the leaves of Stagshorn (*Rhus typhina*) and pods of tara (*Caesalpinia spinosa*). Used as a mordant in dyeing, ink manuf., tanning, clarifying beer and wine and photography and as a coagulant in rubber manuf. Can be used as an astringent. Used as 3% aq. soln. for gravimetric detn. of Nb, Ta, Ti, U, W; separation of Ta and Nb. Yellowish powder. Sol. H₂O, EtOH, Me₂CO; sl. sol. Et₂O. Mp 210-215° dec. $[\alpha]_D^{20} + 12.0^\circ$ to $+18.4^\circ$ (c, 2 in Me₂CO)(from Chinese galls, Sicilian sumach or Stagshorn sumach), $[\alpha]_D^{20} + 21.7^\circ$ to $+23.2^\circ$ (c, 2 in Me₂CO)(from Turkish galls). $C_{18}H_{15}P$ M 262.290

Nucleophile with many synthetic uses; deoxygenating and desulfurising reagent, reagent for alkene synth. by double extrusion. Converted by alkyl halides into quaternary triphenylphosphonium salts used to prepare ylides for Wittig reactions. Reagent for the deoxygenation of nitroso and nitro compds. (often with the formn. of N-containing heterocyclic compds.), oxiranes and peroxides, and for the desulfurization of thiiranes and di- and polysulfides. Reagent for the dehalogenation of 1,2-dihalogenoalkanes. Used in conjunction with CCl_4 or CBr_4 to convert alcohols into alkyl chlorides or bromides, and carboxamides into nitriles. Used in conjunction with diethyl azodicarboxylate in phosphorylations. Used for extraction separation of Ag; photometric detn. of NH_3 ; extraction-photometric detn. of Pd ($PdCl_4^{2-}$ associated with the reagent). Reference material used in elemental microanalysis. Plates or prisms (Et_2O). Mp 80°. Bp > 360° (under N_2). Triboluminescent.

Name Index

The Name Index lists in alphabetical order all names and synonyms contained in the Dictionary.

Each index term refers the user to a Dictionary Number consisting of a single letter of the alphabet followed by five digits. The letter is the first letter of the relevant Dictionary Name.

A Dictionary Number which follows immediately upon an index term means that the term is itself used as the Entry Name.

A Dictionary Number which is preceded by the word '*see*' means that the term is a synonym to an Entry Name.

A Dictionary Number which is preceded by the word '*in*' means that the term is embedded within an Entry, usually as a synonym to a particular stereoisomeric form or to a derivative.

The symbol \triangleright preceding an index term indicates that the Dictionary Entry contains information on toxic or hazardous properties of the compound.

Molecular Formula Index

The Molecular Formula Index lists the molecular formulae of all reagents in the Dictionary whether they occur as main Entry compounds or as derivatives.

Where a molecular formula applies to a derivative the Dictionary Number is prefixed by the word '*in*'.

The Symbol \triangleright preceding an index term indicates the Dictionary Entry contains information on toxic or hazardous properties of the compound.

Chemical Abstracts Service Registry Number Index

This Index lists in numerical order all Chemical Abstracts Service (CAS) registry numbers contained in the Dictionary.

Where a CAS registry number applies to a derivative or to a stereoisomer or other variant embedded within the entry, the Dictionary number is preceded by the word '*in*'.

The Symbol \triangleright preceding an index term indicates that the Dictionary Entry contains information on toxic or hazardous properties.
