Reactivity order with Mg : $R\text{I} > R\text{Br} > R\text{Cl}$.

(ii) With Li

$$RX + 2\text{Li} \xrightarrow{\text{Dry ether}} \underset{\text{(alkyl lithium)}}{R\text{Li}} + \text{Li}X$$

The application of alkyl lithium is seen in **Corey House Synthesis** of late 1960s. The process can be summerised as

(i) $CH_3Br + 2Li \xrightarrow{\text{Ether}} CH_3Li + LiBr$

(ii) $2CH_3Li + CuI \xrightarrow{\text{Ether}} \underset{\text{lithium dimethyl cuperate}}{Li(CH_3)_2Cu} + LiI$

(iii) $Li(CH_3)_2Cu + CH_3CH_2Br \longrightarrow CH_3CH_2—CH_3 + CH_3Cu + LiBr$

(iii) With Na

$$2RX + 2\text{Na} \xrightarrow{\text{Dry ether}} \underset{\text{alkane}}{R\text{—}R} + 2\text{Na}X \qquad \text{(Wurtz reaction)}$$

Just like Wurtz reaction, **Wurtz-Fittig** and **Fittig reaction** are also given which looks like

(a) $C_6H_5X + 2Na + RX \xrightarrow{\text{Dry ether}} R — C_6H_5 + 2NaX$

It is **Wurtz-Fittig reaction.**

(b) $2C_6H_5X + 2Na \xrightarrow{\text{Dry ether}} C_6H_5 — C_6H_5 + 2NaX$

This is **Fittig reaction.**

TEL (tetra ethyl lead) the antiknock compound of petroleum industry is produced as

$$4C_2H_5Cl + 4Na / 4Pb \longrightarrow (C_2H_5)_4Pb + 4NaCl + 3Pb$$

(iv) With Zn

$$2\ RX + \text{Zn} \xrightarrow[\text{ether}]{\text{Dry}} \underset{\text{alkane}}{R\text{—}R} + \text{Zn}X_2 \qquad \text{(Frankland reaction)}$$

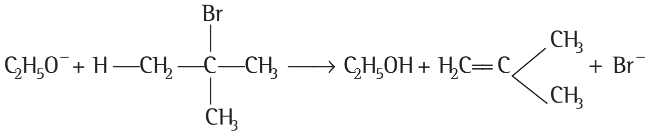
(Zn also form organometallic compounds like RMg but its reactivity is less than Mg).

Hot Spot 2

ELIMINATION Reactions

It is also an important topic of the chapter for JEE Main examination. Many a times question is from this topic. However the level of question is generally typical as it also involve stereo chemistry of the reaction.

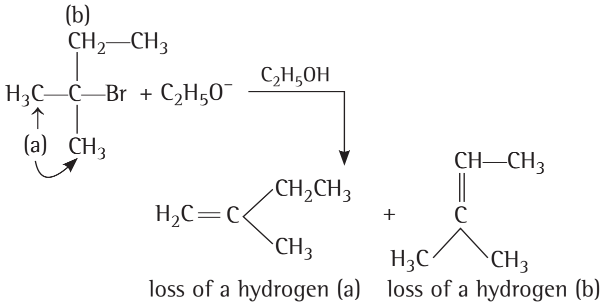
When an alkyl halide (better a tertiary one) reacts with a Bronsted base (such as ethoxide ion ($C_2H_5O^-$), elimination reaction takes place in which two or more groups are lost from the same molecule (in the following case H and Br).



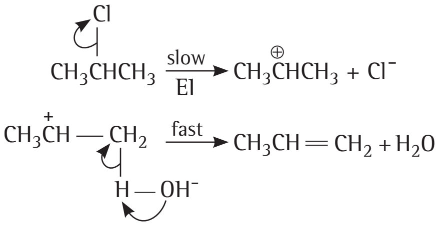
$$C_2H_5O^- + H—CH_2—\overset{\overset{\large Br}{|}}{\underset{\underset{\large CH_3}{|}}{C}}—CH_3 \longrightarrow C_2H_5OH + H_2C{=}C(CH_3)_2 + Br^-$$

Remember! OH^- is used in aqueous solution (H_2O). $C_2H_5O^-$ (ethoxide ion) is used in ethanol (C_2H_5OH). $(CH_3)_3CO^-$ (*tert*-butoxide ion) is used in *tert*-butyl alcohol [$(CH_3)_3COH$].

If there are more than one β hydrogen, it results in more than one elimination products as

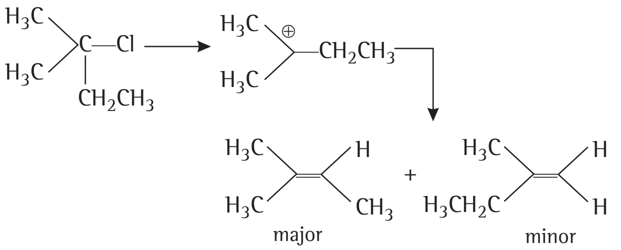


Elimination can be E1 (unimolecular elimination) in which alkyl halide dissociates first to form carbocation and halide ion.



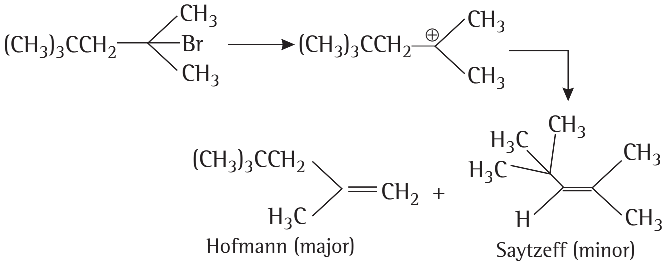
The order of reactivity of alkyl group is; tertiary > secondary > primary, since, the rate-determining step is the formation of a carbocation, which has stability in order; 3° > 2° > 1°.

Most substituted alkene is the Saytzeff product and less substituted alkene is the Hofmann product.



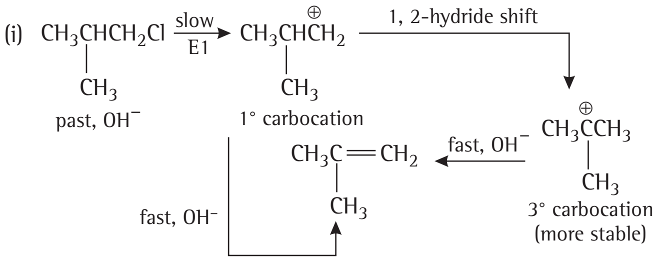
However, when the product of Saytzeff elimination is more sterically compressed, the less substituted alkene may be formed.

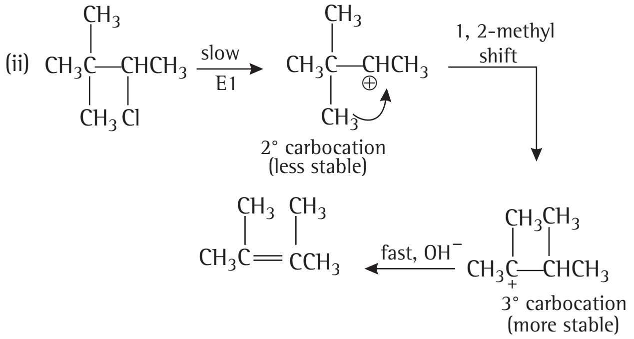
Saytzeff product has significant repulsive forces between the hydrogens on the *t*-butyl group and those on the methyl group *cis* to it.



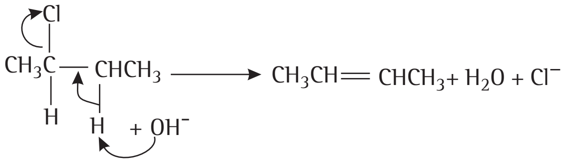
The carbocation may not only eliminate but may also add a nucleophilic species to give a substitution product by S_N1 reaction. The E1 and S_N1 reactions are therefore, competitive.

There can be 1, 2-hydride or 1, 2-methyl shift to attain greater stability of carbocation.

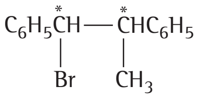




Elimination can be E$_2$ (bimolecular elimination)

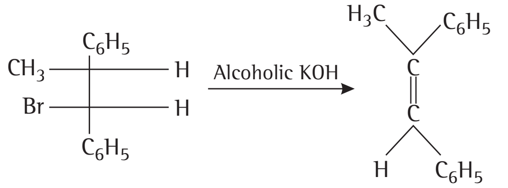


Reactivity towards E2 or E1 elimination is 3° > 2° > 1° alkyl halides. E2 elimination is stereospecific. 1-bromo-1,2-diphenyl propane contains two chiral carbon atoms (*)

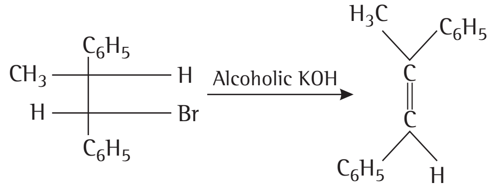


$$C_6H_5\overset{*}{C}H(Br)—\overset{*}{C}H(CH_3)C_6H_5$$

Dehydrohalogenation follows *trans*-**elimination.**

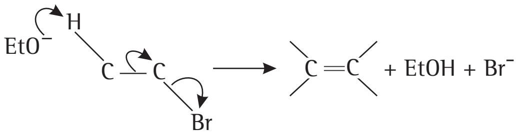


cis-1,2-diphenyl-1-propene



trans

E2 reaction is facilitated by attack by a base on the hydrogen atom which is to be removed.



Reaction rate increases with the increasing strength of the base

$$CH_3CO_2^- < OH^- < EtO^- < Me_3CO^- < NH_2^-$$

The ease of the E2 reaction on alkyl halides is —I > —Br > —Cl > —F (bond strengths being in order C — F > C — Cl > C — Br > C — I) and amongst the alkyl groups, the order of reactivity is

tertiary > secondary > primary.

$$(CH_3)_3C—Br \xrightarrow{EtO^-} (CH_3)_2C{=}CH_2 \text{ faster than}$$

$$(CH_3)_2CH—Br \xrightarrow{EtO^-} CH_3CH{=}CH_2 \text{ faster than}$$

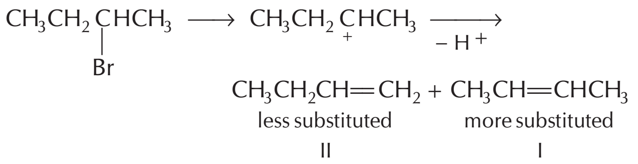
$$CH_3CH_2—Br \xrightarrow{EtO^-} CH_2{=}CH_2$$

A nucleophile is also a base, so that E2 reaction competes with substitution.

Sample **Problem 4** *Ellimination of bromine from 2-bromobutane results in the formation of*

- (a) *predominantly 2-butyne*
- (b) *predominantly -1-butene*
- (c) *predominantly 2-butene*
- (d) *equimolar mixture of 1- and 2 butene*

Interpret (c)



$$CH_3CH_2\underset{\displaystyle Br}{\underset{|}{C}}HCH_3 \longrightarrow CH_3CH_2\underset{+}{C}HCH_3 \xrightarrow[-H^+]{} \underset{\substack{\text{less substituted}\\ \text{II}}}{CH_3CH_2CH{=}CH_2} + \underset{\substack{\text{more substituted}\\ \text{I}}}{CH_3CH{=}CHCH_3}$$

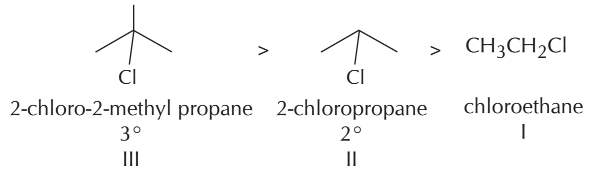
Stability of I > II, hence I is the predominant product.

Sample **Problem 5** *The ease of dehydrohalogenation with alcoholic KOH in case of chloroethane (I), 2-chloropropane (II) and 2-chloro-2-methylpropane (III) is of the order*

- (a) *III > II > I*
- (b) *I > II > III*
- (c) *II > I > III*
- (d) *I > III > II*

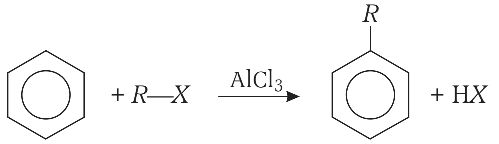
Interpret (a) Dehydrohalogenations are also called β-elimination reaction and for such reactions, the reactivity of haloalkanes towards elimination reaction is

3° > 2° > 1°



Friedel-Craft Alkylation

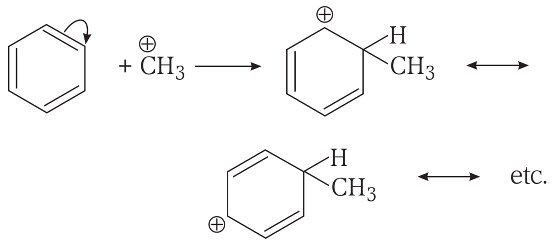
Alkyl benzene are the product of this reaction. The reaction takes place as



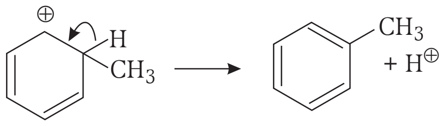
Intermediate is σ complex stabilised by resonance.

Function of anhydrous $AlCl_3$ (Lewis acid) is to generate electrophile, which is carbocation in this case. It is thus, S_E reaction.

$$CH_3Cl + AlCl_3 \longrightarrow AlCl_4^{\ominus} + \overset{\oplus}{C}H_3$$

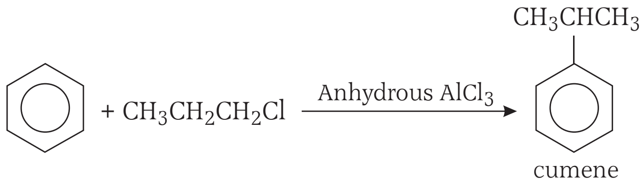


σ complex (stable due to resonance)



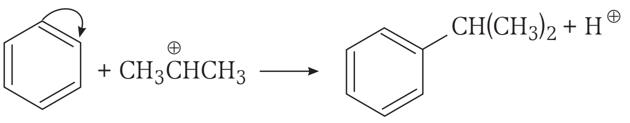
$$H^{\oplus} + AlCl_4^{\ominus} \longrightarrow AlCl_3 + HCl$$

In the carbocation, there may be 1, 2-hydride or 1, 2-methyl shift to attain its greater stability.



$$CH_3CH_2CH_2Cl + AlCl_3 \longrightarrow CH_3CH_2\underset{1^\circ}{\overset{\oplus}{C}}H_2 + AlCl_4^{\ominus}$$

$$CH_3CH_2\overset{\oplus}{C}H_2 \xrightarrow{\text{1,2-hydride shift}} \underset{\substack{2^\circ\\ \text{(more stable than 1°)}}}{CH_3\overset{\oplus}{C}HCH_3}$$



This reaction can also be extended to alkylation of alkenes.

$$(CH_3)_3\,C—Cl + CH_2{=}CH_2 \xrightarrow{AlCl_3,\ 263\ K} (CH_3)_3CCH_2CH_2Cl$$

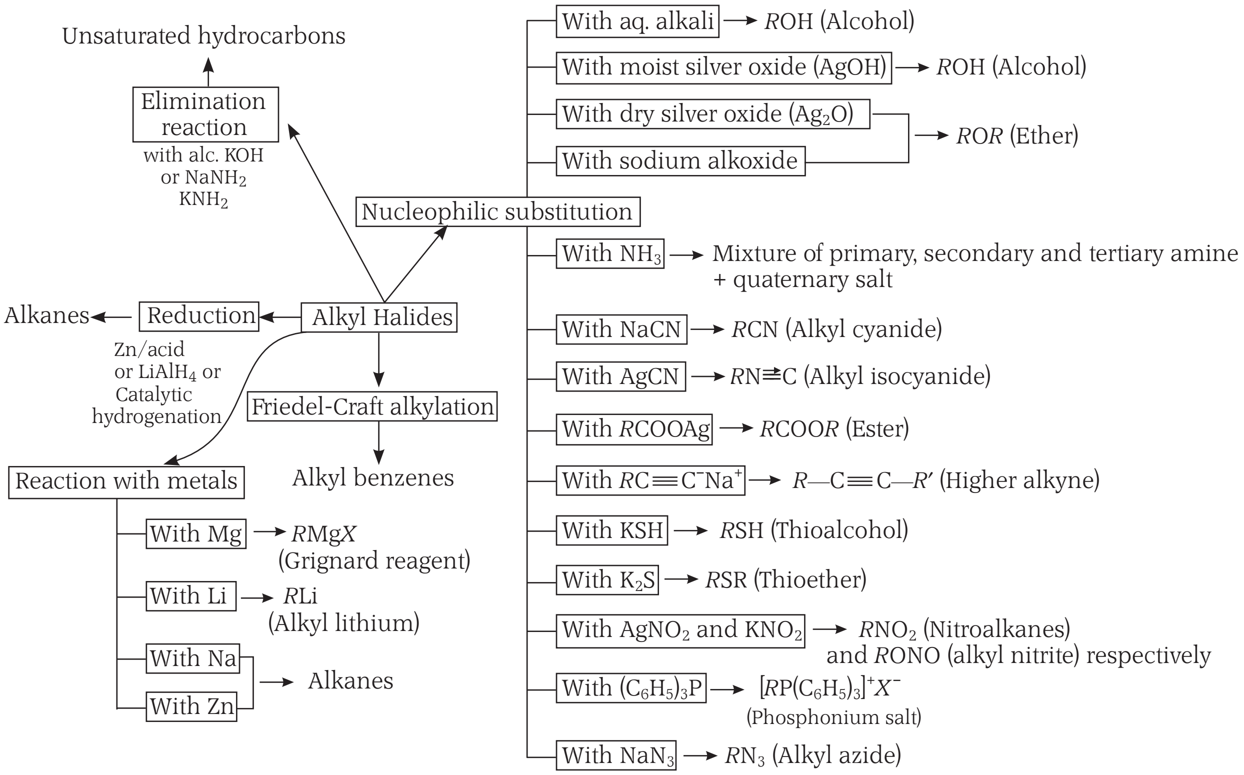
$$(CH_3)_3\,C—Cl + AlCl_3 \xrightarrow[-AlCl_4^{\ominus}]{} (CH_3)_3C^{\oplus}$$

$$(CH_3)_3C^{\oplus} + CH_2{=}CH_2 \longrightarrow (CH_3)_3CCH_2CH_2^{\oplus}$$

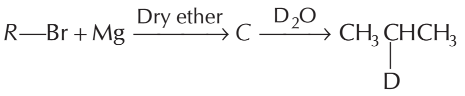
$$(CH_3)_3\,CCH_2CH_2^{\oplus} + AlCl_4^{\ominus} \longrightarrow (CH_3)_3CCH_2CH_2Cl + AlCl_3$$

This reaction is described fully in properties of benzene and for meachanism see some basic principles of organic chemistry also.

The outline of chemical properties of monohalogen derivatives looks like



Sample Problem 6 *Identify C in the following reaction sequence.* **[NCERT]**



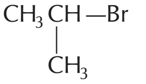
$$R\text{—Br} + \text{Mg} \xrightarrow{\text{Dry ether}} C \xrightarrow{D_2O} CH_3\underset{\underset{D}{|}}{C}HCH_3$$

(a) $(CH_3)_2\,CHMgBr$

(b) $CH_3\ CH_2CH_2MgBr$

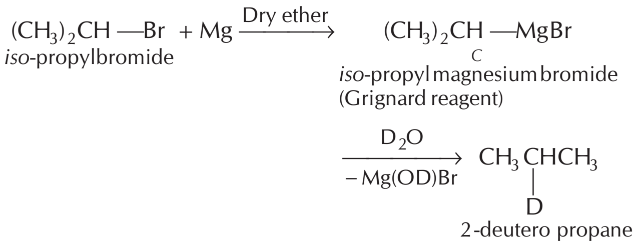
(c) $(CH_3)_3\ CMgBr$

(d)



$$CH_3\underset{\underset{CH_3}{|}}{C}H\text{—Br}$$

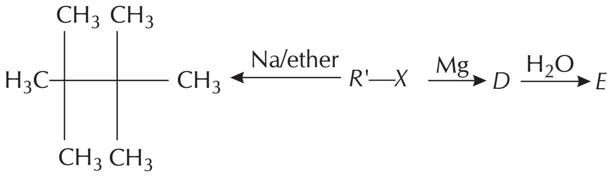
Interpret (a) Since the product contains three carbon atoms, so there must be three C atoms in '*C*'. Moreover, D gets attached to second carbon atom. So, —MgBr must be at second carbon atom. So, *R* is $(CH_3)_2CH$— and *C* is $(CH_3)_2CHMgBr$.



$$\underset{\textit{iso}\text{-propylbromide}}{(CH_3)_2CH\text{—Br}} + \text{Mg} \xrightarrow{\text{Dry ether}} \underset{\substack{C \\ \textit{iso}\text{-propyl magnesium bromide} \\ \text{(Grignard reagent)}}}{(CH_3)_2CH\text{—MgBr}}$$

$$\xrightarrow[-\,Mg(OD)Br]{D_2O} \underset{\text{2-deutero propane}}{CH_3\underset{\underset{D}{|}}{C}HCH_3}$$

Sample Problem 7 *E in the following reaction sequence is* **[NCERT]**



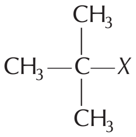
(a) *propane*

(b) *butane*

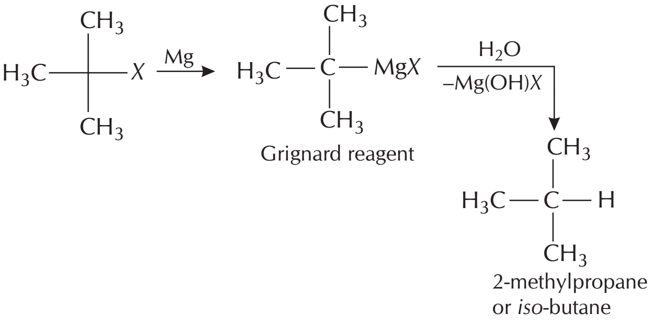
(c) *isobutane*

(d) *Neo-pentane*

Interpret (c) Since, *R′* — *X* gives $(CH_3)C\text{—}C(CH_3)_3$ when subjected to Wurtz reaction. So, *R′* must be $(CH_3)_3C$— group. Hence, *R′*—*X* must be



$$CH_3\text{—}\overset{\overset{CH_3}{|}}{\underset{\underset{CH_3}{|}}{C}}\text{—}X$$



$$H_3C-C(CH_3)_2-X \xrightarrow{Mg} \underset{\text{Grignard reagent}}{H_3C-C(CH_3)_2-MgX} \xrightarrow[-Mg(OH)X]{H_2O} \underset{\text{2-methylpropane or } iso\text{-butane}}{H_3C-C(CH_3)_2-H}$$

Check Point 1

1. Why is allyl alcohol more reactive than propane-2-ol towards HCl?
2. Protonation of alcohol is a Bronsted Lowry acid-base reaction as well as a Lewis acid-base reaction. Explain.
3. Alkyl halides, though polar, are insoluble in water, Explain.
4. CH_3CH_2OH does not react with NaBr but on adding H_2SO_4, CH_3CH_2Br is formed. Explain.
5. Although the C—I bond is longer than a C—Cl bond, the C—Cl bond has a larger dipole moment. Explain.
6. KCN reacts with *R*I to form alkyl cyanide while AgCN gives isocyanides as a major product in the same reaction. Explain.

10.4 Dihaloalkanes

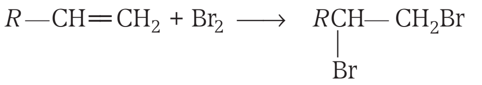
In these compounds two halogen atoms are present in a molecules. They may occupy the same place or different place. They have the general formula $C_nH_{2n}X_2$.

Methods of Preparation

Following methods can be employed to prepare dihalogen derivatives of alkanes.

(a) Addition Reactions

(i) **Addition of Br_2 to alkenes** This reaction gives *vic* dihalides.

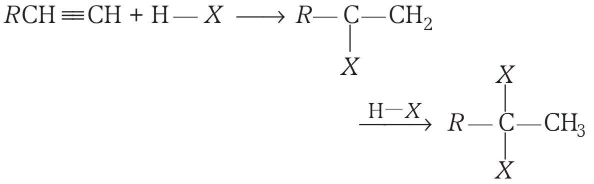


$$R-CH{=}CH_2 + Br_2 \longrightarrow RCH(Br)-CH_2Br$$

alkylene bromide
(*vic* dihalides)

(*gem*-dihalides are not prepared by this method.)

(ii) **Addition of halogen acids to alkynes** By this method only *gem* dihalides can be prepared.

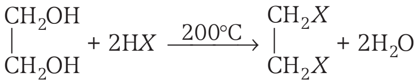


$$RCH{\equiv}CH + H-X \longrightarrow R-C(X){=}CH_2 \xrightarrow{H-X} R-CX_2-CH_3$$

gem-dihalide

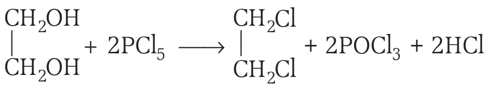
(b) Substitution Reactions

(i) **Reaction of glycol with H*X*** This method gives *vic* dihalides.



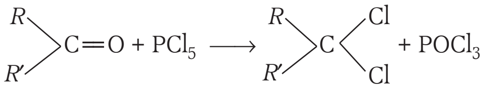
$$\begin{matrix}CH_2OH\\ |\\ CH_2OH\end{matrix} + 2HX \xrightarrow{200°C} \begin{matrix}CH_2X\\ |\\ CH_2X\end{matrix} + 2H_2O$$

(ii) **Reaction of glycol with PCl_5** This method also gives only *vic* dihalides.



$$\begin{matrix}CH_2OH\\ |\\ CH_2OH\end{matrix} + 2PCl_5 \longrightarrow \begin{matrix}CH_2Cl\\ |\\ CH_2Cl\end{matrix} + 2POCl_3 + 2HCl$$

(iii) **Reaction of aldehydes and ketones with PCl_5** By this method *gem*-dihalides are prepared.



$$RR'C{=}O + PCl_5 \longrightarrow RR'CCl_2 + POCl_3$$

(where, *R′* = H or alkyl group)

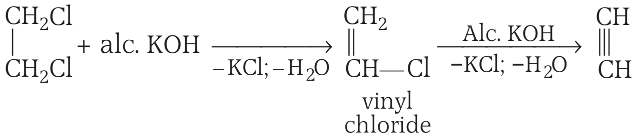
Physical and Chemical Properties

(a) Physical Properties

These are colourless, sweet smelling liquids. The boiling points of CH_2Cl_2 is 313K. Because of its low boiling point and low inflammability, it is an effective extraction solvent used in pharamaceutical and food industries.

(b) Reaction with Alcoholic KOH

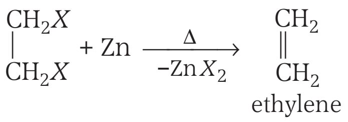
This is a dehydrohalogenation reaction. Both *gem*-dihalides and *vic* dihalides give alkynes as final product when treated with alc. KOH.



$$\begin{matrix}CH_2Cl\\ |\\ CH_2Cl\end{matrix} + \text{alc. KOH} \xrightarrow[-KCl;\,-H_2O]{} \underset{\text{vinyl chloride}}{\begin{matrix}CH_2\\ \|\\ CH-Cl\end{matrix}} \xrightarrow[-KCl;\,-H_2O]{\text{Alc. KOH}} \begin{matrix}CH\\ |||\\ CH\end{matrix}$$

(c) Reaction with Zn Dust

Gem and *vic*-dihalides when heated with Zn dust, give alkenes by losing both the halogen atoms. Thus, it is a dehalogenation reaction.

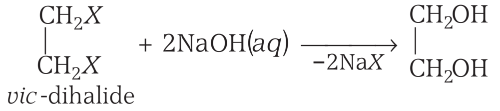


$$\begin{matrix}CH_2X\\ |\\ CH_2X\end{matrix} + Zn \xrightarrow[-ZnX_2]{\Delta} \underset{\text{ethylene}}{\begin{matrix}CH_2\\ \|\\ CH_2\end{matrix}}$$

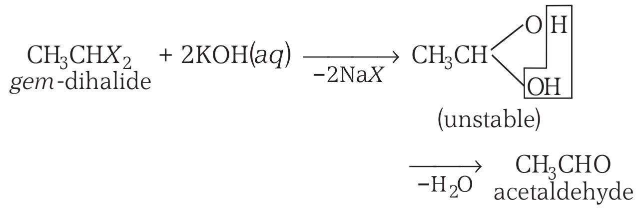
$$CH_3-CHX_2 + Zn \xrightarrow[-ZnX_2]{\Delta} \underset{\text{ethylene}}{CH_2{=}CH_2}$$

(d) Reaction with Aqueous Alkali

vic-dihalides give glycol while *gem*-dihalides give ketones when treated with aqueous alkali. *e.g.,*



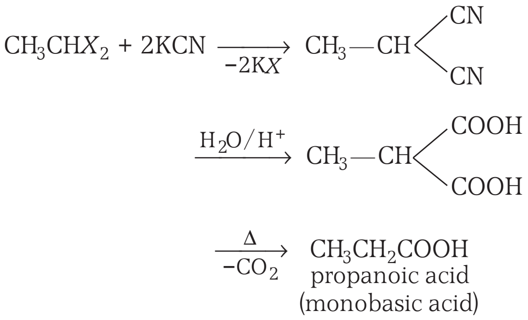
$$\underset{vic\text{-dihalide}}{\begin{matrix}CH_2X\\|\\CH_2X\end{matrix}} + 2NaOH(aq) \xrightarrow[-2NaX]{} \begin{matrix}CH_2OH\\|\\CH_2OH\end{matrix}$$



$$\underset{gem\text{-dihalide}}{CH_3CHX_2} + 2KOH(aq) \xrightarrow[-2NaX]{} \underset{\text{(unstable)}}{CH_3CH\begin{matrix}OH\\OH\end{matrix}} \xrightarrow[-H_2O]{} \underset{\text{acetaldehyde}}{CH_3CHO}$$

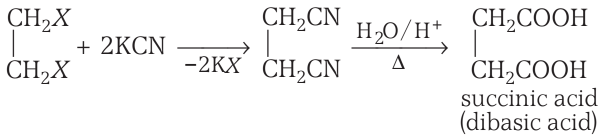
(e) Reaction with KCN Followed by Hydrolysis and Heating

Gem-dihalides when treated with KCN, form alkylidene cyanide which on hydrolysis and heating gives monobasic acid as



$$CH_3CHX_2 + 2KCN \xrightarrow[-2KX]{} CH_3{-}CH\begin{matrix}CN\\CN\end{matrix} \xrightarrow{H_2O/H^+} CH_3{-}CH\begin{matrix}COOH\\COOH\end{matrix} \xrightarrow[-CO_2]{\Delta} \underset{\substack{\text{propanoic acid}\\\text{(monobasic acid)}}}{CH_3CH_2COOH}$$

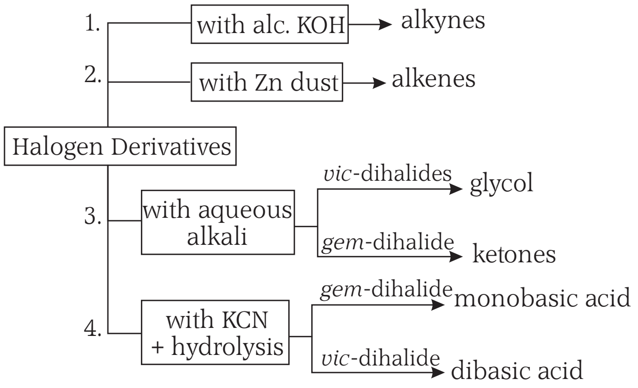
vic-dihalides on the other hand, when subjected to the same procedure give dibasic acid.



$$\begin{matrix}CH_2X\\|\\CH_2X\end{matrix} + 2KCN \xrightarrow[-2KX]{} \begin{matrix}CH_2CN\\|\\CH_2CN\end{matrix} \xrightarrow[\Delta]{H_2O/H^+} \underset{\substack{\text{succinic acid}\\\text{(dibasic acid)}}}{\begin{matrix}CH_2COOH\\|\\CH_2COOH\end{matrix}}$$

(The dibasic acid having —COOH group at successive carbon atoms, do not lose —CO_2 on heating.)

The outlines of their chemical reactions looks as



10.5 Trihaloalkanes

These compounds are commonly called haloforms, *i.e.,* chloroform, bromoform, iodoform etc., and have general formula CHX_3 (where, X = Cl, Br, I). Chloroform is the first discovered haloform.

Methods of Preparation

The important methods used to prepare haloform are as follows

(a) Halogenation of Alkanes

$$CH_4 + Cl_2 \xrightarrow{h\nu} CH_3Cl \xrightarrow{Cl_2/h\nu} CH_2Cl_2 \xrightarrow{Cl_2/h\nu} \underset{\text{chloroform}}{CHCl_3}$$

It is fully described in the properties of alkanes (halogenation) for mechanism see free radical mechanism chapter 'some basic principles' of organic chemistry.

(b) Reaction of Ethanol or Acetone with Aqueous Na_2CO_3 and KI

$$\text{Ethanol or acetone} + Na_2CO_3 + KI \xrightarrow[60\text{–}70°]{\text{Electrolysis}} \underset{\text{yellow ppt.}}{CHI_3\downarrow}$$

The complete reaction looks like

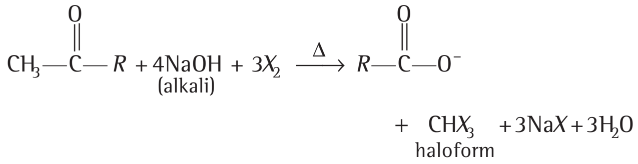
$$CH_3CH_2OH + 4I_2 + 3Na_2CO_3 \longrightarrow \underset{\text{iodoform}}{CHI_3} + HCOO^-Na^+ + 5NaI + 2H_2O + 3CO_2$$

Hot Spot 3

HALOFORM Reaction

This reaction is also important for JEE Main examination. Many times questions is based on it. The level of question vary from easy to average.

When methyl ketone or 2° alcohol having $CH_3\underset{\substack{|\\OH}}{CH}—$ group or ethyl alcohol is treated with halogen, in the presence of alkali, haloform is obtained. The reaction is called haloform reaction.

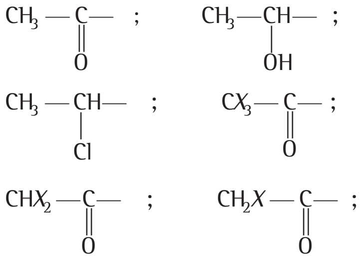


$$CH_3—\overset{\substack{O\\\|}}{C}—R + \underset{\text{(alkali)}}{4NaOH} + 3X_2 \xrightarrow{\Delta} R—\overset{\substack{O\\\|}}{C}—O^- + \underset{\text{haloform}}{CHX_3} + 3NaX + 3H_2O$$

Important facts related to haloform reaction are as

(i) KOH may also be used as alkali.

(ii) The compounds which can give this test must contain either one of these :



$$CH_3—\underset{\substack{\|\\O}}{C}— \;;\quad CH_3—\underset{\substack{|\\OH}}{CH}— \;;$$
$$CH_3—\underset{\substack{|\\Cl}}{CH}— \;;\quad CX_3—\underset{\substack{\|\\O}}{C}— \;;$$
$$CHX_2—\underset{\substack{\|\\O}}{C}— \;;\quad CH_2X—\underset{\substack{\|\\O}}{C}— \;;$$

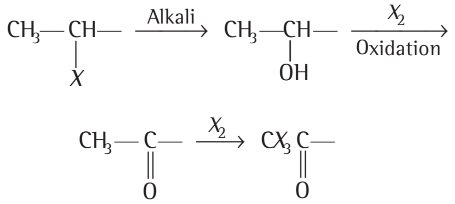
i.e., any compound containing $CH_3CO—$ group or any compound which on oxidation give such group or their halogen derivatives in which halogen is substituted from CH_3 group give this reaction.

(iii) $CH_3CO\underset{\substack{\uparrow\\\text{Active methylene group}}}{CH_2}COOC_2H_5$ does not give haloform reaction inspite of the presence of $CH_3CO—$ group in it. The reason is the presence of active methylene $—CH_2—$ group which prevents the conversion of $CH_3CO—$ to $CX_3CO—$ (a necessity for the reaction).

(iv) The outline of the mechanism is seen as

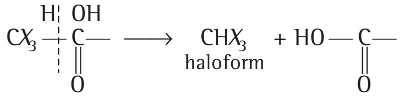
Step I Halogen first oxidises (only in case of alcohols to carbonyl compounds) and then halogenated the compound to get $CX_3\underset{\substack{\|\\O}}{C}—$ group. (If $CH_3—\underset{\substack{|\\X}}{CH}—$ is taken it is first converted to $CH_3—\underset{\substack{|\\OH}}{CH}—$ by alkali and oxidised followed by halogenation)

i.e.,



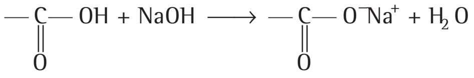
$$CH_3—\underset{\substack{|\\X}}{CH}— \xrightarrow{\text{Alkali}} CH_3—\underset{\substack{|\\OH}}{CH}— \xrightarrow[\text{Oxidation}]{X_2}$$
$$CH_3—\underset{\substack{\|\\O}}{C}— \xrightarrow{X_2} CX_3\underset{\substack{\|\\O}}{C}—$$

Step II This $CX_3—\underset{\substack{\|\\O}}{C}—$ is then hydrolysed by alkali as



$$CX_3 \overset{H\;\vdots\;OH}{—\!\!\!\vdots\!\!\!—}\underset{\substack{\|\\O}}{C}— \longrightarrow \underset{\text{haloform}}{CHX_3} + HO—\underset{\substack{\|\\O}}{C}—$$

Step III The $—\underset{\substack{\|\\O}}{C}—OH$ is further reacts with alkali to give salt and water as



$$—\underset{\substack{\|\\O}}{C}—OH + NaOH \longrightarrow —\underset{\substack{\|\\O}}{C}—O^-Na^+ + H_2O$$

Reaction of Bleaching Powder with Ethyl Alcohol or Acetone

It is a modified form of haloform reaction in which bleaching powder ($CaOCl_2$) works as the source of halogen (Cl_2) and weak base ($Ca(OH)_2$) as

$$CaOCl_2 + H_2O \longrightarrow Ca(OH)_2 + Cl_2$$

Rest of the reaction is same, *i.e.*,

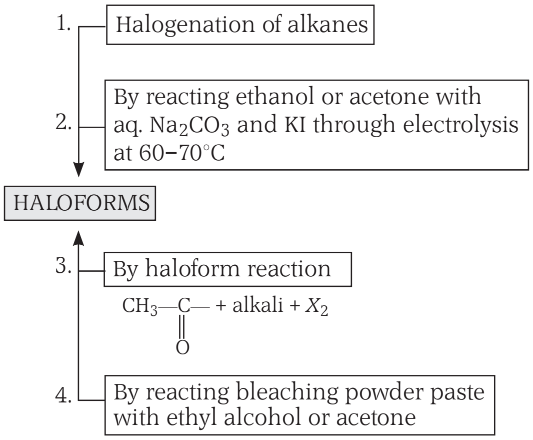
$$CH_3COCH_3 + 3Cl_2 \longrightarrow CCl_3COCH_3 + 3HCl$$

$$2CCl_3COCH_3 + Ca(OH)_2 \xrightarrow{\text{Hydrolysis}} \underset{\text{chloroform}}{2CHCl_3} + (CH_3COO)_2Ca$$

The reaction is used for the preparation of only $CHCl_3$.

Caution Point *Preparation of chloroform from alcohol and bleaching powder involves three steps, viz, oxidation, chlorination and hydrolysis.*

The outline of methods of preparation looks like

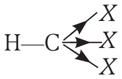


Physical Properties

1. $CHCl_3$ and $CHBr_3$ are sickly smelling liquid, while CHI_3 is in the form of yellow, hexagonal plates.
2. Their boiling point increases with increase in mol. wt. [$CHCl_3$ 334K, $CHBr_3$ 422.5 K and CHI_3 392 K mp].
3. $CHCl_3$ and $CHBr_3$ are sparingly soluble in water but more soluble in organic solvents, CHI_3 is insoluble in H_2O but soluble in ether and ethanol.

Chemical Properties

Before going into detail of reactions, remember the presence of three halogen atoms distort the trihalogen compounds molecule. Their dipole moments are very high and the structure looks like



Thus, here the C—H bond is polar and can be easily broken with the help of any base, resulting to dihalocarbenes as for $CHCl_3$

$$CHCl_3 + \bar{O}H \rightleftharpoons :\bar{C}Cl_3 + H_2O$$

$$:\bar{C}Cl_3 \longrightarrow \underset{\text{dichlorocarbene}}{:CCl_2} + Cl^-$$

This dihalocarbene is a very good electrophile and most of the reaction of trihalogen derivatives are attributed to it. Their reactivity order follows

$$CHI_3 > CHBr_3 > CHCl_3 >> CHF_3$$

This is because the C—I bond is less stable as compared to C— Cl or C—F bond.

(a) Oxidation

Chloroform is so sensitive to oxygen that it autoxidises in the presence of sunlight with air only and result in the formation of phosgene (carbonyl chloride) gas.

$$CHCl_3 + \frac{1}{2}O_2 \longrightarrow COCl_2 + HCl$$

The phosgene gas formed is extremely poisonous. To retard this oxidation we use 1% C_2H_5OH which converts poisonous phosgene to non-poisonous ethyl carbonate.

$$COCl_2 + 2C_2H_5OH \longrightarrow \underset{\text{ethyl carbonate}}{(C_2H_5O)_2CO} + 2HCl$$

(b) Reduction

On using simple reducing agents/molecular H_2 with **catalyst, dihalogen** and **monohalogen derivatives** of alkanes along with **alkanes can** be produced.

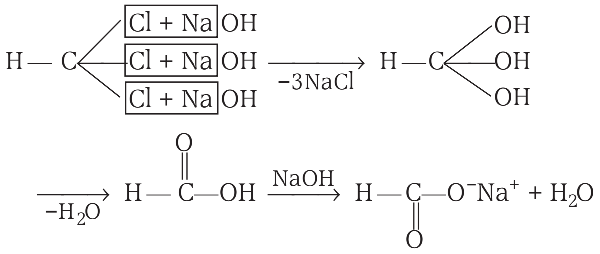
$$CH_4 \xleftarrow[-HCl]{Zn/H_2O} CHCl_3 \xrightarrow{Zn/HCl-C_2H_5OH} CH_2Cl_2$$

(c) Hydrolysis

Sodium or potassium salt of acid is obtained.

$$CHCl_3 + 4NaOH \longrightarrow HCOO^-Na^+ + 3NaCl + 2H_2O$$

The reader can grasp it as



$$\xrightarrow[-H_2O]{} H—\overset{\overset{O}{\|}}{C}—OH \xrightarrow{NaOH} H—\underset{\underset{O}{\|}}{C}—O^-Na^+ + H_2O$$

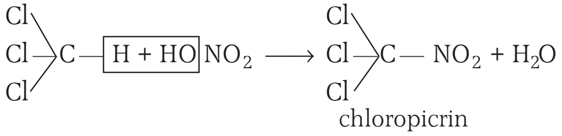
(d) Halogenation

On further halogenation $CHCl_3$ results in the formation of CCl_4.

$$\underset{\text{chloroform}}{CHCl_3} \xrightarrow{Cl_2/h\nu} \underset{\text{tetrachloromethane (pyrene)}}{CCl_4}$$

(e) Nitration

It results in the formation of chloropicrin, which is also called tear gas.



Chloropicrin (nitro chloroform) is used as **insecticide** and **a war gas.**

(f) **With Ag**

(See, Alkynes method of preparation) The reaction looks as

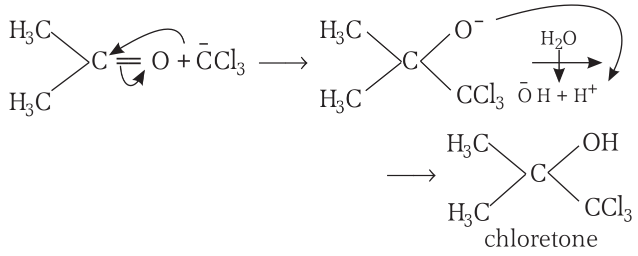
$$CHCl_3 + Ag \longrightarrow \underset{\text{alkyne}}{CH \equiv CH}$$

It is an example of dehalogenation reaction.

(g) With Acetone

The reaction occurs in alkaline medium and $\bar{C}Cl_3$ attacks at $\rangle C{=}O$ group of acetone as a nucleophile *i.e.,*

$$CHCl_3 + \bar{O}H \longrightarrow \bar{C}Cl_3 + H_2O$$

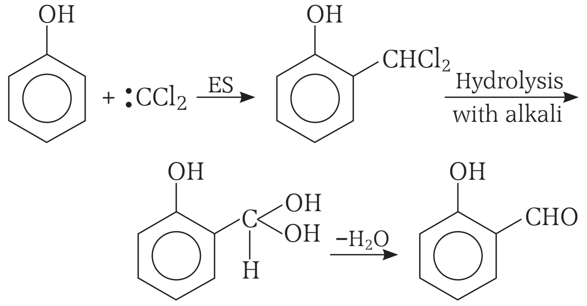


Chloretone is a sleep inducing medicine, (*i.e.,* hypnotic).

(h) **Reimer-Tiemann Reaction**

The attacking electrophile in this reaction is $:CCl_2$ (dichlorocarbene) which attacks itself to benzene ring through electrophilic substitution to give .

This compound undergoes hydrolysis due to the presence of electrophile to give salicylaldehyde. Thus ,



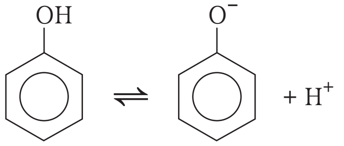
salicylaldehyde

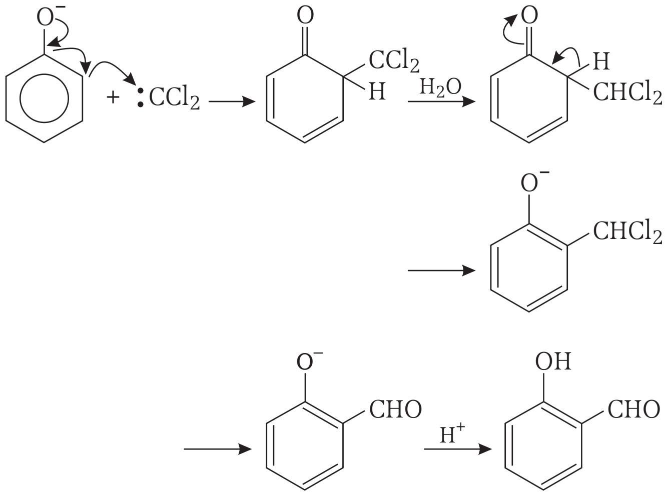
The mechanism of the reaction can be seen as

Step I $CHCl_3 + OH^- \rightleftharpoons :CCl_3^- + H_2O$

$:CCl_3^- \longrightarrow :CCl_2 + Cl^-$

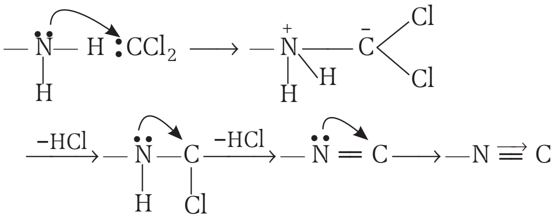
Step II





(i) **Carbylamine Reaction**

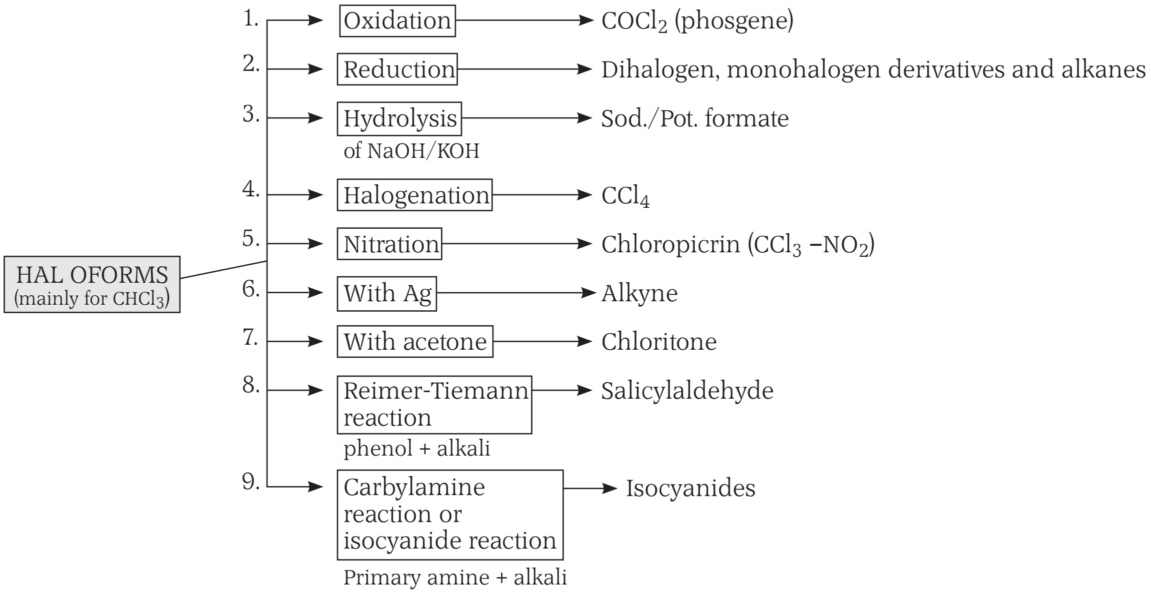
The attacking reagent in this reaction is also $:CCl_2$ which attacks on the lone pair of nitrogen of amino group as



The complete reaction is as

$$CHCl_3 + 3KOH + RNH_2 \xrightarrow{\Delta} \underset{\substack{\text{isocyanide or}\\ \text{carbylamine}}}{RNC} + 3KCl + 3H_2O$$

The outline of their chemical properties can be summarised as



Uses of Haloforms

The important applications of haloforms are as

1. Chloroform is used for the synthesis of drug like chloretone and insecticide like chloropicrin. Moreover, it can be used as an anaesthetic but because of its harmful effects it is not used for this purpose now a days.
2. Chloroform is used as a solvent for fats, waxes, rubber, iodine etc.
3. Iodoform is extensively used as an antiseptic for wounds. Its antiseptic action is due to liberation of free iodine, not because of the iodoform itself.

Environmental Effects of Trihalomethanes (THMs)

THMs (trihalomethanes) are also environmental pollutants, and many are considered **carcinogenic.**

Their adverse effect on environment are as follows

1. **Trifluoromethane** and **chlorodifluoromethane** are both used as **refrigerants** in some applications. Trihalomethanes released to the environment break down faster than **chlorofluorocarbons** (CFCs), thereby doing much less damage to the **ozone layer** (if they contain chlorine). However, fluoroform is not ozone depleting.

   Unfortunately, the breakdown of trihalomethane HCFCs does still result in the creation of some free chlorine radicals in the upper atmosphere and subsequent ozone destruction. Ideally, HCFCs will be phased out entirely in favour of entirely non-chlorinated refrigerants.
2. Chloroform is a very common **solvent** used in organic chemistry. It is a significantly less **polar** solvent than water, well-suited to dissolving many **organic compounds.** Although still toxic and potentially carcinogenic, chloroform is significantly less harmful than **carbon tetrachloride.** Because of the health and regulatory issues associated with the use of carbon tetrachloride, in modern chemistry laboratories. chloroform is used as a cheaper, cleaner alternative wherever possible.
3. **Chloroform** is also formed in **swimming pools** which are disinfected with **chlorine** or **hypochlorite** in the **haloform reaction** with organic substances (**urine, sweat** and **skin** particles). The reaction to **phosgene** under the influence of UV is also possible.
4. Some of the THMs are quite volatile and may easily vaporize into the air. This makes it possible to inhale while showering. In swimmers uptake of THMs is greatest *via* the skin with thermal absorption accounting for 80% of THM uptake. Exercising in chlorinated pool increases the toxicity of a "safe" chlorinated pool atmosphere with toxic effects of chlorine byproducts greater in young swimmers than older swimmers.

10.6 **Polyhaloalkanes**

These are the compounds having more than three halogen atoms, may be same or different.

Some important of such compounds are described below

Carbon Tetrachloride (CCl_4)

It is a covalent molecule so does not have free Cl atoms.

Methods of Preparation

It is prepared by the chlorination of alkane (methane), chloroform, carbondisulphide or propane under different reaction conditions as

$$\underset{\text{methane}}{CH_4} + \underset{\text{(excess)}}{4Cl_2} \xrightarrow{400°C} CCl_4 + 4HCl$$

$$\underset{\text{chloroform}}{CHCl_3} + Cl_2 \xrightarrow{h\nu} CCl_4 + HCl$$

$$\underset{\text{carbon disulphide}}{CS_2} + 3Cl_2 \xrightarrow{AlCl_3 \text{ or } SbCl_3} CCl_4 + \underset{\text{sulphur monochloride}}{S_2Cl_2}$$

$$CS_2 + 2S_2Cl_2 \xrightarrow{AlCl_3} CCl_4 + 6S$$

$$\underset{\text{propane}}{C_3H_8} + 9Cl_2 \xrightarrow[\text{pressure}]{\Delta} \underset{\substack{\text{carbon}\\\text{tetrachloride}\\\text{(liquid)}}}{CCl_4} + \underset{\substack{\text{hexa}\\\text{chloro}\\\text{ethane}\\\text{(solid)}}}{C_2Cl_6} + 8HCl$$

Physical Properties

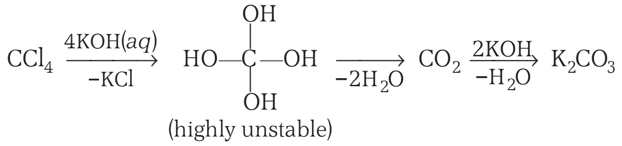
CCl_4 is a colourless, non-inflammable and poisonous liquid with a characteristic odour. Its boiling point is 77°C. It is insoluble in water but soluble in a organic solvents. It is also resistant towards boiling water due to the non-availability of *d*-orbitals in carbon.

Chemical Reactions

(i) **Reduction** With different reducing agents, CCl_4 gives different products as

$$CH_2Cl_2 \xleftarrow{Fe/H_2O} CCl_4 \xrightarrow{Fe/HCl} CHCl_3$$

(ii) **Hydrolysis** This reaction looks like as

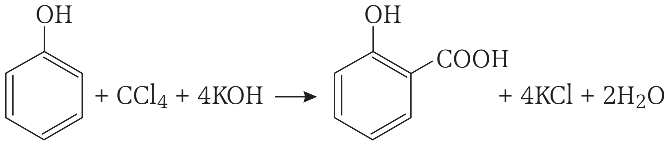


$$CCl_4 \xrightarrow[-KCl]{4KOH(aq)} \underset{\text{(highly unstable)}}{HO-\overset{\displaystyle OH}{\underset{\displaystyle OH}{C}}-OH} \xrightarrow[-2H_2O]{} CO_2 \xrightarrow[-H_2O]{2KOH} K_2CO_3$$

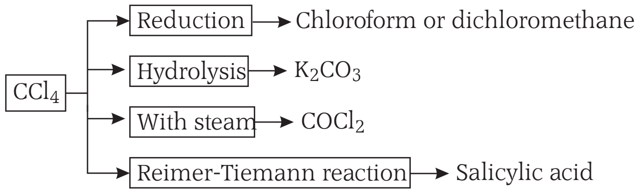
(iii) **With steam** CCl_4 gets oxidised to phosgene when reacts with steam at 500°C.

$$CCl_4 + H_2O \xrightarrow[\text{steam, 500°C}]{\text{Superheated}} COCl_2 + 2HCl$$

(iv) **Reimer-Tiemann reaction** The reaction follows the same mechanism as in case of chloroform and the net reaction looks as



The outlines of chemical properties looks like as



Uses

(i) CCl_4 is used as a fire extinguisher under the name **pyrene**. It is used in medicines as helmenthicide and as a solvent for fats, oils, waxes, greases etc.

(ii) It is also used in the manufacture of refrigerants and propellants for aerosol cans.

(iii) It is also used in the synthesis of CFCs (chloro fluorocarbons) and other chemicals and in pharmaceutical manufacturing.

Harmful Effects

(i) Exposure to CCl_4 may cause irregular heart beat or heart failure. It may irritate the eyes on contact.

(ii) It causes dizzines, light-headedness, nausea, vomitting which can cause permanent damage to nerve cells. Subsequently, these effects may lead to stupor, coma, unconsciousness, or death.

(iii) In air, it depletes the ozone layer which increases the level of ultraviolet rays, causing skin cancer, eye diseases and disruption of the human immune system.

Freons

These are **chlorofluorocarbon** (CFC) *i.e.,* contain, **carbon, chlorine,** and **fluorine** and produced as a **volatile** derivatives of **methane** and **ethane.** A common subclass is the **hydro chloro fluorocarbons** (HCFCs), which contain hydrogen, as well. The most common representative is **dichlorodifluoromethane** (R-12 or Freon-12).

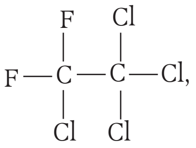
Nomenclature of Freon

(i) **Fron-12** The first number (*e.g.*,1) denotes C atom, whereas the second number (*e.g.*, 2) denotes the number of F atoms and remaining H atoms in CH_4 or C_2H_6 are replaced by Cl atoms. Number of Cl atoms is not mentioned.

(ii) **Freon-22** (These are obtained from ethane, since it contains two C atoms).

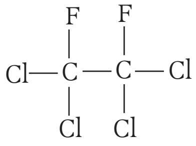
Alkane	Freon
CH_4	Freon-11 $CFCl_3$ (1 C, 1F, 3 Cl)
	Freon-12 CF_2Cl_2 (1 C, 2 F, remaining H atoms are replaced by 2 Cl atoms)
	Freon-13 CF_3Cl (1C, 3F, 1 Cl)
C_2H_6	Freon-22 $C_2F_2Cl_4$ (2C, 2F, remaining 2 H atoms replaced by Cl atoms)
	Freon-23 $C_2F_3Cl_3$ (2 C, 3F, 3Cl)
	Freon-24 $C_2F_4Cl_2$ (2 C, 4F, 2Cl)

Freon derived from ethane can exist in various isomeric forms and the numerals are written according to the number of C and F atoms. *e. g.*, Freon-22 ($C_2F_2Cl_4$) can exist as



$F-\overset{F}{\underset{Cl}{C}}-\overset{Cl}{\underset{Cl}{C}}-Cl$,

freon 1210



$Cl-\overset{F}{\underset{Cl}{C}}-\overset{F}{\underset{Cl}{C}}-Cl$

freon 1111

Methods of Preparation

CFCs and HCFCs are usually produced by halogen exchange starting from chlorinated methanes and ethanes. Illustrative is the synthesis of chlorodifluoromethane from **chloroform.**

$$HCCl_3 + 2HF \longrightarrow HCF_2Cl + 2HCl$$

The brominated derivatives are generated by free-radical reactions of the chlorofluorocarbons, replacing C—H bonds with C—Br bonds. The production of the **anesthetic 2-bromo- 2-chloro-1,1,1-trifluoroethane** ("halothane") is illustrative

$$CF_3CH_2Cl + Br_2 \longrightarrow CF_3CHBrCl + HBr$$

Physical Properties

Their physical properties include

(i) CFCs and HCFCs are colourless, relatively non-toxic liquids and gases with a faintly sweet ethereal odour.

(ii) In general they are volatile, but less so than parent alkane. The decreased volatility is attributed to the molecular polarity induced by the halides and the polarizability of halides, which induces intermolecular interactions. Thus, methane boils at −161°C whereas the fluoromethanes boil between −51.7 (CF_2H_2) and −128°C (CF_4). The CFCs have still higher boiling points because the chloride is even more polarizable than fluoride.

Because of their polarity, the CFCs are useful solvents.

(iii) The CFCs are far less flammable than methane, in part because they contain fewer C—H bonds and in part because, in the case of the chlorides and bromides, the released halides quench the free radicals that sustain flames.

(iv) The densities of CFCS are invariably higher than the corresponding alkanes. In general the density of these compounds correlates with the number of chlorides.

Chemical Reactions

The most important reaction of the CFCs is the **photo-induced cleavage of a C—Cl bond**

$$CCl_3F \longrightarrow CCl_2F^{\bullet} + Cl^{\bullet}$$

The chlorine atom, written often as $Cl^{\bullet}$, behaves very differently from the chlorine molecule (Cl_2). The radical $Cl^{\bullet}$ is long-lived in the upper atmosphere, where it catalyzes the conversion of ozone into O_2. Ozone absorbs UV-radiation better than does O_2, so its depletion allows more of this high energy radiation to reach the Earth's surface. **Bromine** atoms are even more efficient catalysts, hence brominated CFCs are also regulated.

Applications

Their uses include **refrigerants, blowing agents,** propellants in medicinal applications, and degreasing solvents. Billions of kilograms of chlorodifluoromethane are produced annually as a precursor to **tetrafluoroethylene,** the monomer that is converted into **teflon.**

Effect Upon Environment

The decomposition of freons in the atmosphere contributes to the destruction of the ozone layer. Overexposure may cause dizziness, loss of concentration, central nervous system depression and/or cardiac arrhythmia. Vapours displace air and can cause asphyxiation in confined spaces. Although being non-flammable, their combustion products include hydrofluoric acid, phosgene, and related species.

DDT (*p*,*p*'-Dichlorodiphenyl trichloroethane)

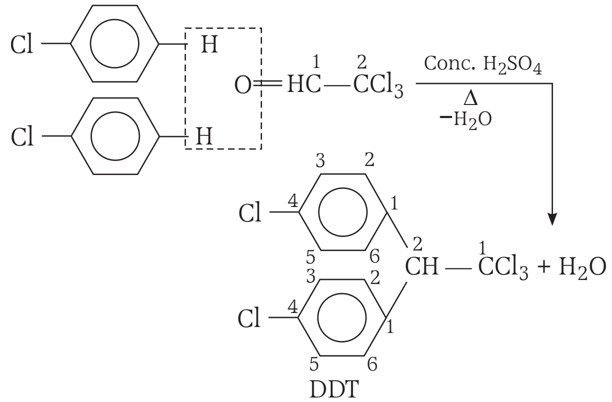
DDT was the first chlorinated organic insecticide and prepared in 1873. But its effectiveness as an insecticide was discovered in 1939 by Paul Muller of Geigy

Pharmaceuticals in Switzerland. In 1948 Paul Muller was awarded the Nobel Prize in medicine and physiology.

Its **IUPAC name** is 2,2-bis (4-chlorophenyl)-1,1,1-trichloroethane.

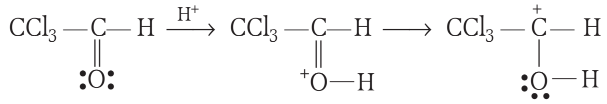
Method of Preparation

It is prepared by heating chloral (trichloro acetaldehyde or 2,2,2-trichloroethanal) with two moles of chlorobenzene in the presence of concentrated H_2SO_4.



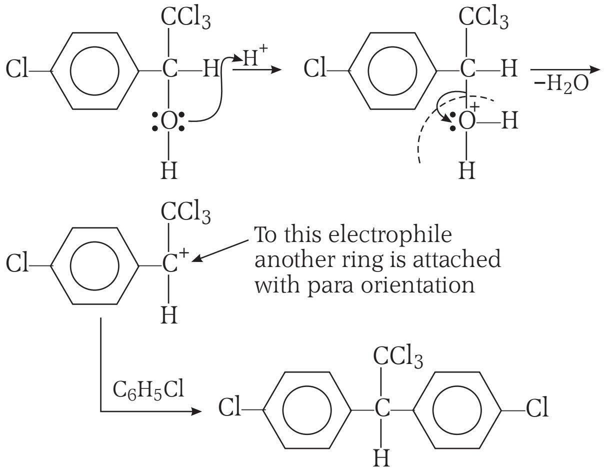
DDT

Mechanism It follows electrophilic substitution in which electrophile is generated as



$$CCl_3-\underset{\underset{:O:}{\|}}{C}-H \xrightarrow{H^+} CCl_3-\underset{\underset{^+O-H}{\|}}{C}-H \longrightarrow CCl_3-\overset{+}{\underset{\underset{:\ddot{O}-H}{|}}{C}}-H$$

After its attachment with one chloro benzene at para position H^+ of acid further takes lone pair from oxygen resulting to removal of water and generation of another electrophile as



Uses

It is a cheap but powerfull insecticide for mosquitoes that spread malaria and lice that carry typhus.

Harmful Effects

Due to its extensive use since 1940s., many species of insects developed resistance to DDT. It has high toxicity towards fish. Due to its stability and fat solubility, it is not metabolised rapidly by animals but is deposited and stored in the fatty tissues. It was banned in the USA in 1973, but is still used in many parts of the word due to the non-availability of any other better and cheaper insecticides.

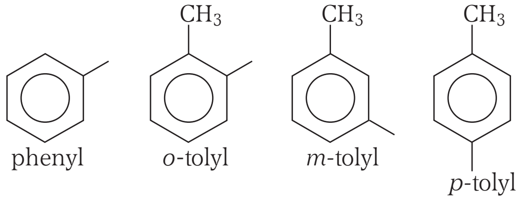
Caution Point *In chloral hydrate two* —OH *groups are present at the same carbon atom but still it is a stable compound. This is because of the existence of intramolecular* H*-bonding between* Cl *and* H *atom (of* OH *group).*

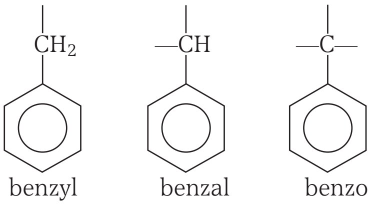
Check Point 2

1. Chloroform is always kept with a little ethyl alcohol in dark coloured bottles. Explain.
2. $CH_2COCH_2COOC_2H_5$ contains CH_3COO— group but does not give positive iodoform test. Explain why?
3. Hydrogen atom of chloroform is definitely acidic in nature. Explain.
4. Iodoform gives yellow precipitate with $AgNO_3$ but chloroform give no precipitate with $AgNO_3$. Explain, why?
5. CCl_4 is used to extinguish fire. Explain.

10.7 Aryl Halides

Aryl halides are the compounds having halogen atom directly attached to the aromatic ring. These compounds are represented by Ar–*X* where Ar represents phenyl, substituted phenyl or any other aryl ring. Before going in detail notice the below written terms and their usage.





Methods of Preparation

General methods used for the preparation of alkyl halide are generally not applied to synthesise **aryl halides.**

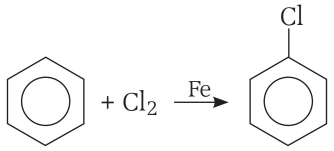
These are prepared by the following methods.

(a) Halogenation

Low temperature and presence of a halogen carrier (Lewis acid) favour this substitution. (The chlorides or bromides of Al, Fe, Sb, Sn, etc, may be used as halogen carriers.) Fe is most commonly used among them as it is converted into Lewis acid.

$$2Fe + 3Cl_2 \longrightarrow 2FeCl_3$$

The reaction looks like

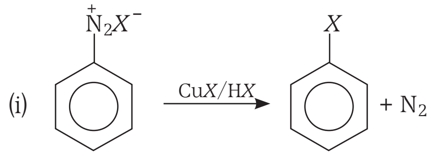


Without halogen carrier halonium ion (X^+) is not formed, thus, the reaction is not possible.

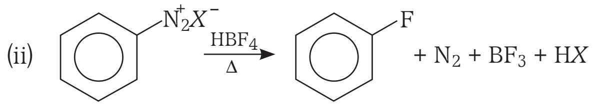
(The mechanism of reaction is given in chapter some basic principles of organic chemistry under electrophilic substitution.)

(b) Decomposition of Diazonium Salt

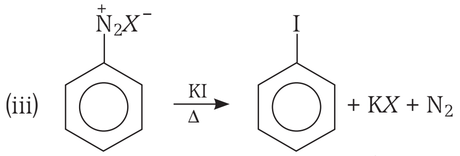
The reaction looks like



(Sandmeyer reaction) [X = Cl, Br]



(Sandmeyer reaction)

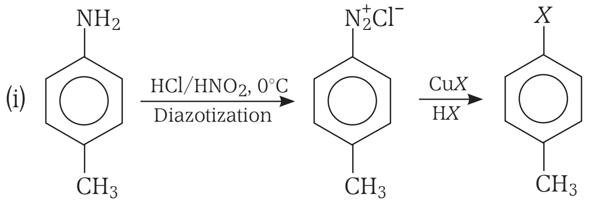


(Gattermann reaction)

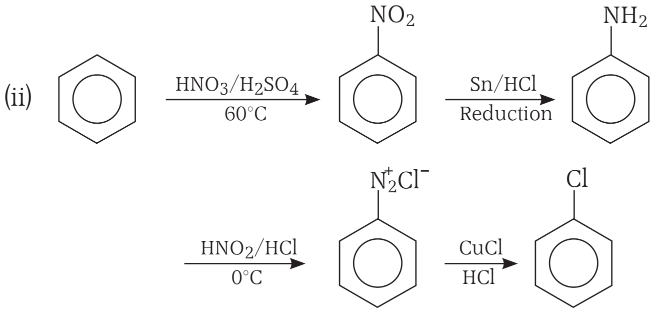
Thus, fluorides, chlorides, bromides and iodides can be prepared with the same method due to their differential reactivity. Above written (i) reaction is used to prepare **chlorides** and **bromides** (ii) reaction is used to prepare **fluorides** and (iii) reaction is used to prepare **aryl iodides.**

(c) From Aromatic Amino and Nitro Compounds

A better yield of aryl halides is obtained through this reaction which is summarised as

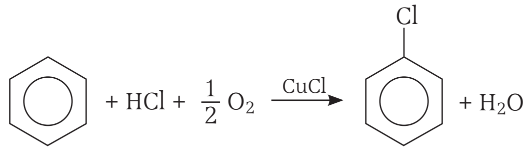


(Laboratory method)



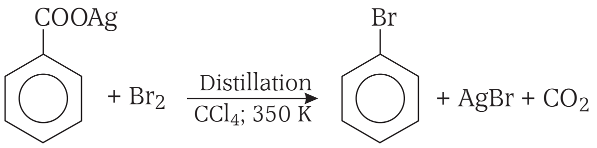
(d) Raschig Process

It is the commercial method of the preparation chlorobenzene. The reaction looks like



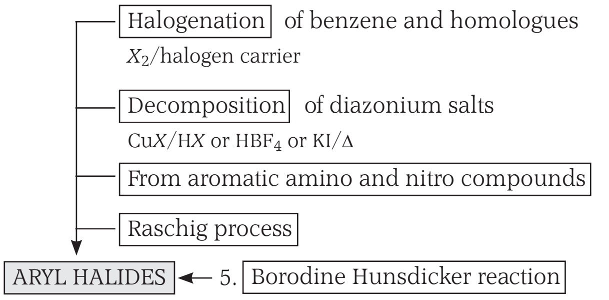
(e) Borodine Hunsdicker Reaction

The reaction looks like as



(Also see methods of preparation of monohalogen derivatives)

The outlines of methods of preparation of aryl halides is as



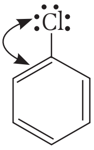
Physical and Chemical Properties

Aryl halides are heavier than water, though polar but immiscible with water (due to incapability of forming H-bonds).

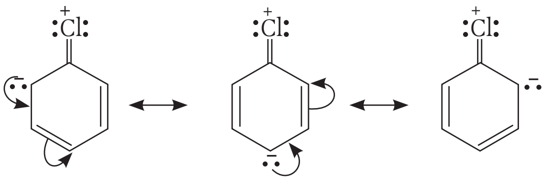
(a) **Nucleophilic Substitution Reactions**

Aryl halides are less reactive towards nucleophilic substitution reactions as compared to alkyl halides due to the following reasons

1. The C–*X* bond in aryl halides have double bond character due to conjugation between lone pair of halogen and benzene ring as :

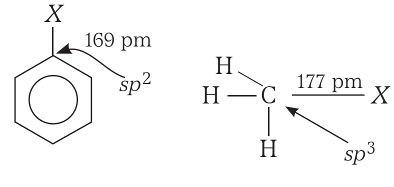


Conjugation resulting to following 3 resonating structures.



Due to the presence of such double bond character, aryl halides does not give the normal reactions of X^- (halides) ions *i.e.*, it is difficult to break C–*X* bond in favour of *X*-atoms. Thus, aryl halides show nucleophilic substitution with difficulty.

2. Moreover in halobenzene, C atom holding the halogen atom is sp^2-hybridised and in methyl halide it is sp^3-hybridised. Since, an sp^2-hydridised orbital is smaller in size as compared to an sp^3-hybridised orbital therefore, the (C—*X*) bond in halobenzene should be shorter and hence stronger than that in CH_3X.



3. The sp^2-hybrid C atom is more electronegative as compared to sp^3-hybrid C atom, therefore, the sp^2-hybrid (of C —*X* bond) in aryl halide is less willing to release electron to the halogen than an sp^3-hybrid C atom in alkyl halide. As a result, (C—*X*) bond in an aryl halide is less polar than in alkyl halides, This is supported by the observation that dipole moment of chlorobenzene is 1.7 D as compared to the dipole moment CH_3Cl *i.e.*, 1.94 D. Consequently, the halogen atom present in aryl halides cannot be easily replaced by nucleophiles.

$$H_5\overset{+\delta}{C_6}—\overset{-\delta}{Cl} \qquad H_3\overset{+\delta}{C}—\overset{-\delta}{Cl}$$

Caution Point *For the same reason, chlorobenzene does not give test for* $Cl^{\ominus}$ *ions when treated with aq.* NaOH *and then with* $AgNO_3$*, whereas* CH_3Cl *gives this test.*

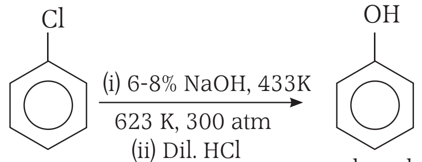
$$C_6H_5Cl + Aq.KOH \xrightarrow{AgNO_3} No.ppt$$

$$CH_3Cl + Aq.KOH \longrightarrow CH_3OH + Cl^{\ominus} \xrightarrow{AgNO_3}$$
$$AgCl \text{ (White ppt., soluble in } NH_4OH)$$

4. Phenyl cation formed as a result of self-ionisation will not be stabilised by resonance, and therefore, S_N1 mechanism is not possible.
5. It is difficult for the electron rich nucleophile to approach electron rich arenes because of repulsion between them.

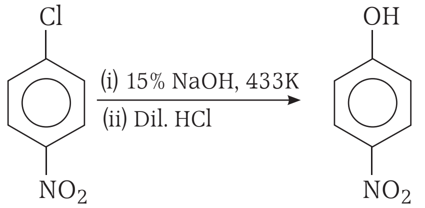
However, aryl halides can be made to undergo nucleophilic substitution either under drastic conditions (such as the use of high temperature, pressure, or very strong nucleophile) or by the presence of electron-withdrawing group (*e.g.*, $—NO_2$, —COOH, etc.) at the *o*-and *p*-positions to the nuclear halogen. *e.g.*,

(i)



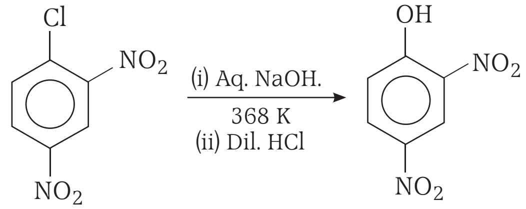
phenol

(ii)



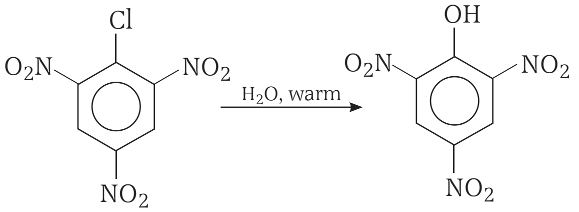
p-nitrophenol

(iii)



2, 4-dinitro-chlorobenzene 2, 4-dinitrophenol

(iv)



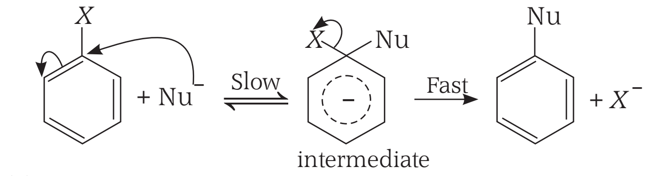
2, 4, 6 trinitro chlorobenzene (picryl chloride)

2, 4, 6-trinitrophenol (picric acid)

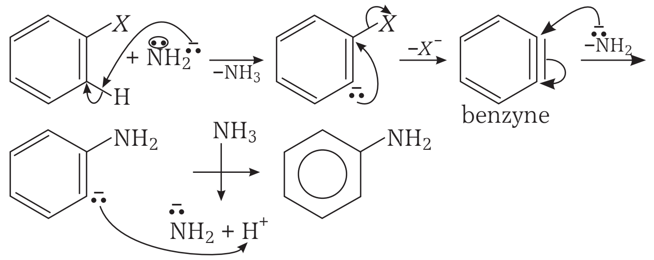
Explanation The presence of nitro group at *ortho*- and *para* positions withdraws the electron density from the benzene ring and thus facilitates the attack of the nucleophile on haloarene. The carbanion thus formed is stabilised through resonance. The negative charge appearing at *ortho*- and *para*-positions with respect to the halogen substituent is stabilised by (—NO_2) group, while in case of *meta*-nitrobenzene, none of the resonating structures bears the negative charge on carbon atom bearing the (—NO_2) group. Therefore, the presence of nitro group at *meta*- position does not stabilise the negative charge and no effect on reactivity is observed by the presence of (—NO_2) group at *meta*-position.

In general **nucleophilic substitution** reactions does not take place through straight S_N mechanism but alternate benzyne or bimolecular mechanisms has been provided which are summarised as

(i) Bimolecular mechanism



(ii) Benzyne mechanism



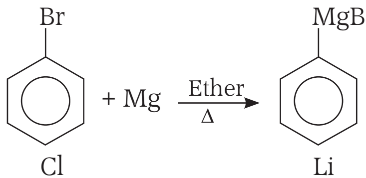
Nucleophilic substitution of NH_2 can also perform by reacting aryl halides with $NaNH_2$ or KNH_2 in liquid NH_3.

Caution Point *In the absence of electron withdrawing groups or in the presence of electron donating groups, the nucleophilic substitution reactions in aryl halides occur by the benzyne mechanism.*

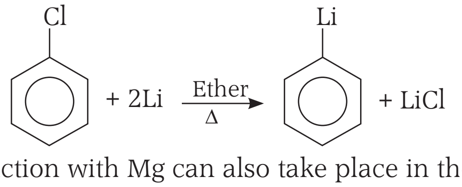
(b) Reaction with Metals

By this reaction, organometallic compounds are formed. The reactions looks like

(i)



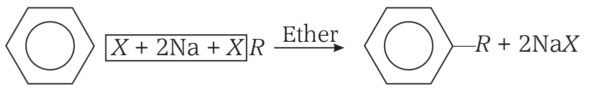
(ii)



The reaction with Mg can also take place in the presence of THF.

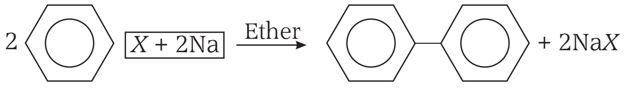
(c) Wurtz-Fittig and Fittig Reaction

These reactions are infact modified form of Wurtz reaction and involves aryl halide in place of alkyl halide as



alkyl benzene

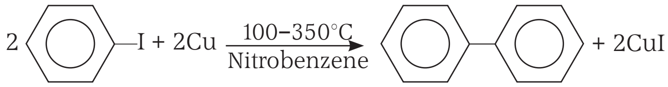
(Wurtz-Fittig reaction)



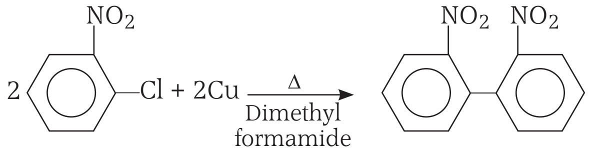
biphenyl (Fittig reaction)

(d) Ullmann Reaction

The reaction is successful with aryl iodides as C—I bond is weakest among all C—*X* bonds in aryl halides and looks like

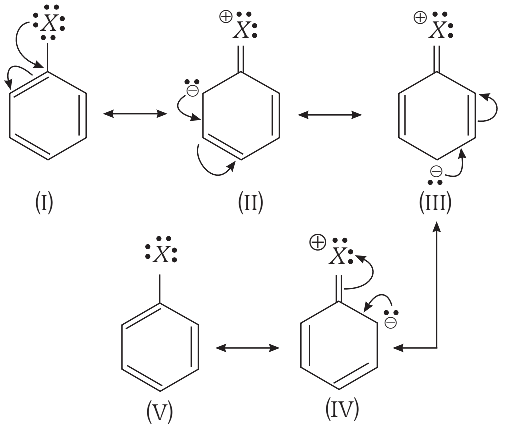


However, aryl chlorides and bromides also react when some electronegative substituent with ability to activate the halogen is present, *e.g.*,



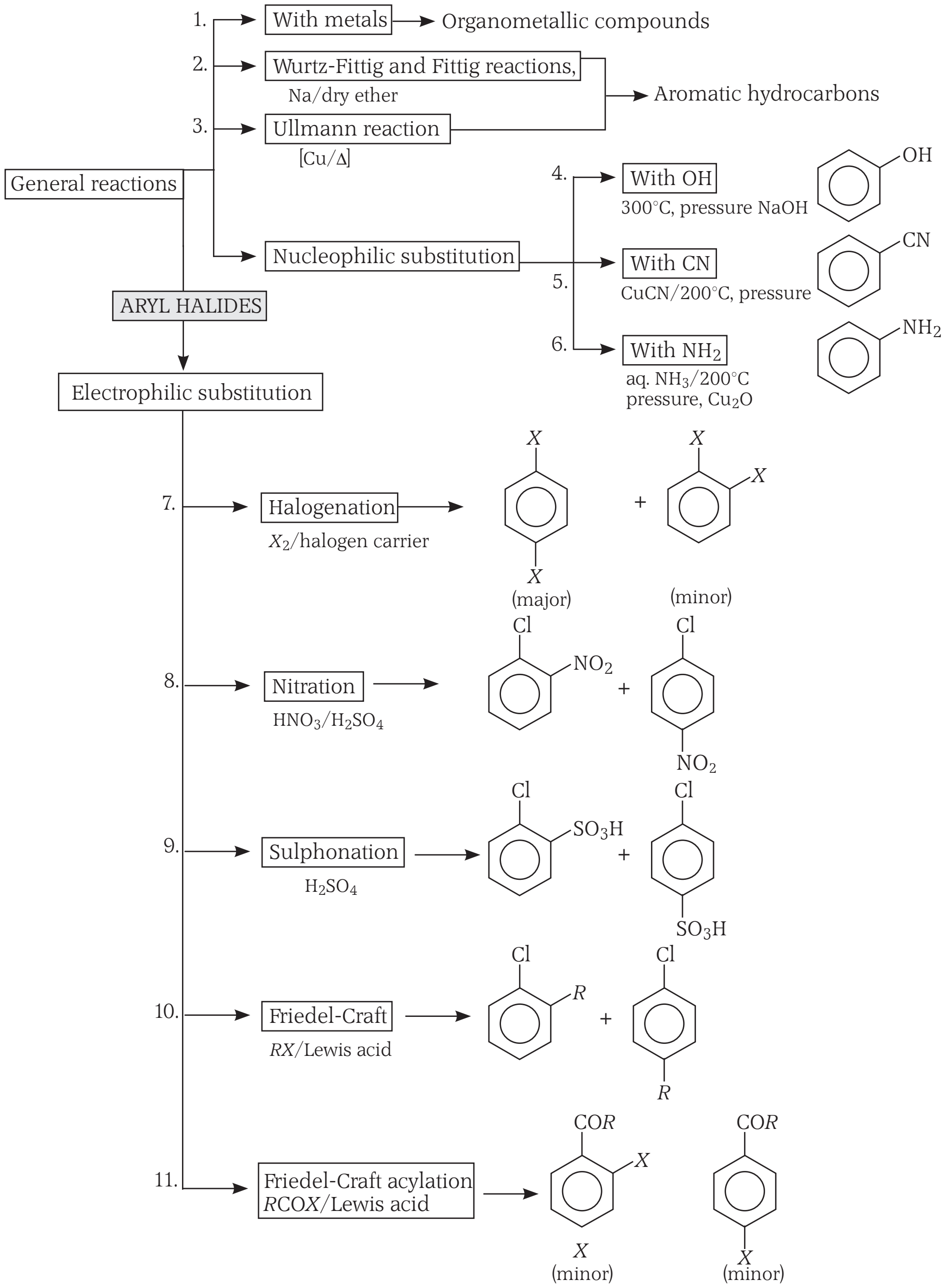
Electrophilic Substitution Reactions

Ar*X* undergoes the usual electrophilic substitution reactions of the benzene ring such as halogenation, sulphonation, nitration, and Friedel-Crafts reactions. Although slightly deactivating (due to–*I* effect), yet they are *o*, *p*-directing. Orientation (*o*-,*p*-directing) influence of halogens is explained by the resonance. Due to + *R* effect, Ar*X* is resonance stabilised as follows



Due to resonance, benzene ring is activated at *o*-and *p*-positions, thereby increasing the electron density more at *o*-and *p*-positions than at *m*-position. Moreover, due to –*I* effect of *X*, there is some tendency to withdraw electron from the benzene ring; as a result the ring gets slightly deactivated as compared to benzene and hence SE reaction in Ar*X* occurs slowly and drastic conditions are required as compared to those in benzene.

The chemical properties of aryl halides looks like



Check Point 3

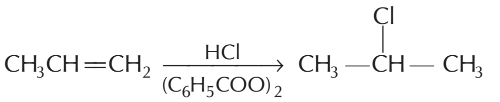
1. Aryl halides do not give the normal reactions of halide ions. Why?
2. In order to prepare chlorobenzene from benzene, presence of a halogen carrier is a necessity. Explain.
3. Chlorobenzene does not give Ullmann reaction but *ortho* nitrochlorobenzene does. Explain why?

WORKED OUT Examples

Example 1 *When hydrochloric acid gas is treated with propene in the presence of benzoyl peroxide, it gives*

(a) *2-chloropropane* (b) *allyl chloride*
(c) *n-propyl chloride* (d) *isopropyl chloride*

Solution (a) Peroxide effect is observed only in case of HBr. Therefore, addition of HCl to propene even in the presence of benzoyl peroxide occurs according to Markownikoff's rule.



$$CH_3CH{=}CH_2 \xrightarrow[(C_6H_5COO)_2]{HCl} CH_3-\overset{\overset{\large Cl}{|}}{C}H-CH_3$$

Example 2 *Identify (C) in*

$$CH_3CH_2CH_2Br \xrightarrow{aq.\ NaOH} A \xrightarrow{Al_2O_3} B \xrightarrow{Cl_2/H_2O} C$$

(a) $CH_3CHOHCH_2Cl$
(b) $CH_3CHClCH_2Cl$
(c) *mixture of* $CH_3CHCl\cdot CH_2Cl$ *and* $CH_3CHOHCH_2Cl$
(d) $CH_3CH_2ClCH_2OH$

Solution (a)

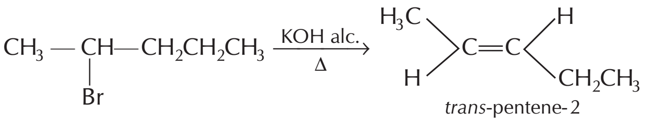
$$CH_3CH_2CH_2Br \xrightarrow{Aq.\ NaOH} CH_3CH_2CH_2OH \xrightarrow[-H_2O]{Al_2O_3,\,\Delta} CH_3CH{=}CH_2$$

$$CH_3CH{=}CH_2 \xrightarrow{Cl_2\,/\,H_2O} CH_3-CHOH-CH_2Cl$$

Example 3 *2-bromopentane is heated with potassium ethoxide in ethanol. The major product obtained is*

(a) *pentene-1*
(b) *2-ethoxypentane*
(c) *trans-pentene-2*
(d) *cis-pentene-2*

Solution (c) Secondary alkyl halides on treatment with alcoholic KOH preferably undergo elimination rather than substitution to give alkenes in accordance with Saytzeff rule. Usually the more stable *trans*-alkenes predominate in this reaction. Thus, 2-bromopentane gives *trans*-pentene-2



trans-pentene-2

Example 4 C—Cl *bond of chlorobenzene in comparison to* C—Cl *bond of methyl chloride is*

(a) *longer and stronger*
(b) *shorter and stronger*
(c) *longer and weaker*
(d) *shorter and weaker*

Solution *(b) Due to resonance* C—Cl *bond of chlorobenzene is shorter but stronger.*

Example 5 *The yield of chlorobenzene obtained by reaction of phenol with* PCl_5 *is less due to the formation of*

(a) *p-chlorophenol*
(b) *o-chlorophenol*
(c) *triphenyl phosphate*
(d) *phosphorus oxychloride*

Solution (c) $C_6H_5OH + PCl_5 \longrightarrow C_6H_5Cl + POCl_3 + HCl$

$$3C_6H_5OH + POCl_3 \longrightarrow (C_6H_5)_3PO_4 + 3HCl$$

The yield of phenol is poor because the main product is triphenyl phosphate.

Example 6 *In which of the following molecules p-electron of halogen is delocalised over the entire structure?*

(a) *Picryl chloride*
(b) *Benzyl chloride*
(c) *Allyl chloride*
(d) *Benzal chloride*

Solution (a) In picryl chloride or 1–chloro-2,4,6-trinitro benzene, the Cl group is directly attached to benzene ring and *p*-electrons are delocalised over the entire structure due to the presence of three deactivating NO_2 groups.

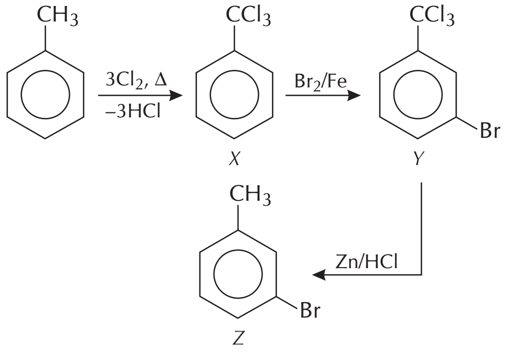
Example 7 *The compound*

$$C_7H_8 \xrightarrow{3Cl_2/\Delta} X \xrightarrow{Br_2/Fe} Y \xrightarrow{Zn/HCl} Z.$$

The compound Z is

(a) *m-bromotoluene*
(b) *p-bromotoluene*
(c) *o-bromotoluene*
(d) *2,4,6-trichlorotoluene*

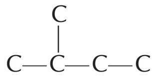
Solution (*a*)



Example 8 *An alkyl chloride (A) on reaction with magnesium in dry ether followed by treatment with ethanol gave 2-methylbutane. Give the possible structure of (A).*

(*a*) $(CH_3)_2C(Cl)CH_2CH_3$
(*b*) $(CH_3)_2CHCH_2CH_2Cl$
(*c*) $CH_3CH_2CH_2CH_2CH_2X$
(*d*) *Both (a) and (b)*

Solution (*d*) Since, the compound gives 2-methyl butane, it must contain the following carbon skeleton.

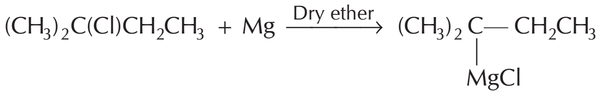


$$\overset{\displaystyle C}{\overset{|}{}}\!\!\!\!\!C—C—C—C$$

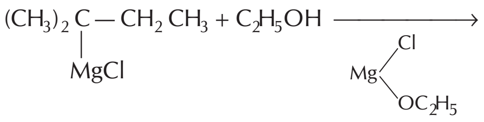
Thus, the structure of chloride may be

$(CH_3)_2C(Cl)CH_2CH_3$ or $(CH_3)_2CHCH_2CH_2Cl$

and reactions are as follows



$$(CH_3)_2C(Cl)CH_2CH_3 + Mg \xrightarrow{\text{Dry ether}} (CH_3)_2\underset{\displaystyle MgCl}{\underset{|}{C}}—CH_2CH_3$$



$$(CH_3)_2\underset{\displaystyle MgCl}{\underset{|}{C}}—CH_2CH_3 + C_2H_5OH \longrightarrow Mg\langle^{Cl}_{OC_2H_5}$$

$$\underset{\text{2-methyl butane}}{(CH_3)_2CHCH_2CH_3}$$

or $(CH_3)_2CHCH_2CH_2Cl + Mg \xrightarrow{\text{Dry ether}}$

$$(CH_3)_2CHCH_2CH_2MgCl$$

$$(CH_3)_2CHCH_2CH_2MgCl + C_2H_5OH \longrightarrow$$

$$\underset{\text{2-methylbutane}}{(CH_3)_2CHCH_2CH_3}$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

General Characteristics and Preparation of Monohaloalkanes

1. The position of —Br in the compound $CH_3CH{=}CHC(Br)(CH_3)_2$ can be classified as [**NCERT** Exemplar]

(a) allyl (b) aryl
(c) vinyl (d) secondary

2. What should be the correct IUPAC name for diethylbromomethane? [**NCERT** Exemplar]

(a) 1-bromo-1, 1-diethylmethane
(b) 3-bromopentane
(c) 1-bromo-1-ethylpropane
(d) 1-bromopentane

3. Which of the following is an example of *vic*-dihalide? [**NCERT** Exemplar]

(a) Dichloromethane (b) 1, 2-dichloroethane
(c) Ethylidene chloride (d) Allyl chloride

4. Alkyl iodides can be prepared by

(a) $RCH_2COOAg + I_2 \xrightarrow[\Delta]{CCl_4} RCH_2I$

(b) $RCH_2Cl + NaI \xrightarrow[\Delta]{Acetone} RCH_2I + NaCl$

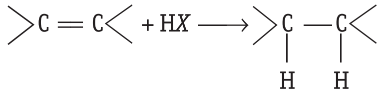
(c) $R - OH + I_2 \longrightarrow RI + H_2O$

(d) $CH_4 + I_2 \longrightarrow CH_3I$

5. Which of the following is halogen exchange reaction? [**NCERT** Exemplar]

(a) $RX + NaI \longrightarrow RI + NaX$

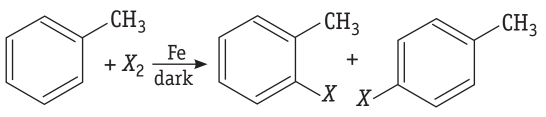
(b)



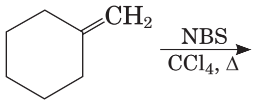
$>C=C< + HX \longrightarrow >\underset{H}{\underset{|}{C}}-\underset{H}{\underset{|}{C}}<$

(c) $R{-}OH + HX \xrightarrow{ZnCl_2} R-X + H_2O$

(d)

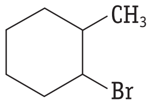


6. The major product formed in the reaction

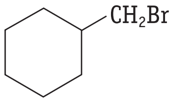


is

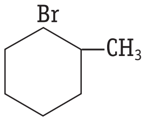
(a)



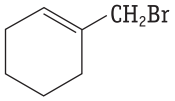
(b)



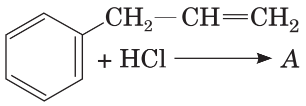
(c)



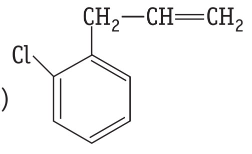
(d)



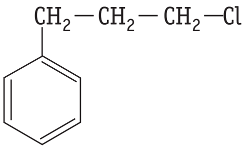
7. What is '*A*' in the following reaction? [**NCERT** Exemplar]



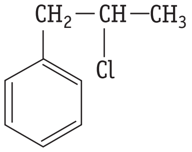
(a)



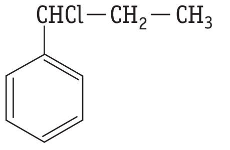
(b)



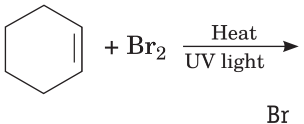
(c)



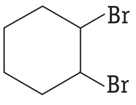
(d)



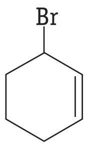
8. Draw the structure of major monohalo product in the following reaction [**NCERT**]



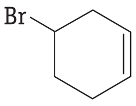
(a)



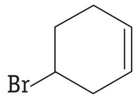
(b)



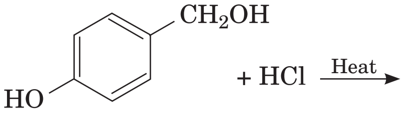
(c)



(d)

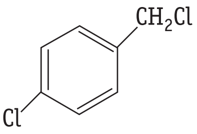


9. Find the structure of the product

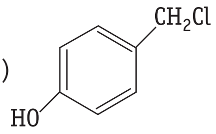


[NCERT]

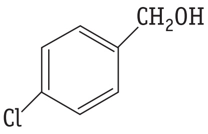
(a)



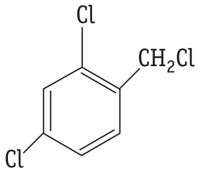
(b)



(c)



(d)



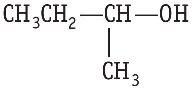
10. Among the isomeric alkanes of molecular formula C_5H_{12} identify the one that on photochemical chlorination yields 1 four isomeric monochlorides. [NCERT]

(a) 2-methylbutane (b) 2, 2-dimethylpropane
(c) 3-methylbutane (d) *n*-pentane

11. Which of the following alcohols will yield the corresponding alkyl chloride on reaction with concentrated HCl at room temperature? [NCERT Exemplar]

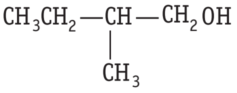
(a) $CH_3CH_2—CH_2—OH$

(b)



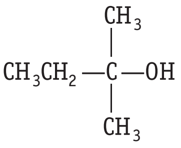
$CH_3CH_2—\underset{\substack{|\\CH_3}}{CH}—OH$

(c)



$CH_3CH_2—\underset{\substack{|\\CH_3}}{CH}—CH_2OH$

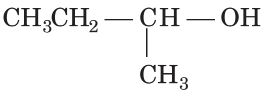
(d)



$CH_3CH_2—\overset{\substack{CH_3\\|}}{\underset{\substack{|\\CH_3}}{C}}—OH$

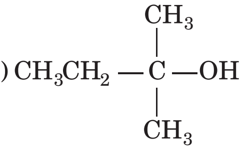
12. The order of reactivity of the following alcohols with halogen acids is [NCERT Exemplar]

(*A*) $CH_3CH_2—CH_2—OH$ (*B*)



$CH_3CH_2—\underset{\substack{|\\CH_3}}{CH}—OH$

(*C*)



$CH_3CH_2—\overset{\substack{CH_3\\|}}{\underset{\substack{|\\CH_3}}{C}}—OH$

(a) (*A*) > (*B*) > (*C*) (b) (*C*) > (*B*) > (*A*)
(c) (*B*) > (*A*) > (*C*) (d) (*A*) > (*C*) > (*B*)

13. Grignard reagents should be prepared under anhydrous conditions because [NCERT Exemplar]

(a) it is highly reactive towards protonic substances
(b) it reacts with ether
(c) Both (a) and (b)
(d) None of the above

14. Sulphuric acid cannot be used during the reaction of alcohols with KI because it is a [NCERT]

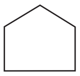
(a) strong oxidant (b) strong reductant
(c) weak oxidant (d) it can be used

15. The reagents required to obtain 1-iodobutane from but-1-ene is/are [NCERT]

(a) I_2 / red P
(b) KI
(c) HI / H_2O_2
(d) HBr / H_2O_2 and KI/acetone

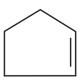
16. A hydrocarbon C_5H_{10} does not react with chlorine in dark but gives a single monochloro compound C_5H_9Cl in bright sunlight. Identify the hydrocarbon. [NCERT]

(a)



(b) $CH_3CH_2—CH=CHCH_2Cl$

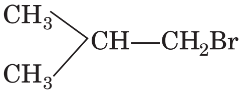
(c) $CH_3CH=CHCH_2CH_2Cl$ (d)



Properties of Monohaloalkanes

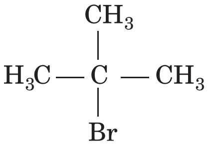
17. Arrange the following compounds in the increasing order of their boiling points. [NCERT Exemplar]

(*A*)



(*B*) $CH_3CH_2CH_2CH_2Br$

(*C*)



$H_3C—\overset{\substack{CH_3\\|}}{\underset{\substack{|\\Br}}{C}}—CH_3$

(a) (*B*) < (*A*) < (*C*) (b) (*A*) < (*B*) < (*C*)
(c) (*C*) < (*A*) < (*B*) (d) (*C*) < (*B*) < (*A*)

18. Which is the correct increasing order of boiling points of the following compounds?

1-iodobutane, 1-bromobutane, 1-chlorobutane, Butane [NCERT Exemplar]

(a) Butane < 1-chlorobutane < 1-bromobutane <1-iodobutane
(b) 1-iodobutane < 1-bromobutane < 1-chlorobutane < butane
(c) Butane < 1- iodobutane < 1-bromobutane < 1-chlorobutane
(d) Butane <1-chlorobutane < 1-iodobutane <1-bromobutane

19. The order of reactivities of the following alkyl halides for a S_N2 reaction is

(a) *R*F > *R*Cl > *R*Br > *R*I (b) *R*F > *R*Br > *R*Cl > *R*I
(c) *R*Cl > *R*Br > *R*F > *R*I (d) *R*I > *R*Br > *R*Cl > *R*F

20. A primary alkyl halide would prefer to undergo [**NCERT** Exemplar]

(a) S_N1 reaction (b) S_N2 reaction
(c) α-elimination (d) racemisation

21. The reaction of ethyl bromide and silver cyanide results in the formation of

(a) ethylene (b) ethyl cyanide
(c) ethyl isocyanide (d) ethyl alcohol

22. The alkyl halide that undergoes S_N1 reaction more readily is

(a) ethyl bromide (b) *iso*-propyl bromide
(c) vinyl bromide (d) *t*-butyl bromide

23. Among the following alkyl halides the one having the highest bond polarity is

(a) CH_3Cl (b) CH_3Br
(c) CH_3I (d) CH_3F

24. In the reaction,

$$R-Br + Cl^- \xrightarrow{\text{Dimethyl formamide}} R-Cl + Br^-$$

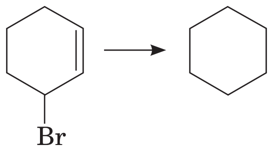
the relative rates of reaction of methyl bromide (I), ethyl bromide (II), *iso*-propyl bromide (III) and tert-butyl bromide (IV) follow the order

(a) I > II > III > IV (b) IV > III > II > I
(c) IV > I > II > III (d) II > III > IV > I

25. The Friedel-Crafts reactions of *n*-propylbromide with benzene in the presence of anhydrous $AlCl_3$ gives

(a) *n*-propyl benzene (b) *iso*-propyl benzene
(c) 1,4-dipropyl benzene (d) 1,2-dipropyl benzene

26. The transformation



can be brought about using

(a) Zn/H^+ (b) CuI
(c) Na (d) $(CH_3)_2CuLi$

27. Which alkyl halide from the following pairs would you expect to react more rapidly by an S_N2 mechanism? [**NCERT**]

(a) $CH_3CH(CH_3)CH_2CH_2Br$

(b) $CH_3CH_2CH(CH_3)CH_2Br$

(c) $CH_3CH_2C(CH_3)_2CH_2Br$

(d) $CH_3CH_2CH_2CH(CH_3)Br$

28. In the reaction,

$CH_3CH_2CHBrCH_3 + (CH_3)_3COK \longrightarrow$

the main product is

(a) $CH_3CH_2CH(OC(CH_3)_3)CH_3$

(b) $CH_3CH_2CH(OH)CH_3$

(c) $CH_3CH_2CH=CH_2$ (d) $CH_3CH=CHCH_3$

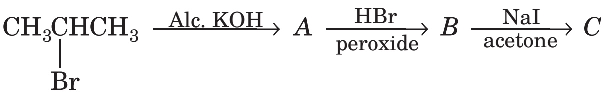
29. Butyronitrile may be prepared by heating

(a) propyl alcohol with KCN
(b) butyl alcohol with KCN
(c) propyl chloride with KCN
(d) butyl chloride with KCN

30. Wet ether is not used as a solvent in Wurtz reaction, because the water present in it

(a) hydrolyses *RX* to *R*OH (b) reduces *RX* to *R*H
(c) destroy the Na metal (d) reacts with *R*–*R*

31. In the reaction,



$$CH_3CH(Br)CH_3 \xrightarrow{\text{Alc. KOH}} A \xrightarrow[\text{peroxide}]{\text{HBr}} B \xrightarrow[\text{acetone}]{\text{NaI}} C$$

C is

(a) $CH_3CH_2CH_2I$

(b) $CH_3-CH(I)-CH_3$

(c) $CH_3-CH(I)-CH_2I$

(d) $CH_3CH=CHI$

32. A mixture of 1-chloropropane and 2-chloropropane when treated with alcoholic KOH, gives

(a) *iso*-propylene
(b) 2-propene
(c) 1-propene
(d) a mixture of 1-propene and 2-propene

33. The treatment of tertiary butyl chloride with 80% aqueous ethanol at 140°C gives

(a) $(CH_3)_3C-OH$ (b) $(CH_3)_3C-OCH_2CH_3$

(c) $CH_2=C(CH_3)_2$

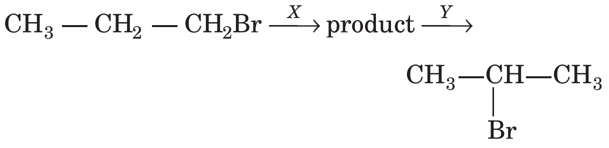
(d) All of these

34. An alkyl halide with molecular formula, $C_6H_{13}Br$ on treatment with alcoholic KOH gave two isomeric alkenes, *A* and *B*. Ozonolysis of the mixture gave the following compounds.
CH_3COCH_3, CH_3CHO, CH_3CH_2CHO and $(CH_3)_2CHCHO$. The alkyl halide is

(a) 2-bromohexane
(b) 3-bromo-2-methylpentane
(c) 2, 2-dimethyl-1-bromobutane
(d) 2-bromo-2, 3-dimethylbutane

35. Identify the set of reagent/reaction conditions 'X' and 'Y' in the following set of transformations.



$$CH_3-CH_2-CH_2Br \xrightarrow{X} \text{product} \xrightarrow{Y} CH_3-\underset{\substack{|\\ Br}}{CH}-CH_3$$

(a) X = dilute aqueous NaOH, 20°C; Y = HBr/acetic acid, 20°C
(b) X = concentrated alcoholic NaOH, 80°C; Y = HBr/acetic acid, 20°C
(c) X = dilute aqueous NaOH, 20°C; Y = $Br_2/CHCl_3$, 0° C
(d) X = concentrated alcoholic NaOH, 80°C; Y = $Br_2/CHCl_3$, 0°C

Di, tri and Polyhalogen Compounds

36. Which one of the following has the highest dipole moment ? **[NCERT]**
(a) CH_2Cl_2
(b) $CHCl_3$
(c) CCl_4
(d) All have equal dipole moment

37. Chloroform reacts with conc HNO_3 to give
(a) water gas (b) tear gas
(c) laughing gas (d) producer gas

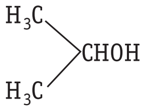
38. The bad smelling substance formed by the reaction of chloroform with methyl amine and alcoholic KOH will be
(a) methyl amine (b) methyl alcohol
(c) methyl cyanide (d) methyl isocyanide

39. If chloroform is left open in air in presence of sun, rays
(a) polymerisation taken place
(b) no reaction takes place
(c) explosion takes place
(d) phosgene gas is formed

40. The trade name of trichloroethylene is
(a) freon (b) westron
(c) westrosol (d) DDT

41. The compound which does not give iodoform with I_2 and alkali is
(a) CH_3CH_2OH (b) CH_3COCH_3

(c)



$(H_3C)_2CHOH$

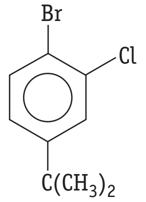
(d) CH_3OH

42. Haloform reaction cannot be used to prepare
(a) CHF_3 (b) $CHCl_3$
(c) $CHBr_3$ (d) CHI_3

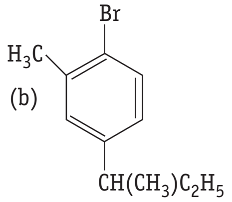
43. Which is not the correct statement ?
(a) Chloretone is an insecticide
(b) $COCl_2$ is called phosgene
(c) Chloropicrin is used as an insecticide
(d) CCl_4 is used as fire extinguisher under the name pyrene

44. Write the structure of the following compounds.
1-bromo-4-*sec*-butyl-2-methylbenzene **[NCERT]**

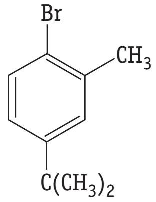
(a)



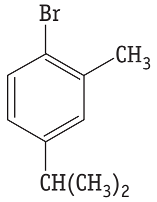
(b)



(c)

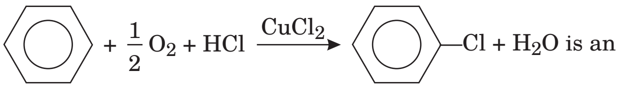


(d)



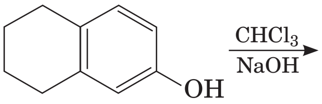
45. Out of $C_6H_5CHClC_6H_5$ and $C_6H_5CH_2Cl$ which is more easily hydrolysed by aqueous KOH? **[NCERT]**
(a) $C_6H_5CHClC_6H_5$
(b) $C_2H_5CH_2Cl$
(c) Both get equally hydrolysed
(d) Unpredictable

46. Conversion of,



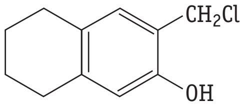
example of which of the following reaction?
(a) Nucleophilic substitution
(b) Electrophilic substitution
(c) Free radical addition
(d) Free radical substitution

47. The product obtained in the reaction,

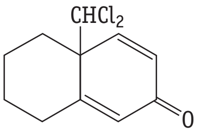


are

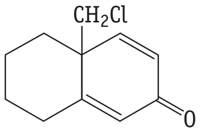
(a)



(b)



(c)



(d) None of these

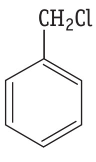
48. Chlorobenzene is formed by reaction of chlorine with benzene in the presence of $AlCl_3$. Which of the following species attacks the benzene ring in this reaction ? **[NCERT Exemplar]**

(a) Cl^- (b) Cl^+

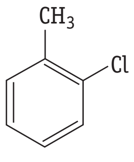
(c) $AlCl_3$ (d) $[AlCl_4]^+$

49. The reaction of toluene with chlorine in the presence of iron and in the absence of light yields. …… **[NCERT Exemplar]**

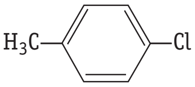
(a)



(b)



(c)



(d) Mixture of (b) and (c)

50. *p*-dichlorobenzene has higher melting point and lower solubility than those of *o*-and *m*-isomers. This is because *p*-isomer is **[NCERT]**

(a) more symmetrical (b) resonance stabilised

(c) stabilised by + *I* effect (d) Both (a) and (b)

51. Aryl halides undergo

(a) the Fittig reaction (b) the Ullmann reaction

(c) the Grignard reaction (d) All of these

52. Arrange *m*-nitrochlorobenzene (I), 2, 4- dinitrochlorobenzene (II) *p*-nitrochlorobenzene (III) according to reactivity with sodium ethoxide.

(a) I > II > III (b) III > I > II

(c) II > III > I (d) II = III > I

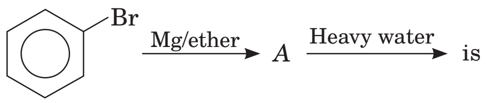
53. Arrange the following in order of increasing ease of nucleophilic substitution reaction

Chlorobenzene (I), 2, 4, 6-trinitrochlorobenzene (II), 2, 4- dinitrochlorobenzene (III) and 4-nitrochlorobenzene (IV)

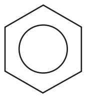
(a) I < IV < III < II (b) I < III < IV < II

(c) II < III < IV < I (d) IV < III < II < I

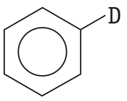
54. The final product obtained in the reaction



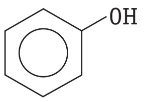
(a)



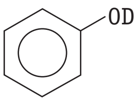
(b)



(c)



(d)



55. Arrange the following compounds in the order of reactivity with alcoholic silver nitrate,

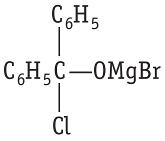
$C_6H_5CH_2CH_2Br$ (I), $C_6H_5CHBrCH_3$ (II) and $C_6H_5CH{=}CHBr$ (III)

(a) II > I > III (b) I > II > III

(c) III > II > I (d) II = I > III

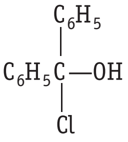
56. Which of the following is the final product in the reaction between benzoyl chloride and phenyl magnesium bromide?

(a)



$C_6H_5\overset{\displaystyle C_6H_5}{\underset{\displaystyle Cl}{C}}{-}OMgBr$

(b)



$C_6H_5\overset{\displaystyle C_6H_5}{\underset{\displaystyle Cl}{C}}{-}OH$

(c) C_6H_5COOH (d) $(C_6H_5)_3COH$

57. Aryl halides are less reactive towards nucleophile than alkyl halides due to

(a) resonance (b) stability of carbonium ion

(c) high boiling point (d) None of these

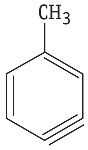
58. A convenient reagent for the conversion of bromobenzene into benzonitrile is

(a) alc KCN alone (b) KCN and pyridine

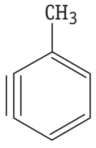
(c) silver cyanide (d) CuCN and pyridine

59. *o*-chlorotoluene reacts with sodamide in liquid NH_3 to give *o*-toluidine and *m*-toluidine. This proceeds through an intermediate

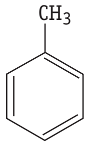
(a)



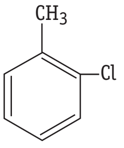
(b)



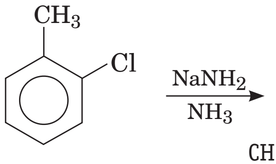
(c)



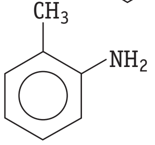
(d)



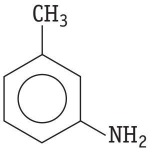
60. What is the product expected in the following reaction?



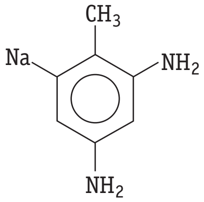
(a)



(b)



(c)



(d) None of these

61. Which of the following reactions is feasible ?

(a) 
(b) 
(c) 
(d) 
62. Which of the following compounds is the most likely to undergo a bimolecular nucleophilic substitution reaction with aqueous NaOH?

(a) 
(b) 
(c) 
(d) 
63. Benzyl chloride ($C_6H_5CH_2Cl$) can be prepared from toluene by chlorination with

$$\underset{\text{I}}{SO_2Cl_2}\ \ \underset{\text{II}}{SOCl_2}\ \ \underset{\text{III}}{Cl_2}\ \underset{\text{IV}}{NaOCl}$$

(a) I, II and III
(b) I and III
(c) II and III
(d) All the four

64. Which of the following sequence of reactions will give 1-bromo-4-trichloromethylbenzene ?

(a) Toluene $\xrightarrow[\text{Fe}]{Br_2}$ *o*-bromotoluene $\xrightarrow[h\nu \text{ or heat}]{Cl_2}$

(b) Toluene $\xrightarrow[\text{Fe}]{Br_2}$ *p*-bromotoluene $\xrightarrow[h\nu \text{ or heat}]{Cl_2}$

(c) Toluene $\xrightarrow[h\nu \text{ or heat}]{Cl_2}$ trichloromethyl benzene $\xrightarrow[\text{Fe}]{Br_2}$

(d) None of the above

Miscellaneous

65. Chlorine is the most reactive towards aqueous NaOH in

(a) methyl chloride
(b) chlorobenzene
(c) vinyl chloride
(d) ethyl chloride

66. Which of the following reagents can be used to distinguish chlorobenzene from chlorocyclohexane ?

(a) $AgNO_3/C_2H_5OH$
(b) $Ag(NH_3)_2OH$
(c) Na fusion; HNO_3; $AgNO_3$
(d) Br_2/CCl_4

67. Which of the following will be the least reactive towards nucleophilic substitution ?

(a) 
(b) 
(c) 
(d) C_2H_5Cl

68. 1, 4-dibromobutane is treated with Na_2S in aqueous ethanol. The product formed is

(a) $BrCH_2CH_2CH_2CH_2OH$
(b) $HSCH_2CH_2CH_2SH$
(c) $BrCH_2CH_2CH_2S^-Na^+$
(d) 
69. The reactivity of the compounds

(i) MeBr (ii) $PhCH_2Br$ (iii) MeCl (iv) *p*-$MeOC_6H_4Br$ decreases as

(a) (i) > (ii) > (iii) > (iv)
(b) (iv) > (ii) > (i) > (iii)
(c) (iv) > (iii) > (i) > (ii)
(d) (ii) > (i) > (iii) > (iv)

70. Which of the following will give yellow precipitate on shaking with an aqueous solution of NaOH followed by acidification with dil HNO_3 and addition of $AgNO_3$ solution ?

(a) C_2H_5I

(b) 
(c) 
(d) 
Round II (Mixed Bag)

1. Which reagent will you use for the following reaction ?

$$CH_3CH_2CH_2CH_3 \longrightarrow CH_3CH_2CH_2CH_2Cl + CH_3CH_2CHClCH_3$$

[NCERT]

(a) Cl_2 / UV light
(b) $NaCl + H_2SO_4$
(c) Cl_2 gas in dark
(d) Cl_2 gas in the presence of iron in dark

2. An alkyl halide (RX) reacts with Na to form 4, 5-diethyloctane. Compound RX is

(a) $CH_3(CH_2)_3Br$
(b) $CH_3(CH_2)_2CH(Br)CH_2CH_3$
(c) $CH_3(CH_2)_3CH(Br)CH_3$
(d) CH_3Br

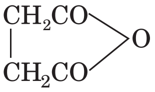
3. Reaction of $C_6H_5CH_2Br$ with aqueous sodium hydroxide follows **[NCERT Exemplar]**

(a) S_N1 mechanism
(b) S_N2 mechanism
(c) any of the above two depending upon the temperature of reaction
(d) Saytzeff rule

4. Among the following the most reactive towards alcoholic KOH is

(a) $CH_2{=}CHBr$
(b) $CH_3COCH_2CH_2Br$
(c) CH_3CH_2Br
(d) $CH_3CH_2CH_2Br$

5. The product of which of the following reactions on dehydration gives



(a) 1,2-dibromoethane $\xrightarrow{KCN} \xrightarrow[\Delta]{H_3O^+}$

(b) 1,1,-dibromoethane $\xrightarrow{KCN} \xrightarrow[\Delta]{H_3O^+}$

(c) 1,1,1-trichloroethane $\xrightarrow[\text{hydrolysis}]{\text{Alkaline}}$

(d) None of the above

6. The hydrogen atoms in chloroform are

(a) acidic
(b) basic
(c) neutral
(d) unpredictable

7. The main product of the reaction,

2-butene + chloroform $\xrightarrow{NaOH}$ would be

(a) butanoic acid
(b) 2-methylbutanoic acid
(c) 1,1,1-trichloro-2-methylbutane
(d) 1,4-butanediol

8. Chloroform with alcoholic KOH gives

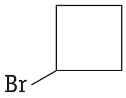
(a) potassium acetate
(b) potassium formate
(c) potassium chloride
(d) potassium chlorate

9. 1, 2-dibromoethane reacts with alcoholic KOH to yield a product X. The hybridisation state of the carbons present in X respectively, are

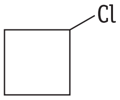
(a) sp, sp
(b) sp^3, sp^3
(c) sp^3, sp^2
(d) sp^3, sp^2

10. What would be the product formed when 1-bromo-3-chlorocyclobutane reacts with two equivalents of metallic sodium in ether?

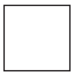
(a)



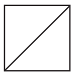
(b)



(c)



(d)



11. The product of which of the following reaction gives the acid catalysed elimination most readily?

(a) $(CH_3)_3COMgBr \xrightarrow{H_3O^+}$

(b) $CH_3CH_2CH_2OMgBr \xrightarrow{H_3O^+}$

(c) $(CH_3)_2CHOMgBr \xrightarrow{H_3O^+}$

(d) $CH_3CH_2OMgBr \xrightarrow{H_3O^+}$

12. Identify Z in the following sequence of reactions

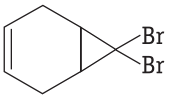
$$C_3H_7I \xrightarrow{\text{Alc KOH}} X \xrightarrow[\Delta]{\text{NBS}, h\nu} Y \xrightarrow{\text{Alc KCN}} Z$$

(a) $(CH_3)_2CH{-}CN$
(b) $Br{-}CH{=}CH{-}CN$
(c) $CH_2{=}CH{-}CH_2CN$
(d) $CH_2{=}CH{-}CHBr{-}CN$

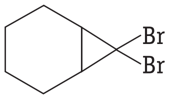
13. CBr_4 + MeLi +  $\longrightarrow$?

Identify the end product.

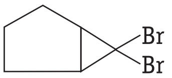
(a)



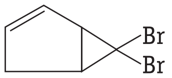
(b)



(c)



(d)

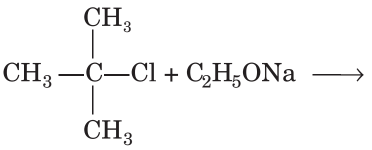


14. A new carbon-carbon bond formation is possible in
- (a) Cannizzaro reaction
- (b) Reimer-Tiemann reaction
- (c) Clemmensen reduction
- (d) None of the above

15. A compound obtained by the hydrolysis of the substance *A*, on reduction forms 2-hexanol. Hence, the substance *A* is
- (a) 3,3-dichlorohexane (b) 2,3-dichlorohexane
- (c) 2,2-dichlorohexane (d) 1,1-dichlorohexane

16. A dihaloalkane '*X*', having formula $C_3H_6Cl_2$, on hydrolysis gives a compound, that can reduce Tollen's reagent. The compound '*X*' is
- (a) 1, 2-dichloropropane (b) 1, 1-dichloropropane
- (c) 1, 3-dichloropropane (d) 2, 2-dichloropropane

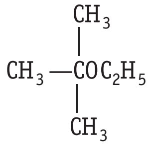
17.



$$CH_3-\overset{\displaystyle CH_3}{\underset{\displaystyle CH_3}{\overset{|}{\underset{|}{C}}}}-Cl + C_2H_5ONa \longrightarrow$$

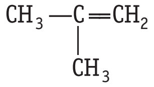
Major product of this reaction is

(a)



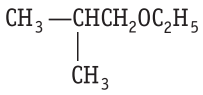
$CH_3-\overset{\displaystyle CH_3}{\underset{\displaystyle CH_3}{\overset{|}{\underset{|}{C}}}}OC_2H_5$

(b)



$CH_3-\underset{\displaystyle CH_3}{\underset{|}{C}}=CH_2$

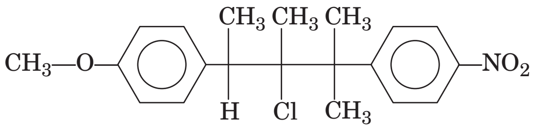
(c)



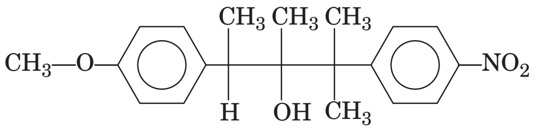
$CH_3-\underset{\displaystyle CH_3}{\underset{|}{C}}HCH_2OC_2H_5$

(d) None of these

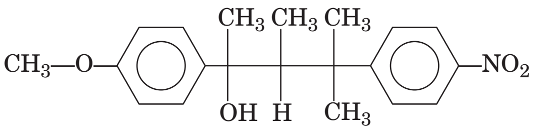
18. The following compound on hydrolysis in aqueous acetone will give



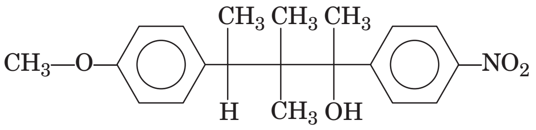
(K)



(L)



(M)

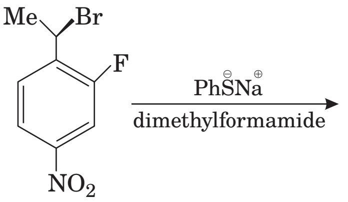


- (a) mixture of (K) and (L) (b) mixture of (K) and (M)
- (c) only (M) (d) only (K)

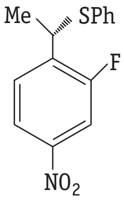
19. Primary alkyl halide $C_4H_9Br(A)$ reacted with alcoholic KOH to give compound (*B*). Compound (*B*) is reacted with HBr to give (*C*) which is an isomer of (*A*). When (*A*) is reacted with sodium metal, it gives compound (*D*), C_8H_{18} which is different from the compound formed when *n*-butyl bromide is reacted with sodium. Give the name of (*A*). **[NCERT Exemplar]**
- (a) 2-methylbromopropane
- (b) 1-bromobutane
- (c) 2-bromobutane
- (d) 1-bromo-2-dimethyl propane

20. A hydrocarbon of molecular mass 72 g mol^{-1} gives a single monochloro derivative and two dichloro derivatives on photochlorination. Give the name of the hydrocarbon. **[NCERT]**
- (a) *n*-pentane (b) 2, 2-dimethyl propane
- (c) 2, 2-dimethyl pentane (d) *iso*-pentane

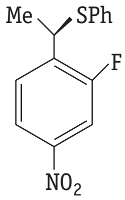
21. The major product of the following reaction is



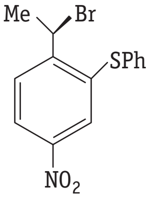
(a)



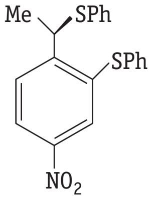
(b)



(c)

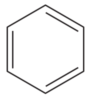


(d)

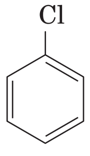


22. Arrange the following compounds in the increasing order of their densities. **[NCERT]**

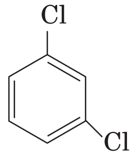
(*A*)



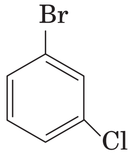
(*B*)



(*C*)



(*D*)



(a) (*A*) < (*B*) < (*C*) < (*D*) (b) (*A*) < (*C*) < (*D*) < (*B*)
(c) (*D*) < (*C*) < (*B*) < (*A*) (d) (*B*) < (*D*) < (*C*) < (*A*)

23. Which of the following compounds will give racemic mixture on nucleophilic substitution by OH^- ion ?

[NCERT Exemplar]

(*A*) $CH_3-\underset{\displaystyle C_2H_5}{\underset{|}{CH}}-Br$

(*B*) $CH_3-\underset{\displaystyle C_2H_5}{\underset{|}{\overset{\displaystyle Br}{\overset{|}{C}}}}-CH_3$

(*C*) $CH_3-\underset{\displaystyle C_2H_5}{\underset{|}{CH}}-CH_2Br$

(a) (*A*) (b) (*A*), (*B*), (*C*)
(c) (*B*), (*C*) (d) (*A*), (*C*)

24. The dihalogen derivative '*X*' of a hydrocarbon with three carbon atoms reacts with alcoholic KOH and produces another hydrocarbon which forms a red precipitate with ammoniacal Cu_2Cl_2. '*X*' gives an aldehyde on reaction with aqueous KOH. The compound '*X*' is

(a) 1, 3-dichloropropane (b) 1, 2-dichloropropane
(c) 2, 2-dichloropropane (d) 1, 1-dichloropropane

25. Match the structures given in Column I with the names in Column II.

	Column I		Column II
(A)		(p)	4-bromopent-2-ene
(B)		(q)	4-bromo-3-methylpent-2-ene
(C)		(r)	1-bromo-2-methylbut-2-ene
(D)		(s)	1-bromo-2-methylpent-2-ene

	A	B	C	D		A	B	C	D
(a)	p	q	r	s	(b)	q	p	r	s
(c)	p	q	p	s	(d)	p	q	p	p

26. Match the items of Column I and Column II

	Column I		Column II
(A)	S_N1 reaction	(p)	*vic*-dibromides
(B)	Chemicals in fire extinguisher	(q)	*gem*-dihalides
(C)	Bromination of alkenes	(r)	Racemisation
(D)	Alkylidene halides		
(E)	Elimination of HX from alkyl halide	(s)	Saytzeff rule
		(t)	Chlorobromocarbons

	A	B	C	D	E		A	B	C	D	E
(a)	r	t	q	p	s	(b)	r	t	p	q	s
(c)	t	r	p	q	s	(d)	r	t	p	s	q

More than One Correct Option

27. Haloalkanes contain halogen atom(s) attached to the sp^3 hybridised carbon atom of an alkyl group. Identify haloalkane from the following compounds.

(a) 2-bromopentane **[NCERT Exemplar]**
(b) Vinyl chloride (chloroethene)
(c) 2-chloroacetophenone
(d) Trichloromethane

28. Reagent which cannot be used to distinguish allyl bromide from *n*-propyl bromide are

(a) Br_2/CCl_4
(b) shaking with an aqueous solution of $AgNO_3$
(c) boiling with aqueous KOH solution followed by acidification with dil. HNO_3 and addition of $AgNO_3$ solution
(d) fusion with Na followed by acidification with dilute HNO_3 and addition of $AgNO_3$ solution

29. In the reaction,

$CHCl_3 + 4OH^- \longrightarrow HCOO^- + 3Cl^- + 2H_2O,$ the intermediate species formed is/are

(a) $CH(OH)_3$ (b) $:CCl_2$ (c) CCl_3^- (d) $COCl_2$

30. Which of the following compounds will give haloform test ?

(a) $C_6H_5COCH_3$ (b) CH_3CH_2Br
(c) $CH_3-CHCl-CH_3$ (d) CH_3COCH_2I

31. Alkyl fluorides are synthesised by heating an alkyl chloride/bromide in presence of …… or …… .

[NCERT Exemplar]

(a) CaF_2 (b) CoF_2 (c) Hg_2F_2 (d) NaH

32. The products formed when bromocyclohexane and sodium propynide are heated together are

(a) 2-cyclohexyl propyne (b) 1-cyclohexyl propyne
(c) propyne (d) cyclohexene

Assertion and Reason

Directions (Q. No. 33 to 37) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below :

(a) Statement I is true; Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true; Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

33. **Statement I** Nucleophilic substitution reaction on an optically active alkyl halide gives a mixture of enantiomers.

Statement II The reaciton follows $S_N 1$ mechanism.

34. **Statement I** Polar solvents are required in $S_N 2$ reactions.

Statement II Ionic reagents are not sufficiently soluble in non-polar solvents to give a high enough concentration of the nucleophile to allow the reaction to occur at a rapid rate.

35. **Statement I** It is difficult to replace chlorine by —OH in chlorobenzene in comparison to that in chloroethane.

Statement II Chlorine-carbon (C—Cl) bond in chlorobenzene has a partial double bond character due to resonance. **[NCERT Exemplar]**

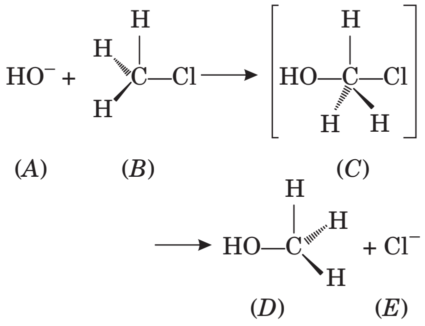
36. Hydrolysis of (–)-2-bromooctane proceeds with inversion of configuration.

Statement II This reaction proceeds through the formation of a carbocation. **[NCERT Exemplar]**

37. **Statement I** In monohaloarenes, further electrophilic substitution occurs at ortho and para positions.

Statement II Halogen atom is a ring deactivator. **[NCERT Exemplar]**

Directions (Q. 38 to 40) Consider the following reactions,



38. Which of the statements are correct about the above reaction? **[NCERT Exemplar]**

(a) (*A*) and (*E*) both are nucleophiles

(b) In (*C*) carbon atom is sp^3 hybridised

(c) In (*C*) carbon atom is sp^2 hybridised

(d) (*A*) and (*C*) both are electrophiles

39. Which of the following statements are correct about this reaction ?

(a) The given reaction follows $S_N 2$ mechanism

(b) (*B*) and (*D*) have opposite configuration

(c) (*B*) and (*D*) have same configuration

(d) The given reaction follows $S_N 1$ mechanism

40. Which of the following statements are correct about the reaction intermediate ?

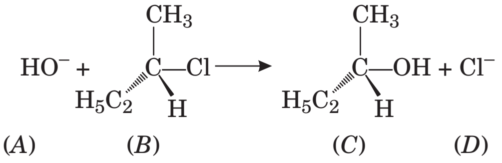
(a) Intermediate (*C*) is unstable because in this carbon is attached to 5 atoms

(b) Intermediate (*C*) is unstable because carbon atom is sp^2 hybridised

(c) Intermediate (*C*) is stable because carbon atom is sp^2 hybridised

(d) Intermediate (*C*) is less stable than the reactant (*B*)

Directions (Q. Nos. 41 and 42) Consider the following nucleophilic substitution reaction.



41. Which of the following statements are correct about the mechanism of this reaction ? **[NCERT Exemplar]**

(a) A carbocation will be formed as an intermediate in the reaction

(b) OH^- will attach the substrate (*B*) from one side and Cl^- will have it simultaneously from other side

(c) An unstable intermediate will be formed in which OH^- and Cl^- will be attached by weak bonds

(d) Reaction proceeds through $S_N 1$ mechanism

42. Which of the following statements are correct about the kinetics of this reaction ?

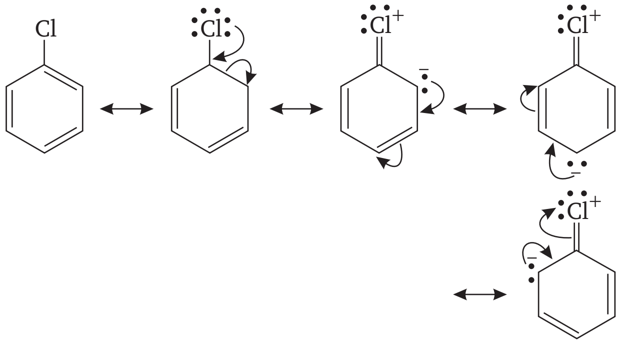
(a) The rate of reaction depends on the concentration of only (*B*)

(b) The rate of reaction depends on concentration of both (*A*) and (*B*)

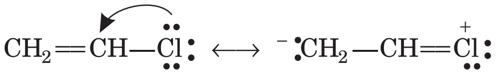
(c) Molecularity of the reaction is one

(d) Molecularity of the reaction is two

Directions (Q. Nos. 43 to 45) Due to sp^2-hybridisation of C-atom holding the halogen atom, resonance effect and smaller polarity of the C—*X* bond, aryl halides do not undergo nucleophilic substitution reactions. Chlorobenzene can be written as a resonance hybrid of the following structures :



Due to resonance, chlorobenzene gets stabilised. In chlorobenzene, the C—Cl bond acquires some double bond charater and hence, it is difficult to break it as compared to C—Cl bond in alkyl halides. Similarly vinyl halides due to resonance are less reactive towards nucleophilic substitution reactions.



$$CH_2{=}CH{-}\ddot{\underset{\cdot\cdot}{Cl}}: \longleftrightarrow {}^{-}:CH_2{-}CH{=}\overset{+}{\underset{\cdot\cdot}{Cl}}:$$

43. Which of the following is most reactive towards nucleophilic substitution reactions?

(a) $ClCH_2CH{=}CH_2$ (b) $CH_3CH{=}CHCl$
(c) C_6H_5Cl (d) None of these

44. Vinyl chloride on treatment with aqueous KOH gives

(a) acetylene (b) acetaldehyde
(c) vinyl alcohol (d) None of these

45. In chlorobenzene, all the six C—C bonds have the same length because of

(a) inductive effect (b) isomerism
(c) tautomerism (d) sp^2-hybridisation

Directions (Q. 46 to 48) The majority of haloalkanes have a dipole moment. This is a result of the electron withdrawing ability of halogen atoms. The halogen atom carries a slight negative charge, with the remainder of the molecule having a slight positive charge. The carbon atom bonded to the halogen can act as a centre of attraction of nucleophiles. Atoms or molecules with lone pairs of electrons and/or a negative charge make good nucleophiles. However, equally important as far as a successful reaction is concerned is that the halogen atom makes a good leaving group. The majority of haloalkanes fit the same pattern in their reactions.

46. The following reaction,

$$C_2H_5Br + KOH \longrightarrow C_2H_5OH + KBr \text{ is}$$

(a) electrophilic substitution
(b) nucleophilic addition
(c) free radical substitution
(d) nucleophilic substitution

47. A solution of (+) 1-chloro-1-phenylethane in toluene racemises slowly in the presence of a small amount of $SbCl_5$, due to the formation of

(a) carbocation (b) carbanion
(c) free radical (d) carbene

48. The rate of S_N2 reaction is maximum when the solvent is

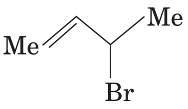
(a) CH_3OH (b) H_2O
(c) DMSO (d) benzene

Previous Years' Questions

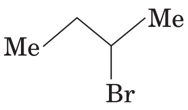
49. Consider the following bromides

(*A*)

(*B*)



(*C*)



The correct order of S_N1 reactivity is [AIEEE 2010]

(a) (*B*) > (*C*) > (*A*)
(b) (*B*) > (*A*) > (*C*)
(c) (*C*) > (*B*) > (*A*)
(d) (*A*) > (*B*) > (*C*)

50. The organic chloro compound, which shows complete stereochemical inversion during an S_N2 reaction is [AIEEE 2008]

(a) $(C_2H_5)_2CHCl$ (b) $(CH_3)_3CCl$
(c) $(CH_3)_2CHCl$ (d) CH_3Cl

51. *Trans*-2-phenyl-1-bromocyclopentane on reaction with alcoholic KOH produces [AIEEE 2006]

(a) 4-phenylcyclopentene
(b) 2-penylcyclopentene
(c) 1-phenylcyclopentene
(d) 3-phenylcyclopentene

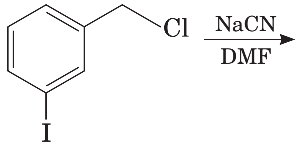
52. $CH_3Br + Nu^- \longrightarrow CH_3{-}Nu + Br^-$

The decreasing order of the rate of the above reaction with nucleophile (Nu^-) *A* and *D* is

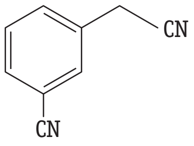
$[Nu = (A)\ PhO^-, (B) AcO^-, (C) HO^-, (D)\ CH_3O^-]$ [AIEEE 2006]

(a) *D* > *C* > *A* > *B* (b) *D* > *C* > *B* > *A*
(c) *A* > *B* > *C* > *D* (d) *B* > *D* > *C* > *A*

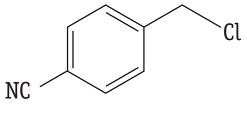
53. The structure of the major product formed in the following reaction is [AIEEE 2006]



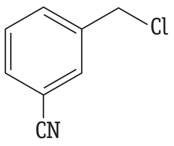
(a)



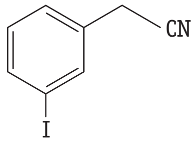
(b)



(c)



(d)



54. Alkyl halides react with dialkyl copper reagents to give [AIEEE 2005]

(a) alkenyl halides (b) alkanes
(c) alkyl copper halides (d) alkenes

55. On mixing ethyl acetate with aqueous sodium chloride, the composition of the resultant solution is [AIEEE 2004]

(a) $CH_3COOC_2H_5 + NaCl$
(b) $CH_3COONa + C_2H_5OH$
(c) $CH_3COCl + C_2H_5OH + NaOH$
(d) $CH_3Cl + C_2H_5COONa$

56. Acetyl bromide reacts with excees of CH_3MgI followed by treatment with a saturated solution of NH_4Cl gives [AIEEE 2004]

(a) acetone (b) acetamide
(c) 2-methyl-2-propanol (d) acetyl ioide

57. The compound formed on heating chlorobenzene with chloral in the presence of concentrated sulphuric acid is [AIEEE 2004]

(a) gammexane (b) DDT
(c) freon (d) hexachloroethane

58. Bottles containing C_6H_5I and $C_6H_5CH_2I$ lost their original labels. They were labelled *A* and *B* for testing. *A* and *B* were separately taken in test tubes and boiled with NaOH solution. The end solution in each tube was made acidic with dilute HNO_3 and then some $AgNO_3$ solution was added. Substance *B* gave a yellow precipitate. Which one of the following statements is true for this experiment ? [AIEEE 2003]

(a) *A* was C_6H_5I
(b) *A* was $C_6H_5CH_2I$
(c) *B* was C_6H_5I
(d) Addition of HNO_3 was unnecessary

59. The reaction of chloroform with alcoholic KOH and *p*-toluidine form [AIEEE 2003]

(a) 
(b) 
(c) 
(d) 
60. CH_3MgI is an organometallic compound due to [AIEEE 2002]

(a) Mg—I bond (b) C—I bond
(c) C—Mg bond (d) C—H bond

Answers

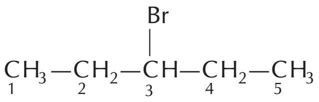
the Guidance

Round I

1. —$CH_2CH{=}CH_2$ is called allyl group, so here Br occupy allylic position.

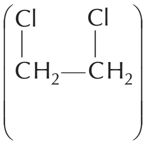
2. Correct IUPAC name for diethylbromomethane is 3-bromopentane.



$$\overset{1}{C}H_3-\overset{2}{C}H_2-\overset{3}{C}H(Br)-\overset{4}{C}H_2-\overset{5}{C}H_3$$

3-bromopentane

3. 1, 2-dichloroethane



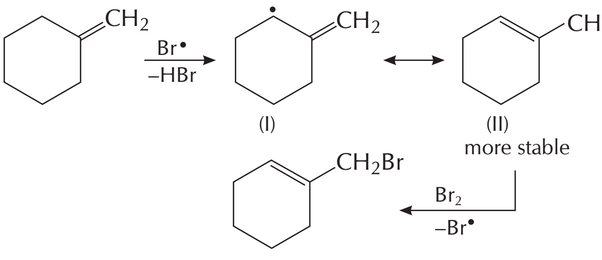
$$\left(\begin{matrix}Cl & & Cl\\ | & & |\\ CH_2 & - & CH_2\end{matrix}\right)$$

is an example of *vic*-dihalide because two halogen atoms occupy successive positions.

4. $RCH_2Cl + NaI \xrightarrow[\Delta]{Acetone} RCH_2I + NaCl$

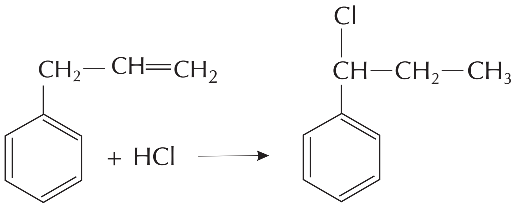
All other reactions are not feasible.

6. The mechanism of allylic bromination is



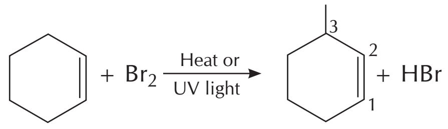
Since, endocyclic double bond is more stable than exocyclic double bond, therefore initially formed less stable free radical (I) gets converted into the more stable free radical (II) which then reacts with Br_2 to give the product.

7.



It is an addition reaction and addition occurs according to Markownikoff's rule.

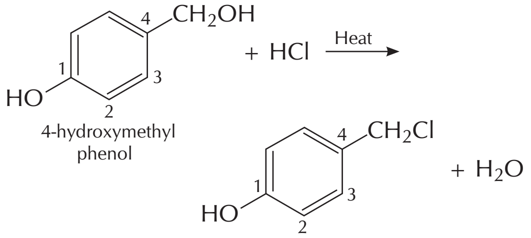
8.



cyclohexene 3-bromocyclohexene

Note Under above specified conditions allylic halogenation takes place. Addition reaction can take place only if reaction is at room temperature.

9.

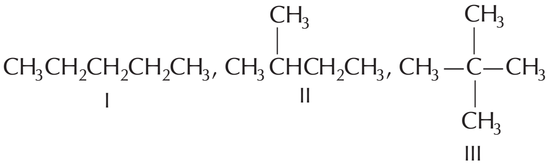


4-hydroxymethyl phenol

4-chloromethyl phenol

Note Phenolic —OH group is not replaced by —Cl group.

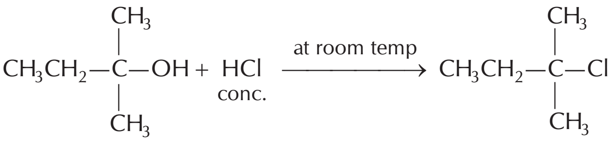
10. The possible isomers of C_5H_{12} are



$$\underset{I}{CH_3CH_2CH_2CH_2CH_3},\quad \underset{II}{CH_3\overset{\overset{CH_3}{|}}{C}HCH_2CH_3},\quad \underset{III}{CH_3-\overset{\overset{CH_3}{|}}{\underset{\underset{CH_3}{|}}{C}}-CH_3}$$

Isomer [II] has four groups of equivalent hydrogen atoms. Therefore, it can produce four isomeric monochlorides.

11.

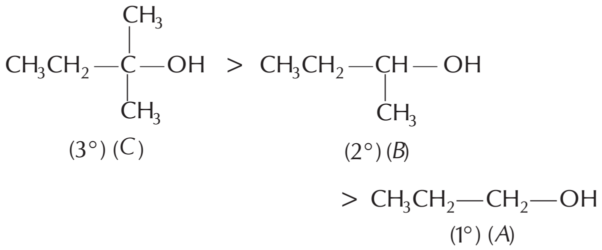


$$CH_3CH_2-\overset{\overset{CH_3}{|}}{\underset{\underset{CH_3}{|}}{C}}-OH + \underset{conc.}{HCl} \xrightarrow{\text{at room temp}} CH_3CH_2-\overset{\overset{CH_3}{|}}{\underset{\underset{CH_3}{|}}{C}}-Cl$$

(2-methylbutan-2-ol)
(because it is a 3° alcohol)

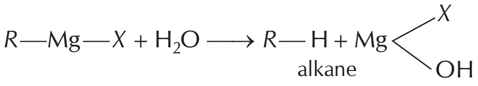
2-chloro-2-methylbutane

12. The order of reactivity of alcohols wih halogen acid is



$$\underset{(3°)\,(C)}{CH_3CH_2-\overset{\overset{CH_3}{|}}{\underset{\underset{CH_3}{|}}{C}}-OH} > \underset{(2°)\,(B)}{CH_3CH_2-\underset{\underset{CH_3}{|}}{C}H-OH} > \underset{(1°)\,(A)}{CH_3CH_2-CH_2-OH}$$

13. Grignard reagents (R—Mg —X) are readily decomposed by water to produce alkanes. That is why they should be prepared under anhydrous conditions. Instead, ether is used as a solvent during the preparation of Grignard reagent as these are inert towards it.



$$R-Mg-X + H_2O \longrightarrow \underset{\text{alkane}}{R-H} + Mg\begin{matrix}X\\ OH\end{matrix}$$

14. When KI reacts with H_2SO_4, It produces HI. In order to produce alkyl iodides (*R*—I), this HI should react with alcohols (*R*—OH). But the reaction does not take place in this manner as H_2SO_4 oxidises HI to I_2 which in turn does not react with alcohol.

$$KI + H_2SO_4 \xrightarrow{Heat} KHSO_4 + HI$$
$$H_2SO_4 \longrightarrow H_2O + SO_4 + [O]$$
$$2HI + [O] \longrightarrow H_2O + I_2$$

Note Instead of H_2SO_4; H_3PO_4 can be used to produce alkyl iodides.

15. Alkene is first reacted with HBr to form alkyl bromide.

$$CH_3CH_2CH=CH_2 \xrightarrow[H_2O_2]{HBr} CH_3CH_2CH_2—CH_2Br$$

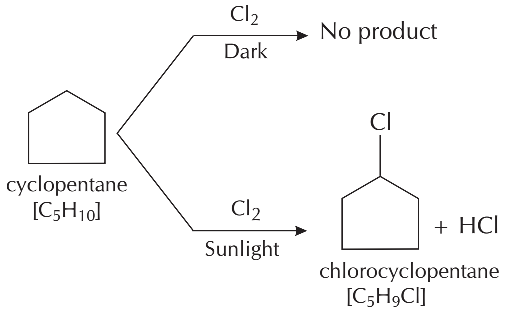
Alkyl bromide formed reacts with potassium iodide to form alkyl iodide.

$$CH_3CH_2CH_2CH_2Br \xrightarrow[Acetone]{KI} CH_3CH_2CH_2CH_2I + KBr$$

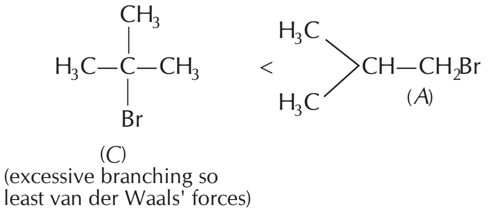
16. Molecular formula C_5H_{10} can be either alkene or cycloalkane.

Since, the hydrocarbon does not react with chlorine in dark, it is not an alkene. So, it is a cycloalkane, *i.e.*, cyclopentane.

Since, it forms only single monochloro derivative in bright sunlight, all the H-atoms should be identical. So, it is cyclopentane.



17. Increasing order of the boiling points of the compounds are



$$H_3C-\underset{Br}{\overset{CH_3}{\underset{|}{\overset{|}{C}}}}-CH_3 < \begin{matrix}H_3C\\H_3C\end{matrix}\!\!>CH-CH_2Br$$

(*C*)
(excessive branching so least van der Waals' forces)

(*A*)

$< CH_3CH_2CH_2CH_2Br$
(*B*)
(no branching)

18. The correct increasing order of boiling points of the compounds are

butane < 1-chlorobutane < 1-bromobutane < 1-iodobutane because boiling point increases with increase in the size of halogen atom.

20. A primary alkyl halide would prefer to undergo S_N2 reaction as transition state is more stable for unhindered halide.

21. Alkyl halides react with silver cyanide to give isocyanides.

$$CH_3CH_2Br + AgCN \longrightarrow \underset{\text{ethyl isocyanide}}{CH_3CH_2NC} + AgBr$$

22. S_N1 mechanism involves formation of carbocation intermediate. Hence, the species which gives the most stable carbocation readily undergoes S_N1 mechanism. *t*-butyl bromide gives the most stable carbocation, *i.e.*, 3° carbocation, so it readily undergoes S_N1 reaction.

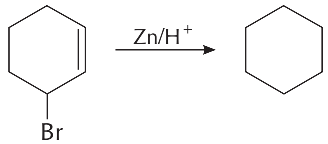
24. Haloalkanes are highly reactive and here, mainly show bimolecular nucleophilic substitution reaction. Hence, the correct order of reactivity of haloalkanes is

$$CH_3Br > CH_3CH_2Br > C_3H_7Br > C_4H_9Br$$

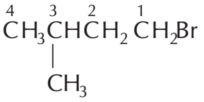
25. $C_6H_6 + C_3H_7Br \xrightarrow{AlCl_3} C_6H_5CH(CH_3)_2 + HBr$

The 1° carbonium ion isomerizes to the more stable 2° carbonium ion, which in turn reacts with benzene in the Friedel-Crafts reaction to give *iso*-propyl benzene.

26.

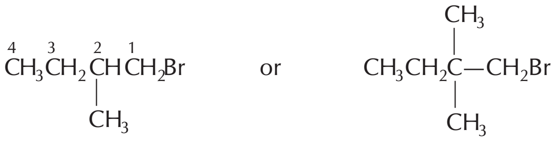


27.



$$\overset{4}{C}H_3\overset{3}{\underset{CH_3}{\underset{|}{C}}}H\overset{2}{C}H_2\overset{1}{C}H_2Br$$

Out of the give compounds three are primary halides. The presence of methyl group closer to halide group increases the steric hindrance and decreases rate in

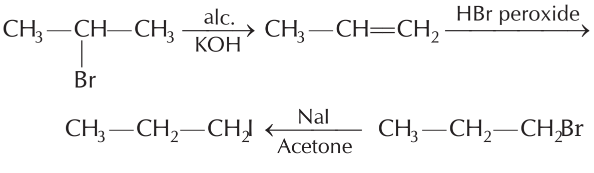


$$\overset{4}{C}H_3\overset{3}{C}H_2\overset{2}{\underset{CH_3}{\underset{|}{C}}}H\overset{1}{C}H_2Br \quad \text{or} \quad CH_3CH_2\underset{CH_3}{\overset{CH_3}{\underset{|}{\overset{|}{C}}}}-CH_2Br$$

29. $\underset{\text{propylchloride}}{CH_3CH_2CH_2Cl} \xrightarrow[-\,KCl]{KCN} \underset{\text{butanenitrile}}{CH_3CH_2CH_2CN}$

30. In Wurtz reaction, wet ether is not used because wet ether destroy the sodium metal.

31.

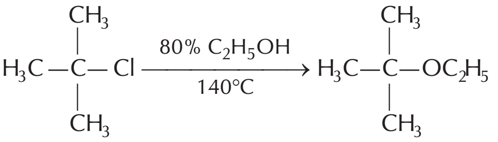


$$CH_3-\underset{Br}{\underset{|}{CH}}-CH_3 \xrightarrow[KOH]{alc.} CH_3-CH=CH_2 \xrightarrow{HBr\ peroxide}$$
$$CH_3-CH_2-CH_2I \xleftarrow[Acetone]{NaI} CH_3-CH_2-CH_2Br$$

32. $CH_3CH_2CH_2Cl \xrightarrow{KOH\ (alc)} CH_3CH=CH_2$

$$CH_3CHClCH_3 \xrightarrow{KOH\ (alc)} \underset{\text{1-propene}}{CH_3CH=CH_2}$$

33.



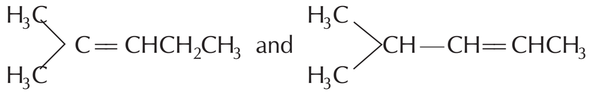
$$H_3C-\underset{CH_3}{\overset{CH_3}{\underset{|}{\overset{|}{C}}}}-Cl \xrightarrow[140°C]{80\%\ C_2H_5OH} H_3C-\underset{CH_3}{\overset{CH_3}{\underset{|}{\overset{|}{C}}}}-OC_2H_5$$

34. Out of CH_3COCH_3, CH_3CHO, CH_3CH_2CHO and $(CH_3)_2CHCHO$ two pairs containing a total six carbon atoms are

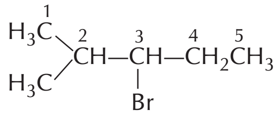
(i) $CH_3COCH_3 + CH_3CH_2CHO$

(ii) $CH_3CHO + (CH_3)_2CHCHO$

The alkenes which will give these pairs of compound on ozonolysis are

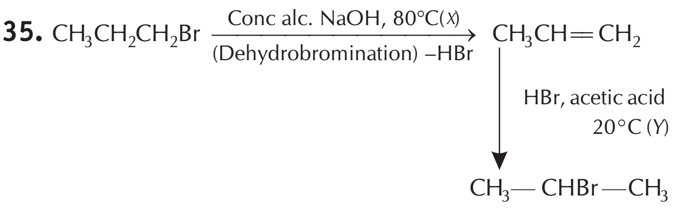


These two alkenes can be obtained on dehydrogenation if the alkyl halide is $(CH_3)_2CHCH(Br)CH_2CH_3$



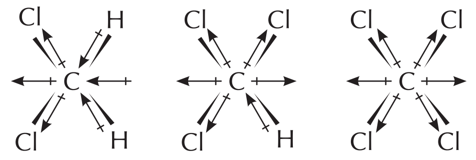
3-bromo-2-methyl pentane

35.



$$CH_3CH_2CH_2Br \xrightarrow[\text{(Dehydrobromination) –HBr}]{\text{Conc alc. NaOH, 80°C}(X)} CH_3CH{=}CH_2 \xrightarrow{\text{HBr, acetic acid, 20°C }(Y)} CH_3-CHBr-CH_3$$

36.



$\mu = 1.62$ D $\quad \mu = 1.03$ D $\quad \mu = 0.0$ D

CCl_4 (tetrachloromethane) is a symmerical molecule so, it has zero dipole moment.

In $CHCl_3$ (trichloromethane/chloroform), the resultant of two C—Cl dipole moments is opposed by the resultant of C—H and C—Cl bond. Since, the letter resultant dipole moment is smaller than the former, $CHCl_3$ has a dipole moment = 1.03D.

In CH_2Cl_2 (dichloromethane), the resultant of two C—Cl dipole moments is reinforced by the resultant ot two C—H bonds. Thus, CH_2Cl_2 has a dipole moment = 1.62 D.

Therefore, CH_2Cl_2 has the highest dipole moment amongst the above three molecules.

37. Chloroform reacts with conc. HNO_3 to give chloropicrin or tear gas.

$$\underset{\text{chloroform}}{CHCl_3} + \underset{\text{conc}}{HNO_3} \longrightarrow \underset{\text{chloropicrin or tear gas}}{CCl_3NO_2} + H_2O$$

38. $$\underset{\text{methyl amine}}{CH_3NH_2} + \underset{\text{chloroform}}{CHCl_3} + 3KOH \longrightarrow \underset{\text{methyl isocyanide}}{CH_3N \overset{\rightarrow}{\equiv} C} + 3KCl + 3H_2O$$

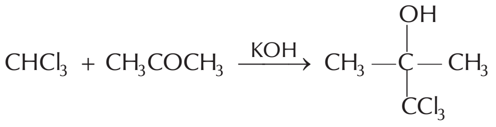
39. Chloroform undergoes oxidation in the presence of light and air to form phosgene gas.

$$2CHCl_3 + \frac{1}{2}O_2 \longrightarrow \underbrace{COCl_2}_{\text{phosgene gas}} + 2HCl$$

41. On heating with I_2 and NaOH, methanol (CH_3OH) does not give yellow compound.

42. F_2 reacts with NaOH to give oxygen difluoride (OF_2) and not hypofluorite ion (OF^-) needed for haloform reaction. Hence, CHF_3 cannot be prepared.

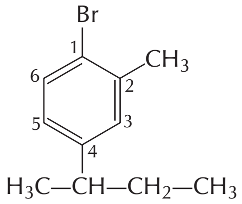
43. When acetone reacts with chloroform in alkaline solution, chloretone is obtained which is used as a hypnotic drug.



$$CHCl_3 + CH_3COCH_3 \xrightarrow{KOH} CH_3-\underset{CCl_3}{\overset{OH}{C}}-CH_3$$

chloretone

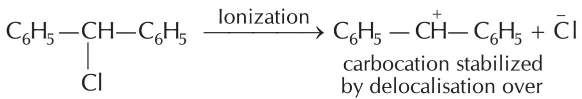
44.



1-bromo-4-sec-butyl-2-methylbenzene

Note After drawing the structures, count the valencies of every element and complete them by using H-atoms, (if incomplete.)

45.



$$C_6H_5-\underset{Cl}{CH}-C_6H_5 \xrightarrow{\text{Ionization}} C_6H_5-\overset{+}{C}H-C_6H_5 + \overset{-}{Cl}$$

1-chloro-1, 1-diphenyl methane (2°)

carbocation stabilized by delocalisation over C_6H_5 rings (more stable)

$$\underset{\text{benzyl chloride (°)}}{C_6H_5CH_2Cl} \xrightarrow{\text{Ionization}} C_6H_5\overset{+}{C}H_2 + Cl^-$$

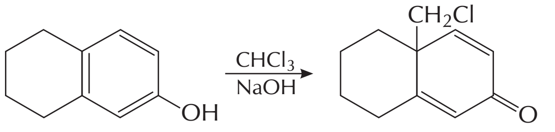
carbocation stabilized by delocalisation over one C_6H_5 ring (less stable)

In S_N1 reaction, reactivity depends upon the stability of carbocations. $C_6H_5-\overset{+}{C}H-C_6H_5$ carbocation is more stable as compared to $C_6H_5\overset{+}{C}H_2$. Therefore, $C_6H_5CHClC_6H_5$ gets hydrolysed more easily than $C_6H_5CH_2Cl$.

46. Replacement of H of benzene by any atom/group is called electrophilic substitution reaction. The electrophile in this reaction is Cl^+. The Cl^+ is produced as a result of redox reaction,

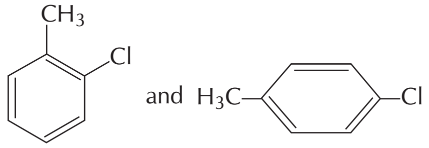
$$O_2 + 2Cl^- + 4H^+ \longrightarrow 2H_2O + 2Cl^+$$

47.

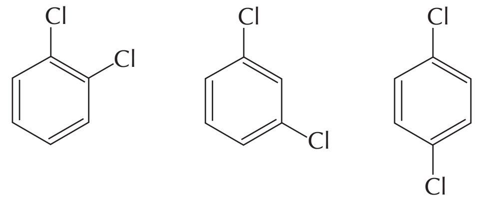


48. $AlCl_3 + Cl_2 \longrightarrow AlCl_4^- + \underset{\text{electrophile}}{Cl^+}$

49. The reaction of toluene with chlorine in the presence of iron and in the absence of light yields the mixture of



50. Symmetry of the molecule is related to its crystal littice structure and hence, to its melting point and solubility. A highly symmetrical structure has a higher melting point.



o-dichlorobenzene *m*-dichlorobenzene *p*-dichlorobenzene

Out of the above three isomers of dichlorobenzene, the *p*-isomer is more symmetrical than other two isomers. *i.e.*, it has more closely packed arrangement of molecules in its crystal lattice. So, *p*-dichlorobenzene has a higher melting point and lower solubility as compared to *ortho* and *meta* isomers.

52. *m*-nitrochlorobenzene is however less reactive than the *p*-nitrochlorobenzene since the NO_2 group at *m*-position can't stabilize the intermediate carbanion by resonance. Thus, the correct option is II > III > I.

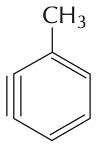
53. Reactivity decreases as the number of NO_2 groups at *o* and *p*-position with respect to chlorine decreases. Thus, the correct order is II > III > IV > I.

54. 
55. The reactivity of an aryl halide towards alcoholic $AgNO_3$ depends on the ability of the aryl halide to ionise.

$$C_6H_5CHBrCH_3 > C_6H_5CH_2CH_2Br > C_6H_5CH{=}CHBr$$

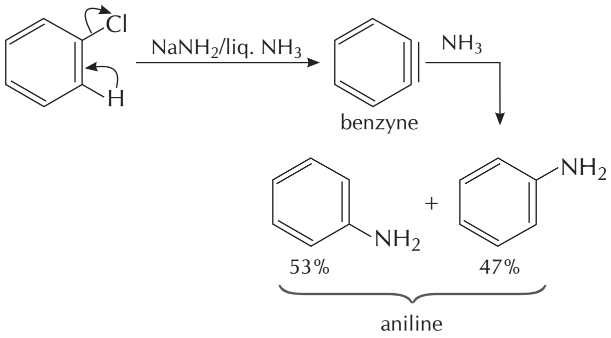
56. 
57. Aryl halides are less reactive towards nucleophile than alkyl halides due to resonance.

59. The formation of a mixture of *ortho* and *meta*-toluidine certainty suggests that the triple bond in benzyne is between *o*- and *m*-positions and hence the structure of intermediate is



60. 
For the formation of benzyne intermediate, it is essential that an hydrogen should be available at an *ortho* position to the halogen.

61. When chlorobenzene is treated with sodamide in liquid ammonia at 196 K, the reaction occurs through the intermediate benzyne formation and finally gives aniline.



62. The reactivity of substance for Ar S_N2 reaction depends on the $-R$ and $-I$ powers of the group present at *o*-and/ or *p*-position. Thus,  is most reactive for S_N2 reaction.

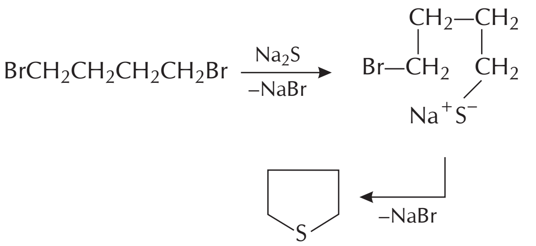
63. $C_6H_5CH_3 \xrightarrow[\text{or } Cl_2/h\nu]{SO_2Cl_2/\text{peroxide}} C_6H_5CH_2Cl$

64. 
65. Bulky groups cause steric hinderance in the formation of transition state. Therefore, higher homologues are less reactive than lower homologues.

66. Chlorocyclohexane behaves like an aliphatic halogen substituted hydrocarbon and can, therefore reacts with alcoholic $AgNO_3$.

67. ArS_N reactions are accelerated by electron withdrawing groups, especially at the *o*-and *p*-positions to the leaving group and retarded by electron-donating groups.

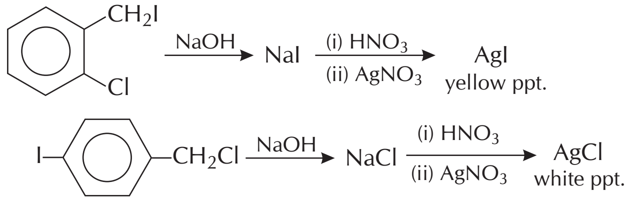
68.



69. The order of reactivity follows the sequence, benzyl halides > alkyl halides > aryl halides. Out of chlorides and bromides, bromides are more reactive. Therefore, the correct order of reactivity is

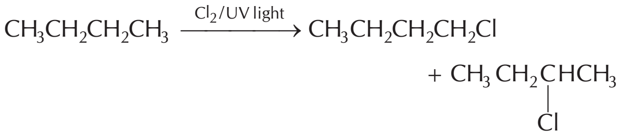
$$PhCH_2Br > MeBr > MeCl > p\text{-}MeOC_6H_4Br$$

70. Only benzyl halide, *i.e.*, *p*-iodobenzyl chloride and *o*-chlorobenzyl iodide undergo hydrolysis on shaking with an aqueous solution of NaOH.



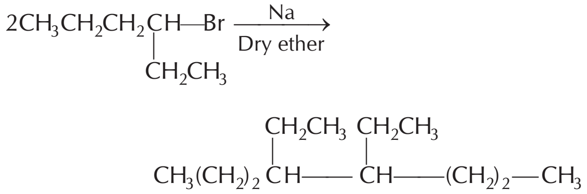
Round II

1.



$$CH_3CH_2CH_2CH_3 \xrightarrow{Cl_2/\text{UV light}} CH_3CH_2CH_2CH_2Cl + CH_3CH_2\underset{\displaystyle Cl}{\underset{|}{C}}HCH_3$$

2. Since, the alkyl halide *RX* gives 4, 5-diethyloctane, when reacts with Na, it must be $CH_3(CH_2)_2CH(Br)CH_2CH_3$.



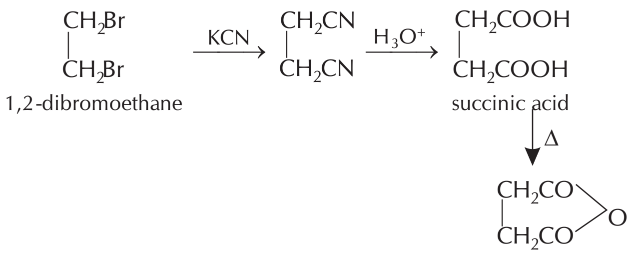
$$2CH_3CH_2CH_2\underset{\displaystyle CH_2CH_3}{\underset{|}{C}}H\text{—}Br \xrightarrow[\text{Dry ether}]{Na} CH_3(CH_2)_2\overset{\displaystyle CH_2CH_3}{\overset{|}{C}}H\text{——}\overset{\displaystyle CH_2CH_3}{\overset{|}{C}}H\text{——}(CH_2)_2\text{—}CH_3$$

This reaction is known as Wurtz reaction.

3. Reaction of $C_6H_5CH_2Br$ with aqueous sodium hydroxide follows S_N1 mechanism as $C_6H_5CH_2^+$ is a more stable carbocation which is involved as intermediate.

4. The polarity between the C—*X* bond increases by increasing +*I* effect. The +*I* effect also increases by increasing the alkyl group, therefore in $CH_3CH_2CH_2Br$ the polarity is maximum than CH_3CH_2Br. While in rest the polarity decreases due to the presence of $=$ bond and $\text{—}\overset{\displaystyle O}{\overset{\|}{C}}\text{—}$ group.

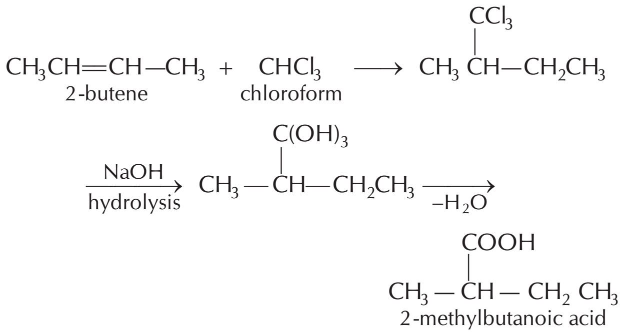
5.



$$\underset{\text{1,2-dibromoethane}}{\begin{matrix}CH_2Br\\|\\CH_2Br\end{matrix}} \xrightarrow{KCN} \begin{matrix}CH_2CN\\|\\CH_2CN\end{matrix} \xrightarrow{H_3O^+} \underset{\text{succinic acid}}{\begin{matrix}CH_2COOH\\|\\CH_2COOH\end{matrix}} \xrightarrow{\Delta} \begin{matrix}CH_2CO\\|\\CH_2CO\end{matrix}\!\!>O$$

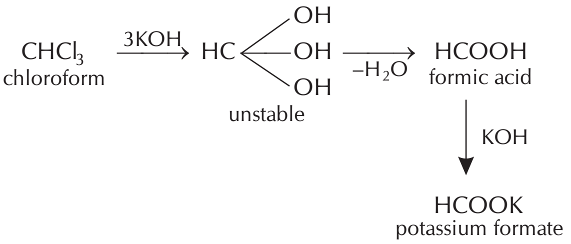
6. The hydrogen of chloroform is acidic in nature.

7.



$$\underset{\text{2-butene}}{CH_3CH{=}CH\text{—}CH_3} + \underset{\text{chloroform}}{CHCl_3} \longrightarrow CH_3\overset{\displaystyle CCl_3}{\overset{|}{C}}H\text{—}CH_2CH_3 \xrightarrow[\text{hydrolysis}]{NaOH} CH_3\text{—}\overset{\displaystyle C(OH)_3}{\overset{|}{C}}H\text{—}CH_2CH_3 \xrightarrow[-H_2O]{} \underset{\text{2-methylbutanoic acid}}{CH_3\text{—}\overset{\displaystyle COOH}{\overset{|}{C}}H\text{—}CH_2CH_3}$$

8. Chloroform with alcoholic KOH gives potassium formate.

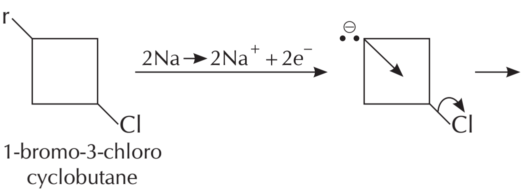


$$\underset{\text{chloroform}}{CHCl_3} \xrightarrow{3KOH} \underset{\text{unstable}}{HC(OH)_3} \xrightarrow[-H_2O]{} \underset{\text{formic acid}}{HCOOH} \xrightarrow{KOH} \underset{\text{potassium formate}}{HCOOK}$$

9. Alkyl halides give elimination reaction with alcoholic KOH and yield an alkene or alkyne (from dihalides) *e.g.*,

$$\underset{\text{1, 2-dibromoethane}}{Br\text{—}CH_2\text{—}CH_2\text{—}Br} \xrightarrow[\Delta]{\text{alc. KOH}} \underset{\text{acetylene}}{\overset{sp}{CH}\equiv\overset{sp}{CH}}$$

10.



11. 
Order of elimination (dehydration) of alcohol is

T > S > P

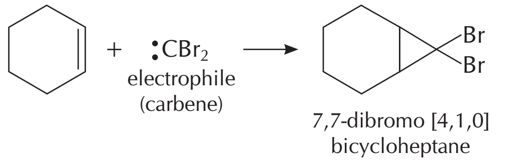
12. $CH_3CH_2CH_2I \xrightarrow{\text{alc KOH}} \underset{(X)}{CH_3CH=CH_2}$

$\xrightarrow[\Delta]{\text{NBS}, h\nu} \underset{(Y)}{CH_2Br-CH=CH_2}$

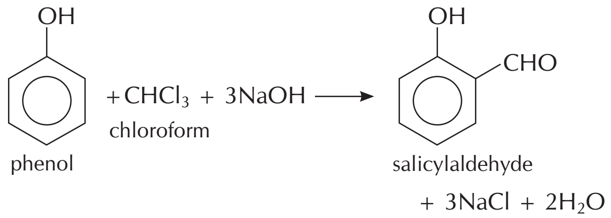
$\xrightarrow{\text{Alc KCN}} \underset{(Z)}{CH_2CN-CH=CH_2}$

13. $CBr_4 + MeLi \longrightarrow MeBr + LiCBr_3$

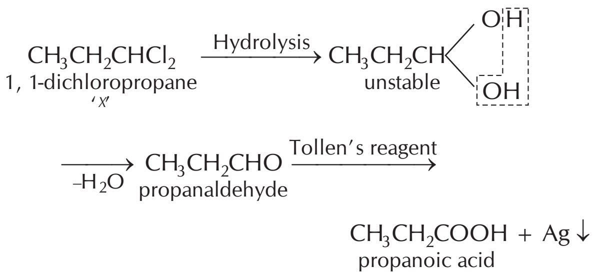
$LiCBr_3 \longrightarrow LiBr + :CBr_2$



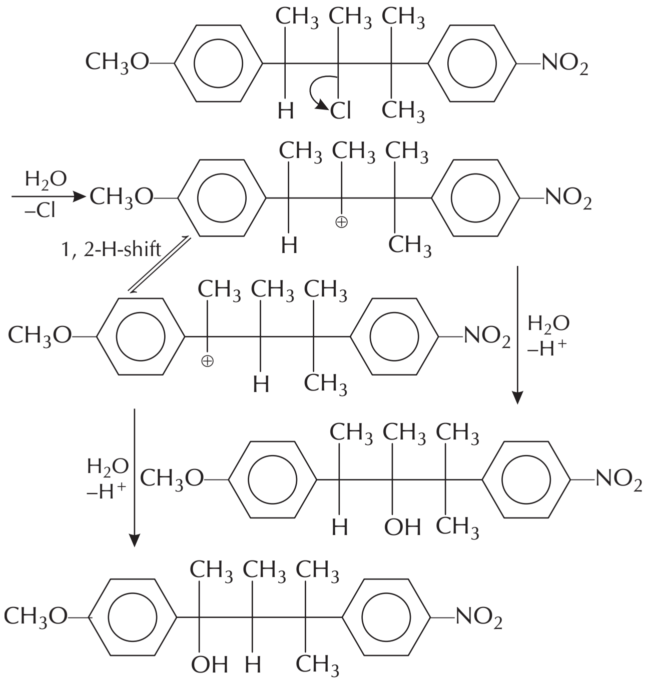
14. In the Reimer-Tiemann reaction, new C—C bond is formed between the carbon of benzene ring and —CHO group.



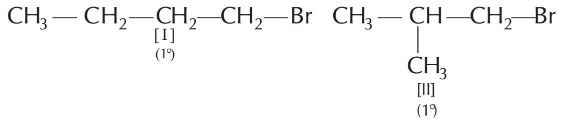
15. 
16. Since, the obtained compound reduces Tollen's reagent, it must be an aldehyde. Thus, it is obvious that both the —Cl atoms are present at C_1. Hence, the compound 'X' is 1,1-dichloropropane and the reactions are as follows



17. 
18. The product (K) is formed through simple nucleophilic substitution while major product (L) is formed through H^- shift *via* S_N1 reaction and methoxy group stabilises the carbocation intermediate of product (L).



19. Two possible isomers of C_4H_9Br are

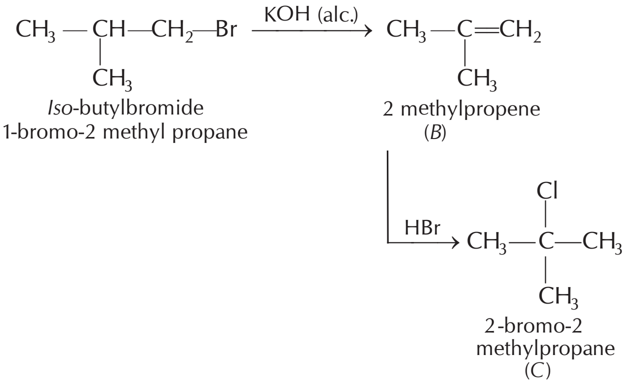


According to the question, compound (*A*) on reaction with sodium does not give the same product produced by *n*-butyl bromide. So, (*A*) cannot be [I].

$$2\,\underset{n\text{–butylbromide}}{CH_3-CH_2-CH_2-CH_2-Br} + 2\,Na \xrightarrow{\text{Ether}}$$

$$\underset{\underset{C_8H_{18}}{n\text{–octane(not formed in the reaction)}}}{CH_3-CH_2-CH_2-CH_2-CH_2-CH_2-CH_2-CH_3}$$

Now [II] must be the correct isomer.



Iso-butylbromide
1-bromo-2 methyl propane

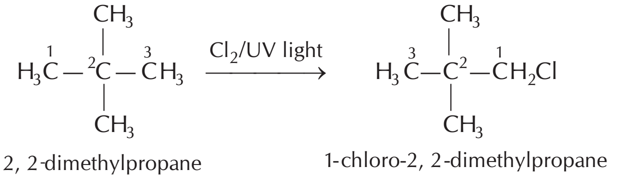
2 methylpropene
(B)

2-bromo-2 methylpropane
(C)

20. Hydrocarbon C_5H_{12} has molecular mass 72 g mol. It has three isomers.

$$\underset{\substack{n\text{-pentane}\\ [I]}}{CH_3—CH_2—CH_2—CH_2—CH_3}$$

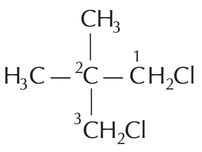
$$\underset{II}{CH_3CH_2CH(CH_3)_2}, \qquad \underset{III}{(CH_3)_4C}$$



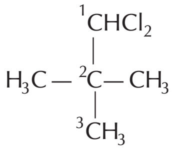
2, 2-dimethylpropane
[IV]

1-chloro-2, 2-dimethylpropane
[monochloro derivative]
[V]

Out of the three isomers [V] structure is correct. Its two dichloroderivatives are

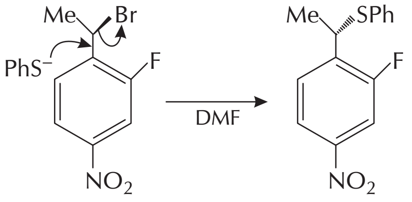


1, 3-dichloro-2, 2-dimethylpropane
[A]

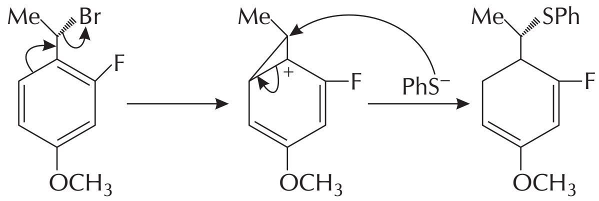


1, 1-dichloro-2, 2-dimethylpropane
[B]

21. PhS^- is a strong nucleophile and dimethylformamide (DMF) is a highly polar aprotic solvent. Condition indicates that nucleophilic substitution (S_N2) takes place at 2° benzylic place, stereochemically. It involves inversion of configuration.

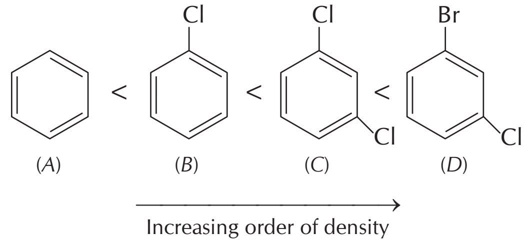


Aryl group can exhibit neighbouring group or can show anchimeric assistance but not possible here due to deactivity imparted by $—NO_2$ and —F., It can be possible if $—OCH_3$ could have been instead of $—NO_2$.



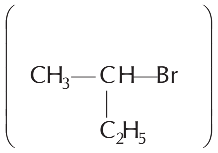
retention of configuration

22. Increasing order of the density of the compounds are



Because density increases with increase in mass (molar mass) or size.

23. 'A' 2-bromobutane



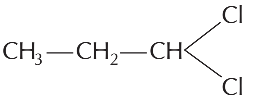
$$\left(\underset{\substack{|\\ C_2H_5}}{CH_3—CH—Br}\right)$$

gives racemic mixture on nucleophilic substitution by OH^- ion. 'B' also gives racemic mixture but 'C' gives inverted product.

24. 'X' is a three carbon compound with two halogen atom, so its molecular formula is $C_3H_6Cl_2$. Only terminal alkynes give red ppt with ammoniacal Cu_2Cl_2, so the hydrocarbon produced by the reaction of 'X' with alc KOH must be a terminal alkyne (*i.e.*, $CH_3C\equiv CH$).

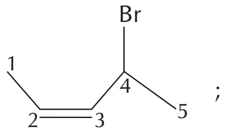
$$C_3H_6Cl_2 \xrightarrow{\text{Alc KOH}} CH_3C\equiv CH \xrightarrow{\text{Amm } Cu_2Cl_2} \underset{\text{red ppt}}{CH_3C\equiv CCu\downarrow}$$

Compound (X) gives an aldehyde when reacts with aqueous KOH. This suggests that both the halogens are present on same terminal carbon atom. Thus, the formula of compound (X) is

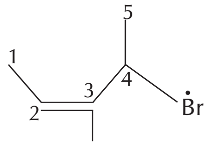


1, 1-dichloropropane

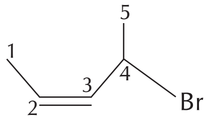
25.



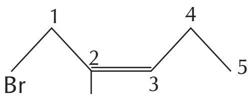
4-bromo-pent-2-ene (p) ;



4-bromo-3-methylpent-2-ene (q)



4-bromopent-2-ene (p) ;



1-bromo-2-methylpent-2-ene(s)

26. (A) S_N1 reaction results in racemisation as well as inversion because of the formation of planar carbocation intermediate.

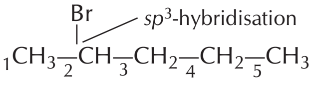
(B) Chlorobromocarbons are used to extinguish fire.

(C) Bromination of alkene result in the formation of *vic* bromide

(D) Alkylidine halides are *gem*-dihalides

(E) Elimination of H*X* from alkyl halide occur in accordance with Saytzeff rule.

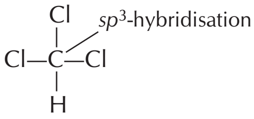
27.



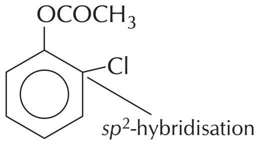
2-bromopentane

$\overset{sp^2}{CH_2}=\overset{sp^2}{CHCl}$

vinyl chloride



trichloromethane



Thus, 2-bromopentane and trichloromethane haloalkanes contain halogen atom (s)attached to the sp^3-hybridised carbon atom of an alkyl group.

28. Br_2 / CCl_4 can be used as allyl bromide being unsaturated will discharge its colour while *n*-propyl bromide does not. On shaking with aq. $AgNO_3$, allyl bromide being more reactive will give pale yellow ppt. of AgBr but *n*-propyl bromide will not.

On boiling with aq. KOH, both will undergo hydrolysis, hence give ppt. of AgBr. Fusion with Na also converts the Br of both the compounds into NaBr, thus both give ppt with $AgNO_3$. Hence, reagents given in option (c) and (d) cannot be used to distinguish between allyl bromide and *n*-propyl bromide.

29. $CHCl_3 + OH^- \longrightarrow :CCl_3^-$

$$:CCl_3^- \rightleftharpoons :CCl_2 + Cl^-$$

$$:CCl_2 \xrightarrow{OH^-} HO-\bar{C}Cl_2 \xrightarrow[-OH^-]{H_2O} HO-CHCl_2 \xrightarrow{OH^-,\,-2Cl^-} HCOO^-$$

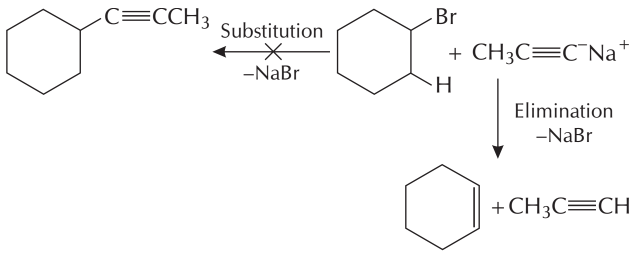
30. $CH_3COCH_2I \xrightarrow[NaOH]{I_2} CHI_3$

$$C_6H_5COCH_3 \xrightarrow[NaOH]{I_2} CHI_3$$

Further under the basic conditions of the reaction, both $CH_3CHClCH_3$ and CH_3CH_2Br will undergo hydrolysis to give $CH_3CHOHCH_3$ and CH_3CH_2OH respectively which will give iodoform test.

31. Alkyl fluorides are synthesised by heating an alkyl chloride/bromide in presence of CoF_2 or Hg_2F_2.

32. 2° alkyl halides preferably undergo elimination rather than substitution.



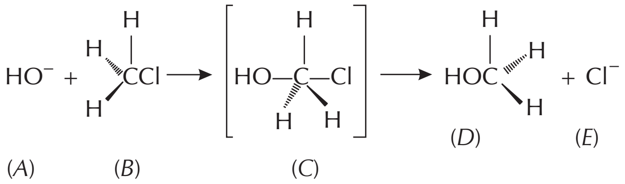
33. Statement II is the correct explanation of statement I.

34. A polar aprotic solvent dissolves ionic compounds and it slovates by orienting the negative end of the dipole around the cation. It is unable to solvate the anion through positive end of its dipole.

35. It is difficult to replace chlorine by —OH in chlorobenzene (C_6H_5Cl) in comparison to that in chloroethane (C_2H_5Cl) because chlorine -carbon (C — Cl) bond in chlorobenzene (C_6H_5Cl) has a partial double bond character due to resonance.

36. Hydrolysis of (–) -2- bromooctane proceeds with inversion of configuration because this reaction does not proceeds through the formation of a carbocation.

37. It involves the formation of transition state. *X* is –*I* showing atom due to which these deactivate benzene nucleus. However due to their electron donating *R* effect, these increases electron density at *ortho* and *para* positions and make them more reactive for electrophilic substitution reaction.



38. In the above reaction molecules HO^- (*A*) and Cl^- (*E*) are nucleophiles. The carbon atom of molecule (*C*) is sp^3 hybridised.

39. Above reaction follows S_N2 mechanism and the compound (*B*) and (*D*) have opposite configuration.

40. Intermediate (*C*) is unstable because in this intermediate carbon is attached to 5 atoms. The intermediate (*C*) is less stable than the reactant (*B*).

41. Since the product have same configuration as the reactant , the reaction must involve carbocation as intermediate. Thus, the reaction involve S_N1 mechanism.

42. Since reaction is S_N1,

rate $= k\,[(CH_3)\cdot CH(C_2H_5)\,Cl]$ or rate $\propto [B]$

It is a unimolecular reaction.

43. Allyl halides (*i.e.,* $ClCH_2CH=CH_2$) are more reactive than vinyl, (*i.e.*, $CH_3CH=CHCl$) and aryl (*i.e.*, C_6H_5Cl) halides towards nucleophilic substitution reactions.

44. $CH_2=CH—Cl \xrightarrow{\text{aq. KOH}}$ No reaction

45. Each sp^2-hybridised carbon atom has a *p*-orbital, these six *p*-orbitals overlap to form a π-molecular orbital in which the electrons are completely delocalized. Due to delocalization of these π-electrons, all the six C—C bonds are equal.

46. Alkyl halides undergo nucleophilic substitution reaction.

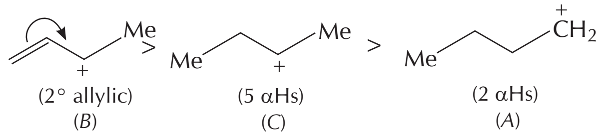
47. In the presence of $SbCl_5$, 1-chloro-1-phenylethane forms a carbocation as follows

$$CH_3CHClC_6H_5 + SbCl_5 \longrightarrow [CH_3\overset{+}{C}H—C_6H_5] + SbCl_6^-$$

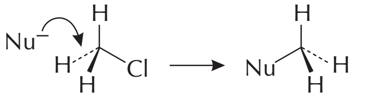
Carbocation is a planar species, therefore, it can be attacked by $SbCl_6^-$ either from the top or the bottom face with equal ease.

48. Polar aprotic solvents such as DMSO increase the rate of the S_N2 reactions.

49. Higher the stability of carbocation, faster is the reaction because S_N1 reactions involve the formation of carbocation intermediate.



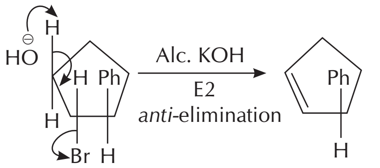
50. Nucleophilic substitution bimolecular (S_N2) prefers less sterically hindered site to attack. Lesser the steric hindrance, faster the S_N2 reaction. So, ease of reaction is 1° > 2° > 3°.



S_N2 involves inversion of configuration stereo chemically.

(**Remember!** if molecule is optically active, optical inversion, also called Walden inversion is known.)

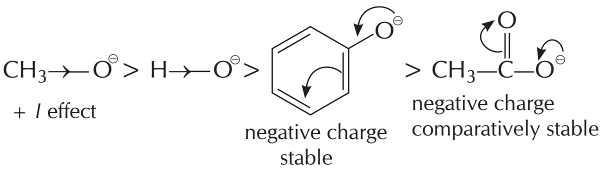
51.



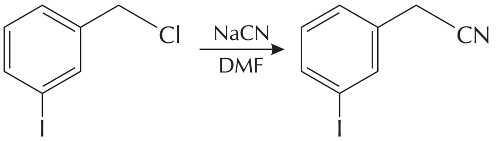
3-phenylcyclopentene

Anti-elimination, means —H and the —Br both departing group must be present at dihedral angle of 180° (*anti*).

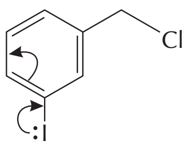
52. Nucleophilicity order is



53.



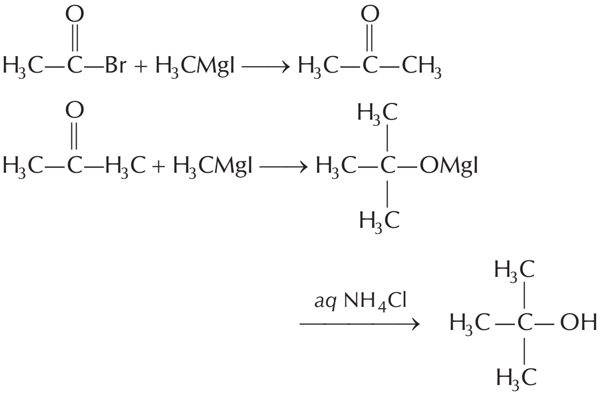
Chloride is on 1° aliphatic carbon which is substituted easier in comparison to iodide which is arylic and more stable due to delocalisation, hence difficult to substitute.



54. It is Corey-House synthesis of alkanes.

55. Aqueous NaCl is neutral hence, there is no reaction between ethyl acetate and aqueous NaCl.

56.



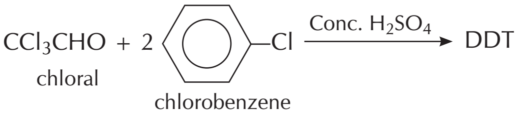
$$H_3C—\overset{\overset{O}{\|}}{C}—Br + H_3CMgI \longrightarrow H_3C—\overset{\overset{O}{\|}}{C}—CH_3$$

$$H_3C—\overset{\overset{O}{\|}}{C}—H_3C + H_3CMgI \longrightarrow H_3C—\underset{H_3C}{\overset{H_3C}{C}}—OMgI$$

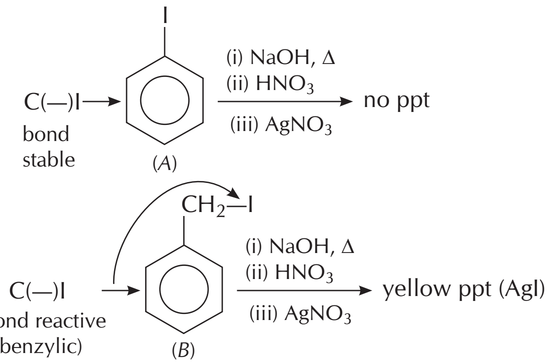
$$\xrightarrow{aq\ NH_4Cl} H_3C—\underset{H_3C}{\overset{H_3C}{C}}—OH$$

2-methyl-2-propanol

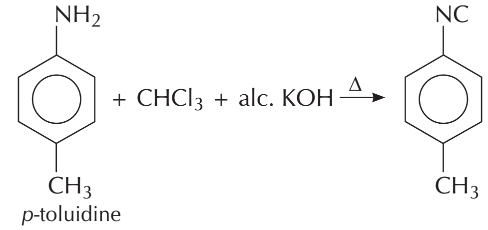
57.



58.



59.



This is carbylamine reaction.

60. CH_3MgI contains carbon-metal (C—Mg) bond, so, classified as organometallic compound.

11

Organic Compounds Containing Oxygen

JEE Main MILESTONE

- Alcohols
- Phenols
- Ethers
- Aldehydes and Ketones
- Carboxylic Acids

11.1 Alcohols

The hydroxy derivatives of aliphatic hydrocarbons are called alcohols. They are obtained by replacing one or more hydrogen atoms of a hydrocarbon by the —OH group.

Alcohols may be classified on the following basis

On the Basis of Position of —OH Group

Alcohols fall into different classes depending on how the —OH group is positioned on the chain of carbon atoms.

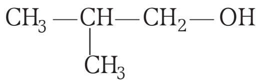
These classes are as

Alcohols, phenols, ethers, aldehydes, ketones and carboxylic acid are included in this group as all of these have O *atom as a part of their functional group. Although these are quite different from each other in structure and chemical properties.*

(a) **Primary Alcohols**

In a primary (1°) alcohol, the carbon, which carries the —OH group, is attached with only one alkyl group, *i.e.*, they contain $—CH_2OH$ group. *e.g.*,

$CH_3—CH_2—OH$
ethanol



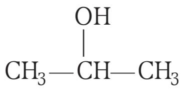
$$CH_3—\underset{\substack{|\\CH_3}}{CH}—CH_2—OH$$

2-methylpropan-1-ol

Methanol, CH_3OH *is an exception to this. It is counted as a primary alcohol even though there is no alkyl group which is attached to the carbon carrying* —OH *group.*

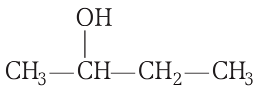
(b) **Secondary Alcohols**

In a secondary (2°) alcohol, the carbon carrying —OH group is joined directly to **two** alkyl groups, which may or may not be same. In other words, they have $\rangle$CHOH group. *e.g.*,



$$CH_3—\overset{\substack{OH\\|}}{CH}—CH_3$$

propan-2-ol

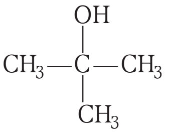


$$CH_3—\overset{\substack{OH\\|}}{CH}—CH_2—CH_3$$

butan-2-ol

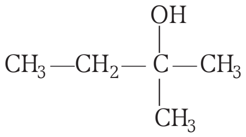
(c) Tertiary Alcohols

In these alcohols (3°), the carbon atom holding the —OH group is attached directly to **three** alkyl groups, which may or may not be same. In other words, they have $\gtrdot$C—OH group. *e.g.*,



$$CH_3-\overset{\overset{\large OH}{|}}{\underset{\underset{\large CH_3}{|}}{C}}-CH_3$$

2-methylpropan-2-ol



$$CH_3-CH_2-\overset{\overset{\large OH}{|}}{\underset{\underset{\large CH_3}{|}}{C}}-CH_3$$

2-methylbutan-2-ol

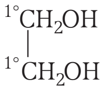
On the Basis of Number of —OH Group Present

However, depending upon the number of —OH group present, the alcohols may be monohydric (*i.e.*, have one —OH group), dihydric (have two —OH groups), trihydric (have three —OH groups).

Some examples of monohydric, dihydric and trihydric alcohols are given below

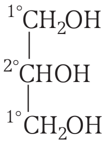
CH_3OH
methanol
(monohydric alcohol)

C_2H_5OH
ethanol
(monohydric alcohol)



$$\begin{array}{l} ^{1°}CH_2OH \\ \quad | \\ ^{1°}CH_2OH \end{array}$$

ethylene glycol
(dihydric alcohol)



$$\begin{array}{l} ^{1°}CH_2OH \\ \quad | \\ ^{2°}CHOH \\ \quad | \\ ^{1°}CH_2OH \end{array}$$

glycerol
(trihydric alcohol)
(mixed alcohol)

Remember! The two or more —OH groups must be present at different carbon atoms as they if present at same carbon atom, lead to the removal of water molecule *e.g.*,

$$CH_2\begin{matrix} \diagup OH \\ \diagdown OH \end{matrix} \xrightarrow{-H_2O} HCHO$$

(unstable) (stable) formaldehyde

Sample **Problem 1** *Which of the following is a tertiary alcohol?* **[NCERT]**

(a) 
$$CH_3-\overset{\overset{\large CH_3}{|}}{\underset{\underset{\large CH_3}{|}}{C}}-CH_2OH$$

(b) $H_2C{=}CH-CH_2OH$

(c) 
(d) 
Interpret (*d*) If —CH_2OH group is present, alcohol is primary (1°), if $\gtrdot$CHOH group is present, it is secondary (2°) and if $\gtrdot$COH group is present, alcohols is (3°), so classification of given alcohols is as follow

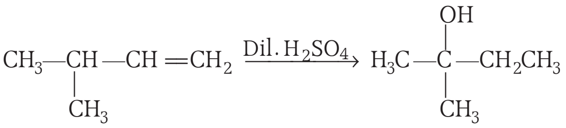
(a) *primary* (b) *primary*
(c) *secondary* (d) *tertiary*

Preparation of Monohydric Alcohols

Important methods used to prepare alcohols are as follows

(i) From Alkenes

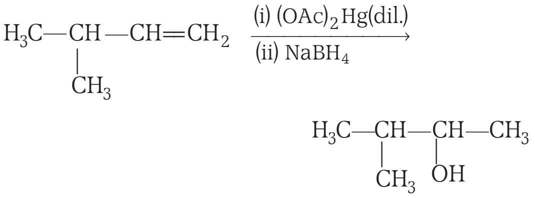
(a) **By acid catalysed hydration** It takes place in the presence of dilute H_2SO_4.



$$CH_3-\underset{\underset{\large CH_3}{|}}{CH}-CH{=}CH_2 \xrightarrow{\text{Dil. }H_2SO_4} H_3C-\overset{\overset{\large OH}{|}}{\underset{\underset{\large CH_3}{|}}{C}}-CH_2CH_3$$

In this reaction intermediate carbocation is formed and rearrange, therefore —OH gets attached at maximum degree of carbon.

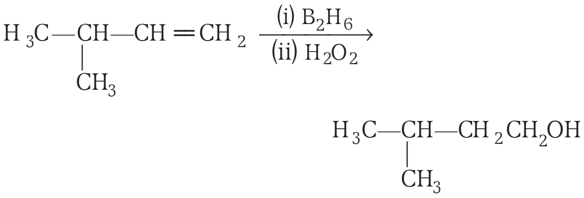
(b) **By oxymercuration-demercuration reaction**



$$H_3C-\underset{\underset{\large CH_3}{|}}{CH}-CH{=}CH_2 \xrightarrow[\text{(ii) NaBH}_4]{\text{(i) (OAc)}_2\text{Hg(dil.)}} H_3C-\underset{\underset{\large CH_3}{|}}{CH}-\underset{\underset{\large OH}{|}}{CH}-CH_3$$

Intermediate carbocation does not form and alcohol is formed according to Markownikoff's rule.

(c) **By hydroboration oxidation reaction**



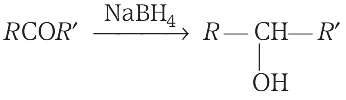
$$H_3C-\underset{\underset{\large CH_3}{|}}{CH}-CH{=}CH_2 \xrightarrow[\text{(ii) }H_2O_2]{\text{(i) }B_2H_6} H_3C-\underset{\underset{\large CH_3}{|}}{CH}-CH_2CH_2OH$$

Intermediate carbocation does not form and alcohol is formed according to anti-Markownikoff's rule.

(ii) By Reduction of Carbonyl Compounds

Aldehydes on reduction give primary alcohols and ketones give secondary alcohols in the presence of weak reducing agent ($NaBH_4$).

$$RCHO \xrightarrow{NaBH_4} RCH_2OH$$



$$RCOR' \xrightarrow{NaBH_4} R-\underset{\underset{\large OH}{|}}{CH}-R'$$

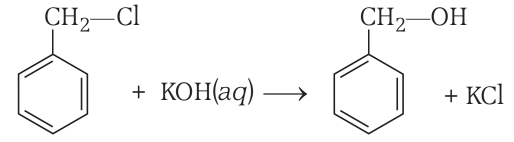
(iii) By Reduction of Acids and Esters

Carboxylic acids and esters on reduction in the presence of strong reducing agent ($LiAlH_4$) give primary alcohols.

$$RCOOH \xrightarrow{LiAlH_4} RCH_2—OH$$

$$CH_3COOCH_2CH_2CH_3 \xrightarrow{LiAlH_4} CH_3CH_2OH + CH_3CH_2CH_2OH$$

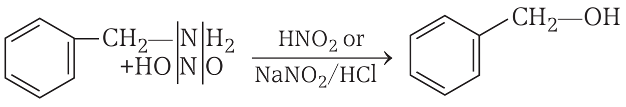
(iv) By Hydrolysis of Alkyl Halides



benzyl chloride

$$CH_3—CH_2Br + NaOH(aq) \longrightarrow CH_3—CH_2—OH + NaBr$$

(v) From Primary Aliphatic Amines

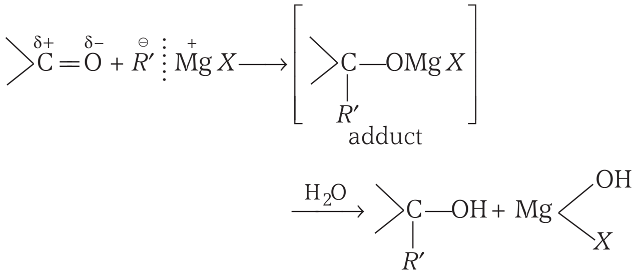


benzyl amine benzyl alcohol

(vi) From Grignard Reagent

Grignard reagent ($R'MgX$) on reaction with aldehydes/ketones followed by hydrolysis gives alcohols.

The nature of alcohol formed depends upon the aldehyde or ketone taken, *e.g.*, if in the reaction aldehyde is formaldehyde, primary alcohol $—CH_2OH$ is obtained while other aldehydes give secondary alcohol ($>CHOH$) with Grignard reagents. Ketones give tertiary alcohol ($\gt COH$) with Grignard reagents.

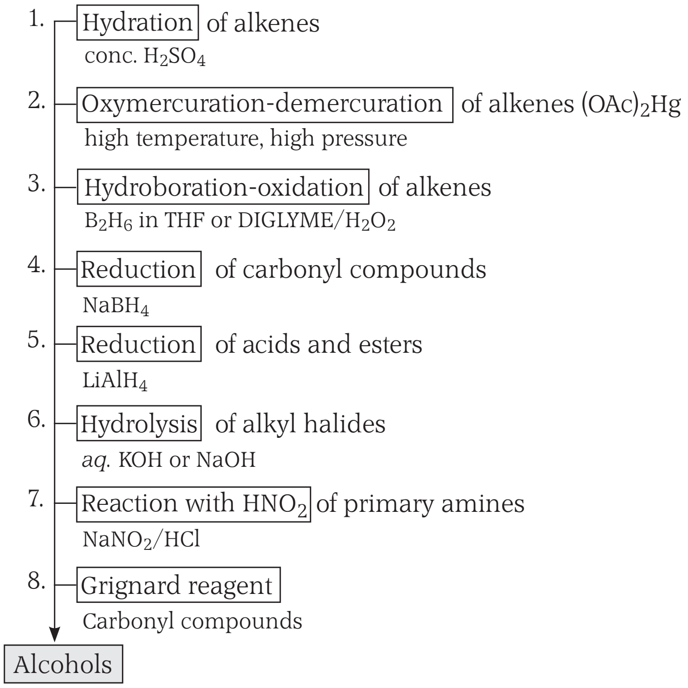


Sample Problem 2 *Propan-1-ol can be prepared from propene by*

(a) H_2O/H_2SO_4
(b) $Hg(OA)_2/H_2O$ *followed by* $NaBH_4$
(c) B_2H_6 *followed by* H_2O_2
(d) CH_3CO_2H / H_2SO_4

Interpret (c) Alkenes undergo addition reaction with diborane. The addition compounds on hydrolysis with H_2O_2 / OH^- yieds alcohols.

$$CH_3—CH=CH_2 \xrightarrow[H_2O_2]{B_2H_6} CH_3—CH_2—CH_2OH$$



1. Hydration of alkenes
   conc. H_2SO_4
2. Oxymercuration-demercuration of alkenes $(OAc)_2Hg$
   high temperature, high pressure
3. Hydroboration-oxidation of alkenes
   B_2H_6 in THF or DIGLYME/H_2O_2
4. Reduction of carbonyl compounds
   $NaBH_4$
5. Reduction of acids and esters
   $LiAlH_4$
6. Hydrolysis of alkyl halides
   aq. KOH or NaOH
7. Reaction with HNO_2 of primary amines
   $NaNO_2/HCl$
8. Grignard reagent
   Carbonyl compounds

Alcohols

Physical Properties of Monohydric Alcohols

(i) Boiling Points

Alcohols have higher boiling point than haloalkanes of comparable molecular mass because alcohols have intermolecular hydrogen bonding.

As the number of carbon atoms increases, boiling point increases. The boiling point decreases with increase of branching in carbon chain.

(ii) Solubility

Alcohols are soluble in water due to ability to form hydrogen bonds with water.

As the number of carbon atoms increases, solubility decreases.

Chemical Properties of Monohydric Alcohols

Order of reactivity of alcohols is as follows

1° alcohol > 2° alcohol > 3° alcohol

The reactions of alcohols may be due to cleavage of O—H bond or C—H bond. The former case shows its acidic behaviour.

(i) Reactions Involving Cleavage of O—H Bond

(a) **Reaction with metals**

$$2R{-}OH + 2Na \longrightarrow 2R{-}O{-}Na + H_2$$

Acidity of alcohols in decreasing order

Primary alcohols > secondary alcohols > tertiary alcohols

Electron releasing group decreases the polarity of —OH bond. Thus, decreases the acid strength.

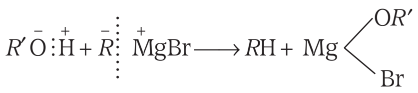
(b) **Reaction with acid and acid derivatives**

Alcohols when react with carboxylic acids, acid chlorides and acid anhydrides, form esters. This reaction is called **esterification.**

$$R'\overset{-}{O}\vdots\overset{+}{H} + R'\overset{+}{C}O\vdots\overset{-}{O}H \xrightleftharpoons{H^+} R'COOR + H_2O$$

(c) **With Grignard reagent**

Alcohols when react with Grignard reagent give alkanes.



$$R'\overset{-}{O}\vdots\overset{+}{H} + \overset{-}{R}\vdots\overset{+}{MgBr} \longrightarrow RH + Mg\begin{cases}OR'\\ Br\end{cases}$$

(ii) Reactions Involving Cleavage of Carbon Oxygen (C—O) Bond

Reaction with hydrogen halides

$$ROH + HX \longrightarrow R{-}X + H_2O$$

Reactivity in decreasing order 3° > 2° > 1°

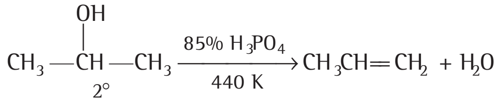
Hot Spot 1

DEHYDRATION

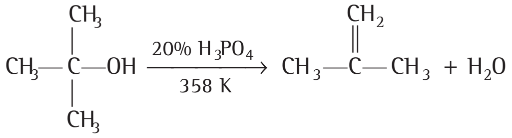
It is an important topic for JEE Main examination. Questions may be asked on the basis of mechanism of dehydration of alcohols.

Dehydration is carried in the presence of protic acids like conc. H_2SO_4 or H_3PO_4 or in presence of catalysts such as anhy. $ZnCl_2$ or Al_2O_3.

$$\underset{1°}{C_2H_5OH} \xrightarrow[443K]{H_2SO_4} CH_2{=}CH_2 + H_2O$$



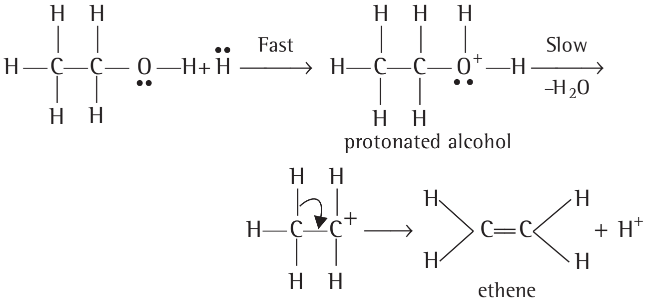
$$\underset{2°}{CH_3{-}\overset{OH}{\overset{|}{C}H}{-}CH_3} \xrightarrow[440\ K]{85\%\ H_3PO_4} CH_3CH{=}CH_2 + H_2O$$



$$CH_3{-}\overset{CH_3}{\underset{CH_3}{C}}{-}OH \xrightarrow[358\ K]{20\%\ H_3PO_4} CH_3{-}\overset{CH_2}{\overset{\|}{C}}{-}CH_3 + H_2O$$

Ease of dehydration of alcohols is as follows 3° > 2° > 1°

Mechanism of dehydration



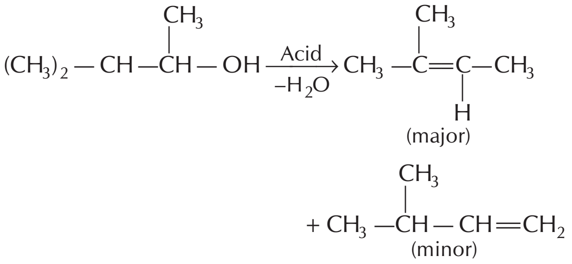
Sample **Problem 3** $(CH_3)_2CHCH(CH_3)OH \xrightarrow[-H_2O]{Acid} X$

The major product obtained in this reaction is

(a) $(CH_3)_2CHCH{=}CH_2$ (b) $(CH_3)_2C{=}CH{-}CH_3$

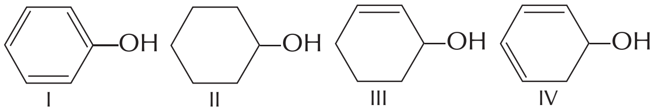
(c) 1 : 1 *mixture of* (a) *and* (b) (d) *None of these*

Interpret (b) Many a time unexpected products result during dehydration of alcohols.



$$(CH_3)_2{-}CH{-}\overset{CH_3}{\overset{|}{C}H}{-}OH \xrightarrow[-H_2O]{Acid} \underset{(major)}{CH_3{-}\overset{CH_3}{\overset{|}{C}}{=}\underset{H}{\underset{|}{C}}{-}CH_3} + \underset{(minor)}{CH_3{-}\overset{CH_3}{\overset{|}{C}H}{-}CH{=}CH_2}$$

Sample **Problem 4** *Dehydration of the following in increasing order is*



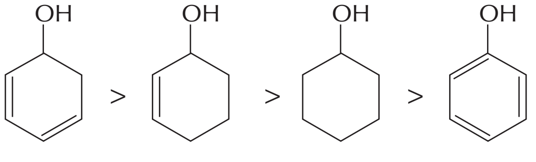
(a) I < II < III < IV

(b) II < III < IV < I

(c) I < III < II < IV

(d) I < IV < II < III

Interpret (a) Greater the chance of conjugation, greater the stability due to resonance and easier the dehydration. Thus, the correct order of dehydration is



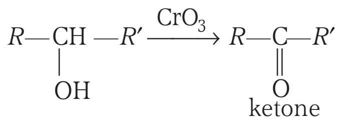
Oxidation

Different reagents are used to oxidise alcohol. The oxidation products are carbonyl compounds generally.

$$R\text{CH}_2\text{OH} \xrightarrow[\text{acidified KMnO}_4]{[\text{O}]} R\text{CHO} \xrightarrow{[\text{O}]} R\text{COOH}$$

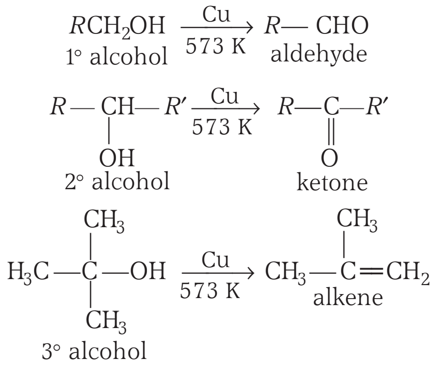
$$R\text{CH}_2\text{OH} \xrightarrow{\text{CrO}_3} R\text{CHO}$$

$$\text{CH}_3\text{—CH=CH—CH}_2\text{OH} \xrightarrow{\text{PCC}} \text{CH}_3\text{—CH=CH—CHO}$$



$$R\text{—}\underset{\text{OH}}{\text{CH}}\text{—}R' \xrightarrow{\text{CrO}_3} \underset{\text{ketone}}{R\text{—}\underset{\text{O}}{\overset{}{\text{C}}}\text{—}R'}$$

Tertiary alcohols do not undergo oxidation reaction. In the presence of strong oxidising agent ($KMnO_4$) and at high temperature cleavage of C—C bond takes place and a mixture of carboxylic acids containing lesser number of carbon atoms is formed.



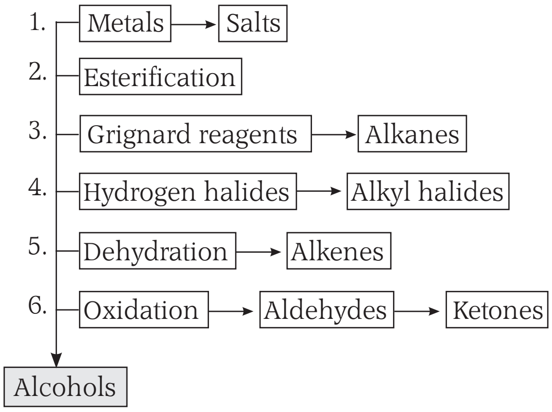
$$\underset{1^\circ\ \text{alcohol}}{R\text{CH}_2\text{OH}} \xrightarrow[573\ \text{K}]{\text{Cu}} \underset{\text{aldehyde}}{R\text{— CHO}}$$

$$\underset{2^\circ\ \text{alcohol}}{R\text{—}\underset{\text{OH}}{\text{CH}}\text{—}R'} \xrightarrow[573\ \text{K}]{\text{Cu}} \underset{\text{ketone}}{R\text{—}\underset{\text{O}}{\overset{}{\text{C}}}\text{—}R'}$$

$$\underset{3^\circ\ \text{alcohol}}{\text{H}_3\text{C—}\overset{\text{CH}_3}{\underset{\text{CH}_3}{\text{C}}}\text{—OH}} \xrightarrow[573\ \text{K}]{\text{Cu}} \underset{\text{alkene}}{\text{CH}_3\text{—}\overset{\text{CH}_3}{\text{C}}\text{=CH}_2}$$

MnO_2 selectively oxidises the —OH group of allylic and benzylic 1° and 2° alcohols to aldehydes and ketones respectively. N_2O_4 in $CHCl_3$ oxidises 1° and 2° benzyl alcohol.

Flow chart showing reactions of alcohols



Uses of Monohydric Alcohols

1. Ethanol, C_2H_5OH, is used for drinking purposes.
2. Ethanol is usually sold as industrial methylated spirits which is ethanol with a small quantity of methanol added and possibly some colour. Methanol is poisonous and so the industrial methylated spirits is unfit to drink.
3. Ethanol burns to give carbon dioxide and water and thus, can be used as a fuel in its own right or in mixtures with petrol (gasoline). "Gasohol" is a petrol/ethanol mixture containing about 10-20% ethanol.
4. Methanol also burns to form carbon dioxide and water.

   $$2CH_3OH + 3O_2 \longrightarrow 2CO_2 + 4H_2O$$

   Thus, it can be used a petrol additive to improve combustion.
5. Ethanol can be produced by fermentation, so this is a useful way for countries without an oil industry to reduce import of petrol.

   $$CH_3CH_2OH + 3O_2 \longrightarrow 2CO_2 + 3H_2O$$
6. Ethanol is widely used as a solvent. It is relatively safe and can be used to dissolve many organic compounds which are insoluble in water. It is used, *e.g.*, in many perfumes and cosmetics.
7. Most methanol is used to make other things *e.g.*, methanal (formaldehyde), ethanoic acid, and methyl esters of various acids. In most cases, these are in turn converted into further products.
8. Propan-2-ol is widely used in an amazing number of different situations as a solvent.

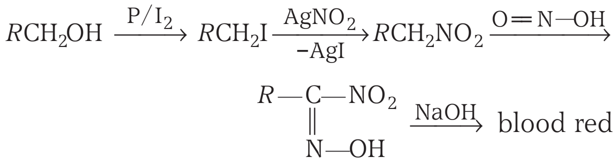
Identification of Primary, Secondary and Tertiary Alcohols

1°, 2° *and* 3° *alcohols can be identified by following tests.*

(a) Victor-Meyer's Test

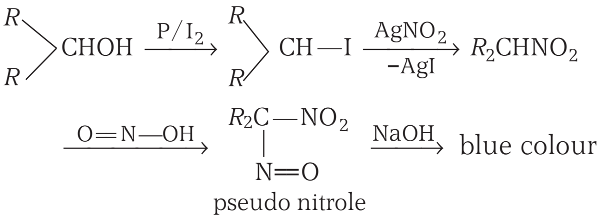
In this test, first the given alcohol is treated with P/ I_2 and then with $AgNO_2$ and HNO_2. The final product obtained gives different (or no) colour with NaOH. By identifying the colour produced, the alcohols are identified. In this test,

(i) Primary alcohols give blood red colour as



$$R\text{CH}_2\text{OH} \xrightarrow{\text{P/I}_2} R\text{CH}_2\text{I} \xrightarrow[-\text{AgI}]{\text{AgNO}_2} R\text{CH}_2\text{NO}_2 \xrightarrow{\text{O=N—OH}} R\text{—}\underset{\text{N—OH}}{\text{C}}\text{—NO}_2 \xrightarrow{\text{NaOH}} \text{blood red}$$

(ii) Secondary alcohols give blue colour as



$$R_2CHOH \xrightarrow{P/I_2} R_2CH-I \xrightarrow[-AgI]{AgNO_2} R_2CHNO_2 \xrightarrow{O=N-OH} R_2C(NO_2)-N=O \xrightarrow{NaOH} \text{blue colour}$$

pseudo nitrole

(iii) Tertiary alcohols produce no colour as

$$R_3C-OH \xrightarrow{P/I_2} R_3C-I \xrightarrow{AgNO_2} R_3CNO_2 \xrightarrow{HNO_2} \text{no reaction} \xrightarrow{NaOH} \text{no colour}$$

(b) Lucas Test

An equimolar mixture of anhydrous $ZnCl_2$ and concentrated HCl is called Lucas reagent. When alcohols are treated with it,

(i) tertiary alcohols produce turbidity immediately.
(ii) secondary alcohols produce turbidity after 5 min.
(iii) primary alcohols do not produce turbidity at room temperature.

(c) Dehydrogenation

Cu or Ag are used for this purpose. In this reaction

(i) primary alcohols give aldehydes as

$$RCH_2OH \xrightarrow{Cu/573K} RCHO + H_2$$

(ii) secondary alcohols give ketones as

$$R_2CHOH \xrightarrow{Cu/573K} R_2C=O$$

(iii) tertiary alcohols are not dehydrogenated. They are rather dehydrated as

$$(CH_3)_3C-OH \xrightarrow[-H_2O]{Cu/573K} (CH_3)_2C=CH_2$$

(d) Oxidation Method

Oxidation reaction is also used to distinguish between 1°, 2° and 3° alcohols. These reactions have been discussed in chemical properties of alcohols.

Sample **Problem 5** *On treatment with a concentrated solution of zinc chloride in concentrated* HCl *at room temperature, an alcohol immediately gives, an oily product. The alcohol can be*

(*a*) $C_6H_5CH_2OH$ (*b*) $CH_3CHOHCH_3$

(*c*) 
$CH_3-C(CH_3)_2-OH$

(*d*) *Any of these*

Interpret (*c*) In Lucas test, when alcohol is mixed with conc. HCl and anhydrous $ZnCl_2$ at room temperature, if oily product is formed immediately, the alcohol can be tertiary.

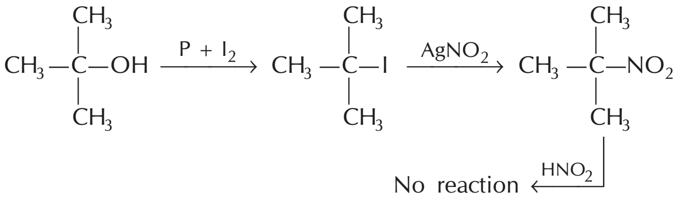
Sample **Problem 6** *In the following reaction sequence*

$$R-OH \xrightarrow{P+I_2} R-I \xrightarrow{AgNO_2} RNO_2 \xrightarrow{HNO_2} \text{no reaction}$$

The alcohol is a

(*a*) *primary alcohol* (*b*) *secondary alcohol*
(*c*) *tertiary alcohol* (*d*) *phenol*

Interpret (*c*) In the given sequence of reaction, the alcohol is tertiary.



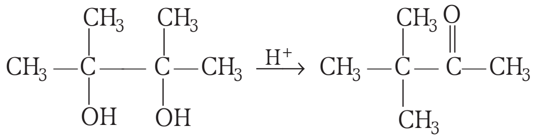
$$(CH_3)_3C-OH \xrightarrow{P+I_2} (CH_3)_3C-I \xrightarrow{AgNO_2} (CH_3)_3C-NO_2 \xrightarrow{HNO_2} \text{No reaction}$$

Alcoholometry

It is the process of determination of alcohol in a given sample. An alcohol water mixture containing 57.1% C_2H_5OH (by volume) or 49.3% C_2H_5OH (by weight) is called **proof spirit.** If the percentage of ethyl alcohol is higher, in comparison to proof spirit, it is called **over proof spirit** and if lower, it is called **under proof spirit.**

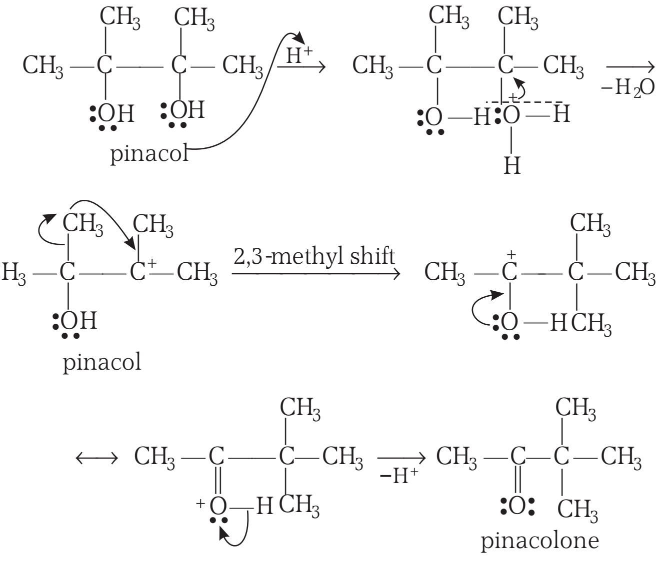
Pinacols

Completely substituted 1,2-diols are called pinacols. Pinacols behave very differently in the presence of acids and the reaction is called pinacol—**pinacolone rearrangement.** The simplest representation of the reaction is



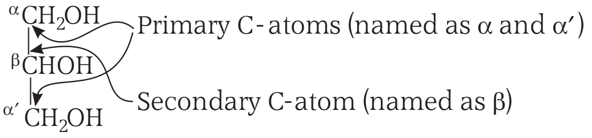
$$CH_3-C(CH_3)(OH)-C(CH_3)(OH)-CH_3 \xrightarrow{H^+} CH_3-C(CH_3)_2-C(=O)-CH_3$$

The reaction proceeds as



Glycerol or Propane -1, 2, 3-triol

Compounds containing three —OH groups at successive C-atoms are called triols. The introduction of third —OH group in a diol makes alcohol more sweet, raises the b.p. by about 100°C (due to enhancement in intermolecular H-bonding) and increases viscocity. Glycerol is the first member of this series with structural formula

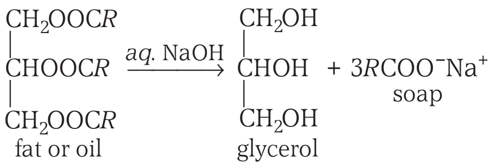


Methods of Preparation

Following methods are used to synthesised alcohols.

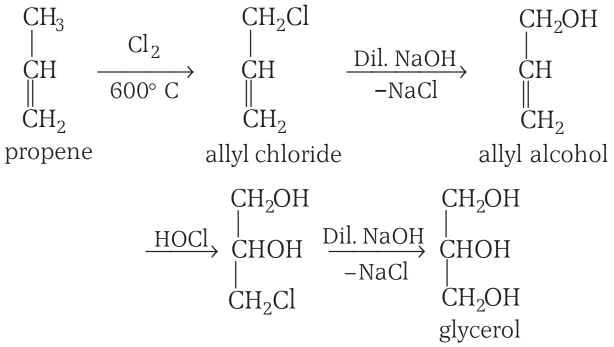
(i) From Fats and Oils

Fats and oils are infact triglycerides (triesters of glycerol with long chain fatty acids or carboxylic acids). Their hydrolysis in alkaline medium produces Na salts of these long chain fatty acids (soap) and glycerol (as **sweet lye** in mother liquor). The reaction (hydrolysis) is called, thus, saponification.

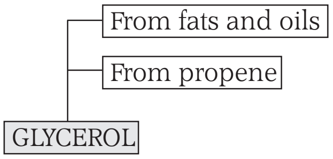


Actually glycerol is the byproduct of saponification reaction.

(ii) From Propene



The outline of methods of preparation looks like



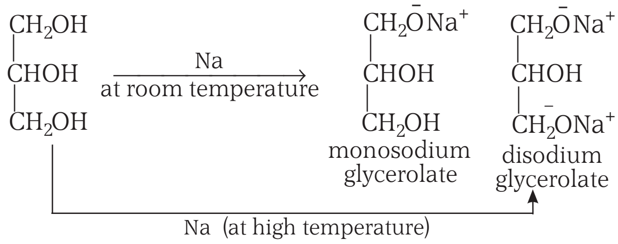
Physical Properties of Glycerol

It is a colourless, odourless, sweet tasting syrupy liquid with b.p. 290°C. It is non-toxic, miscible with water and ethanol but immiscible with ether. It is hygroscopic in nature.

Chemical Properties of Glycerol

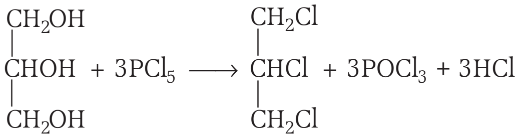
(i) With Na

Disodium salt is obtained.



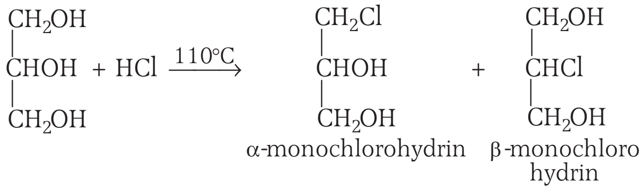
It is seen that the secondary alcoholic group does not react at all.

(ii) With PX_5

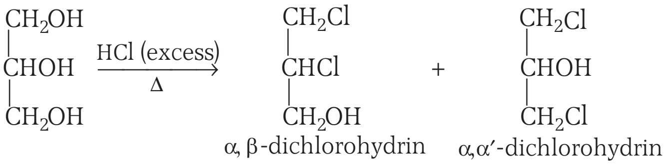


Caution Point *The pentahalides as* Br_2 *and* I_2 *are not known and* PF_5 *is unstable.*

(iii) With HX

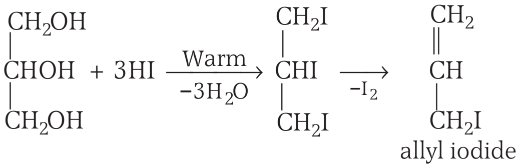


Long exposure to HCl at higher temperature gives,

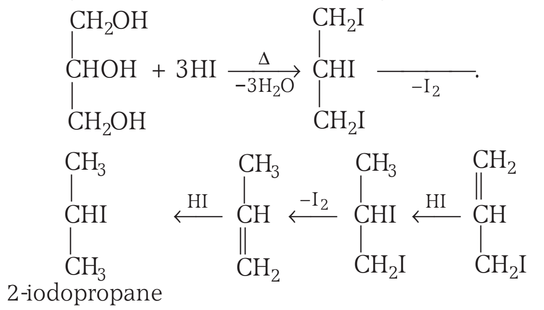


HBr behaves similarly but reaction with HI takes place differently as,

(a) With small amount of HI on warming,



(b) With large amount of HI on heating,

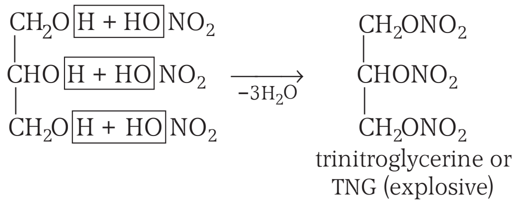


$$\begin{array}{l}CH_2OH\\|\\CHOH\\|\\CH_2OH\end{array} + 3HI \xrightarrow[-3H_2O]{\Delta} \begin{array}{l}CH_2I\\|\\CHI\\|\\CH_2I\end{array} \xrightarrow[-I_2]{} .$$

$$\underset{\text{2-iodopropane}}{\begin{array}{l}CH_3\\|\\CHI\\|\\CH_3\end{array}} \xleftarrow{HI} \begin{array}{l}CH_3\\|\\CH\\\|\\CH_2\end{array} \xleftarrow{-I_2} \begin{array}{l}CH_3\\|\\CHI\\|\\CH_2I\end{array} \xleftarrow{HI} \begin{array}{l}CH_2\\\|\\CH\\|\\CH_2I\end{array}$$

(iv) With HNO_3

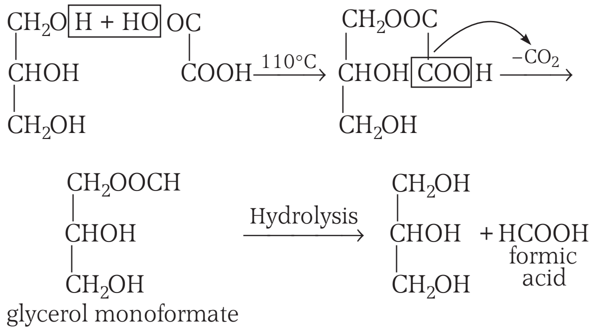
With nitric acid, it yields an explosive compound compound TNG.



$$\begin{array}{l}CH_2O\boxed{H+HO}NO_2\\|\\CHO\boxed{H+HO}NO_2\\|\\CH_2O\boxed{H+HO}NO_2\end{array} \xrightarrow[-3H_2O]{} \underset{\text{trinitroglycerine or TNG (explosive)}}{\begin{array}{l}CH_2ONO_2\\|\\CHONO_2\\|\\CH_2ONO_2\end{array}}$$

(v) With Oxalic Acid

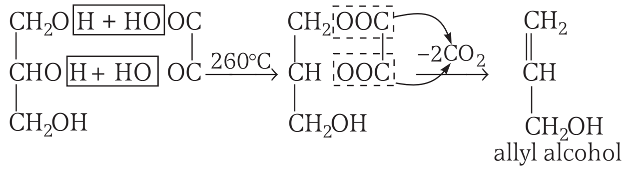
At 110°C



$$\begin{array}{ll}CH_2O\boxed{H+HO}&OC\\|&|\\CHOH&COOH\\|&\\CH_2OH&\end{array} \xrightarrow{110°C} \begin{array}{l}CH_2OOC\\|\qquad\;|\\CHOH\boxed{COO}H\\|\\CH_2OH\end{array} \xrightarrow{-CO_2}$$

$$\underset{\text{glycerol monoformate}}{\begin{array}{l}CH_2OOCH\\|\\CHOH\\|\\CH_2OH\end{array}} \xrightarrow{\text{Hydrolysis}} \begin{array}{l}CH_2OH\\|\\CHOH\\|\\CH_2OH\end{array} + \underset{\text{formic acid}}{HCOOH}$$

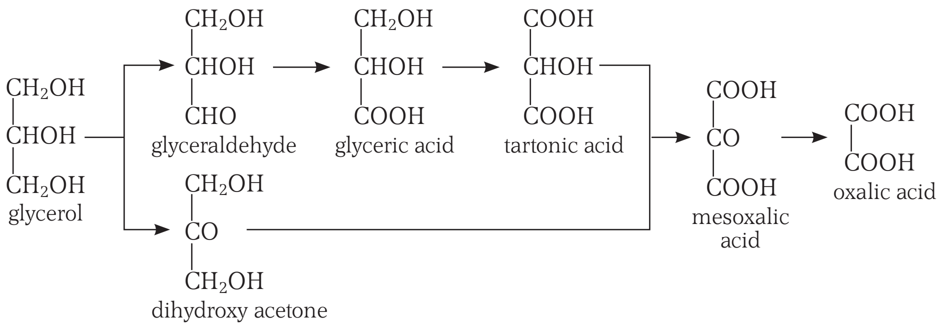
At 260°C



$$\begin{array}{ll}CH_2O\boxed{H+HO}&OC\\|&|\\CHO\boxed{H+HO}&OC\\|&\\CH_2OH&\end{array} \xrightarrow{260°C} \begin{array}{l}CH_2OOC\\|\qquad|\\CH\;OOC\\|\\CH_2OH\end{array} \xrightarrow{-2CO_2} \underset{\text{allyl alcohol}}{\begin{array}{l}CH_2\\\|\\CH\\|\\CH_2OH\end{array}}$$

(vi) Oxidation

Glycerol can give rise to variety of oxidation products which are summarised as,



$$\underset{\text{glycerol}}{\begin{array}{l}CH_2OH\\|\\CHOH\\|\\CH_2OH\end{array}} \longrightarrow \underset{\text{glyceraldehyde}}{\begin{array}{l}CH_2OH\\|\\CHOH\\|\\CHO\end{array}} \longrightarrow \underset{\text{glyceric acid}}{\begin{array}{l}CH_2OH\\|\\CHOH\\|\\COOH\end{array}} \longrightarrow \underset{\text{tartonic acid}}{\begin{array}{l}COOH\\|\\CHOH\\|\\COOH\end{array}} \longrightarrow \underset{\text{mesoxalic acid}}{\begin{array}{l}COOH\\|\\CO\\|\\COOH\end{array}} \longrightarrow \underset{\text{oxalic acid}}{\begin{array}{l}COOH\\|\\COOH\end{array}}$$

$$\underset{\text{glycerol}}{\begin{array}{l}CH_2OH\\|\\CHOH\\|\\CH_2OH\end{array}} \longrightarrow \underset{\text{dihydroxy acetone}}{\begin{array}{l}CH_2OH\\|\\CO\\|\\CH_2OH\end{array}} \longrightarrow \underset{\text{mesoxalic acid}}{\begin{array}{l}COOH\\|\\CO\\|\\COOH\end{array}}$$

(i) With dil. HNO_3 ⟶ Glyceric acid + Tartonic acid

(ii) With conc. HNO_3 ⟶ Glyceric acid.

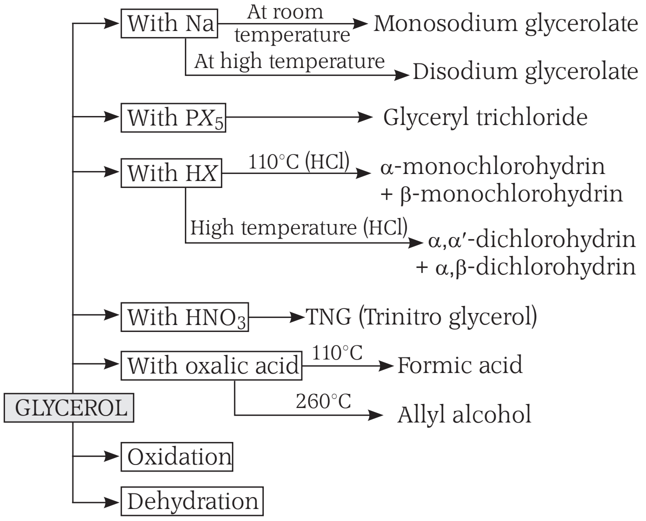
(iii) With bismuth nitrate ⟶ Mesoxalic acid.

(iv) With Br_2 water, sodium hypobromite or Fenton's reagent ($FeSO_4 + H_2O_2$) ⟶ A mixture of glyceraldehyde and dihydroxy acetone (glycerose).

(v) With **periodic acid** ⟶ Formaldehyde + Formic acid.

Chemical Properties

The outline of chemical properties of glycerol looks like

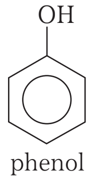


Check Point 1

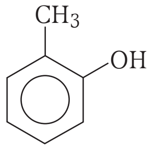
1. R–OH with less number of carbon atoms are water soluble while those with higher number of carbon atoms are not explain.
2. The relative acidity of alcohols is in the order of 3° < 2° < 1° < CH_3OH. Explain why?
3. Ethanol cannot be used as a solvent with Grignard reagent or $LiAlH_4$. Explain it.
4. Why glycerol has high viscosity and is miscible with water in all proportions?

11.2 Phenols

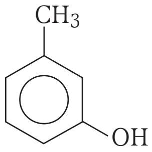
Aromatic compounds in which hydroxyl group (— OH) is directly attached with benzene nucleus are called phenols.



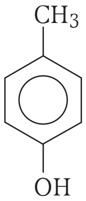
phenol (hydroxy benzene)



o-cresol (*o*-hydroxy toluene)

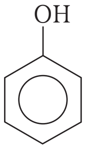


m-cresol (*m*-hydroxy toluene)

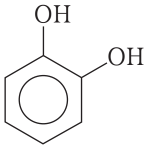


p-cresol (*p*-hydroxy toluene)

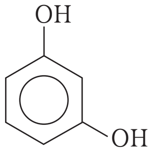
On the basis of number of —OH groups present, phenols are termed as monohydric, dihydric, trihydric phenols etc.



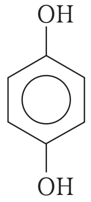
hydroxy benzene (or phenol)



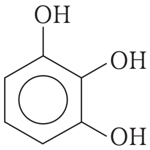
o-dihydroxy benzene (or caticol)



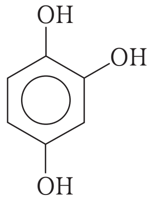
m-dihydroxy benzene (or resorcinol)



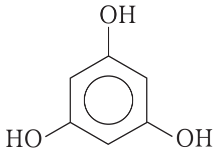
p-hydroxy benzene (or quinol)



1,2,3-trihydroxy benzene (or pyrogalol)



1,2,4-trihydroxy benzene (or hydroxy quinol)

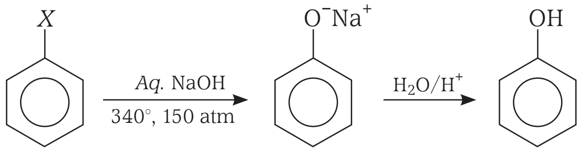


1,3,5-trihydroxy benzene (or fluoroglucinol)

Preparation of Phenols

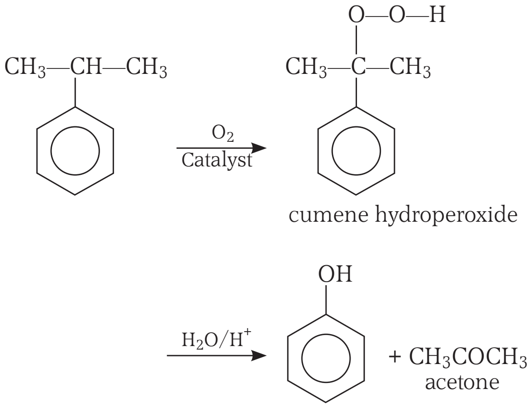
Some general and important methods of preparation of phenols are discussed below

(a) By Hydrolysis of Halobenzene



The halobenzene is prepared by Dow process or Raschig's process.

(b) Cumene Process

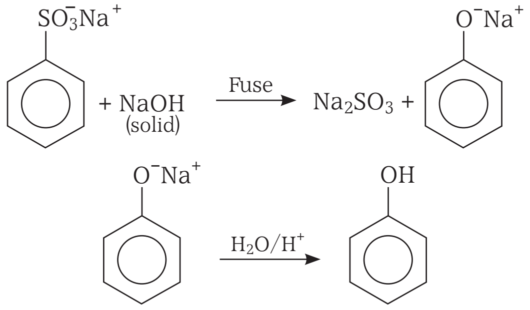


The reaction proceeds at 150°C in the presence of HBr as a catalyst. The reaction is also called **auto-oxidation.**

The advantage of this reaction is that the by product, *i.e.*, acetone is also an important reagent.

(c) From Na or K Salts of Sulphonic Acid

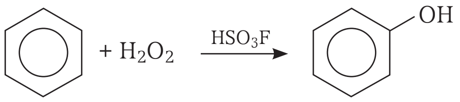
The Na or K salt of sulphonic acid when fused with NaOH, gives phenol.



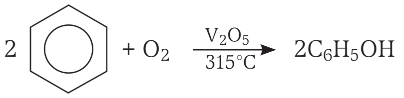
Fusion at high temperatures may leads to undesirable side products.

(d) By Hydroxylation of Benzene

Direct hydroxylation is involved,



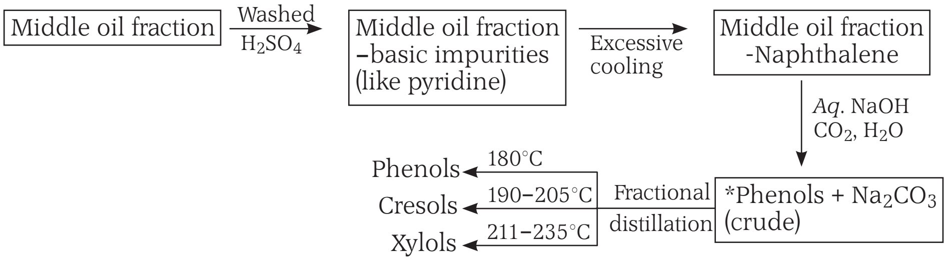
(e) By Oxidation of Benzene



It is the latest method of manufacture.

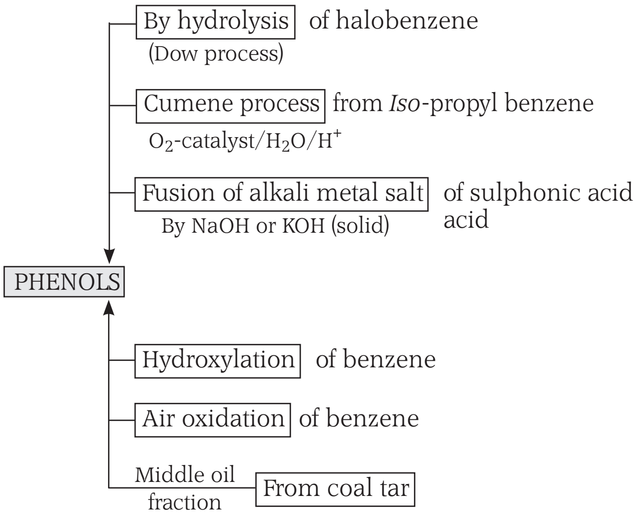
(f) By Middle Oil Fraction of Coal Tar

The middle oil fraction of coal tar distillation has naphthalene and phenolic compounds. From this fraction phenolic compounds are isolated as,



*On reaction with *aq.* NaOH, phenols are dissolved in it as phenoxides. CO_2 is then blown through this phenoxide ion solution to liberate phenols.

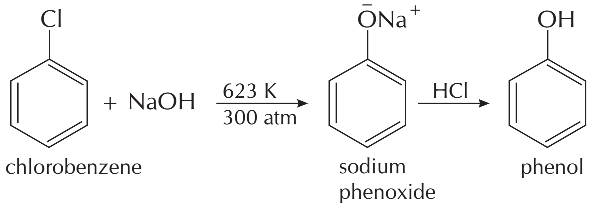
The methods of preparation of phenols in outline looks like



Sample Problem 7 *Phenol may be obtained from chlorobenzene using reagents* **[NCERT]**

(a) NaOH + HCl (b) CO_2
(c) H_2SO_4 (d) NaOH + CaO

Interpret (a)



Physical Properties of Phenols

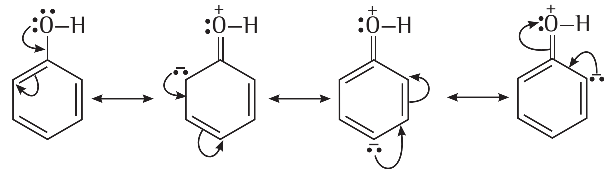
These are colourless liquids or solids with red tint and carbolic odour. They are highly toxic. Their boiling point are higher than corresponding alcohols (due to stronger intermolecular H-bonding). They are more miscible with water. They have high dipole moments and are acidic in nature. (More acidic than aliphatic alcohols.)

Hot Spot 2

ACIDIC Nature of Phenols

This is an important topic for JEE Main examination. Generally questions based on strength of phenols and their derivatives are asked. The level of question is generally easy.

Phenols are acidic in nature, even more acidic than alcohols. The more acidic character of phenols (than corresponding aliphatic alcohols) is due to conjugation between lone pair of oxygen and benzene nucleus, *i.e.*,



The (+) ve charge on oxygen signifies the weakening of O—H bond.

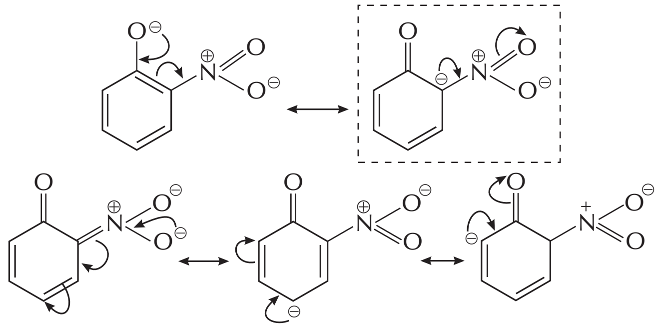
Presence of electron releasing group like —CH_3, —C_2H_5 over benzene nucleus destabilises the phenoxide ion, thus, decreases the acidity of phenol whereas presence of electron withdrawing groups like —NO_2, — CN, etc., stabilises the phenoxide ion and thus, increases the acidity of phenol.

Sample Problem 8 *Phenol is less acidic than*

(a) *ethanol* (b) *o-nitrophenol*

(c) *o-methylphenol* (d) *o-methoxyphenol*

Interpret *(b) Due to –R effect of —NO_2 group, o-nitrophenoxide ion is more stable than phenoxide ion. Consequently, nitrophenols is more acidic than phenol.*



Note Structures in boxe have negative charge on that C-atom to which electron withdrawing —NO_2 group is attached. So, this structure contributes more towards the acidic character than the others.

Sample Problem 9 *The correct increasing order of acidity of the following compounds is*

(a) *phenol < o-cresol < o-nitrophenol*

(b) *o-nitrophenol < phenol < o-cresol*

(c) *o-cresol < o-nitrophenol < phenol*

(d) *o-cresol < phenol < o-nitrophenol*

Interpret (*d*) In substituted phenols the presence of electron withdrawing groups, increases the acidic strength of phenol whereas, electron releasing groups decrease the acidic strength of phenols. Hence, correct order is *o*-cresol < phenol < *o*-nitrophenol.

Chemical Properties of Phenols

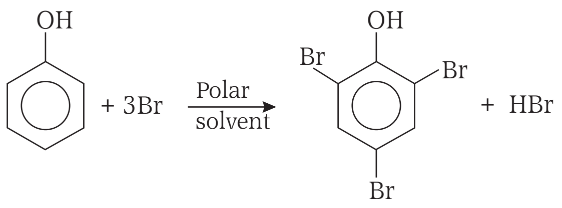
Phenols exhibit following general characteristics.

(a) Electrophilic Substitution Reactions

In phenol, the —OH group shows +*R* and –*I* effect and hence, highly activates the benzene ring towards electrophilic substitution reaction. It is *ortho* and *para* directing group.

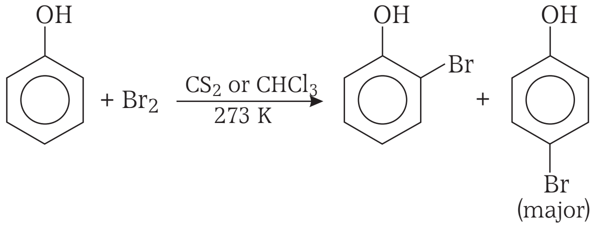
The normal electrophilic substitutions are given as

(i) **Halogenation, *i.e.,***

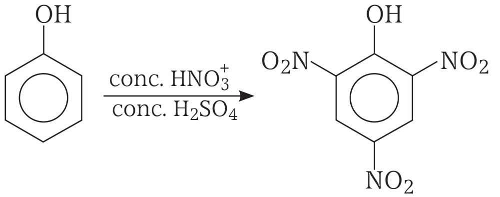


In polar solvent phenol is in equilibrium with phenoxide ion which is the actual substrate.

However, in the presence of CS_2 or $CHCl_3$, *ortho* and *para* halophenols are the main products.

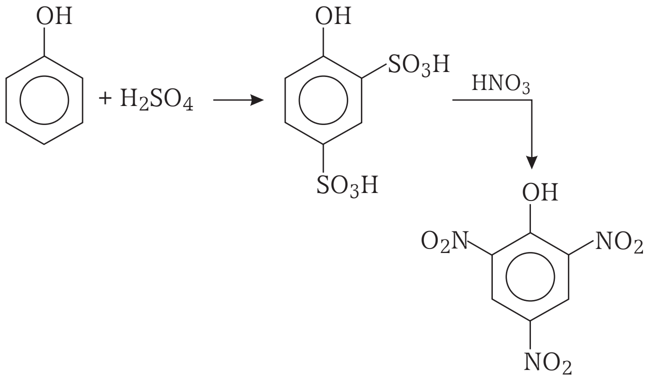


(ii) **Nitration, *i.e.,***



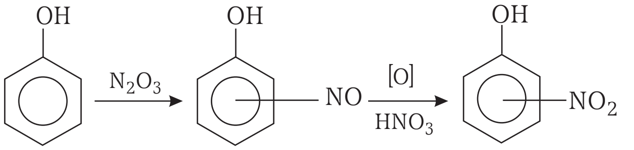
picric acid

However, nitration after deactivating the ring by sulphonation, gives picric acid in better yield.



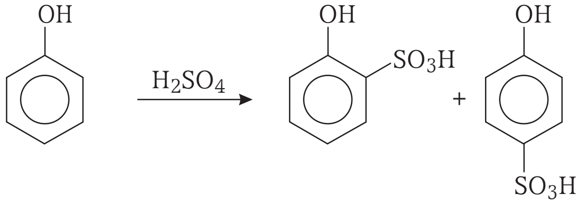
picric acid

For preparing *o*- and *p*-nitrophenols, dil. HNO_3 is used. The reaction involves initial nitrosation of phenol with N_2O_3 which is then oxidised to nitrophenol as,

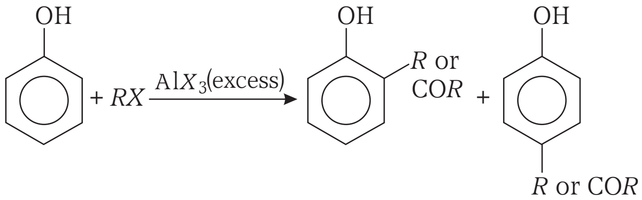


(*O*- and *p*-nitrophenol)

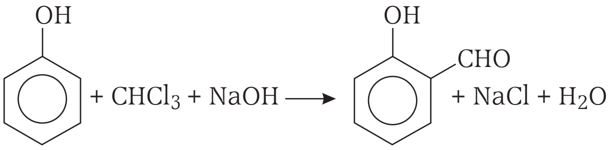
(iii) **Sulphonation *i.e.,***

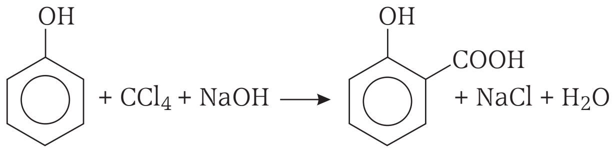


(iv) **Friedel-Craft reactions** (alkylation and acylation) These reactions occur in the excess of Lewis acid like AlX_3 as,

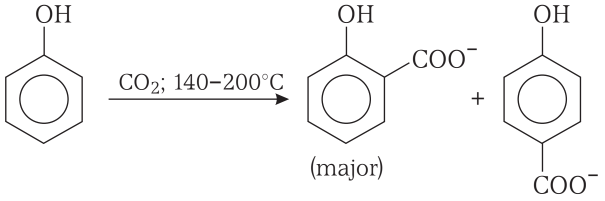


(v) **Reimer-Tiemann reaction** In this reaction, indeed the phenol reacts with trihalogen or tetrahalogen methane followed by hydrolysis with alkali. *o/p* salicylaldehyde or salicylic acid are the products of this reaction.





(vi) **Kolbe and Kolbe Schmidt Reaction** Kolbe's reaction involves electrophilic attack of very weak electrophile (CO_2) on activated *ortho* or *para* position of phenoxide ion. At lower temperatures *ortho* isomer predominates whereas *para* isomer obtained in excess at higher temperatures.



(major)

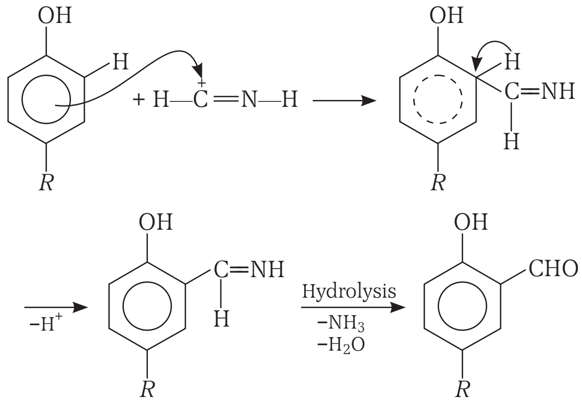
(minor)

Kolbe Schmidt reaction is infact a modification of Kolbe's reaction. Here, a pressure of 5–7 atmosphere is also applied because of which reaction occurs at comparatively lower temperatures.

(vii) **Gattermann synthesis** The reaction is an aromatic electrophilic substitution involving the attack of formaldinium ion formed by HCN and HCl with help of $AlCl_3$ giving rise to aldimine. Aldimine on hydrolysis gives phenolic aldehyde as,

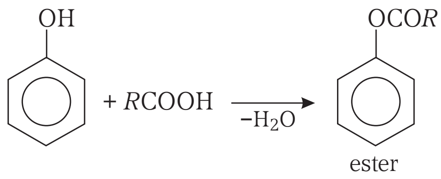
formaldinium ion

[The Cl^- of HCl is trapped by $AlCl_3$ as $Cl^- + AlCl_3 \longrightarrow AlCl_4^-$]



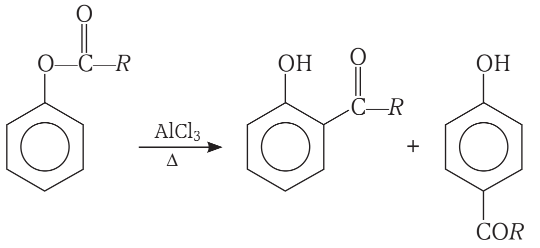
The –CHO group prefers *para*-position and attacks on *ortho*-position only if *para*-position is blocked.

(b) Esterification

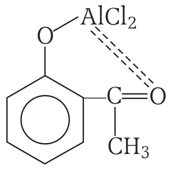


This reaction is already described completely in properties of aliphatic alcohols.

Phenolic esters on heating with $AlCl_3$ (Lewis acid) give *o*- and *p*-acyl phenols, the reaction is called **Fries migration**.*e.g.*,



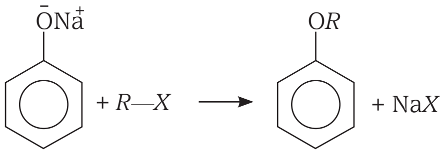
At low temperature (below 100°C) *para* isomer is major product while at high temperature *ortho* isomer is major product. This is because intermediate of *ortho* isomer is stabilised by chelation as



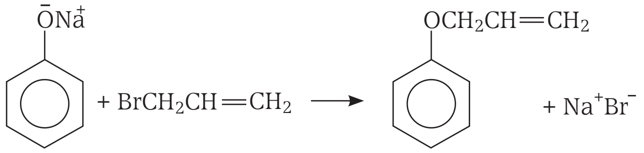
Electron withdrawing group in the substrate favours retardation of reaction.

Solvent is generally not required for the reaction. Nitrobenzene may be used which reduces the reaction temperature.

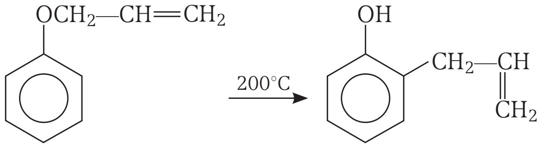
(c) Ether Formation

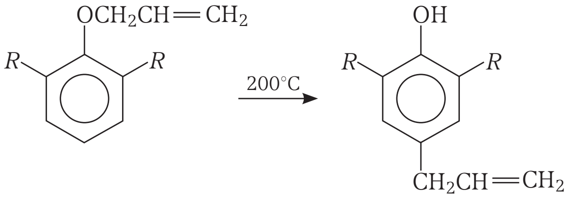


Similarly, sodium or potassium alkoxide on reaction with allyl bromide give aryl allyl ethers as,



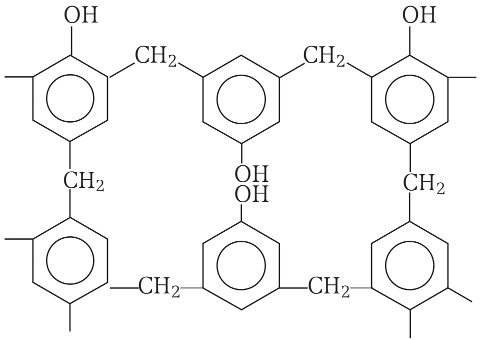
These aryl allyl ethers when heated to 200°C show **Claisen rearrangement** which involves migration of allyl group from ethereal oxygen to ring C at *ortho* position and (when both the *ortho* position are blocked) to *para* position as,





(d) Lederer-Manassae Reaction

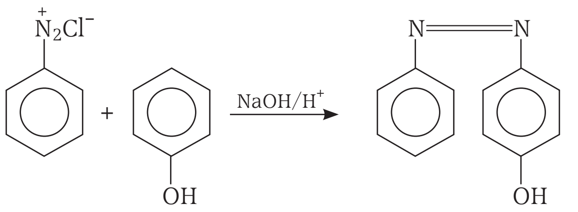
Here when phenol is refluxed with formalin (aqueous solution of HCHO) and 0.88 ammonia as catalyst then bakelite is formed with the following structure



bakelite (a portion)

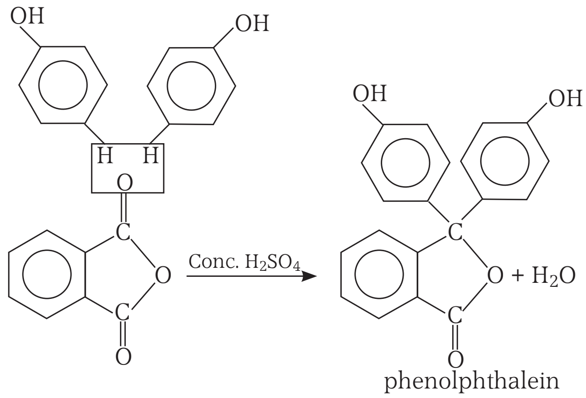
(e) Other Reactions of Phenols

(i) **Coupling reaction** Phenols couple with benzene diazonium chloride in an alkaline solution to form *p*-hydroxyazobenzene (a dye) as

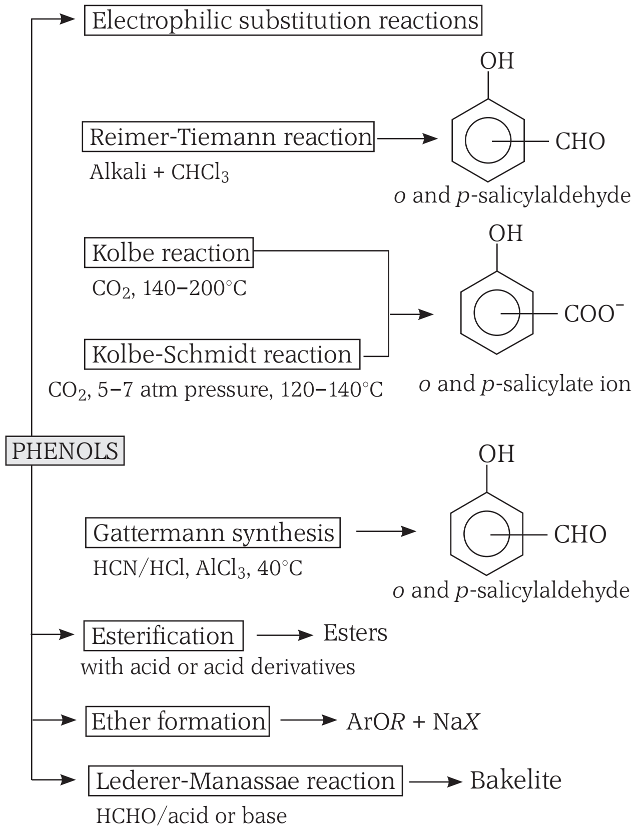


para-hydroxyazobenzene

(ii) **Condensation with phthalic anhydride** In the presence of H_2SO_4, it combines with phthalic anhydride to form phenolphthalein as



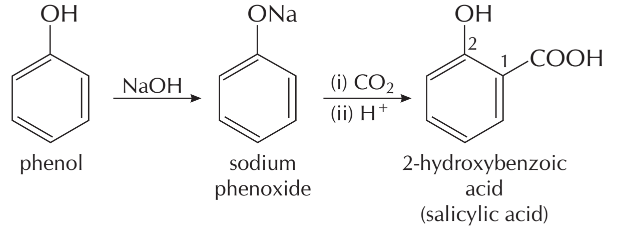
The outline of chemical properties of phenol looks like



Sample **Problem 10** *Synthesis of salicylic acid from phenol is done by* **[NCERT]**

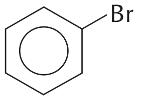
(a) *Williamson synthesis*
(b) *Reimer-Tiemann reaction*
(c) *Kolbe's reaction*
(d) *Gattermann synthesis*

Interpret (c) When phenol reacts with sodium hydroxide, reactive phenoxide ion is formed. So, electrophilic aromatic substitution takes place with CO_2 under a pressure of 4-7 atm followed by acidification and ortho hydroxybenzoic acid (salicylic acid) is formed. This is called Kolbe's reaction.

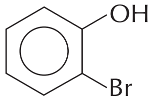


Sample **Problem 11** *The product obtained by the reaction of* HBr *with phenol is*

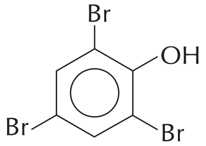
(a)



(b)



(c)



(d) *There is no reaction*

Interpret (d) Phenol reacts with PCl_5 to form chlorobenzene. Halogenation of phenol does not take place with HX.

Uses of Phenols

(i) Phenol is used in the manufacture of bakelite, soaps, lotions, etc.
(ii) It is used in the manufacture of drugs like aspirin, salol, phenacetin, etc.

Check Point 2

1. Explain, why phenol is more acidic than benzyl alcohol?
2. Phenol is an acid but does not react with $NaHCO_3$. Explain
3. During esterification of phenol, sometimes nitrobenzene is used as a solvent. Explain, why?
4. *para*-isomer is the major product of the Fries migration of phenolic esters at low temperature. Explain.

11.3 Ethers

Organic compounds having —O— functional group are called ethers. Thus, ethers may look like

$$R'—O—R''$$

In other words, esters are the derivatives of water as these are obtained when both the H-atoms of H_2O are replaced by *R* groups. The *R* groups may be same or different. When both the *R* groups (alkyl groups) are same, the ethers are called **simple** or **symmetrical ether** and when both the groups are different, the ethers are called **mixed** or **unsymmetrical ethers,** *e.g.,*

$CH_3—O—CH_3$ (simple or symmetrical ethers) $CH_3OC_2H_5$ (mixed ether)

Structure of Ethers

The ethers have following general structure

$$R\overset{\sigma}{—}\ddot{\underset{\cdot\cdot}{O}}\overset{\sigma}{—}R$$

This structure shows that O atom has two bond pairs and two lone pairs of electrons, *i.e.*, total four pairs of electrons. Hence, it is sp^3 hybridised. The two sp^3 hybridised orbitals overlap with the hybrid orbitals (one each) of two carbon atoms to form sigm bonds. The bulkier R groups result in the greater forces of repulsion and thus the $\begin{matrix}R\\R\end{matrix}\!\!>O$ bond angle is 110° (somewhat greater than the tetrahedral bond angle). Thus, ethers have a bent structure (like H_2O) and dipolar nature.

Preparation of Ethers

General methods used to synthesise ethers are as follows

(a) Williamson's Synthesis

$$R\bar{O}\,Na^+ + R'X \longrightarrow ROR' + Na^+X^-$$

Best yield of asymmetrical ethers are obtained when the alkyl halides are primary and alkoxides are tertiary. Also see the properties of alkylhalides.

(b) Reaction of *RX* with Dry Silver Oxide

It is already discussed in properties of alkylhalides.
The reaction looks as

$$2RX + Ag_2O \longrightarrow ROR + 2AgX$$

(c) By Dehydration of Alcohols

$$\underset{\text{(excess)}}{RCH_2OH} \xrightarrow[140°C]{\text{Conc. } H_2SO_4} RCH_2—O—CH_2R$$

The order of ease of dehydration of alcohols follow the sequence, tertiary < secondary < primary.

The method is generally useless for the preparation of asymmetrical ethers, since complex mixture are obtained *e.g.*,

$$ROH + R'OH \xrightarrow[140°]{\text{Conc. } H_2SO_4} ROR + ROR' + R'OR'$$

$$\underset{\text{(excess)}}{RCH_2OH} \xrightarrow[250°C]{Al_2O_3} RCH_2—O—CH_2R$$

Here, Al of Al_2O_3 works as Lewis acid.

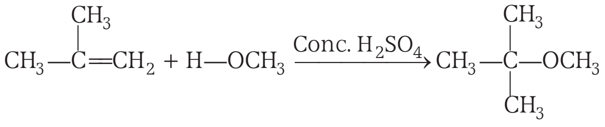
(d) By the Action of Diazomethane on Alcohols

$$ROH + CH_2N_2 \xrightarrow{HBF_4} R—O—CH_3 + N_2$$

The method is suitable for methyl ethers only and remember, tetrafluoroboric acid (HBF_4) is used as the catalyst.

(e) From Alkenes

(i) **By adding alcohols**



$$CH_3—\overset{\overset{\displaystyle CH_3}{|}}{C}{=}CH_2 + H—OCH_3 \xrightarrow{\text{Conc. } H_2SO_4} CH_3—\overset{\overset{\displaystyle CH_3}{|}}{\underset{\underset{\displaystyle CH_3}{|}}{C}}—OCH_3$$

This reaction proceeds through the formation of a carbonium ion, thus a possibility always exists that the carbonium ion may rearranges itself to form a more stable carbonium ion to affect the result.

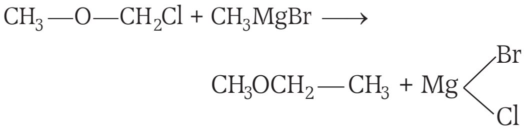
(ii) **Alkoxy mercuration-demercuration**

$$\text{Alkene} + \text{Alcohol} \xrightarrow[\text{(ii) } NaBH_4/OH^-]{\text{(i) } Hg(OOCCF_3)_2} \text{Ether}$$

This reaction does not involve carbonium ion formation thus no rearrangements are possible to affect the result of reaction.

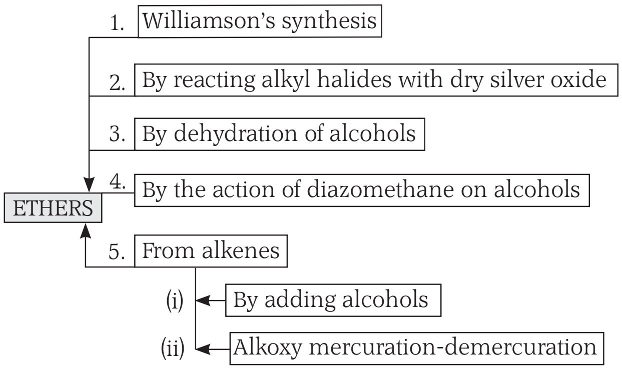
(f) Preparation of Higher Ethers

Higher ethers can be prepared by treating α-halo ethers with suitable Grignard's reagent as



$$CH_3—O—CH_2Cl + CH_3MgBr \longrightarrow CH_3OCH_2—CH_3 + Mg\begin{matrix}\diagup Br\\ \diagdown Cl\end{matrix}$$

The outlines of the methods of preparation of ethers looks like.



Here, R' and R'' may be same or different alkyl or aryl groups.

Sample **Problem 12** *Which of the following reagents will be used for the preparation of* 1*-propoxypropane?*

[NCERT]

(a) *Sodium propoxide + propane*
(b) *Sodium ethoxide +* 1*-bromopropane*
(c) *Sodium propoxide +* 1*-bromopropane*
(d) *None of the above*

Interpret (*c*) $R—X + Na—O—R' \xrightarrow[\text{synthesis}]{\text{Williamson's}} R—O—R' + NaX$

Here alkyl halide should be primary. Therefore, equation will be

$$\underset{\text{1-bromopropane}}{CH_3CH_2CH_2-Br} + \underset{\text{sodium propoxide}}{Na^+O^-CH_2CH_2CH_3} \xrightarrow{\Delta} \underset{\text{1-propoxypropane}}{CH_3CH_2CH_2—O—CH_2CH_2CH_3} + NaBr$$

Sample **Problem 13** *Which of the following reactions can be used for the preparation of tertiary butylmethyl ether?*

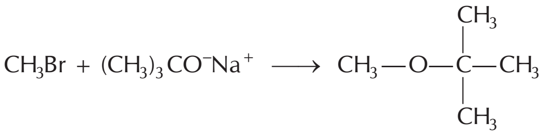
(*a*) $CH_3Br + (CH_3)_3CO^-Na^+ \longrightarrow$

(*b*) $(CH_3)_3CCl + CH_3O^-Na^+ \longrightarrow$

(*c*) $(CH_3)_3COH + CH_3Cl \longrightarrow$

(*d*) $(CH_3)_3CCl + CH_3OH \longrightarrow$

Interpret (*a*)

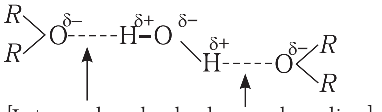


$$CH_3Br + (CH_3)_3CO^-Na^+ \longrightarrow CH_3—O—\overset{\overset{\large CH_3}{|}}{\underset{\underset{\large CH_3}{|}}{C}}—CH_3$$

tert-butylmethyl ether

Physical Properties

Dimethyl ether and ethyl methyl ether are gases at room temperature while other homologues are colourless liquids with characteristic ether smell and with a dipole moment of 1.15 to 1.3D. These have the **boiling points lower than their isomeric alcohols**. (Due to lesser hydrogen bonding than corresponding alcohols). Ethers upto 3 C-atoms are soluble in water due to the formation of intermolecular hydrogen bonds as



[Intermolecular hydrogen bonding]

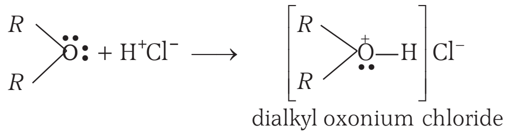
Chemical Properties

The reactions of ethers are mainly due to lone pair of ethereal O, cleavage of C—O bond and —*R* group.

(a) Reactions Due to Ethereal Oxygen

These reactions are mainly due to the lone pair of oxygen. Here ethers behave as base.

(i) **Action of concentrated acids** Oxonium salts are formed *i.e.,* such a reaction occur due to the presence of two lone pairs of electrons over oxygen.



dialkyl oxonium chloride

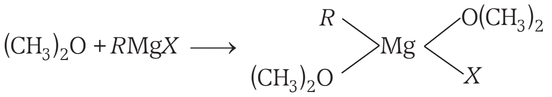
These salts are stabilised due to stabilisation by the anion of acids as

$$(CH_3)_2O + H_2SO_4 \longrightarrow \underset{\text{diethyl oxonium hydrogen sulphate}}{[(CH_3)_2OH]^+HSO_4^-}$$

(ii) **Formation of coordination complexes** Similarly, ethereal oxygen, being **Lewis base** form coordination complexes, called **etherates**, with Lewis acids such as BF_3, $AlCl_3$, $FeCl_3$, Grignard's reagent etc., as

borontrifluoride etherate

Similarly,



Grignard reagent etherate

[Due to this complex formation Grignard reagents dissolve in dry ether.]

(b) Reactions Involving Cleavage of Carbon-Oxygen Bond

(i) **With H*X***

$$R—O—R + HX \xrightarrow{100°C} R—OH + RX$$

The order of reactivity of halogen acids follow the sequence

$$HI > HBr > HCl$$

In case of asymmetrical ethers, the alkyl halide is always formed from the **smaller alkyl group** provided no tertiary (3°) alkyl group is present and if any 3° alkyl group is present, the halogen gets attached with it. *e.g.,*

$$CH_3—O—C_2H_5 + HBr \xrightarrow{100°C} CH_3Br + CH_3CH_2OH$$

In case of alkyl aryl ethers the products are **always phenol and an alkyl halide** as

$$C_6H_5—O—CH_3 + HBr \xrightarrow{100°C} C_6H_5OH + CH_3Br$$

(ii) **With sulphuric acid** With dil H_2SO_4, under pressure, ethers are hydrolysed to alcohols as

$$R—O—R + H_2O/H^+ \xrightarrow[\text{under pressure}]{\text{Dil. }H_2SO_4,\Delta} 2R—OH$$

With conc H_2SO_4, alcohols and alkyl hydrogen sulphates are formed as

$$\underset{\text{(primary ether)}}{R—O—R} + \text{conc. }H_2SO_4 \xrightarrow{\Delta} R—OH + RHSO_4$$

Secondary and tertiary ethers however, form alkenes instead of alcohols.

(iii) **With** PCl_5 The reaction looks like

$$CH_3—O—CH_3 + PCl_5 \longrightarrow 2CH_3—Cl + POCl_3$$

(iv) **With acid derivatives** Acid chlorides react with ethers in the presence of anhydrous $ZnCl_2$ or $AlCl_3$ to form alkyl halide and esters as

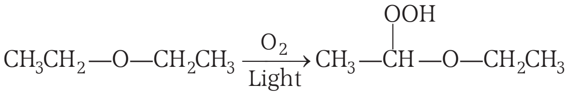
$$ROR + R'COCl \xrightarrow[\Delta]{AlCl_3 \text{ or Anhy. } ZnCl_2} RCl + R'COOR$$

Acid anhydrides form esters under similar conditions as :

$$R—O—R + (CH_3CO)_2O \xrightarrow[\text{or } ZnCl_2/\Delta]{\text{Anhy. } AlCl_3} 2CH_3COOR$$

(c) Reactions Involving Alkyl Group

(i) **Action of air and light** When exposed to air and light for a long time, ethers are oxidised to form hydroperoxides or simply peroxides as



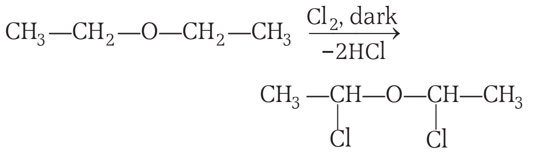
$$CH_3CH_2—O—CH_2CH_3 \xrightarrow[\text{Light}]{O_2} CH_3—\underset{}{\overset{OOH}{\overset{|}{C}H}}—O—CH_2CH_3$$

The reaction is free radical and oxidation occurs at the C-atom next to ethereal oxygen.

These peroxides are very dangerous compounds as these decompose violently at high temperatures.

(ii) **Halogenation** With halogens, ethers give substitution products. The extent of halogenation, however, depends upon the reaction conditions.

Diethyl ether reacts in dark to form only mono substituted products of alkyl group, *e.g.*,



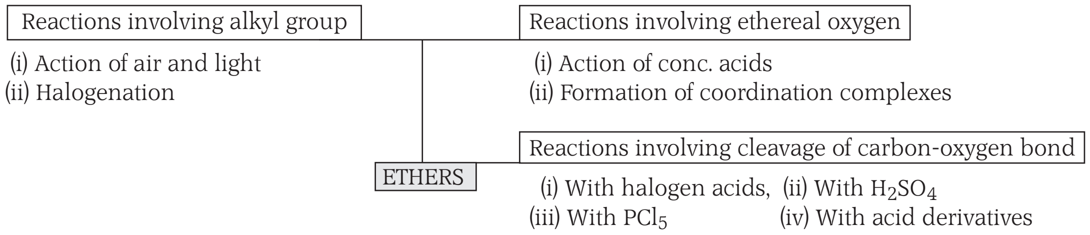
$$CH_3—CH_2—O—CH_2—CH_3 \xrightarrow[-2HCl]{Cl_2,\text{ dark}} CH_3—\underset{\underset{Cl}{|}}{CH}—O—\underset{\underset{Cl}{|}}{CH}—CH_3$$

α, α′-dichlorodiethyl ether

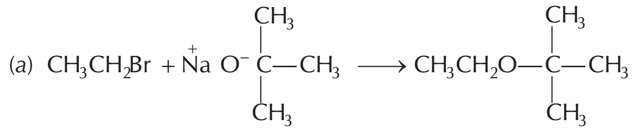
In the presence of light and excess of chlorine all hydrogen atoms are substituted as

$$CH_3—CH_2—O—CH_2—CH_3 + 10Cl_2 \xrightarrow{h\nu} C_2Cl_5—O—C_2Cl_5 + 10HCl$$

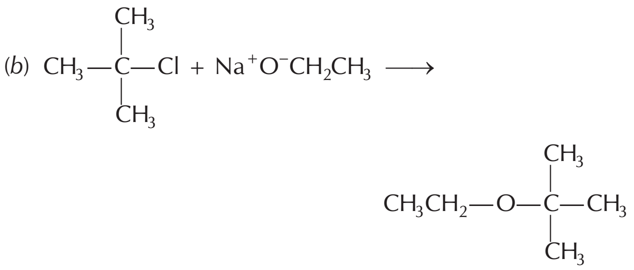
The outline of their chemical properties looks like



Sample **Problem 14** *Which of the following reactions is/are feasible?*



$$(a)\ CH_3CH_2Br + \overset{+}{Na}\,O^-\underset{\underset{CH_3}{|}}{\overset{\overset{CH_3}{|}}{C}}—CH_3 \longrightarrow CH_3CH_2O—\underset{\underset{CH_3}{|}}{\overset{\overset{CH_3}{|}}{C}}—CH_3$$



$$(b)\ CH_3—\underset{\underset{CH_3}{|}}{\overset{\overset{CH_3}{|}}{C}}—Cl + Na^+O^-CH_2CH_3 \longrightarrow CH_3CH_2—O—\underset{\underset{CH_3}{|}}{\overset{\overset{CH_3}{|}}{C}}—CH_3$$

(c) Both (a) and (b)
(*d*) None of the above

Interpret (*a*) The reactivity of primary halides is in the order, $CH_3 > CH_3CH_2 > CH_3CH_2CH_2$ and the tendency of alkyl halides to undergo elimination is $3° > 2° > 1°$. Hence, for better yield, the alkyl halide should be primary and alkoxide should be secondary or tertiary.

Uses of Ethers

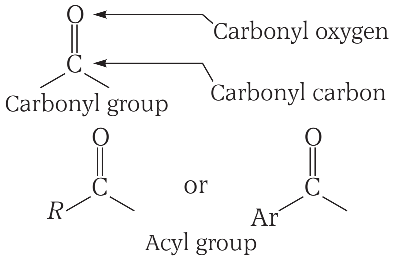
(i) Ethers are used as a solvent for oils, fats and Grignard reagent etc.
(ii) These are used as general anaesthetic.
(iii) They provide inert and moisture free medium for various reactions.

Check Point 3

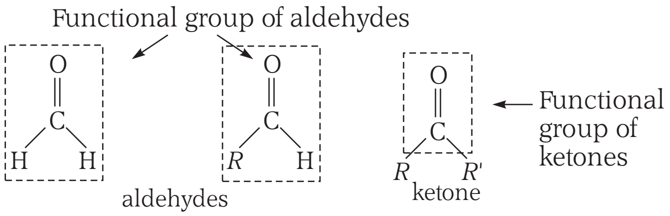
1. HI is a better reagent than HBr for cleavage of ethers. Explain, Why?
2. Account for the following
   (i) Ethers have significant dipole moments.
   (ii) Ethers are soluble in conc H_2SO_4 but separate out from the solution on adding water.
3. Why is diethylether used as a solvent for
   (i) BF_3 and (ii) RMgBr?
4. Why a non-symmetrical ether is not prepared by heating a mixture of R—OH and R' OH in acid?

11.4 Aldehydes and Ketones

The organic compounds containing carbon-oxygen double bond, *i.e.*, $>C=O$ group are called **carbonyl compounds.** These compounds are widely spread both in plants and animal kingdom and they play an important role in biological processes.



$>C=O$ group containing compounds can be divided into two classes. One class includes the carbonyl compounds in which the carbonyl group is attached to either hydrogen atoms or alkyl or aryl groups and other includes the carbonyl compounds in which $>C=O$ group gets attached to —OH, — NH_2 etc., functional groups. **Aldehydes** and **ketones** belong to the former class. The —H atom and alkyl or aryl (—*R* or —Ar) groups of aldehydes and ketones cannot be replaced by another group (*i.e.*, nucleophile).



(where, *R* and *R*′ may be similar or different alkyl or aryl group.)

If the two *R* and *R*′ groups are different, the ketone is called a **mixed ketone** and if *R* and *R*′ represent the same group, the ketone is referred to as **simple ketone.** The functional group of aldehydes is called **the aldehydic group** (—CHO) while that of ketones is called **the ketonic group** ($>C=O$).

Nature of Carbonyl Group

In carbonyl group, π-electron cloud is displaced towards more electronegative oxygen atom thus, causing polarisation of the bond so that carbon acquires partially positive and oxygen acquires partially negative charge.

$$>\overset{+}{C}\overset{\to}{=}\overset{-}{O} \quad \text{or} \quad >\overset{\delta+}{C}-\overset{\delta-}{O}$$

In resonance terms, electron delocalisation in the carbonyl group is represented by contributions from two principal resonance forms.

Preparation of Aldehydes and Ketones

There are serveral method from which aldehydes as well as ketones can be synthesised. *These methods are as follows*

(a) Catalytic Decomposition of Acids and Calcium Salts of Acids

Catalytic decomposition of acids is done with the help of oxides of manganese and thorium.

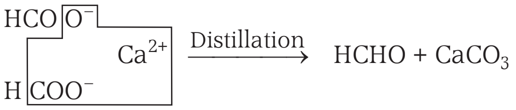
$$\underbrace{HCOOH + HCOOH}_{\text{vapour phase}} \xrightarrow[300°C]{\text{Mn or Th oxide}} HCHO + H_2O + CO_2$$

$$\underbrace{HCOOH + RCOOH}_{\text{vapour phase}} \xrightarrow[300°C]{\text{Mn or Th oxide}} RCHO + H_2O + CO_2$$

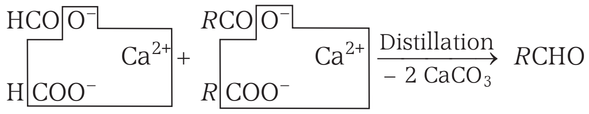
$$\underbrace{RCOOH + RCOOH}_{\text{vapour phase}} \xrightarrow[300°C]{\text{Mn or Th oxide}} RCOR + H_2O + CO_2$$

Similarly distillation of vapours of calcium salts of fatty acids produces aldehydes and ketones as

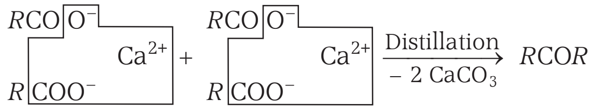
(i)



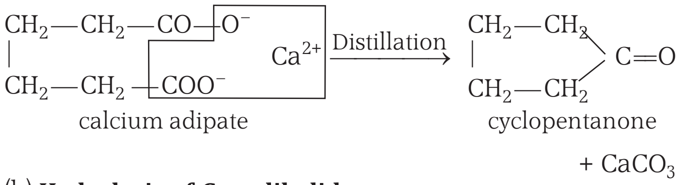
(ii)



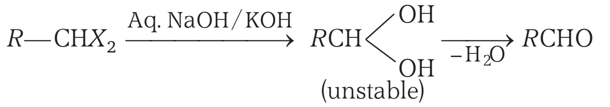
(iii)

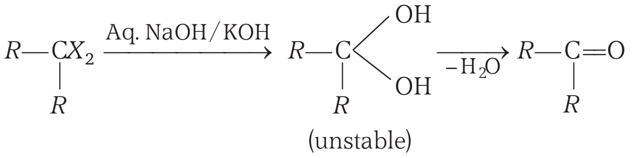


Hence, this method is not suitable for the preparation of these compounds, except formaldehyde. If instead of calcium salts of monocarboxylic acids, calcium salts of dicarboxylic acids are used, five and six-membered cyclic ketones can be prepared.



(b) Hydrolysis of *Gem*-dihalides

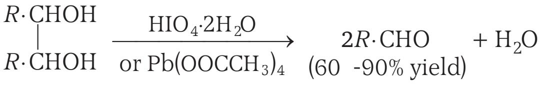




(c) Cleavage of Glycol

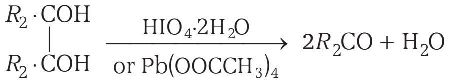
The glycol cleavage using $HIO_4\cdot 2H_2O$ (periodic acid) or $Pb(OOCCH_3)_4$ (lead tetra acetate) gives aldehydes and ketones, *e.g.*,

(i) Oxidation of secondary glycols gives aldehydes.

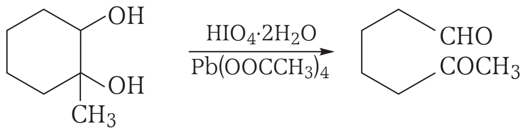


$$\begin{array}{c} R\cdot CHOH \\ | \\ R\cdot CHOH\end{array} \xrightarrow[\text{or } Pb(OOCCH_3)_4]{HIO_4\cdot 2H_2O} \underset{(60\ \text{-}90\%\ \text{yield})}{2R\cdot CHO} + H_2O$$

(ii) Tertiary glycols under similar conditions give ketones.

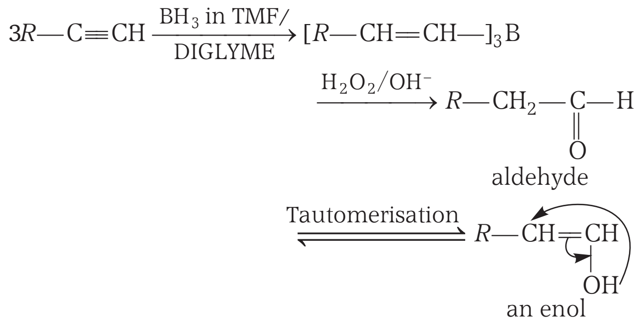


$$\begin{array}{c} R_2\cdot COH \\ | \\ R_2\cdot COH\end{array} \xrightarrow[\text{or } Pb(OOCCH_3)_4]{HIO_4\cdot 2H_2O} 2R_2CO + H_2O$$



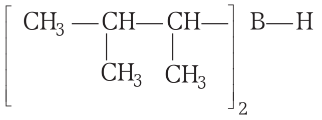
(d) Hydroboration-Oxidation of Alkynes

The reaction works as



$$3R—C\equiv CH \xrightarrow[\text{DIGLYME}]{BH_3\ \text{in TMF/}} [R—CH=CH—]_3B \xrightarrow{H_2O_2/OH^-} \underset{\text{aldehyde}}{R—CH_2—\underset{\underset{O}{\|}}{C}—H} \xrightleftharpoons{\text{Tautomerisation}} \underset{\text{an enol}}{R—CH=CH—OH}$$

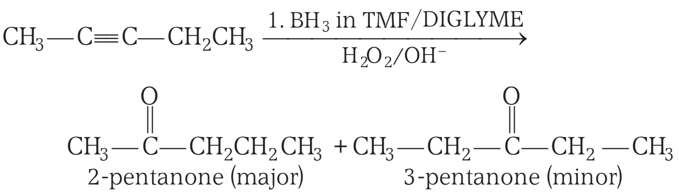
Aldehydes can be prepared from terminal alkynes. To avoid complications due to double addition of BH_3, bulky sterically hindered boranes such as *bis* (1, 2-dimethylpropyl) borane (common name-disiamyl borane) is used.



$$\left[CH_3—\underset{\underset{CH_3}{|}}{CH}—\underset{\underset{CH_3}{|}}{CH}—\right]_2 B—H$$

disiamylborane

Symmetrical non-terminal alkynes give a single ketone and unsymmetrical non-terminal alkynes gives a mixture of two ketones in which methyl ketone predominates.



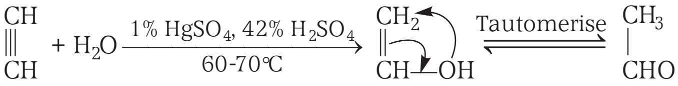
$$CH_3—C\equiv C—CH_2CH_3 \xrightarrow[H_2O_2/OH^-]{1.\ BH_3\ \text{in TMF/DIGLYME}}$$

$$\underset{\text{2-pentanone (major)}}{CH_3—\overset{\overset{O}{\|}}{C}—CH_2CH_2CH_3} + \underset{\text{3-pentanone (minor)}}{CH_3—CH_2—\overset{\overset{O}{\|}}{C}—CH_2—CH_3}$$

Formaldehyde cannot be prepared by this method.

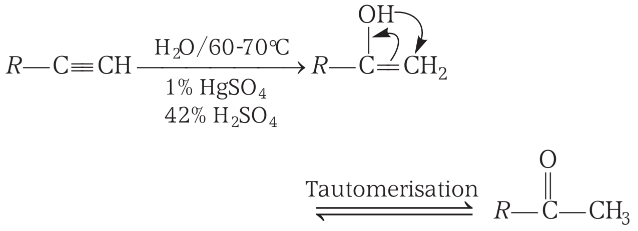
(e) Hydration of Alkynes

When acetylene is passed in 42% H_2SO_4 solution, containing 1% $HgSO_4$ at 60-70°C, acetaldehyde is formed.



$$\begin{array}{c}CH\\ ||| \\ CH\end{array} + H_2O \xrightarrow[60\text{-}70^\circ C]{1\%\ HgSO_4,\ 42\%\ H_2SO_4} \begin{array}{c}CH_2\\ \| \\ CH—OH\end{array} \xrightleftharpoons{\text{Tautomerise}} \begin{array}{c}CH_3\\ | \\ CHO\end{array}$$

Hydration of other alkynes gives ketones. The addition of water follows Markownikoff's rule.



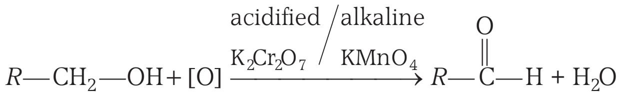
$$R—C\equiv CH \xrightarrow[\substack{1\%\ HgSO_4\\ 42\%\ H_2SO_4}]{H_2O/60\text{-}70^\circ C} R—\overset{\overset{OH}{|}}{C}=CH_2 \xrightleftharpoons{\text{Tautomerisation}} R—\overset{\overset{O}{\|}}{C}—CH_3$$

Formaldehyde cannot be prepared by this reaction.

(f) Oxidation of Alcohols

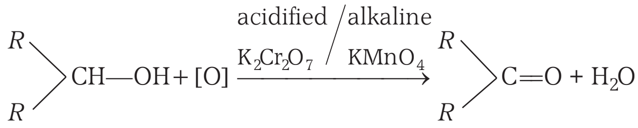
Different alcohols give different products on oxidation, *e.g.*,

(i) Primary alcohols are oxidised to give aldehydes.



$$R—CH_2—OH + [O] \xrightarrow[K_2Cr_2O_7\ /\ KMnO_4]{\text{acidified / alkaline}} R—\overset{\overset{O}{\|}}{C}—H + H_2O$$

(ii) Secondary alcohols are oxidised to give ketones.



$$\begin{matrix}R\\R\end{matrix}\!\!>CH—OH + [O] \xrightarrow[K_2Cr_2O_7\ /\ KMnO_4]{\text{acidified / alkaline}} \begin{matrix}R\\R\end{matrix}\!\!>C=O + H_2O$$

To prevent the further oxidation to acids some another reagents are also used. These are

(a) Sarett reagent – $CrO_3\cdot 2C_5H_5N$ in pyridine

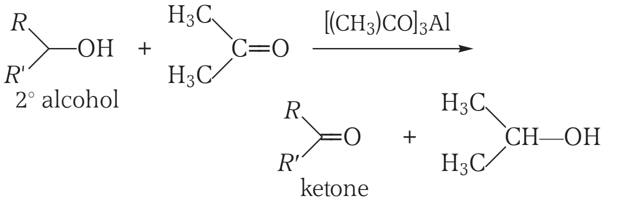
(b) Collin's reagent – $CrO_3\cdot 2C_5H_5N$ in CH_2Cl_2

(c) Corey's reagent (PCC – pyridinium chloro chromate) – $C_5H_5NH^+CrO_3Cl^-$

(d) Pyridinium dichromate (PDC) – $(C_5H_5NH^+)_2Cr_2O_7^{2-}$

As these reagents are very selective, hence used to oxidise allylic and benzylic alcohols.

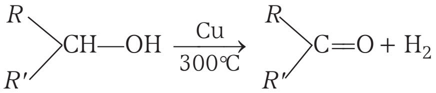
Oxidation of secondary alcohols with tertiary butoxide of aluminium in the presence of *iso*-propyl alcohol is called **Oppenauer oxidation.**



$$\underset{2^\circ\ \text{alcohol}}{\begin{matrix}R\\R'\end{matrix}\!\!>—OH} + \begin{matrix}H_3C\\H_3C\end{matrix}\!\!>C=O \xrightarrow{[(CH_3)CO]_3Al} \underset{\text{ketone}}{\begin{matrix}R\\R'\end{matrix}\!\!>=O} + \begin{matrix}H_3C\\H_3C\end{matrix}\!\!>CH—OH$$

(g) Catalytic Dehydrogenation of Alcohols

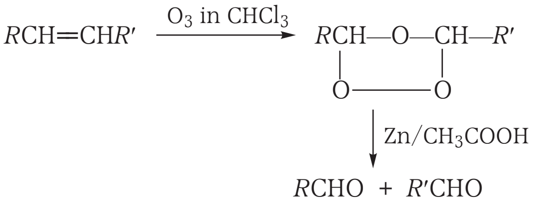
$$RCH_2OH \xrightarrow[300°C]{Cu} RCHO + H_2$$



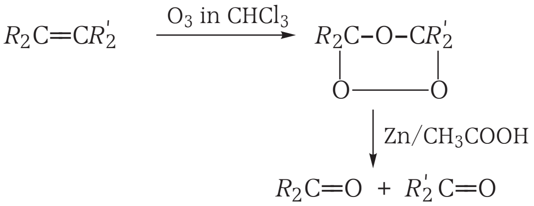
This method gives good yield.

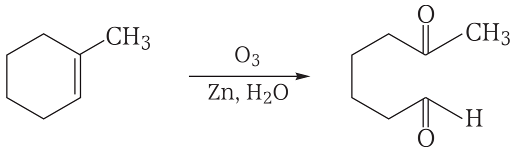
(h) Ozonolysis of Alkenes

The alkenes upon treatment with O_3 gives ozonide, which on subsequent treatment with Zn/CH_3COOH gives aldehydes and ketone depending on the structure of alkene.



With dialkyl substituted alkenes, ketones are obtained.





(i) Wacker's Process

The alkene is oxidised as

$$CH_2{=}CH_2 + \frac{1}{2} O_2 \xrightarrow[H_2O]{PdCl_2 \cdot CuCl_2} CH_3CHO$$

The oxidation is mainly done by $PdCl_2$ as

$$CH_2{=}CH_2 + PdCl_2 + H_2O \xrightarrow{CuCl_2} CH_3CHO + Pd + 2HCl$$

$$Pd + 2HCl \longrightarrow PdCl_2 + H_2$$

$CuCl_2$ is helpful in the reconversion of Pd to $PdCl_2$ as

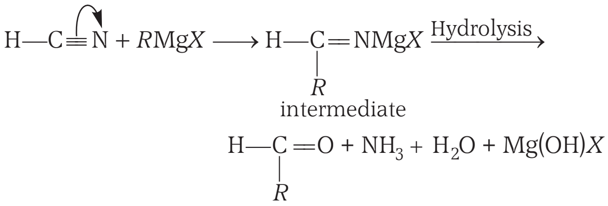
$$Pd + 2CuCl_2 \longrightarrow PdCl_2 + 2CuCl$$

$$4CuCl + 4HCl + O_2 \longrightarrow 4CuCl_2 + 2H_2O$$

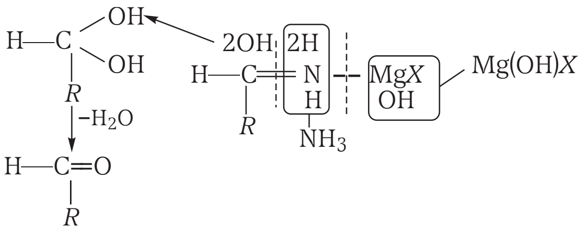
Because $PdCl_2$ is an expensive reagent, hence, cooxidant $CuCl_2$ reoxidise Pd to $PdCl_2$ and itself reoxidise by air. Hence, the atmospheric oxygen is the only oxidising agent used.

(j) From Grignard Reagent and Cyanides

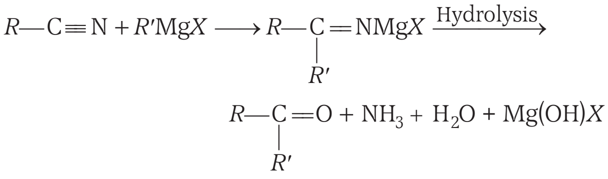
(i) Reaction of Grignard's reagent with HCN gives aldehydes other than HCHO. In fact HCHO cannot be prepared by this reaction.



The breakage of intermediate is seen as

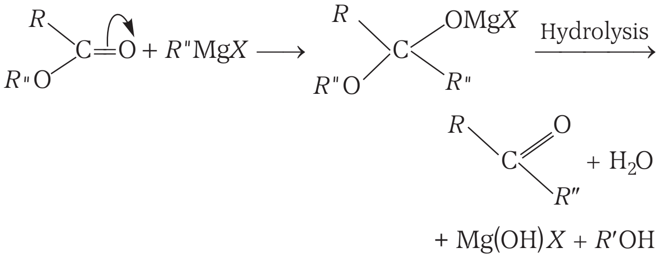


(ii) Ketones are produced by the reaction of RCN with $R'MgX$ as



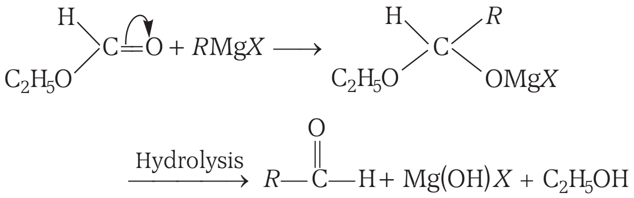
(k) From Grignard Reagent and Esters

Grignard reagents also give ketones on treatment with acid derivatives like esters as

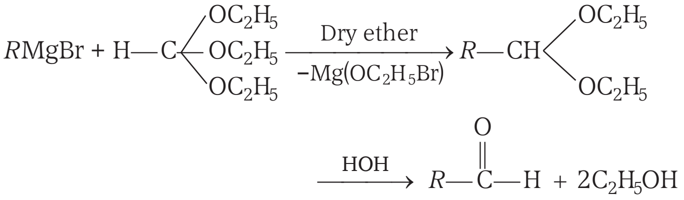


But the yield here is very less as the ketone formed further reacts with $R''MgX$.

Aldehydes are formed by reaction of ethyl formate with Grignard reagent.



Aldehydes can also be prepared by the action of Grignard reagent on orthoformic esters.



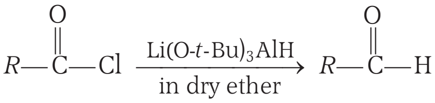
$$RMgBr + H-C(OC_2H_5)_3 \xrightarrow[-Mg(OC_2H_5Br)]{\text{Dry ether}} R-CH(OC_2H_5)_2 \xrightarrow{HOH} R-\overset{O}{\overset{\|}{C}}-H + 2C_2H_5OH$$

Methods of Preparation for Aldehydes Only

The methods given below can employed for the synthesis of aldehydes, not for the ketones.

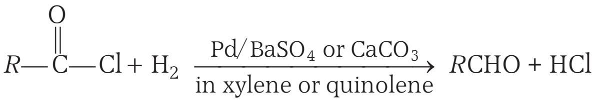
(a) Reduction of Acids and Acid Derivatives

Reduction of acids and acid derivatives under normal conditions with strong reducing agents like $LiAlH_4$ results to alcohols through carbonyl compounds. Thus, mild reducing agents like DIBAL-H (di *iso*-butyl aluminium hydride), lithium *tri*-(tertiary) butoxy aluminium hydride $[Li(O\text{-}t\text{-}C_4H_9)_3AlH]$ and *tri n*-butyl tinhydride are used for the purpose. $NaAlH_4$ also shows same results.



$$R-\overset{O}{\overset{\|}{C}}-Cl \xrightarrow[\text{in dry ether}]{Li(O\text{-}t\text{-}Bu)_3AlH} R-\overset{O}{\overset{\|}{C}}-H$$

In particular hydrogenation of $RCOCl$ with H_2 in the presence of Lindlar's catalyst to produce aldehydes is called **Rosenmund reaction**, *i.e.*,



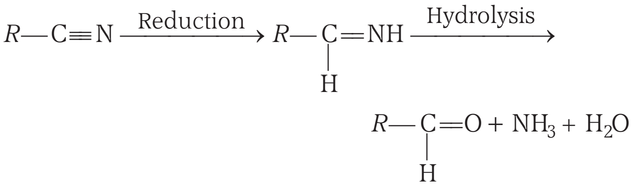
$$R-\overset{O}{\overset{\|}{C}}-Cl + H_2 \xrightarrow[\text{in xylene or quinolene}]{Pd/BaSO_4 \text{ or } CaCO_3} RCHO + HCl$$

Reduction of acids normally produces very less yield that's why acylhalides and esters are preferred over them.

Formyl chloride cannot be reduced to give formaldehyde because of being quite unstable.

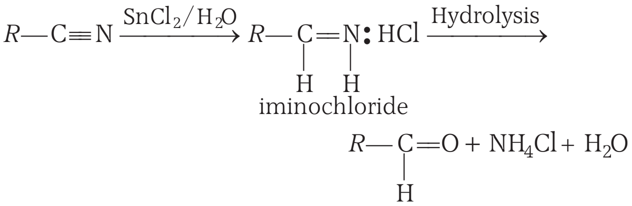
(b) Reductive Hydrolysis of Alkyl Cyanides

The generalised reaction looks like



$$R-C\equiv N \xrightarrow{\text{Reduction}} R-\underset{H}{\underset{|}{C}}=NH \xrightarrow{\text{Hydrolysis}} R-\underset{H}{\underset{|}{C}}=O + NH_3 + H_2O$$

Specifically when reduction is carried out with $SnCl_2/HCl$, it is called **Stephen's method.**

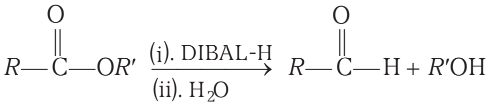


$$R-C\equiv N \xrightarrow{SnCl_2/H_2O} \underset{\text{iminochloride}}{R-\underset{H}{\underset{|}{C}}=\underset{H}{\underset{|}{N}}:HCl} \xrightarrow{\text{Hydrolysis}} R-\underset{H}{\underset{|}{C}}=O + NH_4Cl + H_2O$$

Reduction can also be seen with the help of **DIBAL-H** (di *iso*-butyl aluminium hydride). **It does not reduce double or triple bond other than nitrile group.**

(c) Reduction of Esters

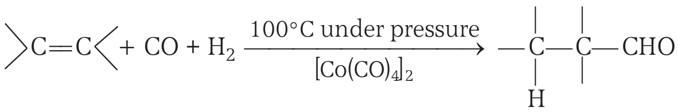
Esters are reduced to aldehydes by DIBAL-H or $NaAlH_4$.



$$R-\overset{O}{\overset{\|}{C}}-OR' \xrightarrow[\text{(ii). } H_2O]{\text{(i). DIBAL-H}} R-\overset{O}{\overset{\|}{C}}-H + R'OH$$

(d) Oxo Process

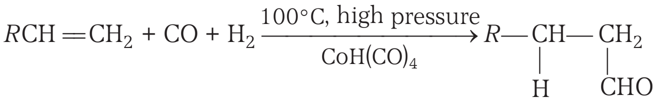
The process is also called **carboformylation** or **hydroformylation**.



$$\rangle C=C\langle + CO + H_2 \xrightarrow[[Co(CO)_4]_2]{100°C \text{ under pressure}} -\underset{H}{\underset{|}{\overset{|}{C}}}-\underset{|}{\overset{|}{C}}-CHO$$

$CoH(CO)_4$ can also be used as catalyst.

The reaction appears to be an *anti*-Markownikoff addition of formaldehyde to the alkene.



$$RCH=CH_2 + CO + H_2 \xrightarrow[CoH(CO)_4]{100°C, \text{ high pressure}} R-\underset{H}{\underset{|}{CH}}-\underset{CHO}{\underset{|}{CH_2}}$$

Methods of Preparation for Ketones Only

The methods given below are used only for the synthesis of ketones.

(a) Hydrolysis of Ethyl Acetoacetate

When ethyl acetoacetate (EAA) is hydrolysed with dil. HCl, acetoacetic acid is formed which on heating undergoes decarboxylation as

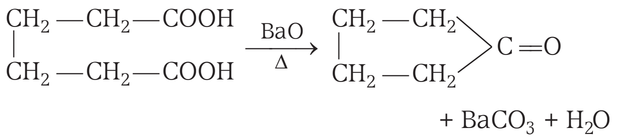
$$CH_3-COCH_2COOC_2H_5 \xrightarrow{H_2O/H^+} \underset{\text{acetoacetic acid}}{CH_3COCH_2COOH} + C_2H_5OH$$

$$CH_3COCH_2COOH \xrightarrow{\Delta} CH_3COCH_3 + CO_2 + H_2O$$

This hydrolysis is called ketonic hydrolysis of EAA. The reaction is specifically used for the preparation of acetone.

(b) From Dicarboxylic Acids

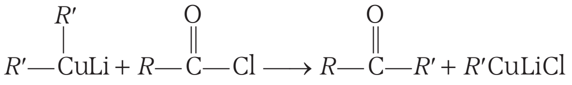
Dicarboxylic acids are heated with BaO or CaO to prepare cyclic ketones.



(c) By Organometallic Compounds

Lithium organocuprate reacts rapidly with acid chlorides to yield ketones.

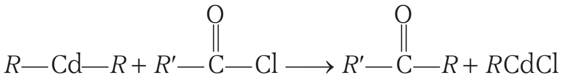
$$RX \xrightarrow{\text{Li}} R\text{Li} \xrightarrow{\text{Cu}X} \underset{\text{lithium dialkyl cuperate}}{R_2\text{CuLi}}$$



$$R'-\overset{\overset{\displaystyle R'}{|}}{\text{Cu}}\text{Li} + R-\overset{\overset{\displaystyle \text{O}}{\|}}{\text{C}}-\text{Cl} \longrightarrow R-\overset{\overset{\displaystyle \text{O}}{\|}}{\text{C}}-R' + R'\text{CuLiCl}$$

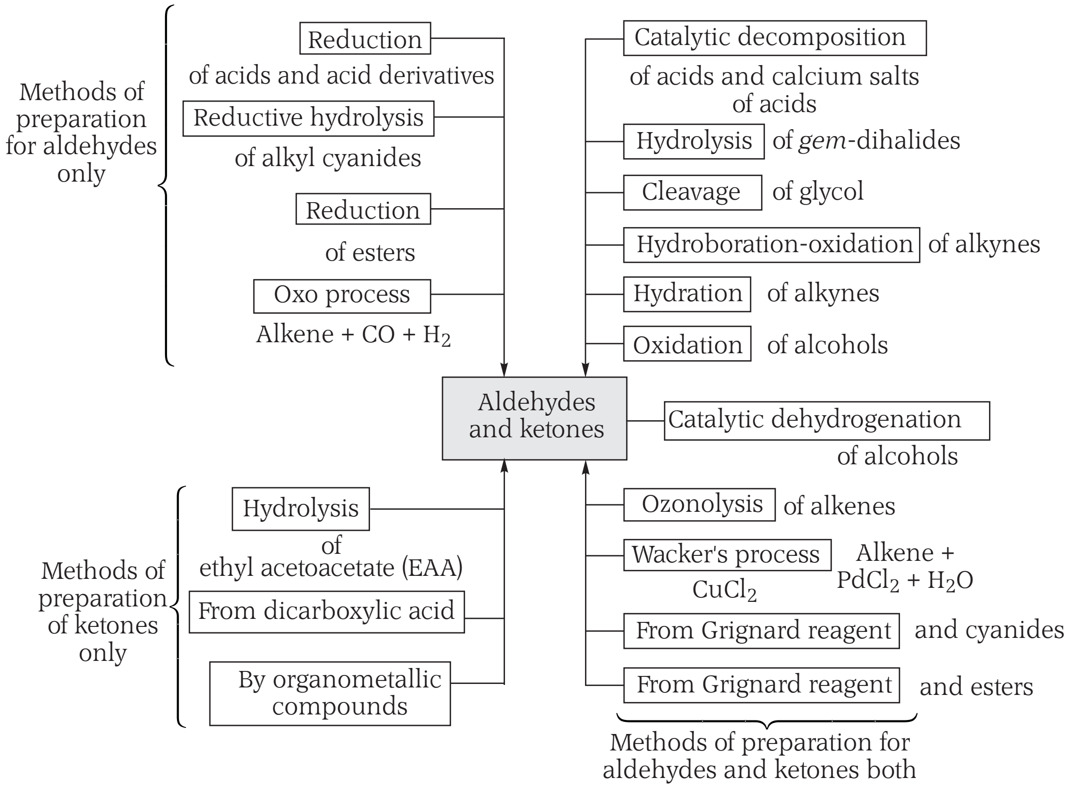
Cadmium salts may also be used.

$$2R\text{Mg}X + \text{CdCl}_2 \longrightarrow R_2\text{Cd} + \text{MgCl}_2 + \text{Mg}X_2$$



$$R-\text{Cd}-R + R'-\overset{\overset{\displaystyle \text{O}}{\|}}{\text{C}}-\text{Cl} \longrightarrow R'-\overset{\overset{\displaystyle \text{O}}{\|}}{\text{C}}-R + R\text{CdCl}$$

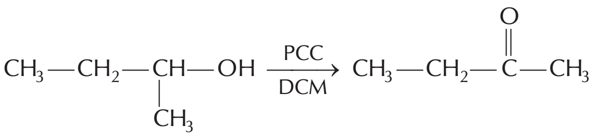
The outline of methods of preparation of these carbonyl compounds looks like



Sample **Problem 15** *Which of the following compounds is oxidised to prepare methyl ethyl ketone?* [**NCERT** Exemplar]

(a) *2-propanol* (b) *1-butanol*
(c) *2-butanol* (d) *tert-butyl alcohol*

Interpret (c) Oxidation of 2-butanol to ethyl methyl ketone can be made effective by using oxidising agent PCC/DCM (pyridinium chlorochromate in dichloro methane).



$$\text{CH}_3-\text{CH}_2-\underset{\underset{\displaystyle \text{CH}_3}{|}}{\text{CH}}-\text{OH} \xrightarrow[\text{DCM}]{\text{PCC}} \text{CH}_3-\text{CH}_2-\overset{\overset{\displaystyle \text{O}}{\|}}{\text{C}}-\text{CH}_3$$

Physical Properties

(i) **Boiling points** of aldehydes and ketones are higher than those of non-polar compounds hydrocarbons and ethers of comparable molecular masses due to dipole-dipole interactions between the opposite ends of the $>\text{C}=\text{O}$ dipoles.

(ii) **Solubility** decreases with increase in molecular mass. Lower aldehydes and ketones containing up to four carbon atoms are soluble in water.

Chemical Reactions of Aldehydes and Ketones

Aldehydes and ketones because of the presence of polar carbonyl group exhibit the following characteristics.

(a) **Nucleophilic Addition Reactions**

Carbonyl compounds show nucleophilic addition reactions. A nucleophile attacks at the electrophilic carbon atom of the polar carbonyl group.

$$\underset{sp^2,\ \text{carbonyl group}}{>C{=}O}$$

As the number of carbon atoms/number of alkyl groups increases, reactivity decreases due to steric hindrance. Hence, the order of reactivity is

$$HCHO > CH_3CHO > CH_3COCH_3 > C_2H_5COC_2H_5$$

Among the aldehydes and ketones, the size of alkyl group is inversely proportional to their reactivity. Among the ketones their less reactivity is due to $+I$ effect of alkyl group present due to which the partial (+) ve charge on carbon atom of carbonyl group decreases, thus decreasing the possibility of nucleophilic attack.

I. **Addition of hydrogen cyanide** The reaction looks like

$$>C{=}O + H^+CN^- \longrightarrow >C\begin{smallmatrix}OH\\CN\end{smallmatrix}$$

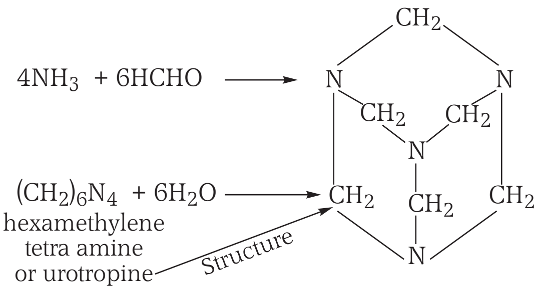
cyanohydrin

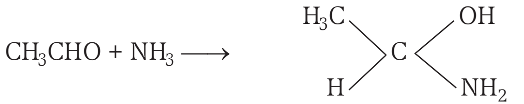
HCN is highly poisonous gas and produced by the reaction of K or Na cyanides with H_2SO_4. HCN itself is not a powerful nucleophile to attack $>C{=}O$ therefore the reaction requires base catalysis in order to convert HCN into more nucleophilic CN^-.

Ketones gives *dl* cyanohydrin only if both the alkyl groups attached to carbonyl carbon are different (*i.e.,* ketone is unsymmetrical). Cyanohydrins are useful synthetic substances since they can be readily hydrolysed to give α-hydroxy acids (Strecker synthesis).

II. **Addition of ammonia and it derivatives**

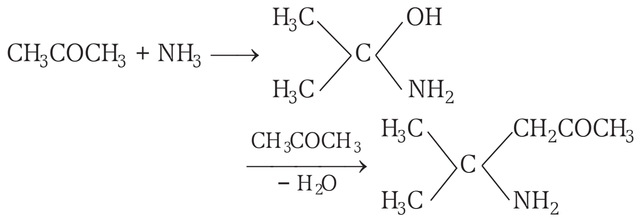
The reaction of aldehydes and ketones with ammonia and its derivatives are illustrated below





$$CH_3CHO + NH_3 \longrightarrow \begin{smallmatrix}H_3C\\H\end{smallmatrix}>C<\begin{smallmatrix}OH\\NH_2\end{smallmatrix}$$

acetaldehyde ammonia (solid)



$$CH_3COCH_3 + NH_3 \longrightarrow \begin{smallmatrix}H_3C\\H_3C\end{smallmatrix}>C<\begin{smallmatrix}OH\\NH_2\end{smallmatrix} \xrightarrow[-H_2O]{CH_3COCH_3} \begin{smallmatrix}H_3C\\H_3C\end{smallmatrix}>C<\begin{smallmatrix}CH_2COCH_3\\NH_2\end{smallmatrix}$$

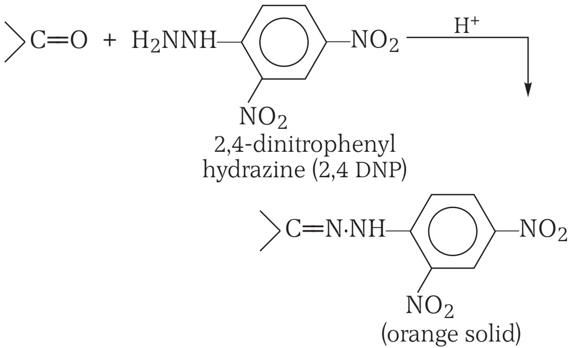
diacetone amine

$$>C{=}O + \underset{\text{hydroxyl amine}}{NH_2OH} \xrightarrow{H^+} \underset{\text{oxime}}{>C{=}NOH} + H_2O$$

$$>C{=}O + \underset{\text{hydrazine}}{NH_2{-}NH_2} \xrightarrow{H^+} \underset{\text{hydrazone}}{>C{=}NNH_2} + H_2O$$

$$>C{=}O + \underset{\text{phenyl hydrazine}}{NH_2{-}NHC_6H_5} \xrightarrow{H^+} \underset{\text{phenyl hydrazone}}{>C{=}NNHC_6H_5} + H_2O$$

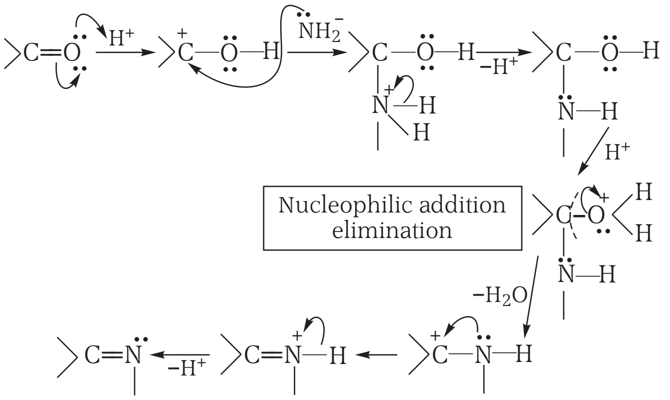
$$>C{=}O + \underset{\text{semicarbazide}}{NH_2\cdot CONH\cdot NH_2} \xrightarrow{H^+} \underset{\text{semicarbazone}}{>C{=}N\cdot NHCONH_2} + H_2O$$



2,4-dinitrophenyl hydrazine (2,4 DNP)

(orange solid) 2,4-dinitrophenyl hydrazone

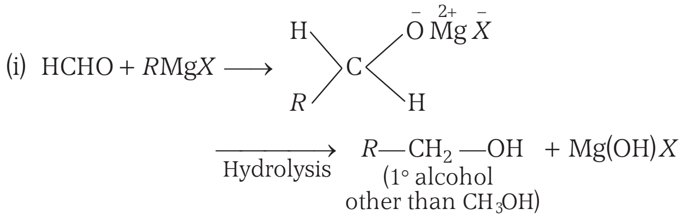
The mechanism of the reactions is summarised as

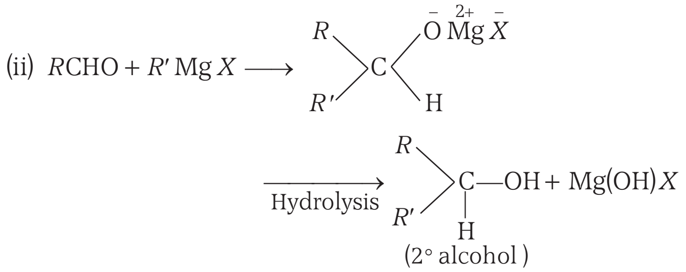


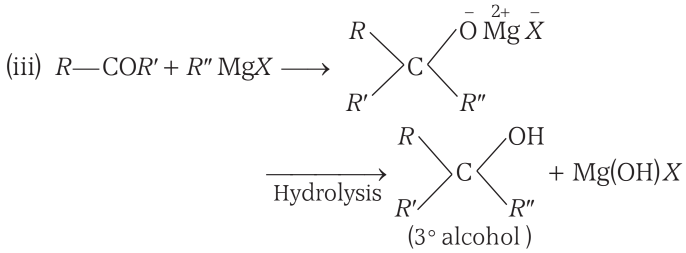
2, 4-DNP is used to distinguish carbonyl compounds from the mixture as we get solid orange precipitate of 2,4-dinitrophenyl hydrazone.

In these reactions, pH of medium must be controlled to about 3.5, *i.e.*, the medium must be weakly acidic in order to protonate the carbonyl group.

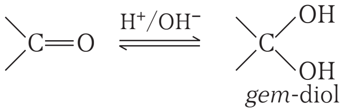
III. **Addition of Grignard reagent** The reactions are as





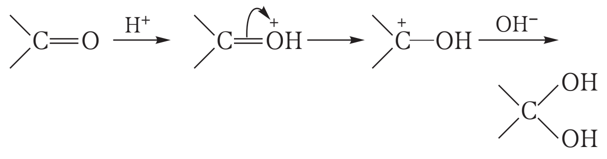


IV. **Addition of water** In aqueous solution, carbonyl compounds are in equilibrium with its hydrate– *gem*-diol, which is unstable and loses water molecule to form original compound.

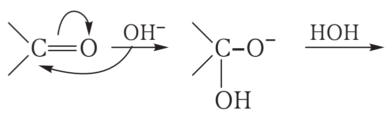


The mechanism of the reaction is summarised as,

(i) **Acid catalysed path**

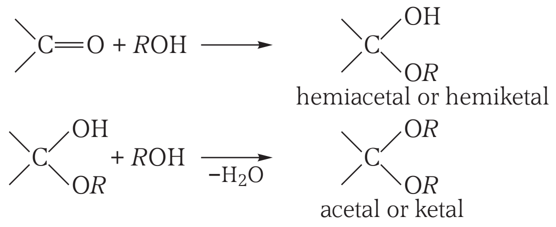


(ii) **Base catalysed path**



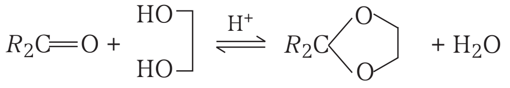
Aldehydes form more stable hydrates as compared to ketones.

V. **Addition of alcohols** Acetals (from aldehydes) and ketals (from ketones) are produced as,



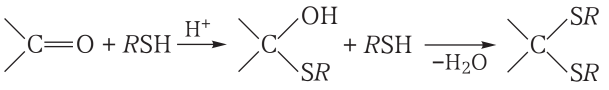
The reaction follows nucleophilic addition-elimination procedure.

Carbonyl compounds react with glycol to produce cyclic acetals or ketals.



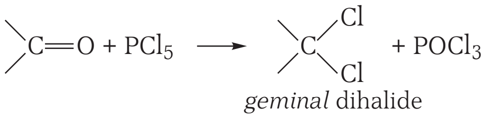
Acetals (or ketals) are stable in the presence of alkali, thus used to protect carbonyl group against alkaline oxidising agent.

VI. **Addition of thioalcohols** Mercaptals (thioacetals) and mercaptols (thioketals) are produced as,



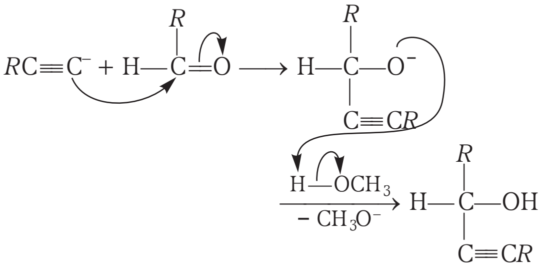
In acidic solutions, aldehyde (and ketone) groups can be protected by mercaptal and mercaptol formation respectively.

VII. **Addition of** PX_5 *Geminal* dihalides (alkylidene dihalides) are produced as,



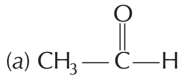
VIII. **Addition of alkynes, *i.e.*, ethinylation** Terminal alkynes ($RC{\equiv}CH$) can add on to carbonyl group in the presence of a base (RO^-) forming alkynol (alkynediol with $CH{\equiv}CH$). This reaction is called **ethinylation.**

$$RC{\equiv}CH + CH_3O^{\ominus} \longrightarrow CH_3OH + RC{\equiv}C^{\ominus}$$

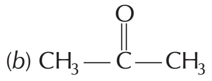


Sample **Problem 16** *Which of the following compounds is most reactive towards nucleophilic addition reactions?*

[**NCERT** Exemplar]

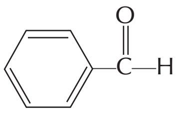


(*a*) $CH_3-\overset{\overset{O}{\|}}{C}-H$

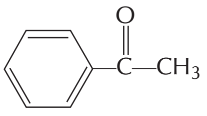


(*b*) $CH_3-\overset{\overset{O}{\|}}{C}-CH_3$

(*c*)



(*d*)



Interpret (*a*) In carbonyl compounds, the size of alkyl group varies inversely with reactivity towards nucleophilic addition reactions. Therefore, $CH_3-\overset{\overset{O}{\|}}{C}-H$ is most reactive among the given carbonyl compounds.

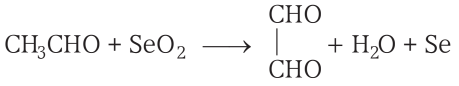
(b) Oxidation

Aldehydes (RCHO) can be easily oxidised to RCOOH by weak oxidising agents like **Tollen's reagent** (ammoniacal $AgNO_3$), **Fehling's solution** (ammoniacal Cu^{2+} solution complexes with tartarate ion), **Benedict's solution** (alkaline Cu^{2+} ion complex with citrate ion) etc.

$$R-CHO + \underset{\text{Tollen's reagent}}{2Ag(NH_3)_2^+} + 3OH^- \longrightarrow R-COO^- + 2H_2O + 4NH_3 + \underset{\text{silver mirror}}{2Ag\downarrow}$$

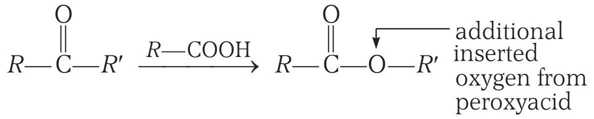
$$R-CHO + \underset{\text{Fehling's solution}}{2Cu(OH)_2} + NaOH \longrightarrow RCOONa + \underset{\text{red ppt.}}{Cu_2O\downarrow} + H_2O$$

Aldehydes and ketones with a methyl or methylene group adjacent to carbonyl group are oxidised with SeO_2 as,



$$CH_3CHO + SeO_2 \longrightarrow \begin{matrix} CHO \\ | \\ CHO \end{matrix} + H_2O + Se$$

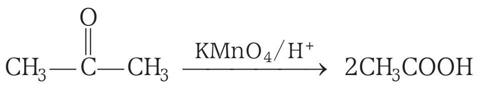
Both aldehydes and ketones are oxidised by peroxy acids to esters and the reaction is called **Baeyer-Velliger oxidation** (especially useful for ketones), *i.e.*,



$$R-\overset{\overset{O}{\|}}{C}-R' \xrightarrow{R-COOH} R-\overset{\overset{O}{\|}}{C}-O-R'$$

Aldehydes and ketones are oxidised by strong oxidising agents like $KMnO_4/H^+$, $K_2Cr_2O_7/H^+$, hot conc. HNO_3 etc.

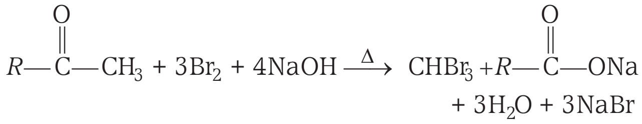
$$CH_3CHO \xrightarrow{KMnO_4/H^+} CH_3COOH$$



$$CH_3-\overset{\overset{O}{\|}}{C}-CH_3 \xrightarrow{KMnO_4/H^+} 2CH_3COOH$$

(c) Haloform Reaction

Acetaldehyde and methylketones react rapidly with halogens (Cl_2, Br_2 or I_2) in the presence of alkali to form haloform and acid salt.

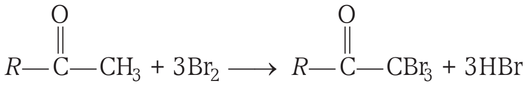


$$R-\overset{\overset{O}{\|}}{C}-CH_3 + 3Br_2 + 4NaOH \xrightarrow{\Delta} CHBr_3 + R-\overset{\overset{O}{\|}}{C}-ONa + 3H_2O + 3NaBr$$

$-CH_3$ group of $-COCH_3$ is converted into haloform as it contains acidic hydrogen atoms. Acid salt is obtained corresponding to total number of carbon atoms apart from $-CH_3$ of $RCOCH_3$.

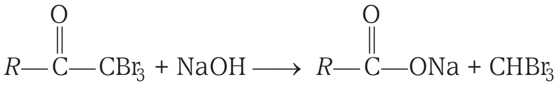
Mechanism of reaction is as follows

(i) **Halogenation**



$$R-\overset{\overset{O}{\|}}{C}-CH_3 + 3Br_2 \longrightarrow R-\overset{\overset{O}{\|}}{C}-CBr_3 + 3HBr$$

(ii) **Alkali hydrolysis of trihaloketone**

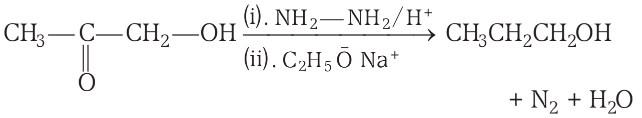


$$R-\overset{\overset{O}{\|}}{C}-CBr_3 + NaOH \longrightarrow R-\overset{\overset{O}{\|}}{C}-ONa + CHBr_3$$

This reaction is used to diagnose the presence of $CH_3-\overset{\overset{O}{\|}}{C}-$ group and also to distinguish methyl ketones from others.

(d) Reduction

Reducing agents like $LiAlH_4$ reduces $>C=O$ group to $>\underset{\underset{H}{|}}{C}-OH$ group generally. $NaBH_4$ can also show same capability but it is unable to reduce $>C=O$ group of ester and acid chlorides. Zn-Hg/HCl reduces $>C=O$ group to $>CH_2$ **(Clemmensen reduction)**. Similarly, hydrazine (NH_2-NH_2) followed by heating with strong base like alkali or alkaline glycol also reduces $>C=O$ group to $>CH_2$. Here, N_2 is also liberated and the reaction is called **Wolff-Kishner reduction. It is the specific method for the reduction of $>C=O$ group.**

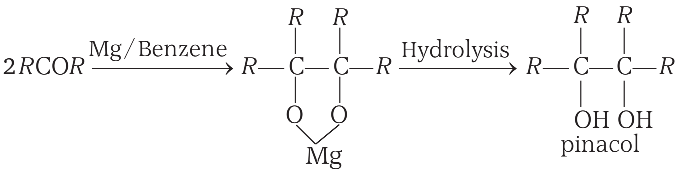


$$CH_3-\underset{\underset{O}{\|}}{C}-CH_2-OH \xrightarrow[\text{(ii). } C_2H_5\bar{O}\,Na^+]{\text{(i). } NH_2-NH_2/H^+} CH_3CH_2CH_2OH + N_2 + H_2O$$

Aluminium *iso*propoxide ($Al[OCH(Me)_2]_3$) in the presence of excess of *iso*propyl alcohol reduces $>C=O$ group to $>\underset{\underset{H}{|}}{C}-OH$ group and the reaction is called **Meerwein-Ponndrof-Verley's** (MPV) **reduction.**

$$R_2CO + [(Me)_2CHO]_3Al \rightleftharpoons R_2CHOAl[OHCMe_2]_2 + MeCOMe \xrightarrow{\text{Dil. } H_2SO_4} R_2CHOH$$

Mg in the presence of benzene reduces carbonyl compounds to pinacols as,



Reduction with Raney Ni (Ni : Al = 1 : 1) along with dimercaptal  produces hydrocarbon with same number of carbon atoms. HI/Red P can be also used effectively at high temperature to reduce $>C{=}O$ to $>CH_2$.

(e) Halogenation

In aliphatic aldehydes and ketones, one or more α-hydrogen atoms are replaced by the halogen atoms in the presence of acid or base.

$$CH_3CHO + Cl_2 \xrightarrow{H^+/OH^-} CH_2ClCHO + HCl$$

α-chloroacetaldehyde

$$CH_3COCH_3 + Br_2 \xrightarrow{H^+/OH^-} CH_2BrCOCH_3 + HBr$$

α-bromoacetone

Hot Spot 3

ALDOL Condensation

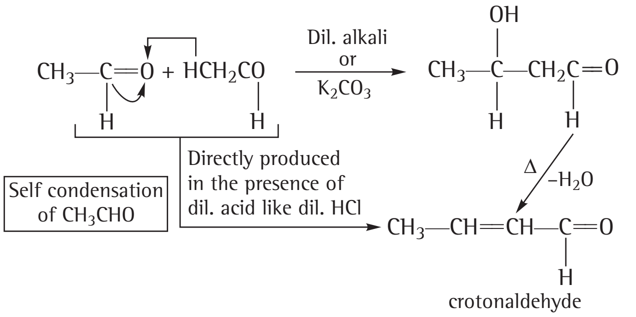
It is an important topic for JEE Main examination. Questions based upon this topic may vary from simple to moderate.

It is a very important reaction of aldehydes and ketones from synthetic point of view. **Enolisation property** (ability to convert into enol form on tautomerisation) **is responsible for the reaction.** As tautomerisation (keto-enol) is possible with acid or base both that's why this reaction can occur in the presence of dil acid as well as dil base.

The reaction can occur between

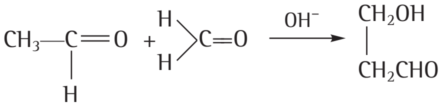
(i) two identical or different aldehydes,
(ii) two identical or different ketones,
(iii) one aldehyde and one ketone.

Presence of α-hydrogen in atleast one type of molecules is necessity of the reaction. The products formed here are called **aldols** as these contain atleast one **aldehyde** (carbonyl) and at least one **alcoholic** groups. However, the ultimate product of the reaction are α,β – unsaturated carbonyl compounds.



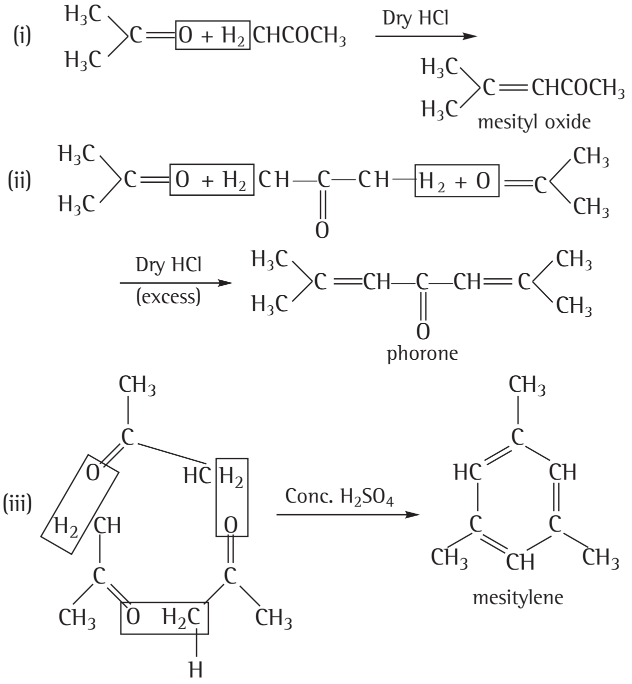
crotonaldehyde
α, β-unsaturated aldehyde.

When the condensation is between two different carbonyl compounds, it is called **'cross aldol condensation'.** In brief, the products (self as well as different) of HCHO, CH_3CHO and CH_3COCH_3 are,

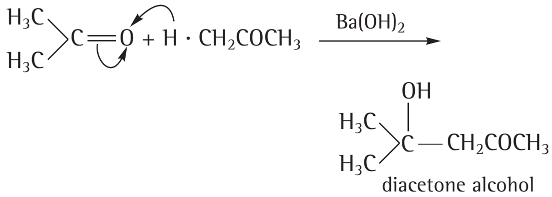


Cross aldol condensation

The different condensation products formed by acetone in different conditions are,

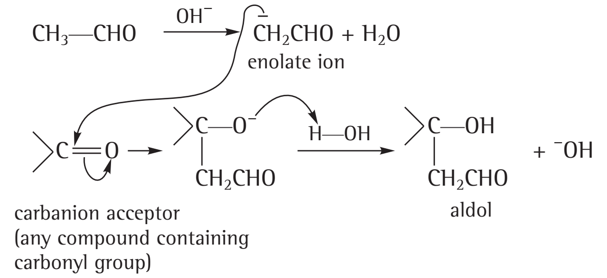


(iv)

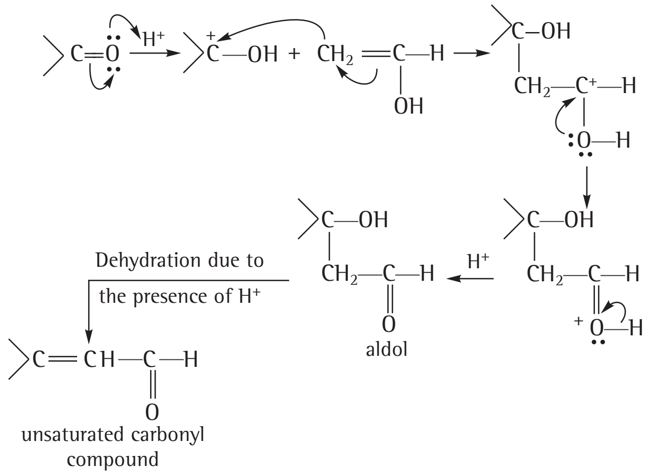


The mechanism of reaction is summarised as

(i) **In the presence of base**



(ii) **In the presence of acid**



Sample **Problem 17** *Which of the following compounds will not undergo aldol condensation?* **[NCERT]**

(*a*) *Methanol*

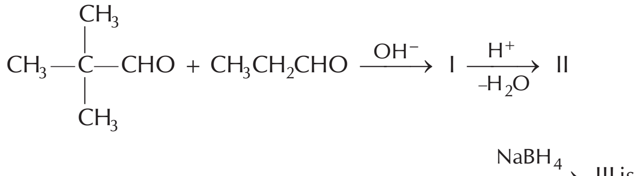
(*b*) *2-methyl pentanal*

(*c*) *Cyclohexanone*

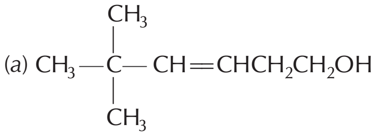
(*d*) *1-phenyl prepanone*

Interpret (*a*) Aldehydes or ketones having at least one α-H-atom undergo aldol condensation. Among the given, methanol is not a carbonyl compound. That's why it does not give aldol condensation reaction.

Sample **Problem 18** *The final product* (III) *obtained in the reaction*

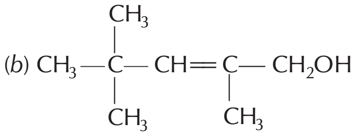


(*a*)



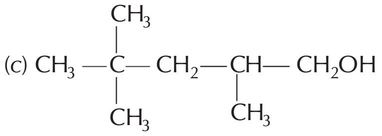
$CH_3-C(CH_3)_2-CH=CHCH_2CH_2OH$

(*b*)



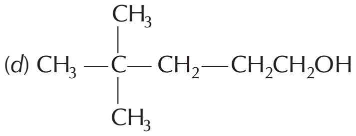
$CH_3-C(CH_3)_2-CH=C(CH_3)-CH_2OH$

(*c*)



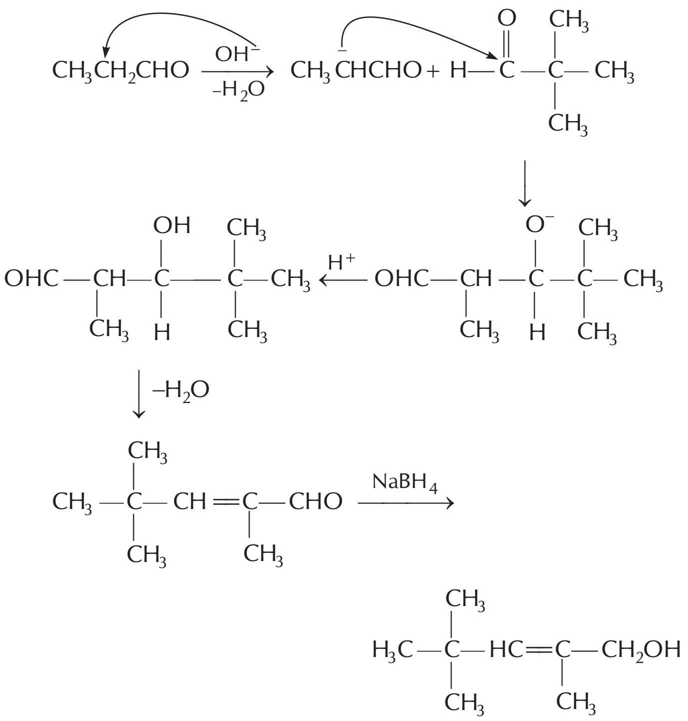
$CH_3-C(CH_3)_2-CH_2-CH(CH_3)-CH_2OH$

(*d*)



$CH_3-C(CH_3)_2-CH_2-CH_2CH_2OH$

Interpret (*b*) Aldol condensation takes place as,



Chemical Properties of Aldehydes

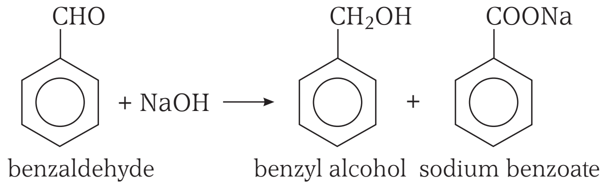
There are several reactions that are shown by aldehydes but not by ketones so these are helpful in differentiating the aldehydes from ketones.

(a) Cannizzaro Reaction

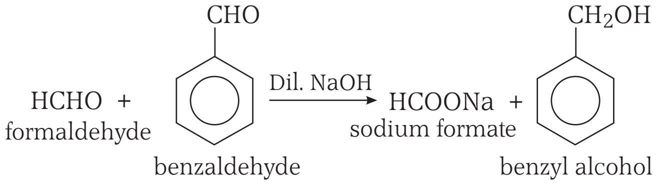
This reaction is given by aldehydes which do not have α-hydrogen atom. It is disproportionation

(self oxidation-reduction) reaction in which half of the molecules of aldehyde are oxidised and other half are reduced.

$$\underset{\text{formaldehyde}}{2HCHO} + NaOH \longrightarrow \underset{\text{methanol}}{CH_3OH} + \underset{\text{sodium formate}}{HCOONa}$$



In cross Cannizzaro reaction two different aldehydes which don't have alpha hydrogen atoms undergo Cannizzaro reaction.



HCHO being smaller molecule having lesser steric hindrance is easily oxidised and other aldehyde is reduced.

Caution Point *2-methylpropanal although has α-hydrogen atom but undergoes both aldol condensation and Cannizzaro reaction.*

(b) Tischenko Reaction

The reaction is similar to reaction (a) with certain differences, which are

(i) A weak base, *i.e.*, aluminium ethoxide is used here instead of alkali.

(ii) The reaction can be shown by any aldehyde (with or without α-hydrogen).

(iii) The final product of reaction is an **ester** instead of a carboxylic acid salt and an alcohol.

The reaction looks like

$$2CH_3CHO \xrightarrow{Al(OEt)_3} \underbrace{CH_3COOH + CH_3CH_2OH}_{\text{Combine to give}}$$

$$\downarrow$$

$$\text{Final products} \longrightarrow CH_3COOC_2H_5 + H_2O$$

(c) Action of Schiff's Reagent

Aldehydes restore the pink colour of Schiff's reagent (megenta or rosaniline hydrochloride dissolved in water and its red or pink colour decolourises by passing SO_2). while ketones do not respond to this test.

$$\text{Aldehyde} + \underset{\text{(colourless)}}{\text{Schiff's reagent}} \longrightarrow \text{pink colour}$$

(d) Polymerisation

HCHO polymerises as,

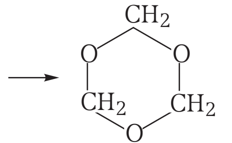
(i) Formalin evaporated to dryness

$$\longrightarrow \underset{\text{paraformaldehyde } (n = 5-60)}{HOCH_2(CH_2O)_nCH_2OH}$$

(ii) HCHO on treatment with conc. H_2SO_4

$$\longrightarrow \underset{\text{polyoxymethylene } (n > 100)}{(CH_2O)_n 2H_2O}$$

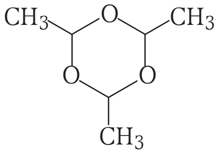
(iii) HCHO gas at room temperature slowly polymerises to



trioxane or metaformaldehyde

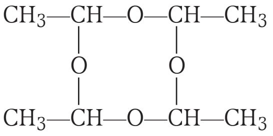
CH_3CHO polymerises as

(i) CH_3CHO + small amount of conc. $H_2SO_4 \xrightarrow[\text{temperature}]{\text{Room}}$



paraldehyde

(ii) CH_3CHO + conc. H_2SO_4 (small amount) $\xrightarrow{0°C}$



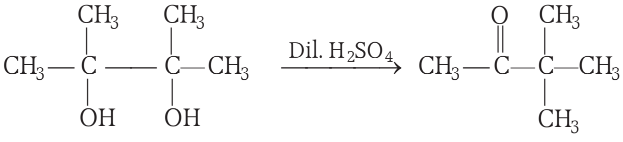
metaldehyde

Chemical Properties of Ketones

Ketones exhibit following reactions that are not shown by aldehydes.

(a) Pinacol-Pinacolone Rearrangement

This is the most common rearrangement involving the carbonyl compounds. The conversion of pinacol into pinacolone is an example of 1, 2-shift and is known as Pinacol-pinacolone rearrang ement.

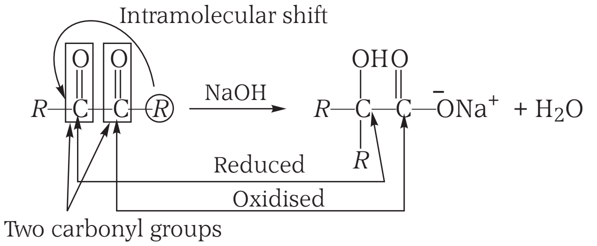


$$CH_3-\underset{OH}{\overset{CH_3}{C}}-\underset{OH}{\overset{CH_3}{C}}-CH_3 \xrightarrow{\text{Dil. } H_2SO_4} CH_3-\overset{O}{\overset{\|}{C}}-\underset{CH_3}{\overset{CH_3}{C}}-CH_3$$

The pinacol-pinacolone rearrangement is general for 1, 2-glycols under acid conditions, the migratory group may be alkyl or aryl.

(b) Benzilic Acid Rearrangement

The intramolecular Cannizzaro reaction type procedure when seen in the case of diketones, the reaction is called **benzilic acid rearrangement.** The reaction looks like

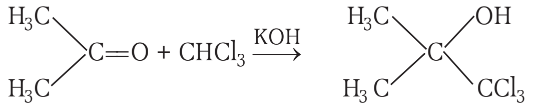


Here, the oxidation and reduction of carbonyl groups is associated with an intramolecular alkyl shift from the carbonyl group to be oxidised to the carbonyl group to be reduced as seen above.

It is seen that barium and thallous hydroxides are more effective than NaOH or KOH.

(c) Addition of Chloroform

Chloroform reacts with ketones in the presence of KOH to form chlorohydroxy condensation compounds.

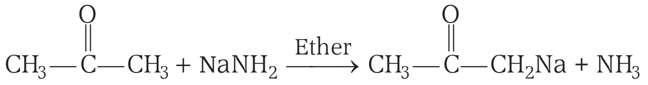


chloretone
(1,1,1-trichloro-2-methyl
propanol-2)

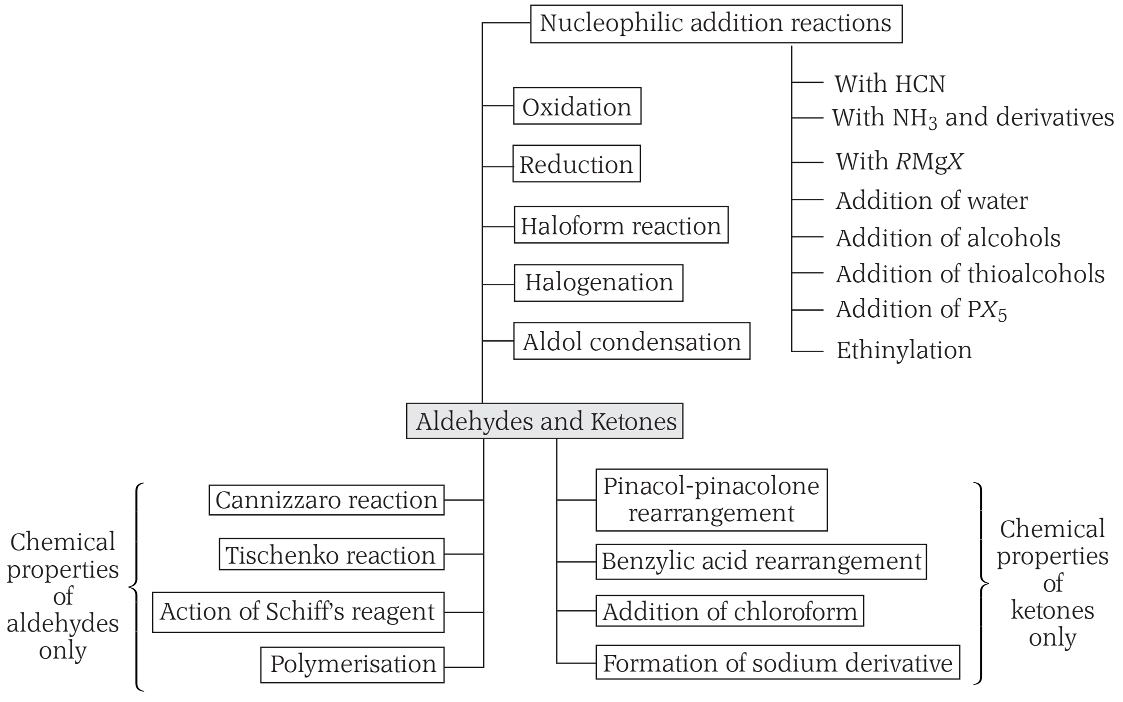
It is an hypnotic chemical.

(d) Formation of Sodium Derivative

Ketones when treated with sodamide in ethereal solution, give sodium derivative of ketones.



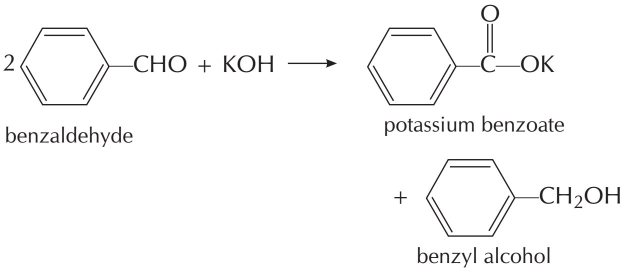
$$CH_3-\overset{\overset{O}{\|}}{C}-CH_3 + NaNH_2 \xrightarrow{\text{Ether}} CH_3-\overset{\overset{O}{\|}}{C}-CH_2Na + NH_3$$



Flow chart showing reactions of aldehydes and ketones

Sample **Problem 19** *Which product is formed when the compound*  *is treated with concentrated aqueous* KOH *solution?* [**NCERT** Exemplar]

(*a*) 
(*b*) 
(*c*) 
(*d*) 
Interpret (*b*) Since,  does not contain α-H atom, so it will perform Cannizzaro reaction with aqueous KOH solution.



Sample **Problem 20** *Three of the following four reactions are due to one similar feature of carbonyl compounds, while the fourth one is different. Which one is fourth?*

(*a*) *Aldol condensation*

(*b*) *Knoevenagel reaction*

(*c*) *Wittig reaction*

(*d*) *Haloform reaction*

Interpret (*c*) Aldol condensation, haloform reaction and Knovenagel reaction involve the formation of a resonance stabilised anion, while the Wittig reaction involves the addition of a nucleophile on the carbonyl carbon. The driving force for the Wittig reaction is the formation of a very strong P—O bond.

Chemical Test to Distinguish Between Aldehydes and Ketones

Aldehydes and ketones can be distinguished by several tests which are tabulated below

Distinguision between Aldehydes and Ketones

Name of test	Reagent	Aldehydes	Ketones
Tollen's test	Ammoniacal silver nitrate	Silver mirror (deposition of Ag on surface of test tube) formed	No change
Fehling's test	Alkaline solution of $CuSO_4$ containing Rochelle salt (sodium potassium tartarate.)	Red precipitate of Cu_2O. (only aliphatic aldehydes give this test)	No change
Benendict test	Alkaline solution of copper acetate and sodium citrate	Red precipitate of Cu_2O. (only aliphatic aldehydes give this test)	No change
Schiff's test	*p*-rosaniline hydrochloride	Pink colour	No change

Caution Point *Aromatic aldehydes do not reduce Fehling solution and Benedict solution because they are weak reagents.*

Check Point 4

1. Ketones are less reactive than aldehydes. Why?
2. How many type of products are formed when calcium formate is distilled with calcium acetate?
3. Justify the significance of pH on the nucleophilic addition of ammonia derivatives to carbonyl compounds.
4. What reagent the doctors used to detect diabetes disease by testing the presence of glucose in urine?
5. The presence of acid or base activates the carbonyl compounds for reaction. Explain.

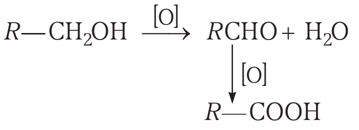
11.5 Carboxylic Acids

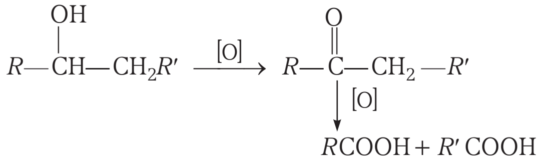
Organic compounds which contain carboxyl group (—COOH) are called **carboxylic acids.** The name carboxyl is derived from carbonyl and hydroxyl as  $—\underset{\underset{O}{\|}}{C}—OH$ contain both the group in it.

In other words, these are the carbonyl compounds in which acyl group is attached to an atom or group that can be easily replaced by another group. Acid derivatives also belongs to this class.

Preparation of Carboxylic Acids

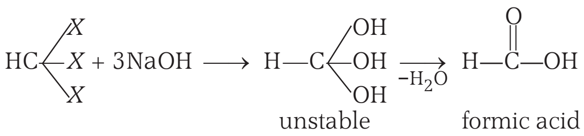
(i) Oxidation of alcohols, aldehydes and ketones yields carboxylic acids.



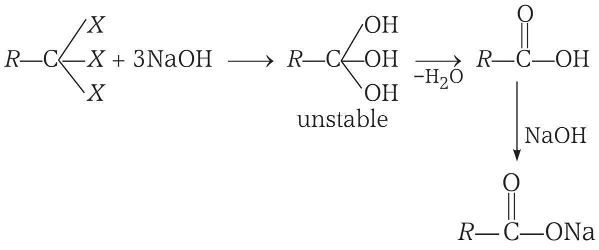


The oxidising agents are acidified $K_2Cr_2O_7$, alkaline $KMnO_4$, Tollen's reagent, Fehling's solution, Benedict's solution (the last 3- for aldehydes only).

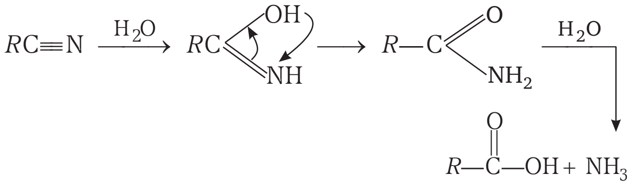
(ii) Haloform on aqueous alkali hydrolysis gives formic acid.



Trihaloderivatives of alkanes give, other carboxylic acids on aqueous alkali hydrolysis.

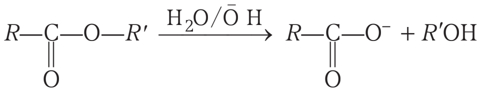


(iii) A very good synthetic method is the hydrolysis of cyanides with acid or alkali.



(iv) Hydrolysis of acid derivative

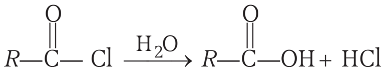
1. **Hydrolysis of ester**



$$R{-}\underset{\underset{O}{\|}}{C}{-}O{-}R' \xrightarrow{H_2O/\bar{O}H} R{-}\underset{\underset{O}{\|}}{C}{-}O^- + R'OH$$

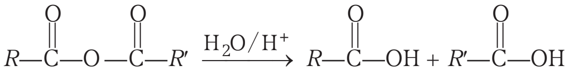
The alkaline hydrolysis is preferred for good yield as in the case of acidic hydrolysis the reaction is reversible.

2. **Hydrolysis of acid chloride**



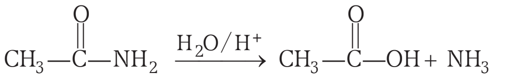
$$R{-}\overset{\overset{O}{\|}}{C}{-}Cl \xrightarrow{H_2O} R{-}\overset{\overset{O}{\|}}{C}{-}OH + HCl$$

3. **Hydrolysis of anhydride**



$$R{-}\overset{\overset{O}{\|}}{C}{-}O{-}\overset{\overset{O}{\|}}{C}{-}R' \xrightarrow{H_2O/H^+} R{-}\overset{\overset{O}{\|}}{C}{-}OH + R'{-}\overset{\overset{O}{\|}}{C}{-}OH$$

4. **Hydrolysis of amide**



$$CH_3{-}\overset{\overset{O}{\|}}{C}{-}NH_2 \xrightarrow{H_2O/H^+} CH_3{-}\overset{\overset{O}{\|}}{C}{-}OH + NH_3$$

Relative reactivity of acyl compounds towards hydrolysis is,

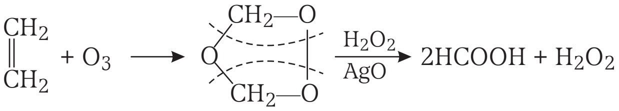
$$RCOCl > RCO{-}O{-}COR > RCOOR' > RCONH_2$$

(v) 
$$CH_3{-}\overset{\overset{O}{\|}}{C}{-}CH_2{-}\overset{\overset{O}{\|}}{C}{-}O{-}C_2H_5 \xrightarrow{\text{Conc. NaOH}} 2CH_3COO^-Na^+ + C_2H_5OH$$

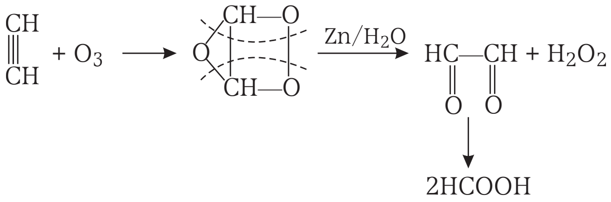
As reaction gives acid as its product that's why it is called acidic hydrolysis.

(vi) From alkenes

1. **Ozonolysis of alkenes**



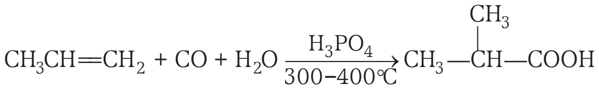
2. **Ozonolysis of alkynes**



3. The recent industrial method of making carboxylic acids looks like

$$CH_2{=}CH_2 + CO + H_2O \xrightarrow[300\text{–}400°C]{H_3PO_4} CH_3CH_2COOH$$

This reaction involves the electrophilic addition of H^+ ion on the alkene to produce more stable carbocation followed by the attack of CO as nucleophile.



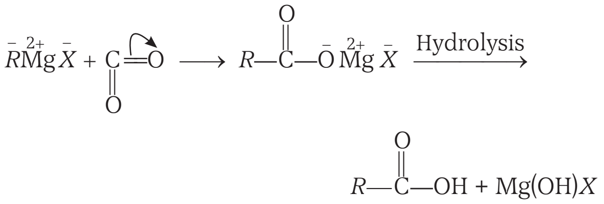
$$CH_3CH{=}CH_2 + CO + H_2O \xrightarrow[300\text{–}400°C]{H_3PO_4} CH_3{-}\overset{\overset{CH_3}{|}}{C}H{-}COOH$$

Formic acid cannot be prepared by this reaction.

(vii) From phenoxide

$$R\bar{O}\,Na^+ + CO \xrightarrow[\text{under pressure}]{\Delta} RCOO^-Na^+ \xrightarrow{H_2O/H^+} RCOOH$$

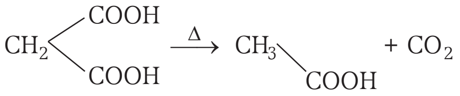
(viii) From Grignard's reagent



$$\bar{R}\overset{2+}{Mg}\bar{X} + \overset{O}{\overset{\|}{C}}{=}O \longrightarrow R-\overset{O}{\overset{\|}{C}}-\bar{O}\,\overset{2+}{Mg}\,\bar{X} \xrightarrow{\text{Hydrolysis}} R-\overset{O}{\overset{\|}{C}}-OH + Mg(OH)X$$

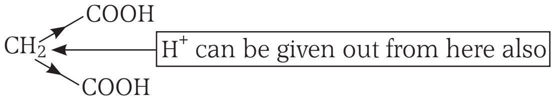
(ix) **From dicarboxylic acid** Malonic acid is β-acid and very useful in the preparation of different carboxylic acids due to its 2 main properties

1. It is decarboxylated very easily on heating as,



$$CH_2(COOH)_2 \xrightarrow{\Delta} CH_3COOH + CO_2$$

2. Due to $-I$ effect of —COOH group, H^+ can also be eliminated from —CH_2 group *i.e.,*



(x) Oxidative cleavage of alkenes and alkynes also gives carboxylic acid.

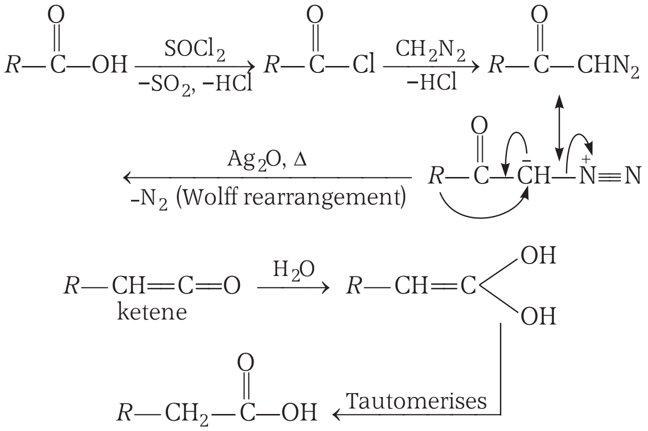
$$R-CH=CH-R' \xrightarrow[\text{(hot, conc)}]{KMnO_4} RCOOH + R'COOH$$

$$CH_3-C\equiv CH \xrightarrow[\text{(hot, conc)}]{KMnO_4} CH_3COOH + HCOOH$$

(xi) Long chain hydrocarbons are oxidised by air at 120°C in the presence of manganous sterate (catalyst).

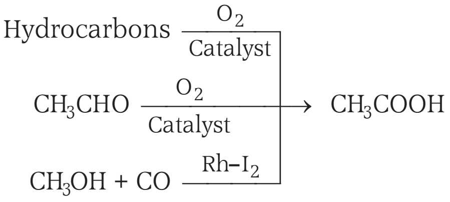
$$\underset{\text{higher alkanes}}{2RCH_3} + 3O_2 \longrightarrow \underset{\text{fatty acid}}{2\ RCOOH} + 2H_2O$$

(xii) The conversion of an acid (RCOOH) into its next higher homologue (RCH$_2$COOH) is called homologation of an acid and carried out by Arndt Eistert synthesis.



$$R-\overset{O}{\overset{\|}{C}}-OH \xrightarrow[-SO_2,\ -HCl]{SOCl_2} R-\overset{O}{\overset{\|}{C}}-Cl \xrightarrow[-HCl]{CH_2N_2} R-\overset{O}{\overset{\|}{C}}-CHN_2 \longleftrightarrow R-\overset{O}{\overset{\|}{C}}-\overset{-}{C}H-\overset{+}{N}\equiv N \xrightarrow[-N_2\ \text{(Wolff rearrangement)}]{Ag_2O,\ \Delta} \underset{\text{ketene}}{R-CH=C=O} \xrightarrow{H_2O} R-CH=C(OH)_2 \xrightarrow{\text{Tautomerises}} R-CH_2-\overset{O}{\overset{\|}{C}}-OH$$

(xiii) Acetic acid is the most important carboxylic acid, prepared by the following methods



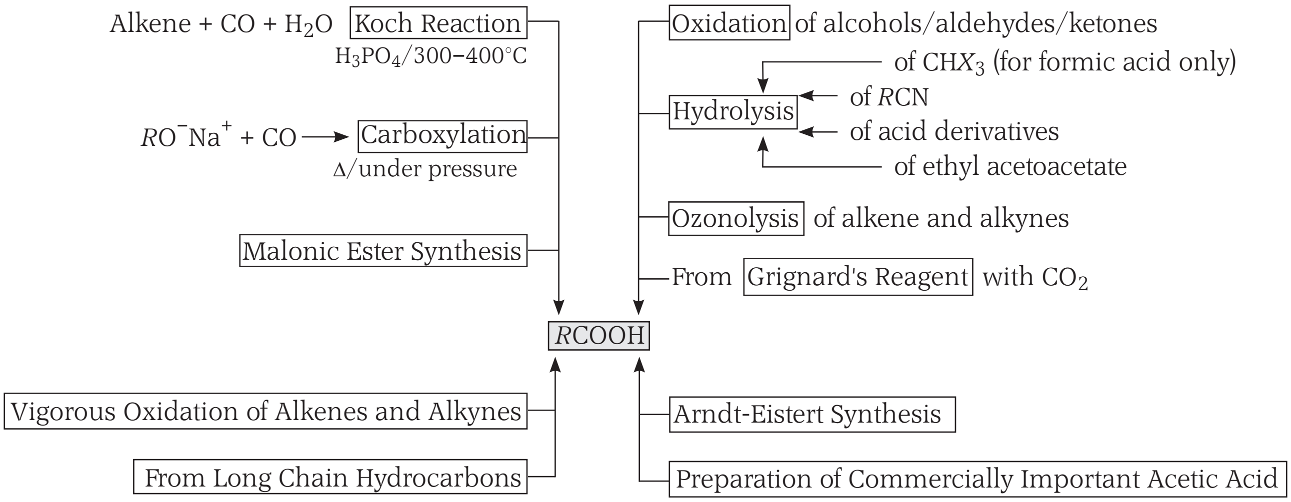
$$\text{Hydrocarbons} \xrightarrow[\text{Catalyst}]{O_2} CH_3COOH$$

$$CH_3CHO \xrightarrow[\text{Catalyst}]{O_2} CH_3COOH$$

$$CH_3OH + CO \xrightarrow{Rh-I_2} CH_3COOH$$

Large amount of acetic acid is produced from oxidation of ethyl alcohol in the presence of aceto-bacter bacteria. This dilute aqueous solution is known as **vinegar**.

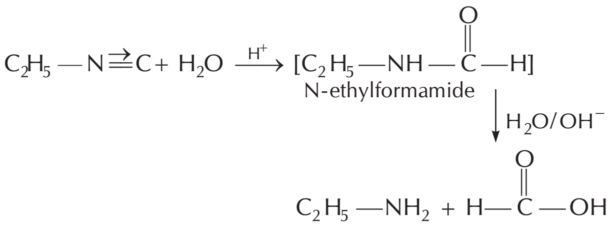
The outline of their methods of preparation looks like



Sample **Problem 21** *Ethyl isocyanide on acidic hydrolysis generates*

(*a*) *ethylamine salt and methanoic acid*
(*b*) *propanoic acid and ammonium salt*
(*c*) *ethanoic acid and ammonium salt*
(*d*) *methyl amine salt and ethanoic acid*

Interpret (*a*)



$$C_2H_5{-}N\overset{\rightarrow}{=}C + H_2O \xrightarrow{H^+} [C_2H_5{-}NH{-}\overset{O}{\overset{\|}{C}}{-}H] \xrightarrow{H_2O/OH^-} C_2H_5{-}NH_2 + H{-}\overset{O}{\overset{\|}{C}}{-}OH$$

N-ethylformamide

Sample **Problem 22** *With the help of following Grignard synthesis which carboxylic acid is formed?*

$$CH_2{=}CHCH_2Br \xrightarrow{Mg/ether} \xrightarrow[(ii)\ H_3O^+]{(i)\ CO_2}$$

(*a*) $CH_2{=}CHCH_2COOH$ (*b*) $CH_3CH_2CH_2COOH$
(*c*) $CH_2{=}CHCOOH$ (*d*) $CH_3CH{=}CH{-}COOH$

Interpret (*a*)

$$CH_2{=}CHCH_2Br \xrightarrow{Mg\ /\ ether} CH_2{=}CHCH_2MgBr \xrightarrow{(i)\ CO_2} CH_2{=}CHCH_2COOMgBr \xrightarrow[-Mg\,(OH)\,Br]{H_3O^+} CH_2{=}CHCH_2COOH$$

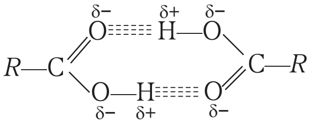
Physical Properties

(i) First three members of this series are colourless, pungent smelling liquids. C_4—C_9 are oily liquids.

(ii) Carboxylic acids exist in the form of dimer due to hydrogen bonding.

(iii) **Solubility** of carboxylic acids in water decreases due to increase in size of hydrophobic hydrocarbon part. Lower carboxylic acids having upto four carbon atoms are miscible in water due to the formation of hydrogen bonds with water.

(iv) **Boiling point** of carboxylic acids is higher than those of hydrocarbons, aldehydes, ketones and alcohols of comparable molecular masses due to intermolecular H-bonding as shown in the figure.



(v) **Melting points** of carboxylic acids increase with increase in their molecular mass. The melting point of an acid with even number of carbon atom is higher than the next lower and next higher homologue containing odd number of carbon atoms.

Hot Spot 4

ACIDIC Strength of Carboxylic Acids

It is an important topic for JEE Main examination. From this topic, questions based upon strength of different acids are asked.

Carboxylic acids are acidic in nature but they are weaker acids than mineral acids but stronger acids than phenols (because the carboxylate ion is more stabilised as compared to phenoxide ion).

The carboxylic acids liberate hydrogen on reaction with electropositive metals like sodium. They form salts with alkalies.

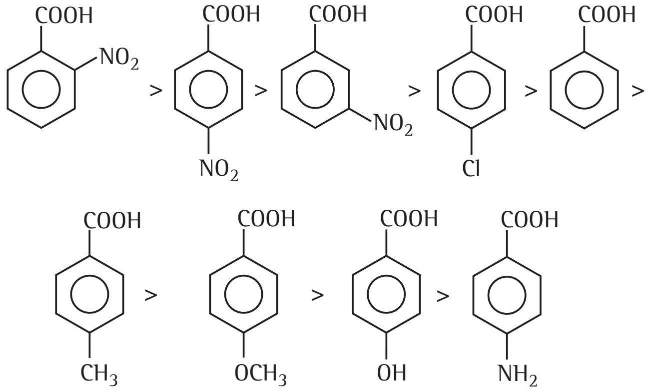
Strength of acid is indicated by pK_a value. Higher the value of K_a or lower the value of pK_a, stronger is the acid.

Aromatic acids are more acidic than aliphatic acids.

Effect of substituent on acidity of aromatic carboxylic acids. Electron donating groups decrease the acidity and electron withdrawing groups increase the acidity of carboxylic acids.

$HCOOH > CH_3COOH > (CH_3)_2CHCOOH > (CH_3)_3COOH$
$Cl_3CCOOH > Cl_2CHCOOH > ClCH_2COOH > CH_3COOH$
$CH_3CH_2CHClCOOH > CH_3CHClCH_2COOH > ClCH_2CH_2CH_2COOH$
$CF_3COOH > CCl_3COOH > CHCl_2COOH > NO_2CH_2COOH$
$FCH_2COOH > ClCH_2COOH > BrCH_2COOH > HCOOH$

Among substituted aromatic acids the strength decreases as follows



***Ortho* effect** The effect of a group is maximum at *ortho* position due to nearness. It is called *ortho* effect.

Sample **Problem 23** *Choose the correct order of strength of following acids* [**NCERT**]

(*I*) $CH_3CH_2CH_2COOH$ (*II*) $CH_3CH_2CH(Br)COOH$

(*III*) $CH_3CH(Br)CH_2COOH$ (*IV*) $(CH_3)_2CHCOOH$

(a) $I < II < III < IV$ (b) $IV < I < III < II$

(c) $IV < III < I < II$ (d) $II < I < III < IV$

Interpret (*b*) Alkyl group with +*I* effect decreases the acidic strength whereas with –*I* effect increases the acidic strength. –*I* effect decreases with distance.

∴**Increasing order of acidic strength is**

$$(CH_3)_2CHCOOH < CH_3CH_2CH_2COOH < CH_3CH(Br)CH_2COOH < CH_3CH_2CH(Br)COOH$$

Sample **Problem 24** *Which of the following represents the correct order of the activity in the given compounds?*

(a) $CH_3COOH > BrCH_2COOH > ClCH_2COOH > FCH_2COOH$

(*b*) $FCH_2COOH > CH_3COOH > BrCH_2COOH > ClCH_2COOH$

(c) $BrCH_2COOH > ClCH_3COOH > FCH_2COOH > CH_3COOH$

(*d*) $FCH_2COOH > ClCH_2COOH > BrCH_2COOH > CH_3COOH$

Interpret (*d*) The acidity of halogenated acid increases almost proportionately with the increase in electronegativity of the halogen present. Therefore, the correct order is

$$FCH_2COOH > ClCH_2COOH > BrCH_2COOH > CH_3COOH$$

Chemical Properties

Carboxylic acids exhibit following characteristic properties.

Reactions of Carboxyl Group

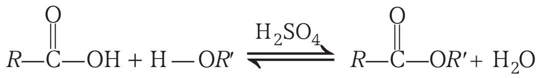
(i) **With alkalies and carbonates** Carboxylic acids react with bases to form ionic salts with pronounced ionic characters and are soluble in water.

$$2RC^{14}OOH + NaHCO_3 \longrightarrow RC^{14}OONa + CO_2 + H_2O$$
$$2RC^{14}OOH + Na_2CO_3 \longrightarrow 2RC^{14}OONa + CO_2 + H_2O$$
$$RCOOH + NaOH \longrightarrow RCOONa + H_2O$$
$$2RCOOH + CaO \longrightarrow (RCOO)_2Ca + H_2O$$
$$RCOOH + AgOH \longrightarrow RCOOAg + H_2O$$

(ii) **With metals** The reaction looks like,

$$2RCOOH + 2Na \longrightarrow 2RCOONa + H_2\uparrow$$
$$2RCOOH + Zn \longrightarrow (RCOO)_2Zn + H_2\uparrow$$

(iii) **Esterification** Carboxylic acids react with alcohols in the presence of conc H_2SO_4 to form ester.

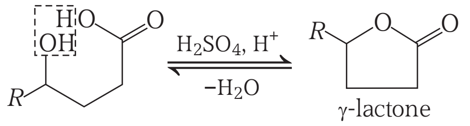


$$R—\overset{O}{\overset{\|}{C}}—OH + H—OR' \xrightleftharpoons{H_2SO_4} R—\overset{O}{\overset{\|}{C}}—OR' + H_2O$$

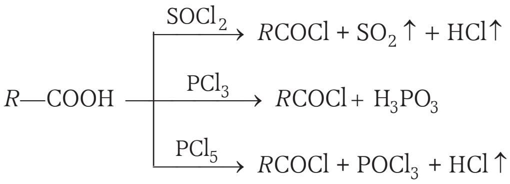
The order of reactivity follows the sequence,

$$HCOOH > CH_3COOH > (CH_3)_2COOH > (CH_3)_3CCOOH$$
$$CH_3OH > CH_3CH_2OH > (CH_3)_2CHOH > (CH_3)_3COH$$

γ or δ hydroxy carboxylic acids undergo an intramolecular esterification to give cyclic ester-lactones.



(iv) **With $SOCl_2$, PCl_3 and PCl_5** Acyl halides are formed.



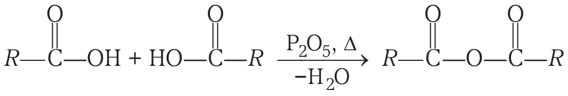
$$R—COOH \xrightarrow{SOCl_2} RCOCl + SO_2\uparrow + HCl\uparrow$$
$$R—COOH \xrightarrow{PCl_3} RCOCl + H_3PO_3$$
$$R—COOH \xrightarrow{PCl_5} RCOCl + POCl_3 + HCl\uparrow$$

$SOCl_2$ is preferred over other two reagents, because SO_2 and HCl escape the reaction mixture (as these are gases) and make the purification of product easier.

(v) **With NH_3** The reaction looks like,

$$RCOOH + NH_3 \longrightarrow RCOO^-NH_4^+ \xrightarrow{Heat} RCONH_2 + H_2O$$

(vi) **Dehydration** The reaction proceeds as,



$$R—\overset{O}{\overset{\|}{C}}—OH + HO—\overset{O}{\overset{\|}{C}}—R \xrightarrow[-H_2O]{P_2O_5,\ \Delta} R—\overset{O}{\overset{\|}{C}}—O—\overset{O}{\overset{\|}{C}}—R$$

(vii) **Decarboxylation** Salts of carboxylic acid on heating with sodalime (NaOH and CaO) undergo decarboxylation to produce alkanes.

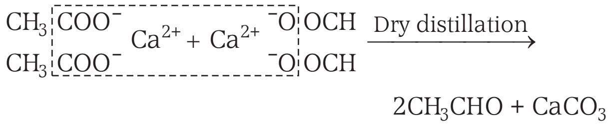
$$RCOONa + NaOH \longrightarrow R—H + Na_2CO_3$$

(viii) **Kolbe's electrolysis** The aqueous solution of sodium or potassium salts of carboxylic acids on electrolysis gives alkanes.

$$2RCOONa + H_2O \xrightarrow{Electrolysis} \underbrace{R—R + 2CO_2}_{anode} + \underbrace{2NaOH + H_2}_{cathode}$$

(ix) The Ca salts of carboxylic acids gives carbonyl compounds on dry distillation.

$$\boxed{\begin{matrix} CH_3CO\boxed{O^-} \\ CH_3\boxed{COO^-} \end{matrix} Ca^{2+}} \xrightarrow{\text{Dry distillation}} CH_3—\overset{O}{\overset{\|}{C}}—CH_3 + CaCO_3$$



$$\begin{array}{l} CH_3\,COO^- \quad Ca^{2+} + Ca^{2+} \quad {}^-O\,OCH \\ CH_3\,COO^- \qquad\qquad\qquad\quad {}^-O\,OCH \end{array} \xrightarrow{\text{Dry distillation}} 2CH_3CHO + CaCO_3$$

(x) **Borodine-Hunsdiecker reaction** The silver salts of carboxylic acids upon treatment with Br_2/CCl_4 give alkyl bromide.

$$RCOOAg + Br_2 \xrightarrow{CCl_4} RBr + CO_2\uparrow + AgBr\downarrow$$

The silver salts of carboxylic acids on treatment with I_2/ether form esters. (Birnbaum-Simonini reaction).

$$2RCOOAg + I_2 \xrightarrow{\text{Ether}} RCOOR + CO_2\uparrow + 2AgI\downarrow$$

(xi) 1. **Reduction to alkanes**

$$RCOOH + 6HI \xrightarrow[\Delta]{\text{Red P}} R{-}CH_3 + 2H_2O + 3I_2$$

2. **Reduction to alcohols**

$$RCOOH \xrightarrow[\text{(ii) } H_3O^+,\ H^+]{\text{(i) } LiAlH_4/\text{ether}} RCH_2OH$$

3. **Reduction to aldehydes and ketones**

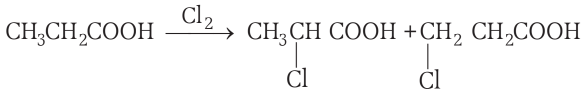
$$\underbrace{HCO\boxed{OH + HCOO}H}_{\text{vapour phase}} \xrightarrow[\Delta]{MnO} HCHO + CO_2 + H_2O$$

$$\underbrace{CH_3CO\boxed{OH + HOOC}CH_3}_{\text{vapour phase}} \xrightarrow[\Delta]{MnO} CH_3COCH_3 + CO_2 + H_2O$$

(xii) **Schmidt reaction** Reaction proceeds as,

$$RCOOH + N_3H \xrightarrow[\Delta]{H_2SO_4} RNH_2 + N_2\uparrow + CO_2\uparrow$$

(xiii) **Halogenation** In monocarboxylic acid bromination takes place only at the α-position, but chlorination may also takes place further in the chain.

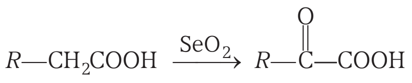


$$CH_3CH_2COOH \xrightarrow{Cl_2} CH_3\underset{\displaystyle Cl}{\underset{|}{CH}}\ COOH + \underset{\displaystyle Cl}{\underset{|}{CH_2}}\ CH_2COOH$$

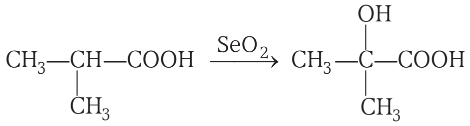
(xiv) **Oxidation**

1. All acids, except formic acid are resistance to oxidation. On prolonged heating, with powerful oxidising agent ($KMnO_4$) they results in CO_2 and H_2O.

$$HCOOH \xrightarrow{SeO_2} CO_2 + H_2O$$

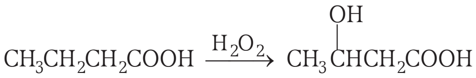


$$R{-}CH_2COOH \xrightarrow{SeO_2} R{-}\overset{\displaystyle O}{\overset{\|}{C}}{-}COOH$$



$$CH_3{-}\underset{\displaystyle CH_3}{\underset{|}{CH}}{-}COOH \xrightarrow{SeO_2} CH_3{-}\overset{\displaystyle OH}{\overset{|}{\underset{\displaystyle CH_3}{\underset{|}{C}}}}{-}COOH$$

2. With mild oxidising agent such as H_2O_2, they are oxidised to β-hydroxy acids.

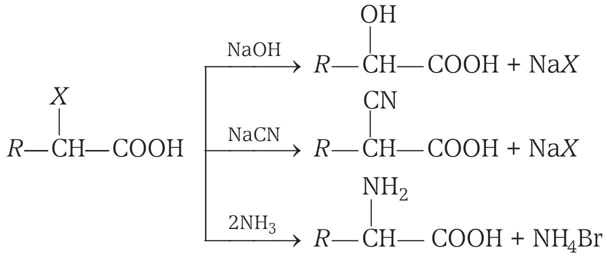


$$CH_3CH_2CH_2COOH \xrightarrow{H_2O_2} CH_3\overset{\displaystyle OH}{\overset{|}{C}}HCH_2COOH$$

(xv) **Hell-Volhard Zelinsky Reaction** α-hydrogen of a carboxylic acid can be replaced by halogen using red phosphorus.

$$R{-}CH_2COOH + X_2 \xrightarrow{\text{Red P}} R{-}\overset{\displaystyle X}{\overset{|}{C}}H{-}COOH$$

α-halogenated acids are infact good starting material for preparing other α-substituted acids as



$$R{-}\overset{\displaystyle X}{\overset{|}{C}}H{-}COOH \xrightarrow{NaOH} R{-}\overset{\displaystyle OH}{\overset{|}{C}}H{-}COOH + NaX$$

$$R{-}\overset{\displaystyle X}{\overset{|}{C}}H{-}COOH \xrightarrow{NaCN} R{-}\overset{\displaystyle CN}{\overset{|}{C}}H{-}COOH + NaX$$

$$R{-}\overset{\displaystyle X}{\overset{|}{C}}H{-}COOH \xrightarrow{2NH_3} R{-}\overset{\displaystyle NH_2}{\overset{|}{C}}H{-}COOH + NH_4Br$$

Caution Points *The first member of series, i.e.,* HCOOH *is unique and different from rest in many aspects, i.e.,*

(*i*) *It decolourises* $KMnO_4$,

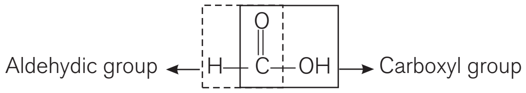
(*ii*) *Gives positive tests with Tollen's reagent (silver mirror) and Fehling's solution,*

(*iii*) *Reduces mercuric chloride to mercurous chloride which is further converted to grey precipitate of mercury.*

$$HCOOH + 2HgCl_2 \longrightarrow CO_2 + Hg_2Cl_2\downarrow + 2HCl$$

$$HCOOH + Hg_2Cl_2 \longrightarrow CO_2 + 2Hg\downarrow + 2HCl$$

Thus, it is the only monocarboxylic acid which can oxidise easily. The abnormal behaviour of formic acid is due to the presence of aldehydic group.



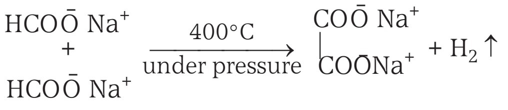
Its boiling point is 373.5 K (H_2O – 373K).

Action of heat

$$HCOOH \xrightarrow[\Delta]{\text{Conc. } H_2SO_4} H_2O + CO_2\uparrow$$

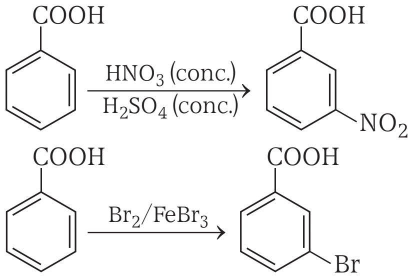
$$HCOOH \longrightarrow CO_2\uparrow + H_2\uparrow$$

Its Na or K salt on heating under pressure at about 400°C produces sodium or potassium salt of oxalic acid. H_2 is liberated in the process as



$$\begin{array}{c} HCO\bar{O}\ Na^+ \\ + \\ HCO\bar{O}\ Na^+ \end{array} \xrightarrow[\text{under pressure}]{400^\circ C} \begin{array}{l} CO\bar{O}\ Na^+ \\ | \\ CO\bar{O}Na^+ \end{array} + H_2\uparrow$$

(xvi) **Electrophilic substitution reaction** Aromatic carboxylic acids undergo electrophilic substitution reaction —COOH group shows –*R* effect, therefore acts as a deactivating and *meta*-directing group. Carboxylic acids do not undergo Friedel-Crafts reaction because the carboxylic group is deactivating and the catalyst $AlCl_3$ (anhyd) gets bonded to the carboxylic group.



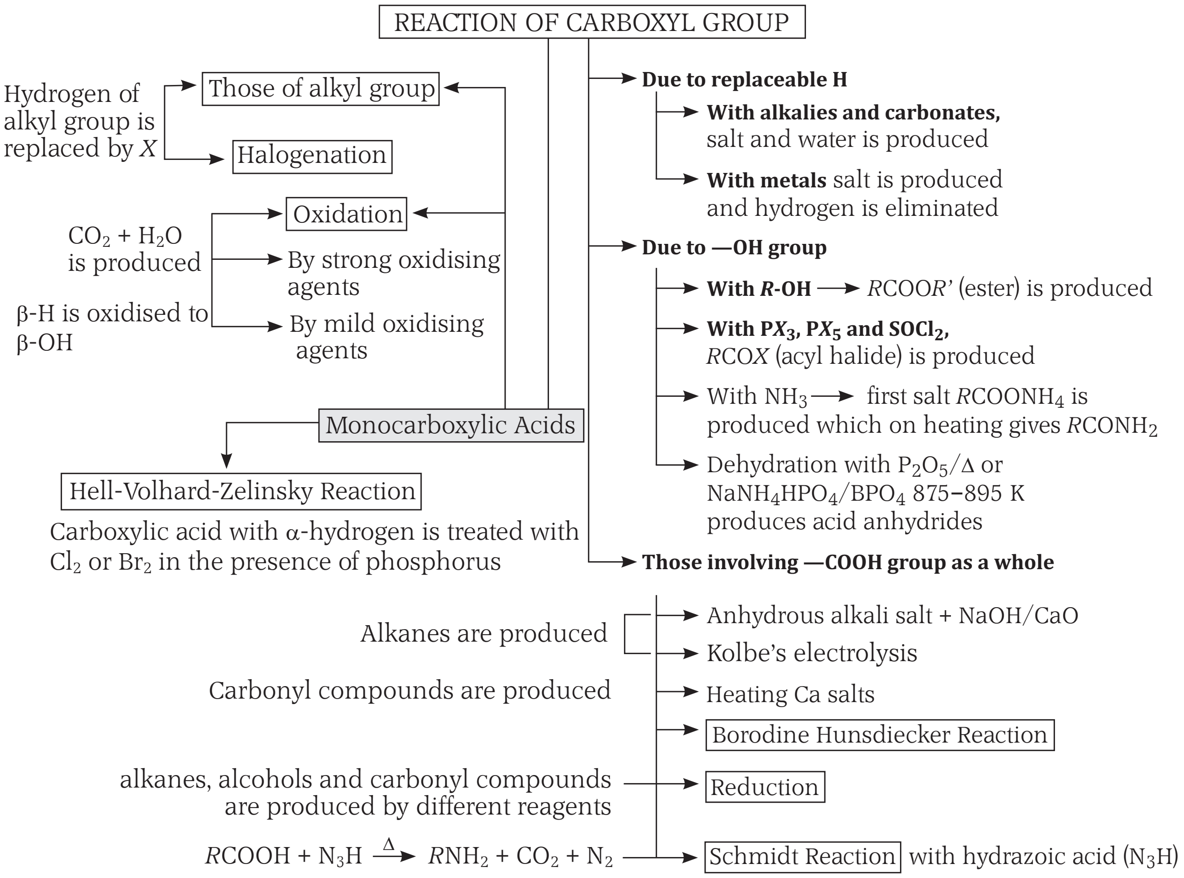
Uses of Carboxylic acids

(i) Formic acid is used in leather tanning, textile dyeing and finishing.

(ii) Acetic acid is used in the manufacture of rayon and in plastics, rubber and silk industries and in cooking.

(iii) Benzoic acid and its salts are used as urinary antiseptics.

The outline of the chemical properties of carboxylic acids looks like



WORKED **OUT**

Examples

Example 1 *An alcohol on oxidation is found to give* CH_3COOH *and* CH_3CH_2COOH. *The structure of the alcohol is*

(*a*) $CH_3CH_2CH_2OH$ (*b*) $CH_3(CH_2)_3CH_2OH$

(*c*) $CH_3CHOHCH_2CH_3$ (*d*) $(CH_3)_2C(OH)CH_2CH_3$

Solution (*c*) $CH_3CHOHCH_2CH_3 \xrightarrow{[O]} CH_3COCH_2CH_3 \xrightarrow{[O]} CH_3COOH + CH_3CH_2COOH$

Example 2 *Which of the following can't be made by using Williamson's synthesis?*

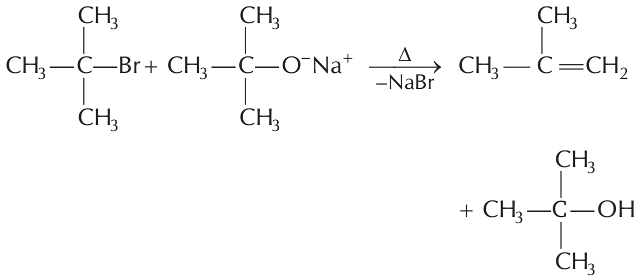
(*a*) *Di-tert-butyl ether*

(*b*) *Methoxybenzene*

(*c*) *Benzyl p-nitrophenyl ether*

(*d*) *Methyl tertiary butyl ether*

Solution (*a*) Di-*tert*-butyl ether can't be made by Williamson's synthesis, since *tert*-alkyl halides prefer to undergo elimination rather than substitution, *i.e.*,



$$CH_3-\underset{CH_3}{\overset{CH_3}{C}}-Br + CH_3-\underset{CH_3}{\overset{CH_3}{C}}-O^-Na^+ \xrightarrow[-NaBr]{\Delta} CH_3-\overset{CH_3}{C}=CH_2 + CH_3-\underset{CH_3}{\overset{CH_3}{C}}-OH$$

Example 3 *Phenol on reaction with* Br_2 *in non-polar aprotic solvent furnishes*

(*a*) *p-bromophenol* (*b*) *m-bromophenol*

(*c*) *o/p-bromophenol* (*d*) *2,4,6-tribromophenol*

Solution (*c*) In the presence of non-polar aprotic solvents such as $CHCl_3$, CCl_4 etc., Br_2 reacts with phenol to give a mixture of *o*-and *p*-bromophenol.

Example 4 *An organic compound* (*X*) *with* Na *gives* (*Y*) *and with* PCl_5 *gives* (*Z*). (*Y*) *and* (*Z*) *react together to form diethyl ether. The compounds* (*X*), (*Y*) *and* (*Z*) *respectively are*

(*a*) C_2H_5Cl, C_2H_6 *and* C_2H_5OH

(*b*) C_2H_5OH, C_2H_5ONa *and* C_2H_5Cl

(*c*) C_2H_5OH, C_2H_5Cl *and* C_2H_5ONa

(*d*) C_2H_5OH, C_2H_6 *and* C_2H_5Cl

Solution (*b*)

$$\begin{tikzcd} \underset{(X)}{C_2H_5OH} \arrow[r, "PCl_5"'] \arrow[d, "Na"] & \underset{(Z)}{C_2H_5Cl} + POCl_3 + HCl \\ \underset{(Y)}{C_2H_5ONa} & \end{tikzcd}$$

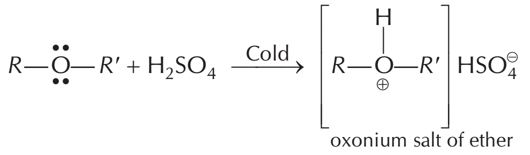
$$\underset{(Y)}{C_2H_5ONa} + \underset{(Z)}{ClC_2H_5} \longrightarrow C_2H_5-O-C_2H_5 + NaCl$$

Example 5 *An ether reacts with cold* H_2SO_4 *to give*

(*a*) *a Zwitter ion* (*b*) *an oxonium ion*

(*c*) *an oxy anion* (*d*) *an alkyl free radical*

Solution (*b*)



$$R-\ddot{\underset{\cdot\cdot}{O}}-R' + H_2SO_4 \xrightarrow{\text{Cold}} \underset{\text{oxonium salt of ether}}{\left[R-\underset{\oplus}{\overset{H}{O}}-R'\right]HSO_4^{\ominus}}$$

Example 6 *Which of the following will not be formed when calcium acetate is distilled with calcium formate?*

(a) *Acetone* (b) *Propanal*

(c) *Ethanal* (d) *Methanal*

Solution (*b*) Propanal will not be formed while all the other three will be formed as shown below

$$\underset{\text{calcium formate}}{(HCOO)_2Ca} \xrightarrow[-CaCO_3]{\Delta} \underset{\text{methanal}}{HCHO}$$

$$(CH_3COO)_2Ca \xrightarrow[-CaCO_3]{\Delta} \underset{\text{acetone}}{CH_3COCH_3}$$

$$(CH_3COO)_2Ca + (HCOO)_2Ca \xrightarrow[-2CaCO_3]{} \underset{\text{ethanal}}{2CH_3CHO}$$

Example 7 *Reagent used for the oxidation of allyl alcohol to acrolein is*

(a) $KMnO_4$ (*b*) H_2O_2

(c) *active* MnO_2 (*d*) OsO_4

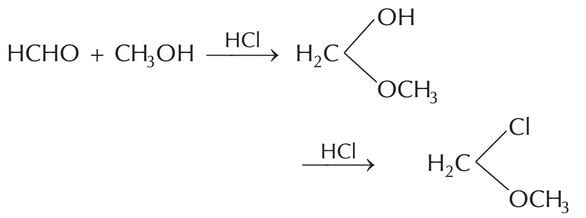
Solution (c) Active MnO_2 is a mild oxidising agent and is used for oxidation of allylic alcohol to the corresponding aldehydes.

$$\underset{\text{allyl alcohol}}{CH_2=CH-CH_2OH} \xrightarrow[MnO_2]{\text{Active}} \underset{\text{acrolein}}{CH_2=CH-CHO}$$

Example 8 *When methanol reacts with formaldehyde in the presence of excess of* HCl*, the product is*

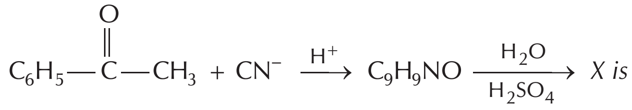
(*a*) $CH_2(OCH_3)_2$ (*b*) CH_2Cl_2
(*c*) CH_3OCH_2OH (*d*) CH_3OCH_2Cl

Solution (*d*) With the excess of methanol, acetal is formed but with excess of HCl, α-chloroethers are formed,



methoxy methyl chloride

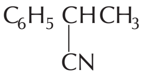
Example 9 *The product X in the reaction*



$$C_6H_5-\overset{O}{\overset{\|}{C}}-CH_3 + CN^- \xrightarrow{H^+} C_9H_9NO \xrightarrow[H_2SO_4]{H_2O} X \text{ is}$$

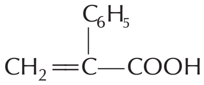
(*a*) $C_6H_5CH_2COOCH_3$

(*b*)



$C_6H_5\underset{CN}{\underset{|}{C}H}CH_3$

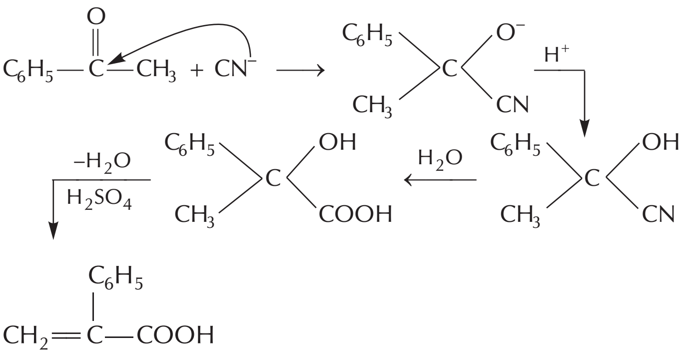
(*c*)



$CH_2=\overset{C_6H_5}{\overset{|}{C}}-COOH$

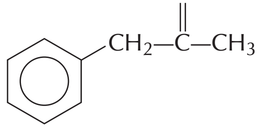
(*d*) $C_6H_5CH=CHCOOH$

Solution (*c*) The reaction proceeds as,

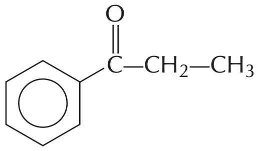


Example 10 *An organic compound (A) with molecular formula* $C_9H_{10}O$ *forms an orange-red precipitate with 2,4-DNP reagent and gives yellow precipitate on heating with iodine and* NaOH. *It does not reduce Tollen's reagent or Fehling's solution nor it decolourises bromine water as Baeyer's reagent. On drastic oxidation with chromic acid, it gives a carboxylic acid having molecular formula* $C_7H_6O_2$. *Identify the compound (A).*

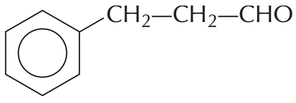
(*a*)



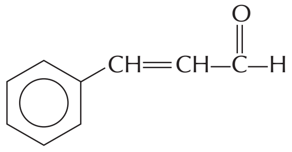
(*b*)



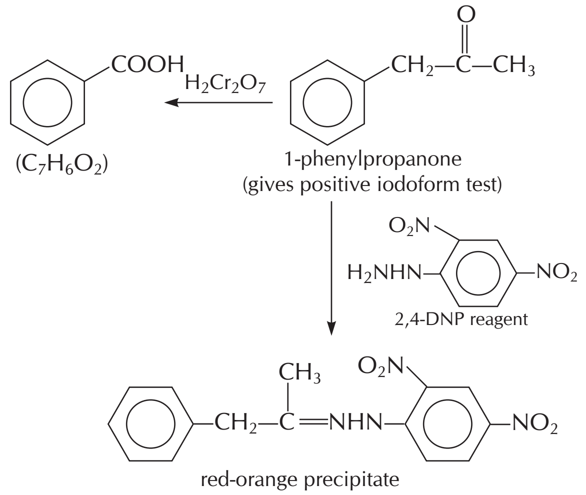
(*c*)



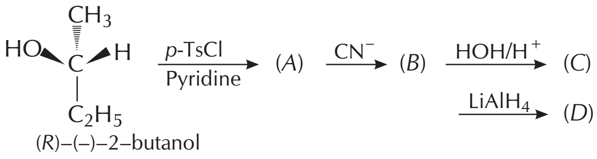
(*d*)



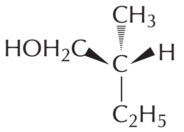
Solution (*a*)



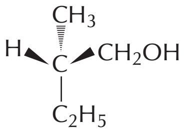
Example 11 *Give stereochemical formula for compound (D)*



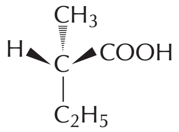
(a)



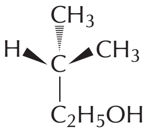
(*b*)



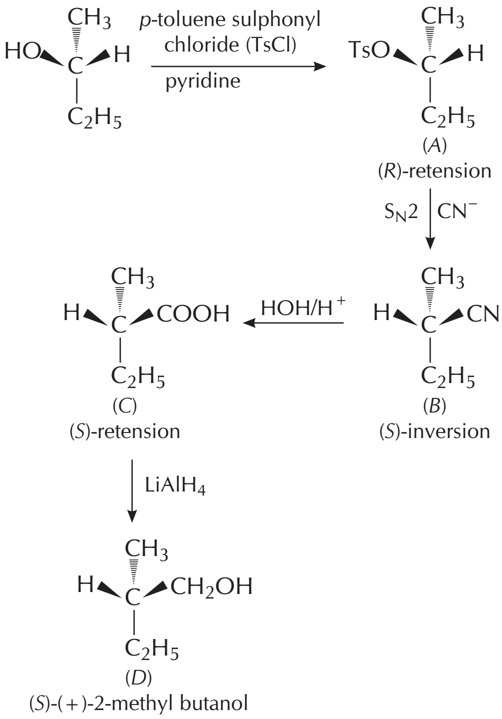
(*c*)



(*d*)



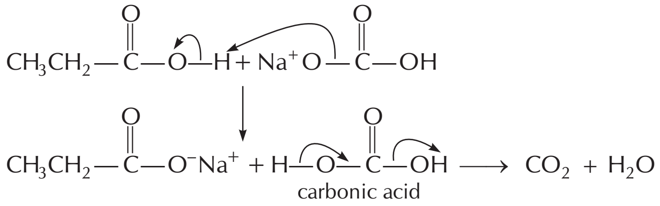
Solution (*b*)



Example 12 *When propionic acid is treated with aqueous sodium bicarbonate, CO_2 is liberated. The C from CO_2 comes from*

(*a*) methyl group
(*b*) carboxylic acid group
(*c*) methylene group
(*d*) bicarbonate

Solution (*d*) Carboxylic acids reacts with weaker bases such as bicarbonates producing CO_2. The CO_2 evolved comes from $NaHCO_3$, not from carboxylic group as shown below

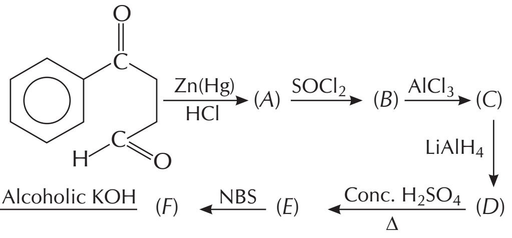


$$CH_3CH_2-\overset{O}{\overset{\|}{C}}-O-H + Na^+\,O-\overset{O}{\overset{\|}{C}}-OH$$

$$CH_3CH_2-\overset{O}{\overset{\|}{C}}-O^-Na^+ + H-O-\overset{O}{\overset{\|}{C}}-OH \longrightarrow CO_2 + H_2O$$

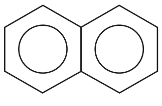
carbonic acid

Example 13

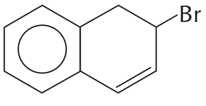


Show the final product of the reaction.

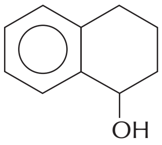
(*a*)



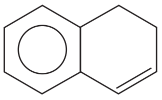
(*b*)



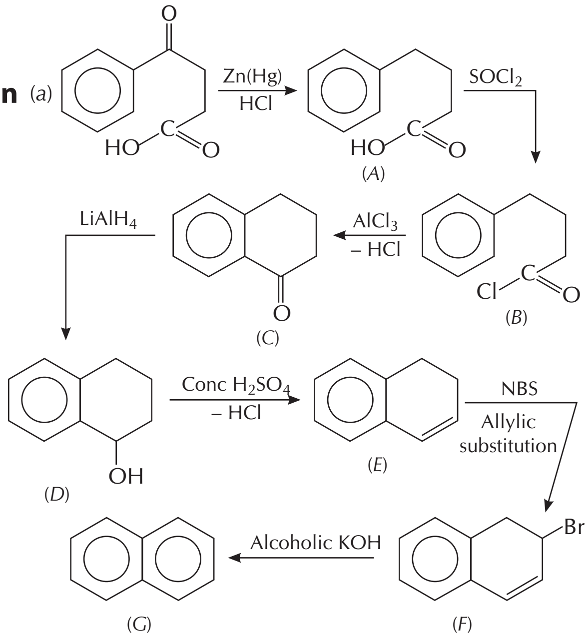
(*c*)



(*d*)



Solution (*a*)

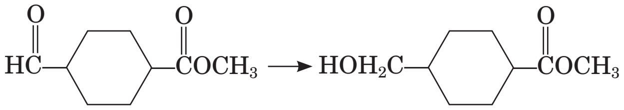


Start Practice for JEE Main

Round I (Topically Divided Problems)

Alcohols

1. The reduction,



can be achieved by using

(a) $NaBH_4$ (b) $LiAlH_4$

(c) $CuO \cdot CuCN_2O_4$ (d) None of these

2. The reaction,

$$2CH_3CH_2OH \xrightarrow[413\ K]{H^+} CH_3CH_2OCH_2CH_3$$

is believed to occur through the formation of

(a) $CH_3CH_2\overset{+}{O}H_2$ (b) $CH_3\overset{+}{C}H_2$

(c)  $CH_3CH_2-\underset{H}{\overset{+}{\ddot{O}}}-CH_2CH_3$ (d) Both (b) and (c)

3. Which of the following structure is represented by 3-cyclohexylpentan-3-ol? [NCERT]

(a) 
(b) 
(c) 
(d) None of these

4. 
A and *B* respectively are

(a) Both 
(b) Both 
(c) 
(d) 
5. In which molecule, cleavage by HIO_4 is not observed?

(a) 
(b) 
(c) 
(d) 
6. The acidic character of $1°, 2°, 3°$ alcohols, H_2O and $RC\equiv CH$ is of the order

(a) $H_2O > 1° > 2° > 3° > RC\equiv CH$

(b) $RC\equiv CH > 3° > 2° > 1° > H_2O$

(c) $1° > 2° > 3° > H_2O > RC\equiv CH$

(d) $3° > 2° > 1° > H_2O > RC\equiv CH$

7. Choose the incorrect statement.

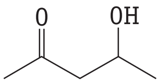
(a) Ordinary ethyl alcohol is known as rectified spirit
(b) The alcohol sold in the market for polishing etc., is known as methylated spirit
(c) Absolute alcohol is 100% ethanol
(d) Power alcohol is 100% ethanol

8. Reaction of tertiary butyl alcohol with hot Cu at 350°C produces

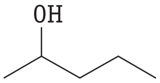
(a) butanol
(b) butanal
(c) 2-butene
(d) 2-methylpropene

9. Which one of the following will most readily be dehydrated in acidic condition?

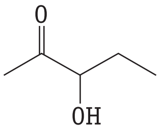
(a)



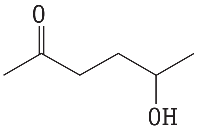
(b)



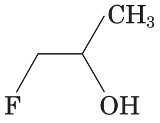
(c)



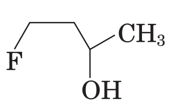
(d)



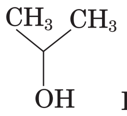
10. The order of reactivity of the following alcohols is



(I)



(II)



(III)

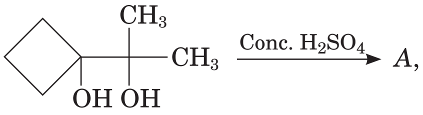
(IV)

(a) I > II > III > IV
(b) I > III > II > IV
(c) IV > III > II > I
(d) IV > III > I > II

11. In the following reaction, identify X. Methyl magnesium bromide $+ X \longrightarrow$ 2-methyl propan-2-ol **[NCERT]**

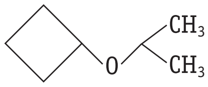
(a) propanol
(b) ethanone
(c) propanone
(d) butane

12.

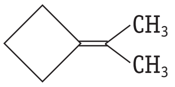


The product A is

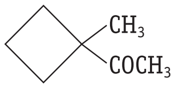
(a)



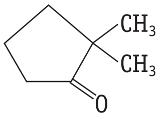
(b)



(c)

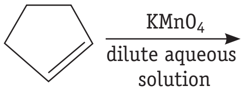


(d)

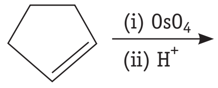


13. By which of the following reactions can *trans*-cyclopentane-1,2- diol be obtained?

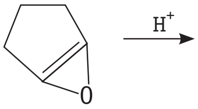
(a)



(b)

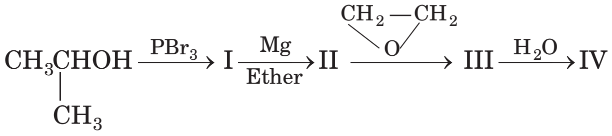


(c)



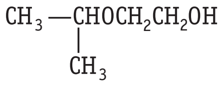
(d) None of these

14. The final product (IV) in the sequence of reactions

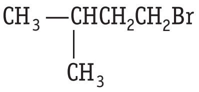


$$\mathrm{CH_3\underset{\substack{|\\CH_3}}{C}HOH \xrightarrow{PBr_3} I \xrightarrow[Ether]{Mg} II \xrightarrow{\overset{CH_2-CH_2}{\diagdown O \diagup}} III \xrightarrow{H_2O} IV}$$

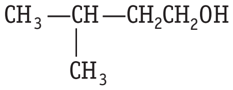
is

(a)


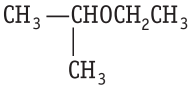
$\mathrm{CH_3-\underset{\substack{|\\CH_3}}{C}HOCH_2CH_2OH}$

(b)


$\mathrm{CH_3-\underset{\substack{|\\CH_3}}{C}HCH_2CH_2Br}$

(c)


$\mathrm{CH_3-\underset{\substack{|\\CH_3}}{CH}-CH_2CH_2OH}$

(d)


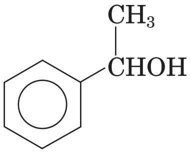
$\mathrm{CH_3-\underset{\substack{|\\CH_3}}{C}HOCH_2CH_3}$

15. Arrange the following compounds in increasing order of boiling point. Propan-1-ol, butan-1-ol, butan-2-ol, pentan-1-ol. **[NCERT Exemplar]**

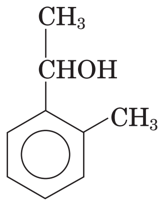
(a) Propan-1-ol, butan-2-ol, butan-1-ol, pentan-1-ol
(b) Propan-1-ol, butan-1-ol, butan-2-ol, pentan-1-ol
(c) Pentan-1-ol, butan-2-ol, butan-1-ol, propan-1-ol
(d) Pentan-1-ol, butan-1-ol, butan-2-ol, propan-1-ol

16. Correct order of dehydration of

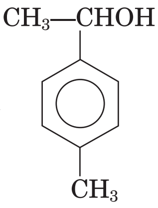
I.



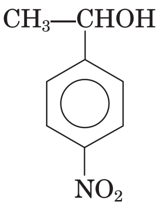
II.



III.



IV.



is

(a) I > II > III > IV
(b) II > III > I > IV
(c) IV > I > III > II
(d) IV > I > II > III

Phenols

17. IUPAC name of *m*-cresol is **[NCERT** Exemplar]

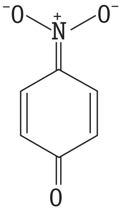
(a) 3-methylphenol
(b) 3-chlorophenol
(c) 3-methoxyphenol
(d) benzene-1,3-diol

18. On Friedel-Crafts acetylation, anisole yields **[NCERT]**

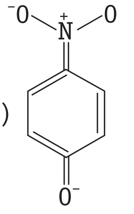
(a) 2-methoxyacetophenone
(b) 4-methoxyacetophenone
(c) Both (a) and (b)
(d) None of the above

19. The most unlikely representation of resonance structures of *p*-nitrophenoxide ion is

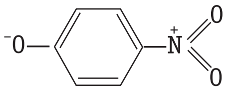
(a)



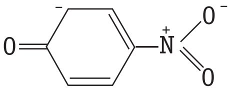
(b)



(c)



(d)



20. Which of the following reactions will not yield *p-tert* butylphenol?

(a) $\text{Phenol} + CH_3{-}\overset{\overset{\large CH_3}{|}}{C}{=}CH_2 \xrightarrow{H^+}$

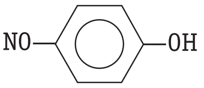
(b) Phenol + $(CH_3)_3COH \xrightarrow{H^+}$

(c) Phenol + $(CH_3)_3C \cdot Cl \xrightarrow{AlCl_3}$

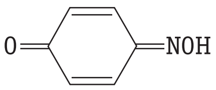
(d) Phenol + $CHCl_3 \xrightarrow{NaOH}$

21. In the Liebermann test for phenols, the blue or green colour produced is due to the formation of

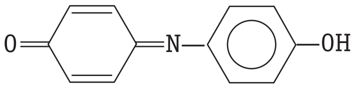
(a)



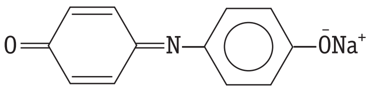
(b)



(c)

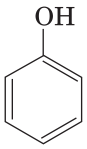


(d)

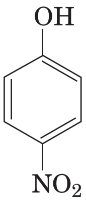


22. Mark the correct order of decreasing acid strength of the following compounds.

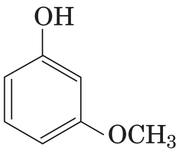
I.



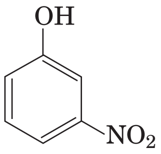
II.



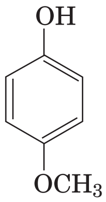
III.



IV.



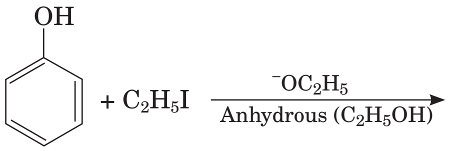
V.



[NCERT Exemplar]

(a) V > IV > II > I > III (b) II > IV > I > III > V
(c) IV > V > III > II > I (d) V > IV > III > II > I

23.



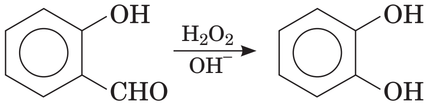
(a) $C_6H_5OC_2H_5$ (b) $C_2H_5OC_2H_5$
(c) $C_6H_5OC_6H_5$ (d) C_6H_5I

24. Phenol $\xrightarrow[\text{(ii) } CO_2/140^\circ C]{\text{(i) NaOH}} A \xrightarrow{H^+/H_2O} B \xrightarrow{Ac_2O} C$

In this reaction, the end product C is **[NCERT]**

(a) salicylaldehyde (b) salicylic acid
(c) phenyl acetate (d) aspirin

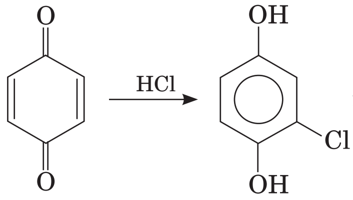
25.



This reaction is called

(a) Reimer-Tiemann reaction
(b) Liebermann's nitroso reaction
(c) Dakin reaction
(d) Lederer-Manasse reaction

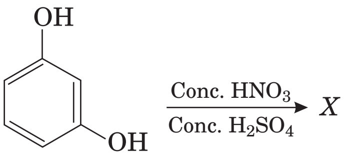
26.



is an example of

(a) 1,2-addition of HCl followed by tautomerism
(b) 1,2-addition followed by reduction
(c) 1,4-addition followed by tautomerism
(d) 1,4-addition followed by oxidation

27. Consider the following reaction,



Product X is

(a) picric acid (b) styphnic acid
(c) salicylic acid (d) benzoic acid

Ethers

28. Which of the following is the best method for making *iso*-propylmethyl ether?

(a) $CH_3I + (CH_3)_2CHOH \longrightarrow$
(b) $CH_3I + (CH_3)_2CHO^- \longrightarrow$
(c) $(CH_3)_2CHI + CH_3O^- \longrightarrow$
(d) $(CH_3)_2CHCl + CH_3OH \longrightarrow$

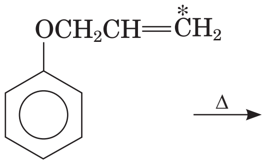
29. Some time explosion occurs while distilling ethers. It is due to the presence of

(a) oxide (b) ketones (c) aldehyde (d) peroxides

30. An ether is more volatile than an alcohol having the same molecular formula. This is due to

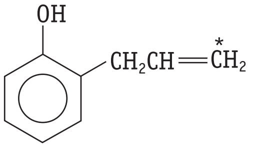
(a) intermolecular hydrogen bonding in alcohols
(b) dipolar character of ethers
(c) alcohols having resonance structures
(d) intermolecular hydrogen bonding in ether

31.

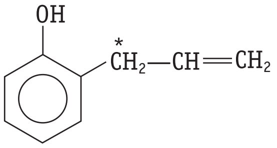


? Product is

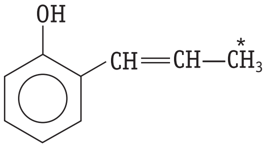
(a)



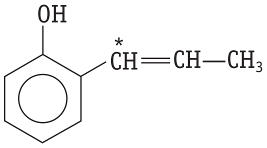
(b)



(c)



(d)



32. C—O—C angle would be maximum in

(a) $CH_3{-}O{-}CH_3$
(b) $CH_3{-}O{-}C_2H_5$
(c) $C_2H_5{-}O{-}C_2H_5$
(d) $(CH_3)_2CH{-}O{-}CH(CH_3)_2$

33. To prepare an ether by Williamson's synthesis, the reactants needed are

(a) ethyl alcohol and *tert* butyl alcohol
(b) sodium ethoxide and *tert* butyl bromide
(c) sodium *tert* butoxide and ethyl bromide
(d) sodium ethoxide and sodium *tert* butoxide

34. Ether in contact with air for a long time form peroxides. The presence of peroxide in ether can be tested by adding Fe^{2+} ion and then adding

(a) KCN (b) $SnCl_2$
(c) $HgCl_2$ (d) KCNS

35. On boiling with concentrated hydrobromic acid, phenyl ethyl ether yields

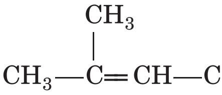
(a) phenol and ethane
(b) phenol and ethyl bromide
(c) bromobenzene and ethanol
(d) bromobenzene and ethane

36. Which of the following reactions does not yield an ether?

(a) Sodium methoxide reacts with dimethyl sulphate
(b) Sodium ethoxide reacts with ethyl bromide
(c) Sodium ethoxide reacts with bromocyclopropane
(d) Ethanol reacts with CH_2N_2 in presence of HBF_4

Aldehydes and Ketones

37. The compound



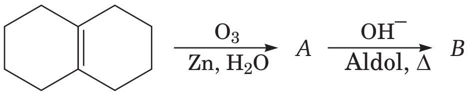
$CH_3{-}\overset{\displaystyle CH_3}{\overset{|}{C}}{=}CH{-}CH_3$ on reaction with $NaIO_4$ in the presence of $KMnO_4$ gives

(a) CH_3COCH_3
(b) $CH_3COCH_3 + CH_3COOH$
(c) $CH_3COCH_3 + CH_3CHO$
(d) $CH_3CHO + CO_2$

38. Arrange the following compounds in increasing order of their boiling points. CH_3CHO, CH_3CH_2OH, CH_3OCH_3, $CH_3CH_2CH_3$ **[NCERT]**

(a) $CH_3CH_2CH_3 < CH_3CH_2OH < CH_3OCH_3 < CH_3CHO$
(b) $CH_3OCH_3 < CH_3CH_2CH_3 < CH_3CH_2OH < CH_3CHO$
(c) $CH_3CH_2CH_3 < CH_3OCH_3 < CH_3CHO < CH_3CH_2OH$
(d) $CH_3CH_2OH < CH_3CHO < CH_3OCH_3 < CH_3CH_2OH$

39. Identify the final product of the reaction.



(a) 
(b) 
(c) 
(d) 
40. Collin's reagent is used to convert

(a) $>C{=}O \longrightarrow >CHOH$

(b) $—CH_2OH \longrightarrow —CHO$

(c) $—CHO \longrightarrow —COOH$

(d) $—CHO \longrightarrow —CH_2OH$

41. Etard's reaction involves the preparation of benzaldehyde from

(a) toluene (b) ethyl benzene

(c) benzoyl chloride (d) sodium benzoate

42. Which of the following compounds will give butanone on oxidation with alkaline $KMnO_4$ solution? **[NCERT** Exemplar]

(a) Butan-1-ol (b) Butan-2-ol

(c) Both (a)and (b) (d) None of these

43. Compounds A and C in the following reaction are **[NCERT** Exemplar]

$$CH_3CHO \xrightarrow[\text{(ii) } H_2O]{\text{(i) } CH_3MgBr} (A) \xrightarrow{H_2SO_4,\ \Delta} (B) \xrightarrow{\text{Hydroboration oxidation}} (C)$$

(a) identical (b) positional isomers

(c) functional isomers (d) optical isomers

44. The final product obtained in the reaction

$$CH_2O + NH_3 \longrightarrow [\quad] \xrightarrow[Ac_2O]{HNO_3} \text{ is}$$

(a) 
(b) 
(c) 
(d) None of these

45. $2DCDO \xrightarrow{OH^-} [X]$ and $[Y]$ are

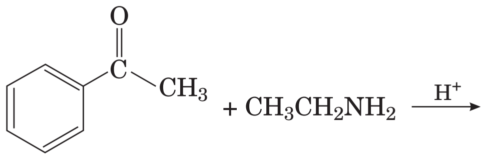
(a) $DCOO^-$, D_2CHOH

(b) $HCOO^-$, CH_3OH

(c) $HCOO^-$, CD_3OH

(d) $DCOO^-$, CD_3OH

46. Predict the product of the following reaction. **[NCERT]**



(a) Schiff's base (b) Tollen's reagent

(c) Bendict solution (d) Molisch's reagent

47. The enol form of acetone, after treatment with D_2O gives

(a) 
$CH_3—\underset{OD}{\underset{|}{C}}{=}CH_2$

(b) 
$CH_3—\underset{O}{\underset{\|}{C}}—CH_3$

(c) 
$CH_2{=}\underset{OH}{\underset{|}{C}}—CH_2D$

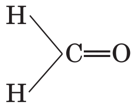
(d) 
$CD_2{=}\underset{OD}{\underset{|}{C}}—CD_3$

48. Which of the following has the most acidic hydrogen?

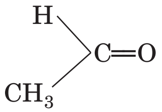
(a) 3-hexanone (b) 2,4-hexanedione

(c) 2,5-hexanedione (d) 2,3-hexanedione

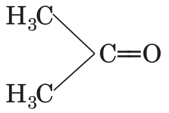
49. What will be the order of reactivity of the following carbonyl compounds with Grignard's reagent?



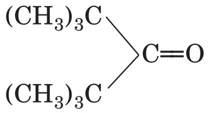
I



II



III



IV

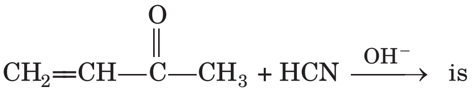
(a) I > II > III > IV

(b) IV > III > II > I

(c) II > I > IV > III

(d) III > II > I > IV

50. The major product obtained in the reaction,



$$CH_2{=}CH—\overset{O}{\overset{\|}{C}}—CH_3 + HCN \xrightarrow{OH^-} \text{ is}$$

(a) 
$CH_2{=}CH—\underset{CN}{\underset{|}{\overset{OH}{\overset{|}{C}}}}—CH_3$

(b) $NC-CH_2-CH_2-\overset{O}{\overset{\|}{C}}-CH_3$

(c) $CH_2=CH-\underset{COOH}{\overset{OH}{C}}-CH_3$

(d) None of the above

51. Which of the following steps will be required for the conversion of ethanal into butane-1,3-diol? **[NCERT]**

(a) Acylation, reduction
(b) Cross aldol condensation, dehydration
(c) Aldol condensation, oxidation
(d) Aldol condensation, reduction

52. Which of the following does not undergo benzoin condensation?

(a) Benzene carbaldehyde
(b) *p*-toluene carbaldehyde
(c) Phenylethanal
(d) 4-methoxybenzaldehyde

53. $\phi CHO + NH_3 \longrightarrow$? Product is

(a) $\phi\underset{NH_2}{\overset{H}{C}}-OH$

(b) $\phi CH=NH$

(c) 
(d) 
54. A mixture of benzaldehyde and formaldehyde on heating with aqueous NaOH solution gives

(a) benzyl alcohol and sodium formate
(b) sodium benzoate and methyl alcohol
(c) sodium benzoate and sodium formate
(d) benzyl alcohol and methyl alcohol

55. Match the following.

I. $\phi COCH_3 \longrightarrow \phi CH_2CH_3$	(A) $SnCl_2$
II. $\phi COCH_3 \longrightarrow \phi CH(OH)CH_3$	(B) Zn-Hg/HCl
III. $\phi NO_2 \longrightarrow \phi NHOH$	(C) $NaBH_4$
IV. $\phi CH_2-OTs \rightarrow \phi CH_3$	(D) Zn/NH_4Cl

Codes

(a) (I)-B, (II)-C, (III)-D, (IV)-A
(b) (I)-B, (II)-A, (III)-D, (IV)-C
(c) (I)-B, (II)-A, (III)-C, (IV)-D
(d) (I)-A, (II)-B, (III)-D, (IV)-C

56. φCHO undergoes Claisen condensation with another aldehyde to give cinnamaldehyde. The aldehyde is

(a) formaldehyde (b) acetaldehyde
(c) crotonaldehyde (d) propanaldehyde

57. In a Cannizzaro reaction, the intermediate that will be best hydride donor is

(a) 
(b) 
(c) 
(d) 
58. 
Identify the final product *X*.

(a) 
(b) 
(c) 
(d) 
59. 
The compound *X* is

(a) CH_3-COOH (b) $BrCH_2-COOH$
(c) $(CH_3CO)_2O$ (d) $CHO-COOH$

60. A compound (*A*) (molecular formula—C_8H_8O) on treatment with $NH_2OH \cdot HCl$ gives *B* and *C*. *B* and *C* rearrange to give *D* and *E* respectively on treatment with acid. *B, C, D* and *E* are all isomers of molecular formula (C_8H_9NO). When *D* is boiled with the alcoholic KOH, an oil *F* (C_6H_7N) separates out. *F* reacts rapidly with CH_3COCl to give back *D*. On the other hand, *E* on boiling with alkali followed by acidification gives a white solid *G* ($C_7H_6O_2$). Identify *A*.

(a) 
(b) 
(c) 
(d) 
61. Which of the following statements is correct about a carbonyl group?

(a) The carbonyl carbon is *sp*-hybridised
(b) The carbonyl carbon is sp^3-hybridised
(c) The three groups attached to the carbonyl carbon lie in the same plane
(d) The three groups attached to the carbonyl carbon lie in different planes

62. An organic compound contains 69.77% carbon, 11.63% hydrogen and rest oxygen. The molecular mass of the compound is 86. It does not reduce Tollen's reagent but forms an addition compound with sodium hydrogen sulphite and give positive iodoform test. On vigorous oxidation it gives ethanoic and propanoic acid. Write the possible structure of the compound. **[NCERT]**

(a) $CH_3COCH_2CH_2CH_3$

(b) $CH_3CH{=}C(OH){-}CH_2CH_3$

(c) $CH_3CH_2COCH_2CH_3$

(d) 
Carboxylic Acids

63. Tamarind contains

(a) (+) tartaric acid
(b) (–) tartaric acid
(c) ± tartaric acid
(d) None of these

64. $CH{\equiv}CH \xrightarrow{CH_3MgBr} A \xrightarrow[\text{(ii) } H_3O^+]{\text{(i) } CO_2} B \xrightarrow{HgSO_4/H_2SO_4}$

$D \xleftarrow[\text{(ii) } H^+]{\text{(i)} [Ag(NH_3)_2]^+,\ OH^-} C$

In the given reaction, product *D* is,

(a) 
(b) $CH_2{-}COOH$ / $CH_2{-}COOH$

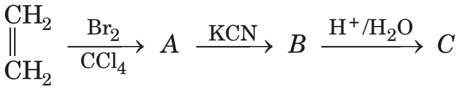
(c) 
(d) 
65. The final product of the following sequence of reaction is



$CH_2{=}CH_2 \xrightarrow[CCl_4]{Br_2} A \xrightarrow{KCN} B \xrightarrow{H^+/H_2O} C$

(a) $CH_2{-}COOH$ / $CH_2{-}COOH$

(b) $CH_2{-}Br$ / $CH_2{-}Br$

(c) $CH_2{-}COOH$ / $CH_2{-}CN$

(d) $CH_2{-}CN$ / $CH_2{-}CN$

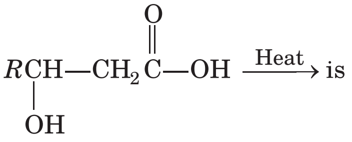
66. The product obtained in the reaction,



$RCH(OH){-}CH_2C(=O){-}OH \xrightarrow{Heat}$ is

(a) 
(b) 
(c) $RCH{=}CHCOOH$

(d) None of the above

67. Which can reduce $RCOOH \longrightarrow RCH_2OH$?

(a) $NaBH_4$
(b) Na/C_2H_5OH
(c) $BH_3/THF/H_3O^+$
(d) H_2/catalyst

68. 
$\underset{[X]}{R{-}\overset{O}{\overset{\|}{C}}{-}OH_2^+} \xleftarrow{H_2SO_4} RCOOH \xrightarrow{H_2SO_4} \underset{[Y]}{R{-}\overset{^+OH}{\overset{\|}{C}}{-}OH}$

Which is more stable ?

(a) *X*
(b) *Y*
(c) Both are equally stable
(d) Can't be predicted

69.  $\xrightarrow{HBr}$? Product is

(a) 
(b) 
(c) 
(d) 
70.

	Column I		**Column II**
I.		(A)	Schmidt
II.	$RCOOH \rightarrow RCH_2COOH$	(B)	Baeyer Villiger
III.	$RCOOH \xrightarrow[H_2O]{N_3H} RNH_2$	(C)	Arndt Eistert

Codes

(a) I–A, II–B, III–C (b) I–C, II–B, III–A

(c) I–B, II–C, III–A (d) None of these

71. Which of the following order represent acidic strength of (I) benzoic acid, (II) 4-nitrobenzoic acids, (III) 3,4-dinitro benzoic acid and (IV) 4-methoxy benzoic acid? **[NCERT]**

(a) $I < II < III < IV$

(b) $IV < I < II < III$

(c) $II < III < I < IV$

(d) $IV < II < III < I$

72. Which statement is correct ?

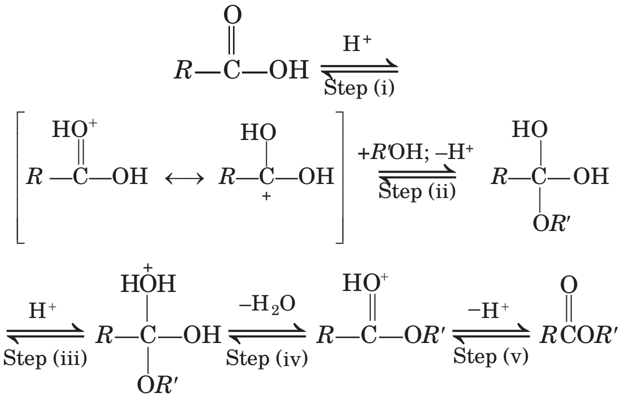
(a) $RCOOOH$ is stronger acid than $RCOOH$

(b) Maleic acid is stronger than fumaric acid

(c) Both (a) and (b)

(d) None of the above

73. The mechanism of ester formation in acidic medium is as follows



The slowest step in the above mechanism is

(a) step (i) (b) step (ii)

(c) step (iii) (d) step (iv)

74. 
Here, A is

(a) 
(b) 
(c) 
(d) reaction not possible

75. Which of the following carboxylic acids undergoes decarboxylation easily ?

(a) $C_6H_5COCH_2COOH$ (b) $C_6H_5COCOOH$

(c)  $C_6H_5CH(OH)COOH$

(d)  $C_6H_5CH(NH_2)COOH$

76. Phthalic acid

$$\text{Phthalic acid} \xrightarrow{\Delta} A \xrightarrow{NH_3} B \xrightarrow[H_2O]{NaOH} C \xrightarrow{Br_2/KOH} D \xrightarrow{HCl} E$$

In this reaction, the product E is

(a) o-nitrobenzoic acid (b) salicylic acid

(c) anthranilic acid (d) crotonic acid

77. Match the following.

I. Claisen condensation	(A) Free radical
II. Allylic bromination	(B) Carbon anion
III. Fries rearrangement	(C) Alkyl migration
IV. Wolff rearrangement	(D) Acyl migration

Codes

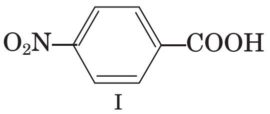
(a) I–B, II–A, III–C, IV–D

(b) I–B, II–A, III–D, IV–C

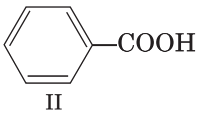
(c) I–A, II–B, III–C, IV–D

(d) I–A, II–B, III–D, IV–C

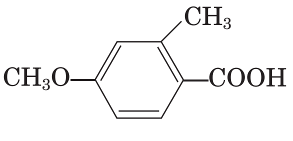
78. Give the order of ease of the esterification of the following acids



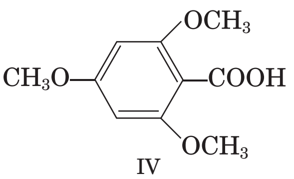
I



II



III



IV

Codes

(a) $I > II > III > IV$ (b) $IV > III > II > I$

(c) $II > I > IV > III$ (d) $I > III > II > IV$

79. In the reaction,

$$C_6H_5COOH + CH_3\overset{*}{O}H \xrightarrow{H^+} \text{Ester + water}$$

(a) isotopically labelled oxygen (O^{18}) is present in water

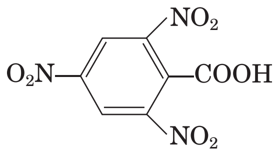
(b) O^{18} is present with ester

(c) O^{18} shifts from acid to alcohol

(d) no reaction takes place

80. Give the order of ease of decarboxylation of the following acids.

$$\underset{I}{CH_3COOH};\quad \underset{II}{CH_2{=}CH{-}CH_2COOH};\quad \underset{III}{CH_2(COOH)_2}$$



IV

(a) I > II > III > IV

(b) III > IV > II > I

(c) IV > III > II > I

(d) I > III > II > IV

Round II (Mixed Bag)

1. $C_4H_{10}O$ gives white precipitate within 5 min with concentrated hydrochloric acid in the presence of anhydrous zinc chloride.

Alcohol can be

(a) 
(b) 
(c) 
(d) 
2. Monochlorination of toluene in sunlight followed by hydrolysis with aqueous NaOH yields. **[NCERT Exemplar]**

(a) *o*-cresol (b) *m*-cresol

(c) 2,4-dihydroxytoluene (d) benzyl alcohol

3. What is the correct order of reactivity of alcohols in the following reaction?

$$R{-}OH + HCl \xrightarrow{ZnCl_2} R{-}Cl + H_2O$$

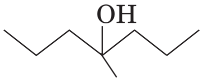
[NCERT Exemplar]

(a) 1° > 2° > 3° (b) 1° < 2° > 3°

(c) 3° > 2° > 1° (d) 3° > 1° > 2°

4. 
A, *A* is

(a) 
(b) 
(c) 
(d) 
5. Which of the following alkene will give the following alcohol? **[NCERT]**



(a) 
(b) 
(c) 
(d) 
6. 2-methoxy butane is obtained by reacting diazomethane with

(a) 2-butanol (b) 1-butanol

(c) 2-butanone (d) butanal

7. 

$$CH_3OH \xrightarrow{CH_2{=}C{=}O} A \xrightarrow{\text{Rearrangement}} CH_3{-}\underset{\underset{O}{\|}}{C}{-}OCH_3$$

In the above reaction, *A* is

(a) $CH_3{-}\underset{OH}{\underset{|}{C}}{=}CH_2$

(b) $CH_2{=}\underset{OH}{\underset{|}{C}}{-}OCH_3$

(c) $CH_2{=}CHOH$ (d) None of these

8. The end product of which of the following reaction is isomer of alcohols?

(a) $C_2H_4 \xrightarrow{B_2H_6} A \xrightarrow[NaOH]{H_2O_2} B$

(b) $CHI_3 \xrightarrow[\Delta]{Ag} A \xrightarrow[Hg^{2+}]{\text{Dil. } H_2SO_4} B \xrightarrow{\text{Reduction}} C$

(c) $C_2H_4 \xrightarrow{HI} A \xrightarrow{\text{Aqueous KOH}} B \xrightarrow[140°C]{\text{Conc. } H_2SO_4} C$

(d) $CH_3MgBr \xrightarrow{CH_2O} A \xrightarrow{H_2O} C$

9. An organic compound C_3H_6O neither gives precipitate with semicarbazide nor reacts with sodium. It could be

(a) CH_3CH_2CHO (b) CH_3COCH_3
(c) $CH_2{=}CHCH_2OH$ (d) $CH_2{=}CHOCH_3$

10. A compound 'A' having the molecular formula $C_5H_{12}O$, on oxidation gives a compound 'B' with molecular formula $C_5H_{10}O$. Compound 'B' gave a 2,4-dinitrophenylhydrazine derivative but did not answer haloform test or silver mirror test. The structure of compound 'A' is

(a) $CH_3CH_2CH_2CH_2CH_2OH$

(b) $CH_3-CH_2-CH_2\underset{\underset{OH}{|}}{CH}-CH_3$

(c) $CH_3-CH_2-\underset{\underset{OH}{|}}{CH}-CH_2-CH_3$

(d) $CH_3-CH_2-\underset{\underset{CH_3}{|}}{CH}-CH_2-OH$

11. An organic compound 'X' with molecular formula, C_7H_8O is insoluble in aqueous $NaHCO_3$ but dissolves in NaOH. When treated with bromine water, 'X' rapidly gives 'Y', $C_7H_5OBr_3$. The compounds 'X' and 'Y' respectively, are

(a) benzyl alcohol and 2,4,6-tribromo-3-methoxybenzene
(b) benzyl alcohol and 2,4,6-tribromo-3-methylphenol
(c) *o*-cresol and 3,4,5-tribromo-2-methylphenol
(d) *m*-cresol and 2,4,6-tribromo-3-methylphenol

12. The products obtained when benzyl phenyl ether is heated with HI in the mole ratio 1 : 1 are

I. phenol II. benzyl alcohol
III. benzyl iodide IV. iodobenzene
(a) I and III only (b) III and IV only
(c) I and IV only (d) II and IV only

13. $(H_3C)_2CH-OH \xrightarrow{P + Br_2} \xrightarrow[ether]{Na} X$, X is

(a) $CH_3-\overset{\overset{CH_3}{|}}{CH}-CH_2-CH_3$

(b) $CH_3-\overset{\overset{CH_3}{|}}{\underset{\underset{CH_3}{|}}{C}}-CH_3$

(c) $(H_3C)_2CH-CH(CH_3)_2$

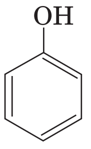
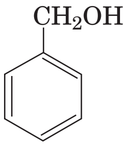
(d) $CH_3-\overset{\overset{CH_3}{|}}{CH}-CH_2CH_2CH_3$

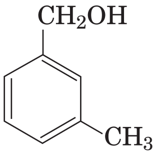
14. Which of the following compounds is aromatic alcohol?



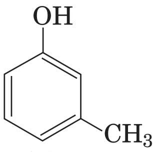
(A)



(B)



(C)



(D)

[NCERT Exemplar]

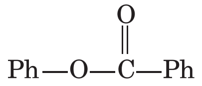
(a) *A, B, C, D*
(b) *A, D*
(c) *B, C*
(d) *A*

15. In the Rosenmund's reaction

$$RCOCl + H_2 \xrightarrow{Pd/BaSO_4} RCHO + HCl$$

$BaSO_4$ here

(a) promotes catalytic activity of Pd
(b) removes the HCl formed in the reaction
(c) deactivates palladium
(d) activates palladium



16. Compound $Ph-O-\overset{\overset{O}{\|}}{C}-Ph$ can be prepared by the reaction of [NCERT Exemplar]

(a) Phenol and benzoic acid in the presence of NaOH
(b) Phenol and benzoyl chloride in the presence of pyridine
(c) phenol and benzoyl chloride in the presence of $ZnCl_2$
(d) phenol and benzaldehyde in the presence of palladium

17. The reagent which does not react with both, acetone and benzaldehyde is [NCERT Exemplar]

(a) sodium hydrogensulphite
(b) phenyl hydrazine
(c) Fehling's solution
(d) Grignard reagent

18. $CH_3-C{\equiv}CH \xrightarrow[1\%\ HgSO_4]{40\%\ H_2SO_4} A \xrightarrow{Isomerisation} CH_3-\underset{\underset{O}{\|}}{C}-CH_3$

Structure of 'A' and type of isomerism in the above reaction are respectively. [NCERT Exemplar]

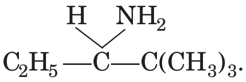
(a) Prop-1-en-2-ol, metamerism
(b) Pro-1-en-1-ol, tautomerism
(c) Prop-2-en-2-ol, geometrical isomerism
(d) Prop-1-en-2-ol, tautomerism

19. Compound *A* when treated with ethyl magnesium iodide in dry ether forms an addition compound which on hydrolysis forms compound *B*. The compound *B* on oxidation form 3-pentanone. Hence, the compound *A* and *B* are

(a) propanal, 3-pentanol (b) pentanol, 3-pentanol

(c) ethanal, pentanal (d) acetone, 3-pentanol

20. A product obtained by the reaction of *X* with hydroxylamine and on further reduction gives



$C_2H_5—\overset{H\ \ NH_2}{C}—C(CH_3)_3$. Hence, the compound *X* can be

(a) 2,2-dimethyl-3-pentanone

(b) 3,3-dimethyl-3-butanone

(c) 1-methyl-3-pentanone

(d) diethyl ketone

21. Hydride ion transfer takes place in

(a) Frankland method

(b) Wurtz reaction

(c) Cannizzaro's reaction

(d) Wolff-Kishner reduction

22. An aromatic compound '*X*' with molecular formula $C_9H_{10}O$ gives the following chemical tests. It

I. forms 2, 4-DNP derivative

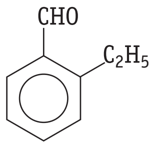
II. reduces Tollen's reagent

III. undergoes Cannizzaro reaction and

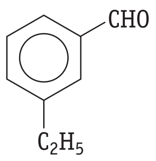
IV. on vigorous oxidation 1,2-benzenedicarboxylic acid is obtained.

X is **[NCERT]**

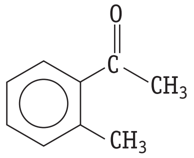
(a)



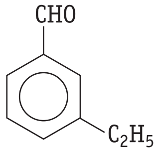
(b)



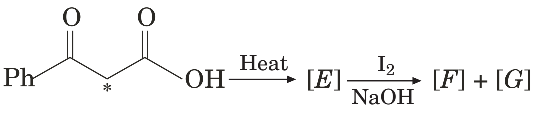
(c)



(d)

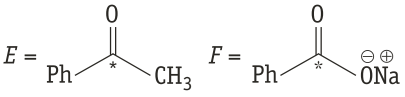


23. In the following reaction sequence, the correct structures of *E, F* and *G* are



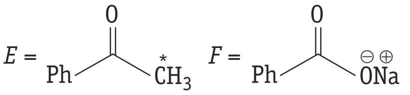
(* implies ^{13}C labelled carbon)

(a)



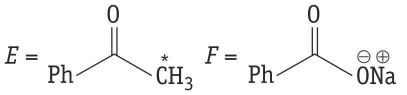
$G = CHI_3$

(b)



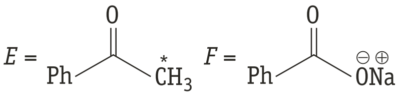
$G = CHI_3$

(c)



$G = \overset{*}{C}HI_3$

(d)

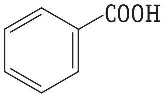


$G = \overset{*}{C}H_3I$

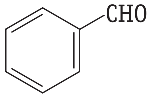
24. The reactant (*X*) in the reaction

$$(X) \xrightarrow[(CH_3CO)_2O]{CH_3COONa} \text{Cinnamic acid, is}$$

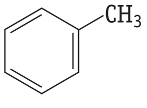
(a)



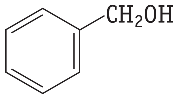
(b)



(c)



(d)



25. Acetyl nitrate is formed when acetic anhydride reacts with

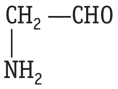
(a) nitrogen pentoxide (b) nitric acid

(c) nitrous acid (d) potassium nitrate

26. $CH_3COOH \xrightarrow{NH_3} \xrightarrow{\Delta}$?

The product of the reaction is isomeric with

(a)



$\underset{NH_2}{CH_2}—CHO$

(b) $CH_3CH{=}NOH$

(c) $HCONH—CH_3$ (d) All of these

27. Match Column I with Column II and choose the correct answer from the codes

Column I	Column II
(A) CH_3CONH_2 and PCl_5	(I) Acid strengthening
(B) $—NO_2$ group	(II) Optically active
(C) Lactic acid	(III) Hydrogen is liberated
(D) CH_3COOH and Na	(IV) Acetonitrile

Codes

	A	B	C	D		A	B	C	D
(a)	I	II	III	IV	(b)	IV	I	II	III
(c)	IV	I	III	II	(d)	III	I	II	IV

28. $CH_3CH_2OH \xrightarrow[I]{Cu,\ 573\ K} X \xrightarrow[II]{[O]} Y \xrightarrow[III]{Br_2,\ P} BrCH_2COOH$

Reactions I, II and III respectively are

(a) reduction, oxidation and substitution

(b) dehydration, oxidation and substitution

(c) dehydrogenation, oxidation and substitution

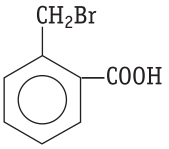
(d) dehydration, oxidation and elimination

29. A colourless water soluble organic liquid decomposes sodium carbonate and liberates CO_2. It produces black precipitate with Tollen's reagent. The liquid is

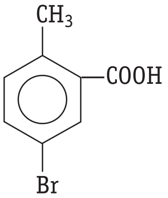
(a) acetaldehyde (b) acetamide
(c) formic acid (d) acetone

30. *o*-toluic acid on reaction with Br_2 + Fe gives

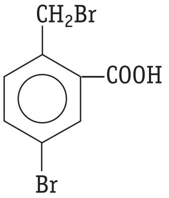
(a)



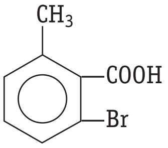
(b)



(c)



(d)



31. On mixing ethyl acetate with aqueous sodium chloride, the composition of the resultant solution is

(a) $CH_3COOC_2H_5$ + NaCl
(b) $C_3COONa + C_2H_5OH$
(c) $CH_3COCl + C_2H_5OH + NaOH$
(d) $CH_3Cl + C_2H_5COONa$

32. Formic acid and acetic acid are distinguished by

(a) $NaHCO_3$ (b) $FeCl_3$
(c) Victor Meyer test (d) Tollen's reagent

33. Acetyl bromide reacts with excess of CH_3MgI followed by treatment with a saturated solution of NH_4Cl to give

(a) acetone
(b) acetamide
(c) 2-methyl-2-propanol
(d) acetyl iodide

34. $C_8H_6O_4 \xrightarrow{\Delta} X \xrightarrow{NH_3} Y$

The compound *X* is

(a) *o*-xylene (b) phthalic acid
(c) phthalic anhydride (d) salicylic acid

35. The reaction involved in the oil of winter green test is salicylic acid $\xrightarrow[\text{Conc } H_2SO_4]{\Delta}$ product. The product is treated with Na_2CO_3 solution. The missing reagent in the above reaction is

(a) phenol (b) NaOH
(c) ethanol (d) methanol

36. An ester (*A*) with molecular formula $C_9H_{10}O_2$ was treated with excess of CH_3MgBr and the complex so formed was treated with H_2SO_4 to give an olefin (*B*). Ozonolysis of (*B*) gave a ketone with molecular formula C_8H_8O which shows positive iodoform test. The structure of (*A*) is

(a) $C_6H_5COOC_2H_5$
(b) $C_6H_5COOC_6H_5$
(c) $C_6H_5COOCH_3$
(d) *p*-$H_3CO—C_6H_4COCH_3$

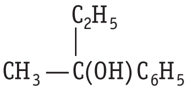
37. In a set of the given reactions, acetic acid yielded a product *C*.

$$CH_3COOH + PCl_5 \longrightarrow A$$

$$A \xrightarrow[\text{anhy. } AlCl_3]{C_6H_6} B \xrightarrow[\text{ether}]{C_6H_5MgBr} C$$

Product *C* would be

(a) $CH_3CH(OH)C_6H_5$

(b)


$CH_3—\overset{\overset{\large C_2H_5}{|}}{C}(OH)C_6H_5$

(c) $CH_3CH(OH)C_2H_5$ (d) $CH_3COC_6H_5$

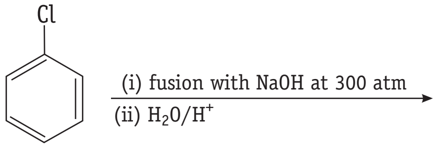
More than One Correct Option

38. Which of the following ae used to convert *R*CHO into RCH_2OH? **[NCERT Exemplar]**

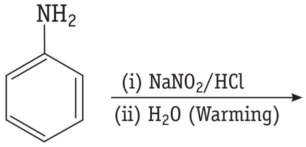
(a) H_2/Pd
(b) $LiAlH_4$
(c) $NaBH_4$
(d) Reaction with *R*Mg*X* followed by hydrolysis

39. Which of the following reactions will yield phenol?

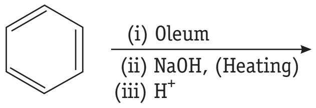
(a)



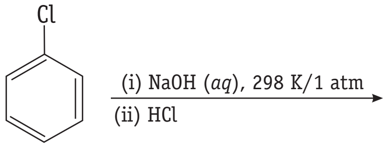
(b)



(c)



(d)



40. Which of the following compounds do not undergo aldol condensation? **[NCERT Exemplar]**

(a) $CH_3—CHO$

(b) 
(c) $CH_3—\overset{\overset{\displaystyle O}{\|}}{C}—CH_3$

(d) $CH_3—\underset{\underset{\displaystyle CH_3}{|}}{\overset{\overset{\displaystyle CH_3}{|}}{C}}—CHO$

41. Which of the following conversions can be carried out by Clemmensen reduction? **[NCERT Exemplar]**

(a) Benzaldehyde into benzyl alcohol
(b) Cyclohexanone into cyclohexane
(c) Benzoyl chloride into benzaldehyde
(d) Benzophenone into diphenyl methane

42. On gently warming, which of the following acids undergo decarboxylation?

(a) $CH_3—\overset{\overset{\displaystyle O}{\|}}{C}—CH_2COOH$

(b) $CH_3—CH_2—CH\begin{cases} COOH \\ COOH \end{cases}$

(c) 
(d) 
Assertion and Reason

Directions (Q. No. 43 to 47) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*), (*d*) *given below*

(a) Statement I is true; Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true; Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

43. Statement I Dehydration of $CH_3CH_2CH(OH)CH_3$ gives $CH_3\,CH_2CH{=}CH_2$ as the minor product and $CH_3\,CH{=}CHCH_3$ as the major product.

Statement II $CH_2{=}CH(OH)CH—CH_3$ can be dehydrated more readily than $CH_3CH_2CH(OH)CH_3$.

44. Statement I Friedel-Crafts reaction between benzene and acetic anhydride in the presence of anhydrous $AlCl_3$ yields acetophenone and not polysubstituted products.

Statement II Acetophenone formed poisons catalyst preventing further reaction.

45. Statement I Pure acetic acid is converted into ice like solid, called glacial acetic acid.

Statement II Acetic acid is stronger than HCOOH.

46. Statement I In sodium formate, both the C—O bonds have same value 1.27 Å.

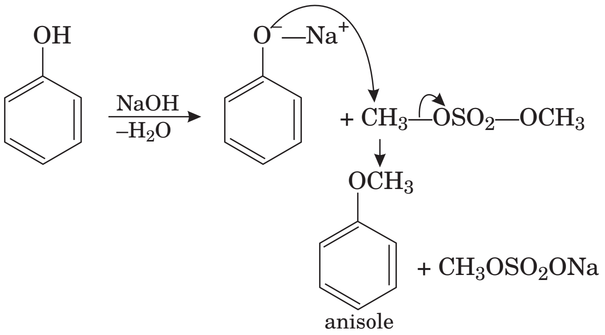
Statement II Same bond length is due to the phenomenon of resonance.

47. Statement I Bond angle in ethers is slightly less than the tetrahedral angle.

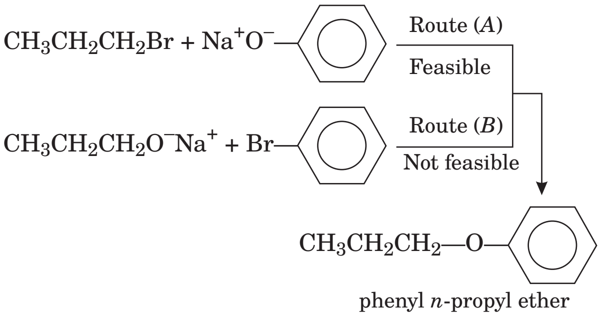
Statement II There is a repulsion between the two bulky (—*R*) groups. **[NCERT Exemplar]**

Comprehension Based Questions

Directions (Q. Nos. 48 to 50) Phenols are converted into alkyl aryl ethers by reaction in alkaline solution with alkyl halides. For the preparation of aryl methyl ethers, dimethy sulphate is frequently used instead of more expensive methyl halides.



The above reaction is familiar Williamson's synthesis which can even be used for the preparation of unsymmetrical ethers like alkyl aryl ethers. Aryl halides can't be used in the Williamsons synthesis because of their low reactivity towards nucleophilic substitution. For the preparation of any alkyl aryl ether, there can be two combinations of reactants, but one combination can usually be ruled out.



48. Ethyl bromide reacts with sodium methoxide to form ethyl methyl ether. It is an example of

(a) S_N2 reaction (b) S_N1 reaction
(c) S_N1 reaction (d) elimination reaction

49. Decreasing order of reactivity of following alkyl halides in the Williamson's ether synthesis is

$\underset{(A)}{(CH_3)_3CCH_2Br}$; $\underset{(B)}{ClCH_2CH{=}CH_2}$; $\underset{(C)}{ClCH_2CH_2CH_3}$, $\underset{(D)}{BrCH_2CH_2CH_3}$

(a) $B > D > C > A$ (b) $A > B > C > D$
(c) $D > C > B > A$ (d) $C > D > B > A$

50. Williamson's synthesis is an example of

(a) electrophilic addition
(b) electrophilic substitution
(c) nucleophilic addition
(d) nucleophilic substitution reaction

Directions (Q. Nos. 51 to 53) Ethanal is heated with a base in two separate test tubes. In one test tube nothing except the two mentioned reactants were present. In second test tube, malonic acid, $CH_2(COOH)_2$ was also added. The final products of both test tubes easily add 1,3-butadiene molecule. The product obtained in the first test tube can be converted into product, identical in all respect, with that obtained in the second test tube.

51. The respective reaction involved in the two test tubes are

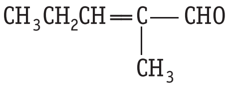
(a) aldol condensation and Cannizaro reaction
(b) aldol condensation and Perkin reaction
(c) aldol condensation and Knoevenagel reaction
(d) aldol condensation and Claisen condensation

52. Which of the final products can undergo Diels' Alder reaction?

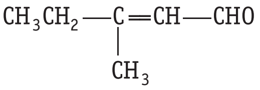
(a) Product from first test tube
(b) Product from second test tube
(c) Products from both test tubes
(d) Neither of the two products

53. What would have been the final product when ethanal of the first test tube is replaced by propanal?

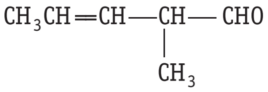
(a) $CH_3CH_2CH{=}CHCH_2CHO$

(b)


$CH_3CH_2CH{=}\underset{\displaystyle CH_3}{\underset{|}{C}}{-}CHO$

(c)


$CH_3CH_2{-}\underset{\displaystyle CH_3}{\underset{|}{C}}{=}CH{-}CHO$

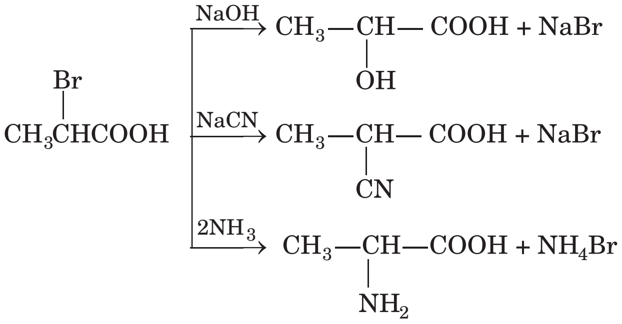
(d)


$CH_3CH{=}CH{-}\underset{\displaystyle CH_3}{\underset{|}{CH}}{-}CHO$

Directions (Q. Nos. 54 to 56) Hell-Volhard-Zelinsky (HVZ) reaction involves the reaction of aliphatic carboxylic acid with bromine in the presence of a trace of PBr_3 to form α-bromocarboxylic acid.

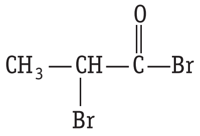
$$CH_3CH_2COOH \xrightarrow{Br_2/PBr_3} CH_3CH_2COBr \longrightarrow$$
$$CH_3CHBrCOOH \xleftarrow{H_2O} CH_3CHBrCOBr$$

α-halogenated acids are infact good starting material for preparing other α-substituted acids as;

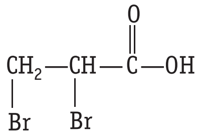


$$\underset{}{CH_3\overset{\displaystyle Br}{\overset{|}{C}H}COOH}\begin{cases}\xrightarrow{NaOH} CH_3{-}\underset{\displaystyle OH}{\underset{|}{CH}}{-}COOH + NaBr\\ \xrightarrow{NaCN} CH_3{-}\underset{\displaystyle CN}{\underset{|}{CH}}{-}COOH + NaBr\\ \xrightarrow{2NH_3} CH_3{-}\underset{\displaystyle NH_2}{\underset{|}{CH}}{-}COOH + NH_4Br\end{cases}$$

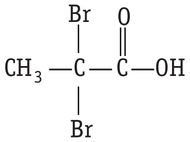
54. When two equivalents of the reagent are used, the product formed in the above reaction will be

(a)


$CH_3{-}\underset{\displaystyle Br}{\underset{|}{CH}}{-}\overset{\displaystyle O}{\overset{||}{C}}{-}Br$

(b)


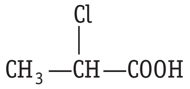
$\underset{\displaystyle Br}{\underset{|}{CH_2}}{-}\underset{\displaystyle Br}{\underset{|}{CH}}{-}\overset{\displaystyle O}{\overset{||}{C}}{-}OH$

(c)


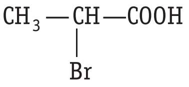
$CH_3{-}\overset{\displaystyle Br}{\overset{|}{\underset{\displaystyle Br}{\underset{|}{C}}}}{-}\overset{\displaystyle O}{\overset{||}{C}}{-}OH$

(d) Both (b) and (c)

55. What product will be formed when PBr_3 in the given set of reactions is replaced by PCl_3?

(a)


$CH_3{-}\overset{\displaystyle Cl}{\overset{|}{CH}}{-}COOH$

(b)


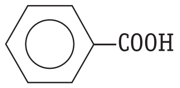
$CH_3{-}\underset{\displaystyle Br}{\underset{|}{CH}}{-}COOH$

(c) Both (a) and (b) (d) Reaction is not possible

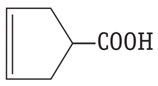
56. Which of the following acid undergoes HVZ reaction?

(a) $CH_3CH{=}CHCOOH$ (b) $CH_3CH_2CBr_2COOH$

(c)



(d)

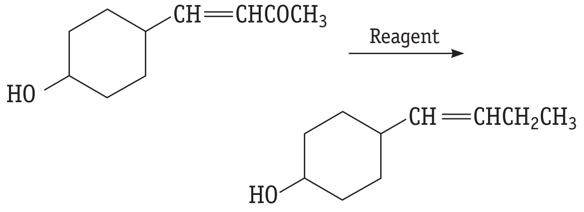


Previous Years' Questions

57. Iodoform can be prepared from all except [AIEEE 2012]

(a) ethyl methyl ketone (b) isopropyl alcohol
(c) 3-methyl-2-butanone (d) isobutyl alcohol

58. In the given transformation, which of the following is the most appropriate reagent? [AIEEE 2012]



(a) $NH_2NH_2, \overset{\ominus}{O}H$ (b) Zn—Hg/HCl
(c) Na, Liq. NH_3 (d) $NaBH_4$

59. Phenol is heated with a solution of mixture of KBr and $KBrO_3$. The major product obtained in the above reaction is [AIEEE 2011]

(a) 2-bromophenol
(b) 3-bromophenol
(c) 4-bromophenol
(d) 2, 4, 6-tribromophenol

60. Which of the following reagents may be used to distinguish between phenol and benzoic acid ? [AIEEE 2011]

(a) Aqueous NaOH (b) Tollen's reagent
(c) Molisch reagent (d) Neutral $FeCl_3$

61. Trichloroacetaldehyde was subjected to Cannizzaro's reaction by using NaOH. The mixture of the products contains sodium trichloroacetate ion and another compound. The other compound is [AIEEE 2011]

(a) 2, 2, 2-trichloroethanol
(b) trichloromethanol
(c) 2, 2, 2-trichloropropanol
(d) chloroform

62. The strongest acid amongst the following compounds is

(a) CH_3COOH (b) HCOOH
(c) $CH_3CH_2CH(Cl)CO_2H$ (d) $ClCH_2CH_2CH_2COOH$

63. Sodium ethoxide has reacted with ethanoyl chloride. The compound that is produced in the above reaction is [AIEEE 2011]

(a) diethyl ether (b) 2-butanone
(c) ethyl chloride (d) ethyl ethanoate

64. Silver mirror test is given by which one of the following compounds? [AIEEE 2011]

(a) Acetaldehyde (b) Acetone
(c) Formaldehyde (d) Benzophenone

65. The correct order of acid strength of the following compounds is

I. Phenol II. *p*-cresol
III. *m*- nitrophenol IV. *p*- nitrophenol

(a) III > II > I > IV (b) IV > III > I > II
(c) II > IV > I > III (d) I > II > IV > III

66. Consider the following reaction,

$$C_2H_5OH + H_2SO_4 \longrightarrow \text{Product}$$

Among the following, which one cannot be formed as a product under any conditions?

(a) Ethyl hydrogen sulphate
(b) Ethylene
(c) Acetylene
(d) Diethyl ether

67. From amongst the following alcohols the one that would react fastest with conc. HCl and anhydrous $ZnCl_2$, is

(a) 2-butanol (b) 2-methylpropan-2-ol
(c) 2-methylpropanol (d) 1-butanol

68. The main product of the following reaction is

$$C_6H_5CH_2CH(OH)CH(CH_3)_2 \xrightarrow{\text{Conc. } H_2SO_4} ?$$

[AIEEE 2010]

(a) 
(b) 
(c) 
(d) 
69. A liquid was mixed with ethanol and a drop of concentrated H_2SO_4 was added. A compound with a fruity smell was formed. The liquid was [AIEEE 2009]

(a) CH_3OH (b) HCHO
(c) CH_3COCH_3 (d) CH_3COOH

70. The major product obtained on interaction of phenol with sodium hydroxide and carbon dioxide is [AIEEE 2009]

(a) benzoic acid (b) salicylaldehyde
(c) salicylic acid (d) phthalic acid

71. Which of the following on heating with aqueous KOH, produces acetaldehyde?

(a) CH_3COCl (b) CH_3CH_2Cl
(c) CH_2ClCH_2Cl (d) CH_3CHCl_2

72. In Cannizzaro reaction given below

$$2PhCHO \xrightarrow{OH^{\ominus}} PhCH_2OH + PhCO_2^{\ominus}$$ [AIEEE 2009]

the slowest step is

(a) the attack of : : $OH^{\ominus}$ at the carboxyl group
(b) the transfer of hydride to the carbonyl group
(c) the abstraction of proton from the carboxylic group
(d) the deprotonation of $PhCH_2OH$

73. Phenol, when it first reacts with concentrated sulphuric acid and then with concentrated nitric acid, gives [AIEEE 2008]

(a) 2, 4, 6-trinitrobenzene
(b) *o*-nitrophenol
(c) *p*-nitrophenol
(d) nitrobenzene

74. In the following sequence of reactions,

$$CH_3CH_2OH \xrightarrow{P + I_2} A \xrightarrow[\text{ether}]{Mg} B \xrightarrow{HCHO} C \xrightarrow{H_2O} D$$

the compound '*D*' is [AIEEE 2007]

(a) butanal (b) *n*-butyl alcohol
(c) *n*-propyl alcohol (d) propanal

75. The compound formed as a result of oxidation of ethyl benzene by $KMnO_4$ is [AIEEE 2007]

(a) benzophenone
(b) acetophenone
(c) benzoic acid
(d) benzyl alcohol

76. Among the following the one that gives positive iodoform test upon reaction with I_2 and NaOH is [AIEEE 2006]

(a) $CH_3CH_2CH(OH)CH_2CH_3$ (b) $C_6H_5CH_2CH_2OH$

(c) 
(d) $PhCHOHCH_3$

77. Phenyl magnesium bromide reacts with methanol to give [AIEEE 2006]

(a) a mixture of anisol and Mg(OH)Br
(b) a mixture of benzene and Mg(OMe)Br
(c) a mixture of toluene and Mg(OH)Br
(d) a mixture of phenol and Mg(Me)Br

78. The structure of the compound that gives a tribromo derivative on treatment with bromine water is [AIEEE 2006]

(a) 
(b) 
(c) 
(d) 
79. 
The electrophile involved in the above reaction is [AIEEE 2006]

(a) dichloromethyl cation ($\overset{\oplus}{C}HCl_2$)
(b) dichlorocarbene ($:CCl_2$)
(c) trichloromethyl anion ($\bar{C}Cl_3$)
(d) formyl cation ($\overset{\oplus}{C}HO$)

80. The increasing order of the rate of HCN addition to compounds I-IV is [AIEEE 2006]

I. HCHO
II. CH_3COCH_3
III. $PhCOCH_3$
IV. PhCOPh

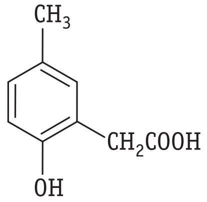
(a) I < II < III < IV
(b) IV < II < III < I
(c) IV < III < II < I
(d) III < IV < II < I

81. Acid catalysed hydration of alkenes except ethene leads to the formation of [AIEEE 2005]

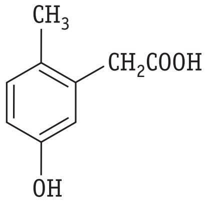
(a) mixture of secondary and tertiary alcohols
(b) mixture of primary and secondary alcohols
(c) secondary or tertiary alcohol
(d) primary alcohol

82. *p*-cresol reacts with chloroform in alkaline medium to give the compound *A* which adds hydrogen cyanide to form the compound *B*. The latter, on acidic hydrolysis gives chiral carboxylic acid. The structure of the carboxylic acid is [AIEEE 2005]

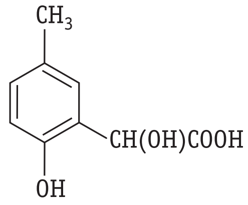
(a)



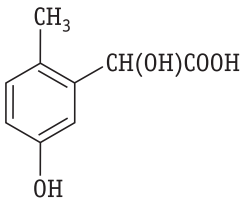
(b)



(c)



(d)



83. The best reagent to convert pent-3-en-2-ol into pent-3-en-2-one is **[AIEEE 2005]**

(a) pyridinium chloro-chromate
(b) chromic anhydride in glacial acetic acid
(c) acidic dichromate
(d) acidic permanganate

84. Which one of the following undergoes reaction with 50% sodium hydroxide solution to give the corresponding alcohol and acid ? **[AIEEE 2004]**

(a) Phenol (b) Benzaldehyde
(c) Butanal (d) Benzoic acid

85. Consider the acidity of the carboxylic acids :

I. PhCOOH II. *o*-$NO_2C_6H_4COOH$
III. *p*-$NO_2C_6H_4COOH$ IV. *m*-$NO_2C_6H_4COOH$

Which of the following order is correct? **[AIEEE 2004]**

(a) I > II > III > IV (b) II > IV > III > I
(c) II > IV > I > III (d) II > III > IV > I

86. During dehydration of alcohols to alkenes by heating with concentrated H_2SO_4, the initiation step is **[AIEEE 2003]**

(a) protonation of alcohol molecule
(b) formation of carbocation
(c) elimination of water
(d) formation of an ester

87. The general formula $C_nH_{2n}O_2$ could be for open chain **[AIEEE 2003]**

(a) diketones (b) carboxylic acids
(c) diols (d) dialdehydes

88. When $CH_2{=}CH{-}COOH$ is reduced with $LiAlH_4$, the compound obtained will be **[AIEEE 2003]**

(a) $CH_3{-}CH_2{-}COOH$
(b) $CH_2{=}CH{-}CH_2OH$
(d) $CH_2{=}CH{-}CH_2OH$
(c) $CH_3{-}CH_2{-}CHO$

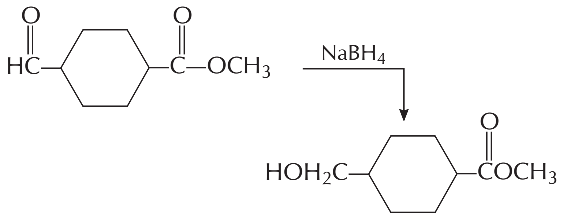
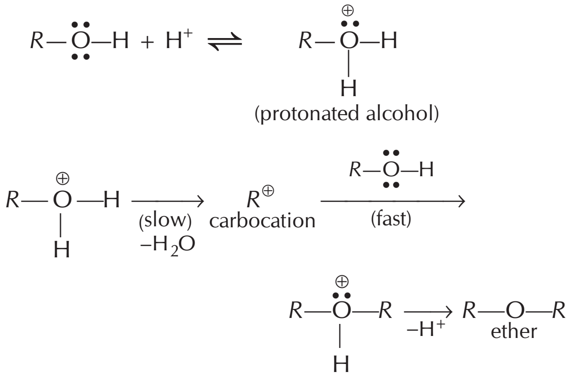
the Guidance

Round I

1.



2. Alcohol is initially protonated by the acid to form protonated alcohol or oxonium ion. It is then attacked by a second molecule of alcohol which acts as nucleophile.

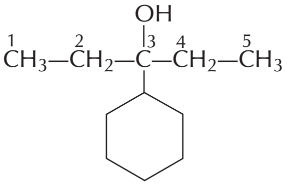


$$R-\ddot{O}-H + H^+ \rightleftharpoons R-\overset{\oplus}{O}(H)-H$$

(protonated alcohol)

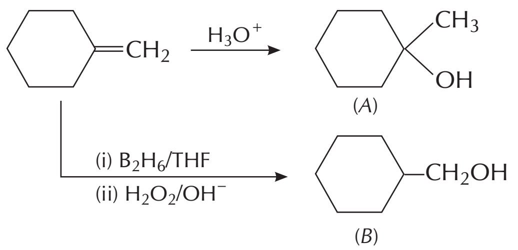
$$R-\overset{\oplus}{O}(H)-H \xrightarrow[-H_2O]{(slow)} \underset{\text{carbocation}}{R^{\oplus}} \xrightarrow[(fast)]{R-\ddot{O}-H} R-\overset{\oplus}{\ddot{O}}(H)-R \xrightarrow{-H^+} \underset{\text{ether}}{R-O-R}$$

3.

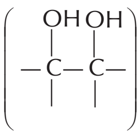


3-cyclohexylpentan-3-ol

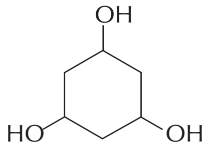
4.



5. All those compounds which have



groups are oxidised by periodic acid (HIO_4). Thus,

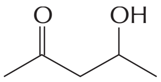


is not oxidised.

6. Alcohols are more acidic than alkynes but less acidic than water thus, the correct order of acidity is

$$H_2O > 1° > 2° > 3° > RC\equiv CH$$

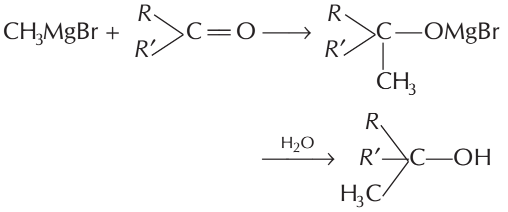
9. Greater the conjugation, greater the stability and hence, easier the dehydration. Thus, in acidic condition



will most readily be dehydrated.

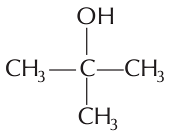
10. The order of reactivity depends upon the stability of the carbocation formed *i.e.*, $FCH_2\overset{+}{C}HCH_3$, $FCH_2CH_2\overset{+}{C}HCH_3$, $CH_3\overset{+}{C}HCH_3$ and $Ph\overset{+}{C}H_2$. The stability order of carbocations is $Ph\overset{+}{C}H_2 > CH_3\overset{+}{C}HCH_3 > FCH_2CH_2\overset{+}{C}HCH_3 > FCH_2\overset{+}{C}HCH_3$. Thus, the order of reactivity follows the order IV > III > II > I.

11. Since carbonyl compounds give alcohols with Grignard regent, so we take a general carbonyl compound $R_2C=O$.



$$CH_3MgBr + \begin{matrix}R\\R'\end{matrix}\!\!>C=O \longrightarrow \begin{matrix}R\\R'\end{matrix}\!\!>C(CH_3)-OMgBr \xrightarrow{H_2O} R'(R)(H_3C)C-OH$$

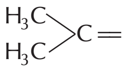
The structure of 2-methyl propan-2-al is



$$CH_3-C(OH)(CH_3)-CH_3$$

Thus, R and R' must be CH_3.

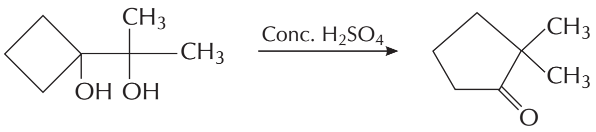
Therefore, X is



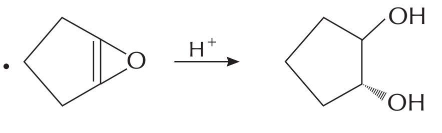
(propanone)

$$\begin{matrix}H_3C\\H_3C\end{matrix}\!\!>C=O$$

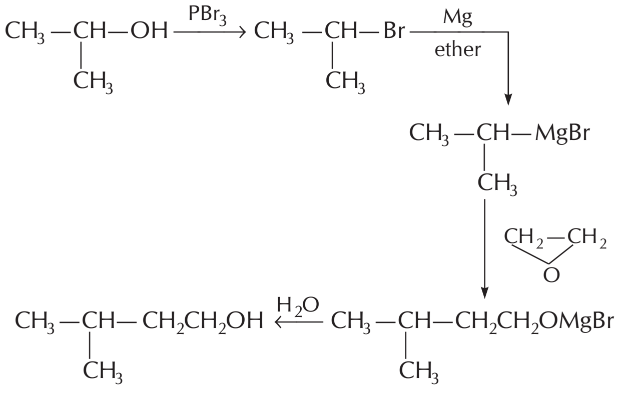
12. The pinacol-pinacolone rearrangement involves dehydration of diols through the formation of carbocation intermediate which rearranges to more stable compound.



13.



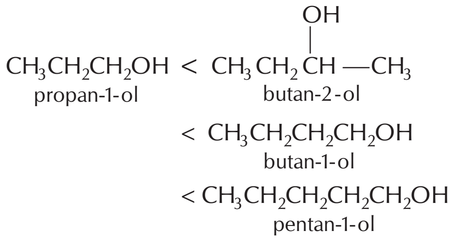
14.



3-methylbutanol

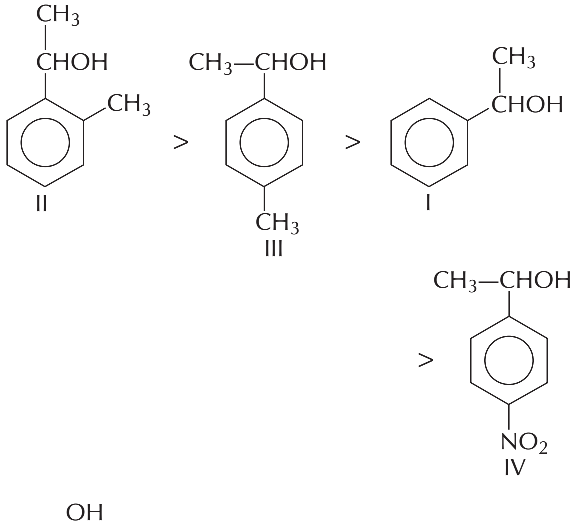
15. Boiling points of alcohols increases with molecular weight. Alcohols with same molecular weight are expected to have almost same boiling point however two more factor other than molecular weight are important, they are namely H-bonding and surface area. Both these factors are least in 3° alcohols and maximum in 1° alcohols.

Therefore, the correct order of boiling points of alcohols will be

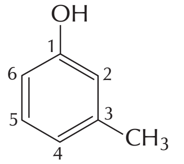


$$\underset{\text{propan-1-ol}}{CH_3CH_2CH_2OH} < \underset{\text{butan-2-ol}}{CH_3CH_2\overset{OH}{\overset{|}{C}H}—CH_3} < \underset{\text{butan-1-ol}}{CH_3CH_2CH_2CH_2OH} < \underset{\text{pentan-1-ol}}{CH_3CH_2CH_2CH_2CH_2OH}$$

16. In the given compounds, correct order of dehydration is

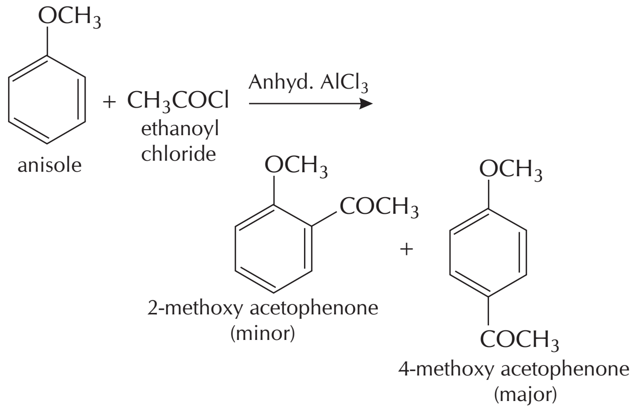


17.

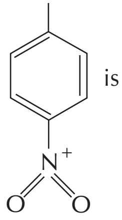


IUPAC name is 3-methylphenol.

18. Friedel–Crafts acetylation of anisole



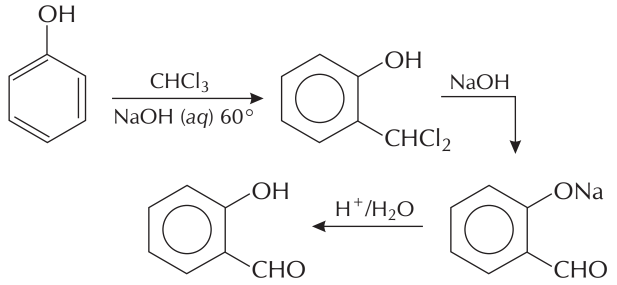
19.



is not a resonating structure of *p*-nitrophenoxide.

Since, N being an element of second period can't contain more than 10 electrons in its valence shell.

20. Phenol, on refluxing with chloroform and sodium hydroxide followed by hydrolysis yields *o*-hydroxy benzaldehyde.



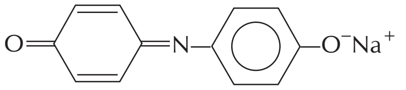
salicylaldehyde

21. Phenol gives Libermann's nitroso reaction.

$$\text{Phenol in conc. } H_2SO_4 \xrightarrow[\text{excess of water}]{NaNO_2} \text{Red colour}$$

$$\xrightarrow[\text{(Excess)}]{NaOH} \text{Blue colour}$$

This blue colour is formed due to the formation of



22. Phenols are acidic in nature due to resonance stabilisation of phenoxide ion. Presence of electron withdrawing groups (such as $—NO_2$, $—X$, $—NR_3^+$, $—CHO$, $—COX$, $—COOR$, $—CN$) in the ring stabilise phenoxide ion and increases the acidic nature of phenols. On the other hand, presence of electron releasing groups (such as $—CH_3$, $—OR$) in the ring destabilises the phenoxide ion and decreases the acidic nature of phenols.

Furthermore *meta*-isomer is less acidic than *p*-and *o*-isomers because it is stabilised by inductive effect only.

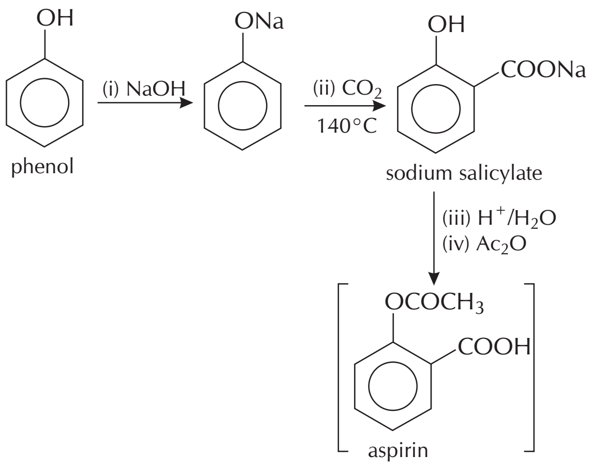
Thus, correct order of acidic strength is II > IV > I > III > V.

23. $C_6H_5O^-$ is a weaker nucleophile than $C_2H_5O^-$. Therefore, the better nucleophile, *i.e.*, $C_2H_5O^-$ will attack C_2H_5I to form diethyl ether.

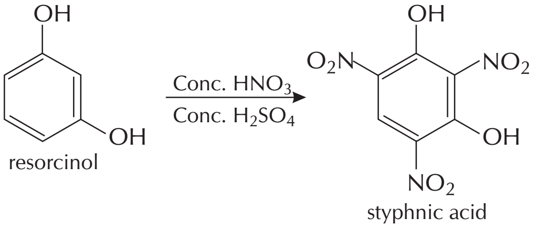
$$C_6H_5OH + \underset{\substack{\text{stronger}\\ \text{nucleophile}}}{C_2H_5O^-} \longrightarrow \underset{\substack{\text{weak}\\ \text{nucleophile}}}{C_6H_5O^-} + C_2H_5OH$$

$$C_2H_5O^- + CH_3-\overset{+\delta}{CH_2}-\overset{-\delta}{I} \longrightarrow \underset{\text{diethyl ether}}{CH_3CH_2-O-CH_2CH_3} + I^-$$

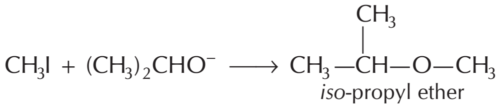
24.



27.



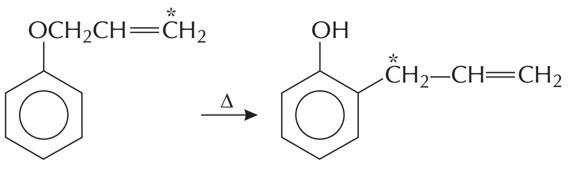
28.



$$CH_3I + (CH_3)_2CHO^- \longrightarrow \underset{\textit{iso}\text{-propyl ether}}{CH_3-\overset{\overset{\displaystyle CH_3}{|}}{CH}-O-CH_3}$$

29. In the presence of air and light, ether form peroxides which cause explosion during distillation.

31.



32. Bulkier the alkyl groups in the ether, greater is the C—O—C bond angle due to steric factor.

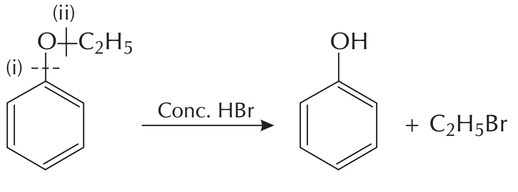
33. 1° alkyl halides on treatment with an alkoxide ion tend to undergo substitution to form ethers. So, sodium tert butoxide and ethyl bromide reagent is used.

34. Peroxide will oxidise Fe^{2+} to Fe^{3+} which gives a blood red colour with KCNS.

$$O_2^{2-} + 2Fe^{2+} + 4H^+ \longrightarrow 2Fe^{3+} + 2H_2O$$

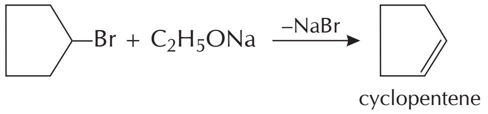
$$Fe^{3+} + 3KCNS \longrightarrow \underset{\text{(blood red colour)}}{Fe(CNS)_3} + 3K^+$$

35.

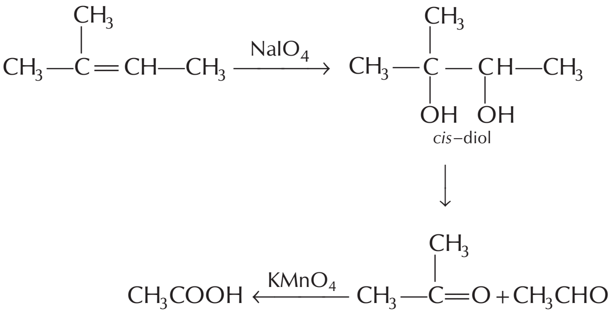


Breaking bond (i) is difficult as this bond has a partial double bond character due to resonance.

36. 2° cyclic alkyl halides tend to undergo elimination. Thus, bromocyclopentane on treatment with sodium ethoxide (a strong base) gives cyclopentane rather than cyclophenyl ethyl ether.



37.



$$CH_3-\overset{\overset{\displaystyle CH_3}{|}}{C}=CH-CH_3 \xrightarrow{NaIO_4} CH_3-\underset{\underset{\displaystyle OH}{|}}{\overset{\overset{\displaystyle CH_3}{|}}{C}}-\underset{\underset{\displaystyle OH}{|}}{CH}-CH_3$$

cis–diol

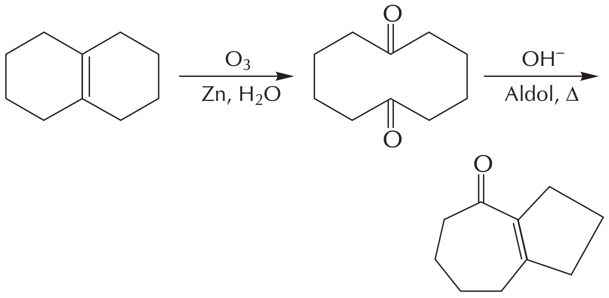
$$\downarrow$$

$$CH_3COOH \xleftarrow{KMnO_4} CH_3-\overset{\overset{\displaystyle CH_3}{|}}{C}=O + CH_3CHO$$

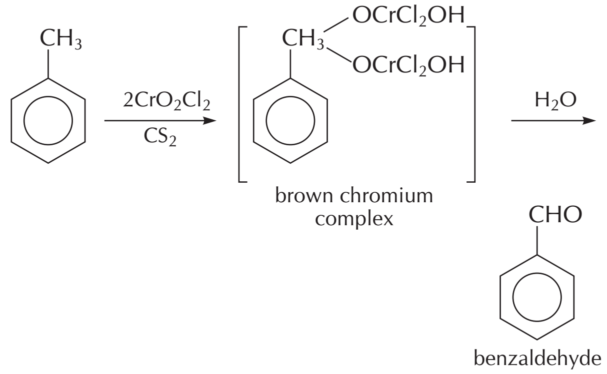
38. Boiling point is related to attractive forces. Stronger the attractive forces, higher is the boiling point. Hydrocarbons are non-polar having weakest attractive forces; Ethers are polar (dipolar forces); Aldehydes have stronger dipolar interactions; Alcohols have maximum inter molecular forces due to hydrogen bonding. Thus the order of boiling point is

$$CH_3CH_2CH_3 < CH_3OCH_3 < CH_3CHO < CH_3CH_2OH$$

39.



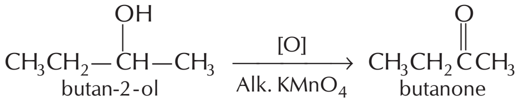
41. Toluene can be oxidised to benzaldehyde with a solution of chromyl chloride (CrO_2Cl_2) in CS_2 or CCl_4. This is known as Etard's reaction.



Further oxidation of benzaldehyde to benzoic acid is avoided by protection of carbonyl group.

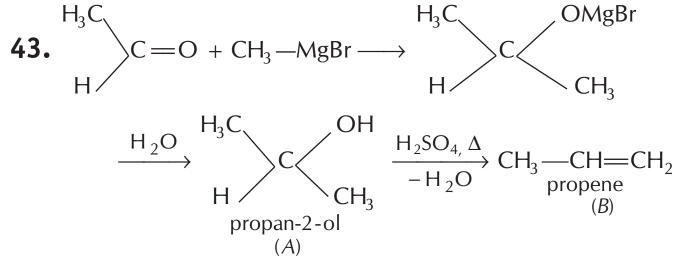
42. Alkaline $KMnO_4$ is a strong oxidising agent. It oxidises primary alcohols into aldehydes and secondary alcohols into ketones.

$$\underset{\text{butan-1-ol}}{CH_3CH_2CH_2CH_2OH} \xrightarrow[\text{Alk. }KMnO_4]{[O]} \underset{\text{butanal}}{CH_3CH_2CH_2CHO}$$



$$\underset{\text{butan-2-ol}}{CH_3CH_2—\overset{\overset{OH}{|}}{C}H—CH_3} \xrightarrow[\text{Alk. }KMnO_4]{[O]} \underset{\text{butanone}}{CH_3CH_2\overset{\overset{O}{\|}}{C}CH_3}$$

43.

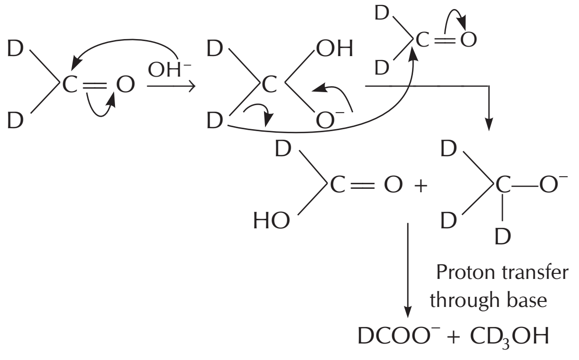


$$\underset{(B)}{6CH_3—CH=CH_2} + B_2H_6 \xrightarrow[\text{oxidation}]{\text{Hydroboration}}$$

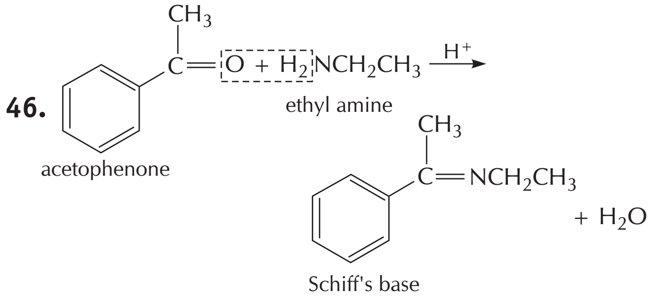
$$\underset{\text{tripropyl borane}}{(2CH_3CH_2CH_2)_3B} \xrightarrow[-2H_3BO_3]{6H_2O_2} \underset{\substack{\text{propan-1-ol}\\(C)}}{6CH_3CH_2CH_2OH}$$

It is clear that compound (*A*) and (*C*) are position isomers.

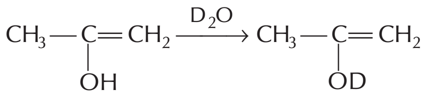
45. Cannizzaro reaction takes place as,



46.

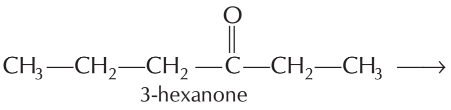


47. After treatment with D_2O, the H^+ ion of —OH group is replaced by D^+ ion, because of being more reactive than deuterium.



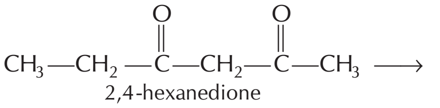
$$CH_3—\underset{\underset{OH}{|}}{C}=CH_2 \xrightarrow{D_2O} CH_3—\underset{\underset{OD}{|}}{C}=CH_2$$

48. A compound that contains a —CH_2— or —CH— group flanked by two electron-withdrawing group such as C=O group, becomes acidic compound and hydrogen atoms are called acidic hydrogen.



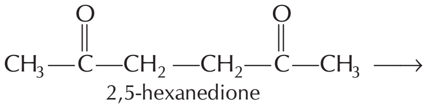
$$\underset{\text{3-hexanone}}{CH_3—CH_2—CH_2—\overset{\overset{O}{\|}}{C}—CH_2—CH_3} \longrightarrow$$

(contains no acidic hydrogen)



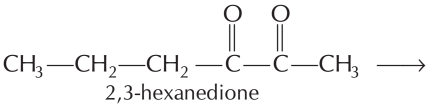
$$\underset{\text{2,4-hexanedione}}{CH_3—CH_2—\overset{\overset{O}{\|}}{C}—CH_2—\overset{\overset{O}{\|}}{C}—CH_3} \longrightarrow$$

(contains 2 acidic hydrogen)



$$\underset{\text{2,5-hexanedione}}{CH_3—\overset{\overset{O}{\|}}{C}—CH_2—CH_2—\overset{\overset{O}{\|}}{C}—CH_3} \longrightarrow$$

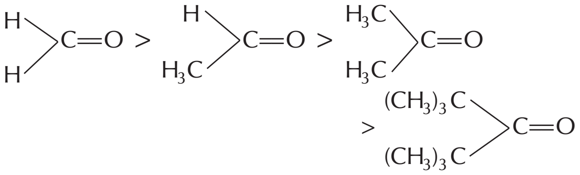
(contains no acidic hydrogen)



$$\underset{\text{2,3-hexanedione}}{CH_3—CH_2—CH_2—\overset{\overset{O}{\|}}{C}—\overset{\overset{O}{\|}}{C}—CH_3} \longrightarrow$$

(contains no acidic hydrogen)

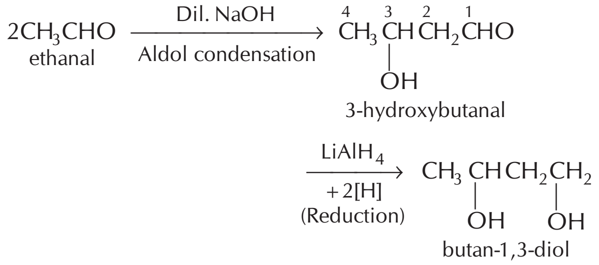
49. As the number and the size of the alkyl groups increases, reactivity decreases. Hence, the reactivity order is



50. When addition of HCN takes place at α, β-unsaturated carbonyl compounds, it gives β-cyano compounds.

$$CH_2=CH—\overset{\overset{O}{\|}}{C}—CH_3 + HCN \xrightarrow{OH^-} NC—CH_2CH_2\overset{\overset{O}{\|}}{C}CH_3$$

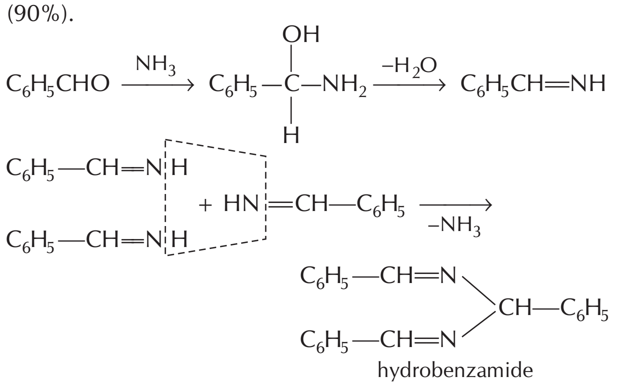
51. Ethanal to butane-1,3-diol



$$\underset{\text{ethanal}}{2CH_3CHO} \xrightarrow[\text{Aldol condensation}]{\text{Dil. NaOH}} \underset{\text{3-hydroxybutanal}}{\overset{4}{C}H_3\overset{3}{C}H(OH)\overset{2}{C}H_2\overset{1}{C}HO}$$

$$\xrightarrow[\substack{+2[H] \\ \text{(Reduction)}}]{\text{LiAlH}_4} \underset{\text{butan-1,3-diol}}{CH_3CH(OH)CH_2CH_2OH}$$

53. Benzaldehyde does not yield a simple addition product with ammonia, but forms a complex product, hydrobenzamide (90%).



$$C_6H_5CHO \xrightarrow{NH_3} C_6H_5-\underset{H}{\overset{OH}{C}}-NH_2 \xrightarrow{-H_2O} C_6H_5CH{=}NH$$

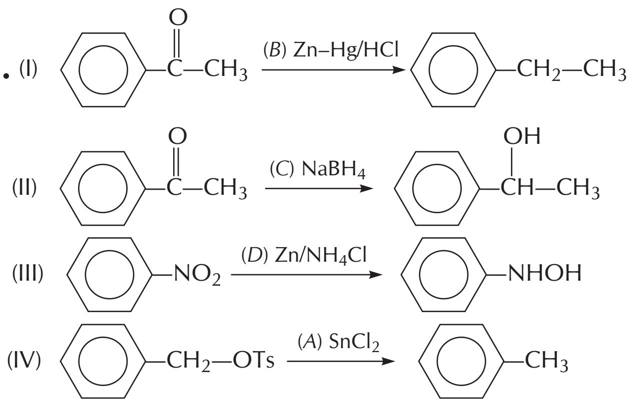
$$2\,C_6H_5-CH{=}NH + HN{=}CH-C_6H_5 \xrightarrow[-NH_3]{} (C_6H_5-CH{=}N)_2CH-C_6H_5$$

hydrobenzamide

54. In Cannizzaro reaction when formaldehyde reacts with other aldehydes lacking α-hydrogen, it is always oxidised and other aldehyde is reduced.

$$HCHO + C_6H_5CHO \xrightarrow[\Delta]{NaOH} HCOO^-Na^+ + C_6H_5CH_2OH$$

55.

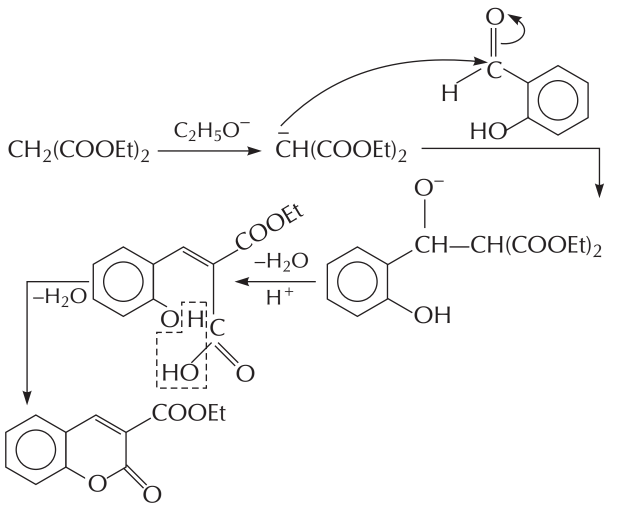


56. Cinnamaldehyde is prepared by the Claisen reaction between benzaldehyde and acetaldehyde.

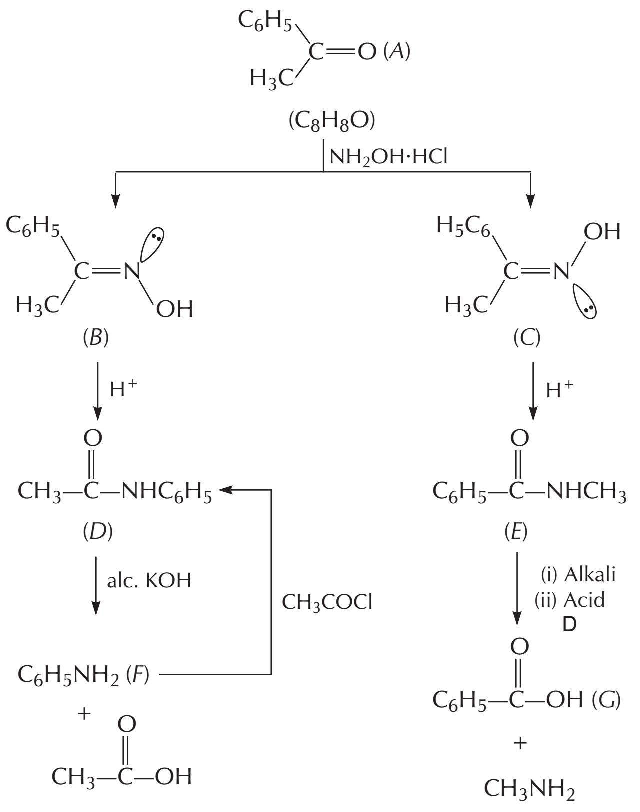
$$C_6H_5CHO + CH_3CHO \xrightarrow{NaOH} \underset{\text{cinnamaldehyde}}{C_6H_5CH{=}CHCHO} + H_2O$$

57. The effect of electron-withdrawing substituent in the benzene ring fastens the Cannizzaro reaction.

58. Formation of α, β-unsaturated carboxylic acid by the action of acetic anhydride and sodium acetate on aromatic aldehyde is known as Perkin reaction. The other Perkin like condensation involve condensation of aromatic aldehyde and α-hydrogen containing compound.



60. The compound is acetophenone.



61. In the carbonyl group, carbon atom is in a state of sp^2 hybridisation. One sp^2 hybrid orbital overlap with a unhybridised *p*-orbital of oxygen to form C—O σ-bond. The remaining two sp^2-orbitals of carbon form σ-bonds with two alkyl groups. Here, all thegroups lie in the same plane.

62. ***Step* I** To determine the molecular formula of the compound.

Element	Percentage	Atomic mass	No. of moles	Simplest molar ratio
C	69.77	12	$\frac{69.77}{12} = 5.81$	$\frac{5.81}{1.16} = 5$
H	11.63	1	$\frac{11.63}{1} = 11.63$	$\frac{11.63}{1.16} = 10$
O	(100 − 69.77 − 11.63) = 18.60	16	$\frac{18.60}{16} = 1.16$	$\frac{1.16}{1.16} = 1$

Empirical formula of the given organic compound = $C_5H_{10}O$.

Molecular formula = $n \times$ (empirical formula)

$$\text{where, } n = \frac{\text{Molecular mass of the compound}}{\text{Empirical formula mass of the compound}}$$

Given, molecular mass = 86

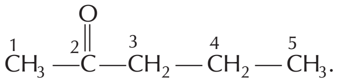
Empirical formula mass of $C_5H_{10}O = (12 \times 5) + (10 \times 1) + (16) = 60 + 10 + 16 = 86$

$$\therefore \quad n = \frac{86}{86} = 1$$

$$\text{Molecular formula} = 1 \times C_5H_{10}O = C_5H_{10}O$$

Thus the structure of the compound can be predicted as

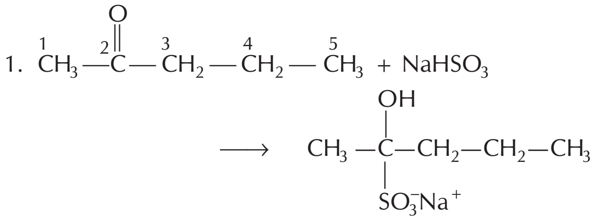
1. Formation of addition compound with $NaHSO_3$ depicts the presence of aldehyde or ketone group.
2. The given compound does not reduce Tollen's reagent but gives positive iodoform test, so it is a methyl ketone.
3. On oxidation, the compound forms a mixture of ethanoic and propanoic acid, so it is



$$\overset{1}{CH_3}-\overset{\overset{O}{\|}}{\underset{2}{C}}-\overset{3}{CH_2}-\overset{4}{CH_2}-\overset{5}{CH_3}.$$

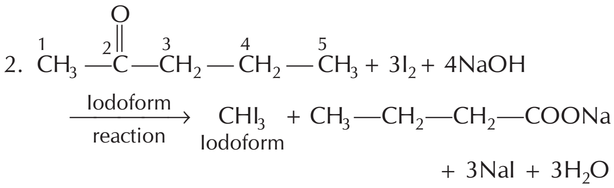
pentan-2-one

The reaction occurring can be shown as

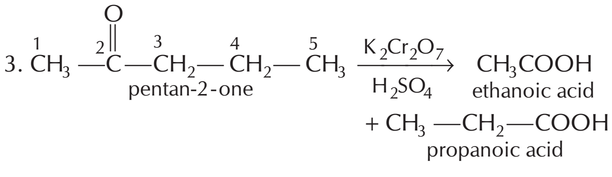


$$1.\ \overset{1}{CH_3}-\overset{\overset{O}{\|}}{\underset{2}{C}}-\overset{3}{CH_2}-\overset{4}{CH_2}-\overset{5}{CH_3} + NaHSO_3 \longrightarrow CH_3-\underset{SO_3^-Na^+}{\overset{OH}{C}}-CH_2-CH_2-CH_3$$

sodium bisulphite addition product



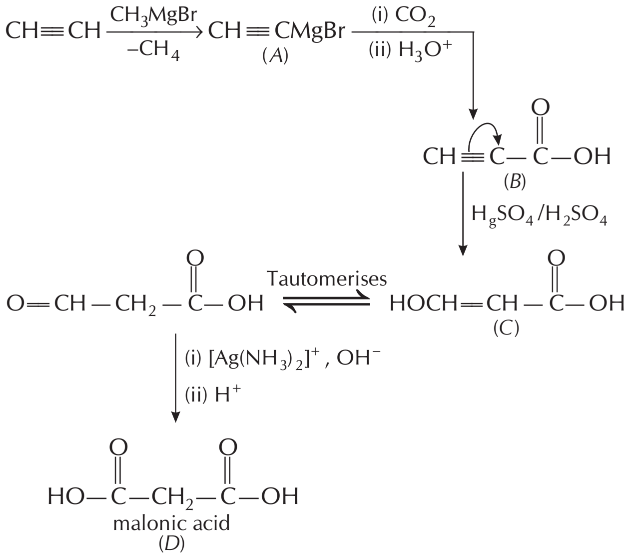
$$2.\ \overset{1}{CH_3}-\overset{\overset{O}{\|}}{\underset{2}{C}}-\overset{3}{CH_2}-\overset{4}{CH_2}-\overset{5}{CH_3} + 3I_2 + 4NaOH \xrightarrow[\text{reaction}]{\text{Iodoform}} \underset{\text{Iodoform}}{CHI_3} + CH_3-CH_2-CH_2-COONa + 3NaI + 3H_2O$$



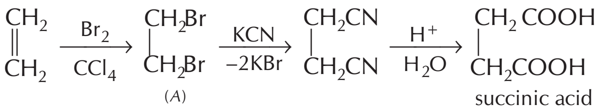
$$3.\ \overset{1}{CH_3}-\overset{\overset{O}{\|}}{\underset{2}{C}}-\overset{3}{CH_2}-\overset{4}{CH_2}-\overset{5}{CH_3} \xrightarrow[H_2SO_4]{K_2Cr_2O_7} \underset{\text{ethanoic acid}}{CH_3COOH} + \underset{\text{propanoic acid}}{CH_3-CH_2-COOH}$$

pentan-2-one

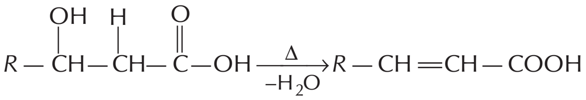
64.



65.



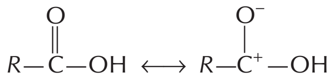
66.



$$R-\overset{OH}{\underset{|}{CH}}-\overset{H}{\underset{|}{CH}}-\overset{\overset{O}{\|}}{C}-OH \xrightarrow[-H_2O]{\Delta} R-CH=CH-COOH$$

67. The reduction of carboxylic acids to alcohols is carried out by $LiAlH_4$ and boranes (BH_3 or B_2H_6) in THF.

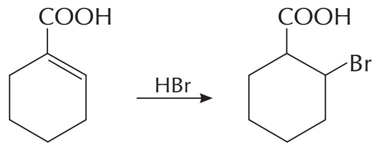
68. In carboxylic acid, the oxygen attached to carboxyl carbon is more electronegative and withdraws the electrons of bond.



$$R-\overset{\overset{O}{\|}}{C}-OH \longleftrightarrow R-\overset{\overset{O^-}{|}}{C^+}-OH$$

Hence, protonation occurs at the carboxyl oxygen.

69. α, β-unsaturated acids add on halogen acids. The mode of addition is contrary to Markownikoff's rule and may be described to the inductive effect of the carboxyl group.



71. Presence of electron withdrawing group (EWG) makes an acid more acidic. As the distance between EWG and —COOH increases, acidity decreases.

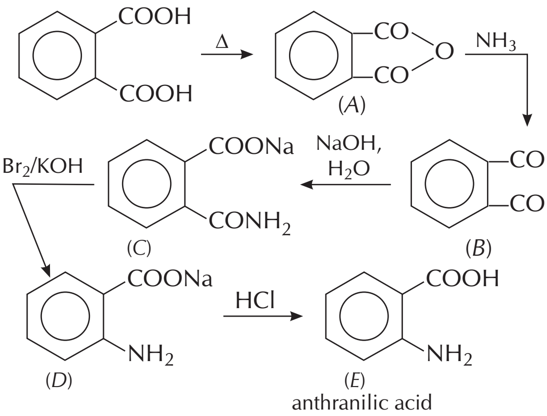
Electron donating group (—OCH_3) decreases the acidic strength. Therefore, increasing order of acidic strength is 4-methoxy benzoic acid < benzoic acid < 4-nitrobenzoic acid < 3,4-dinitrobenzoic acid.

72. Maleic acid contains intramolecular hydrogen bonding while fumaric acid contains intermolecular hydrogen bonding. Thus, maleic acid forms more stable maleate ion after the removal of H^+. Hence, maleic acid is a stronger acid than fumaric acid.

75. β-keto acids are the carboxylic acids that undergo decarboxylation easily.

$$C_6H_5COCH_2\,COOH \xrightarrow{\Delta} C_6H_5COCH_3$$

76.



78. As —CH_3 group has a strong $+I$ effect and —OCH_3 group has a weak $-I$ effect but strong $+R$ effect, hence they increase the electron density on oxygen atom and O—H bond becomes stronger. On the other hand, —NO_2 group has a strong $-I$ and $-R$ effect. It withdraws electrons from benzene ring as well as oxygen atom of —OH group and proton is easily removed. Thus, order of esterification is I > II > III > IV.

79. Carbonic acid is less acidic than carboxylic acids whereas more acidic than phenols and alcohols. Hence, order of acidic strength

$$RCOOH > H_2CO_3 > C_6H_5OH > ROH$$

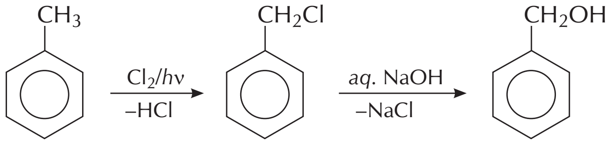
80. In 2,4,6-trinitrobenzoic acid, the decarboxylation takes place most easily, because of $-I$ effect of nitro group, whereas in the dicarboxylic acid with one carbon atom having two carboxylic group it is also easier to remove CO_2. Hence, the order of ease of decarboxylation is

IV > III > II > I

Round II

1. Secondary alcohols give turbidity within 5 min with Lucas reagent.

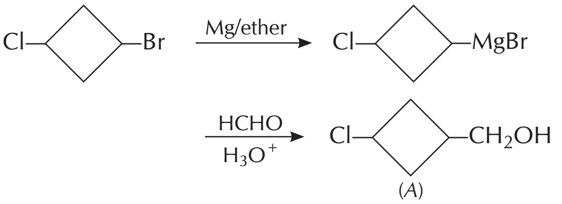
2. On monochlorination in the presence of sunlight, toluene converts into benzyl chloride which on hydrolysis with *aq* NaOH yields benzyl alcohol.



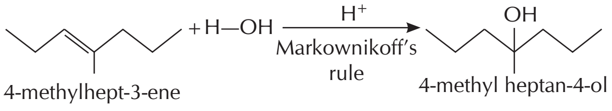
3. Lucas test is used to distinguish between primary, secondary and tertiary alcohols. A mixture of conc HCl + anhy $ZnCl_2$ is called Lucas reagent. In Lucas test, tertiary alcohols immediately give turbidity while secondary alcohols give turbidity after 5 min. Primary alcohols give no reaction with Lucas reagent at room temperature.

Thus, order of reactivity of alcohols is 3° > 2° > 1.

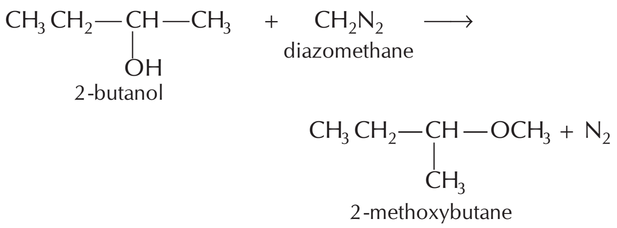
4. C—Br bond is weaker as compared to C—Cl bond.



5.



6.

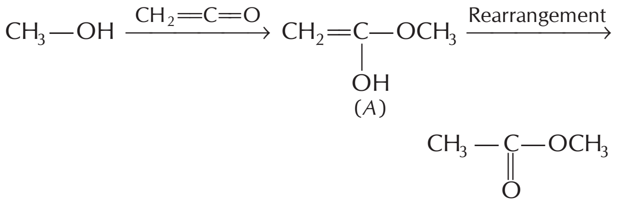


$$CH_3CH_2-\underset{\underset{OH}{|}}{CH}-CH_3 + \underset{\text{diazomethane}}{CH_2N_2} \longrightarrow CH_3CH_2-\underset{\underset{CH_3}{|}}{CH}-OCH_3 + N_2$$

2-butanol

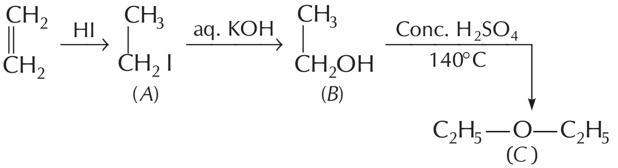
2-methoxybutane

7.



$$CH_3-OH \xrightarrow{CH_2=C=O} \underset{(A)}{CH_2=\underset{\underset{OH}{|}}{C}-OCH_3} \xrightarrow{\text{Rearrangement}} CH_3-\underset{\underset{O}{\|}}{C}-OCH_3$$

8.



$$\begin{array}{c}CH_2\\ \|\\ CH_2\end{array} \xrightarrow{HI} \underset{(A)}{\begin{array}{c}CH_3\\ |\\ CH_2I\end{array}} \xrightarrow{aq.\ KOH} \underset{(B)}{\begin{array}{c}CH_3\\ |\\ CH_2OH\end{array}} \xrightarrow[140^\circ C]{\text{Conc. } H_2SO_4} \underset{(C)}{C_2H_5-O-C_2H_5}$$

Note Ethers are functional isomers of alcohols.

9. Alcohols (—OH) react with sodium and carbonyl compounds ($>C=O$) give precipitate with semicarbazide.

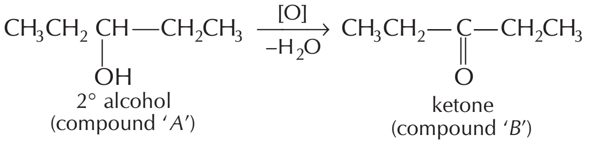
Since, the compound with molecular formula, C_3H_6O does not give precipitate with semicarbazide and does not react with sodium, it is neither a carbonyl compound nor an alcohol. Hence, it must be an ether, *i.e.*, $CH_2=CHOCH_3$

$$CH_2=CHOCH_3 \xrightarrow{Na} \text{no reaction}$$

$$CH_2=CHOCH_3 + \underset{\text{semicarbazide}}{NH_2NHCONH_2} \longrightarrow \text{no reaction}$$

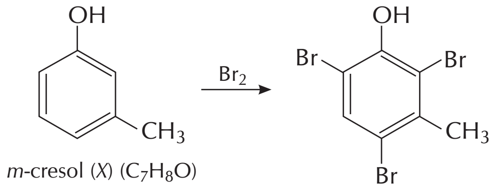
10. Since, the compound '*B*' gave a 2,4-dinitrophenylhydrazine derivative but did not answer haloform test or silver mirrortest, it must contain a $>C{=}O$ group, but it is neither a methyl ketone nor an aldehyde.

Moreover compound '*B*' is obtained by the oxidation of compound *A*, having molecular formula $C_5H_{12}O$, so the compound *A* must be a secondary alcohol.



$$\underset{\substack{\text{2° alcohol}\\\text{(compound 'A')}}}{CH_3CH_2\underset{OH}{\underset{|}{C}H}{-}CH_2CH_3} \xrightarrow[-H_2O]{[O]} \underset{\substack{\text{ketone}\\\text{(compound 'B')}}}{CH_3CH_2{-}\underset{O}{\underset{\|}{C}}{-}CH_2CH_3}$$

11. Compound '*X*' (C_7H_8O) is insoluble in aqueous $NaHCO_3$ but soluble in NaOH, so it is a phenol. Since, the number of carbon atoms remains the same after bromination, the compound must be *meta* cresol and reactions takes place as follows

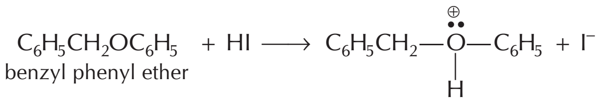


m-cresol (*X*) (C_7H_8O)

2,4,6-tribromo 3-methylphenol

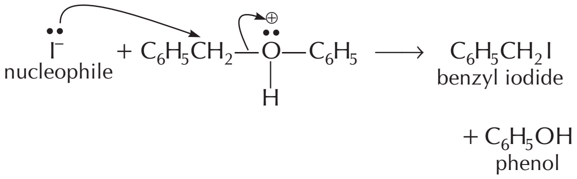
12. Benzyl phenyl ether is an unsymmetrical ether, so halide ion of HI is attached to the simple alkyl group and the reaction takes place by following mechanism :

(i) **Protonation of ether**

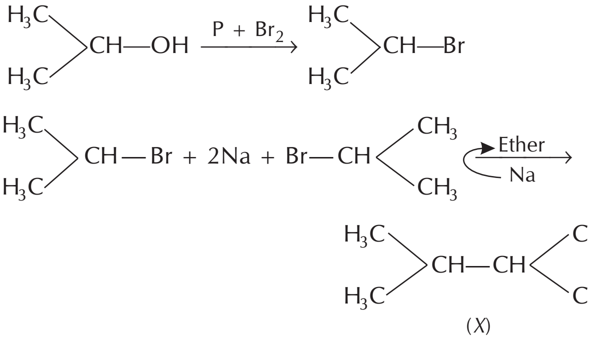


$$\underset{\text{benzyl phenyl ether}}{C_6H_5CH_2OC_6H_5} + HI \longrightarrow C_6H_5CH_2{-}\underset{H}{\underset{|}{\overset{\oplus}{\ddot{O}}}}{-}C_6H_5 + I^-$$

(ii) **Nucleophilic attack**



13.

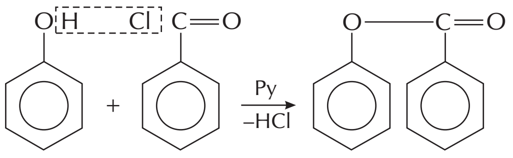


14.  and  are aromatic alcohols due to presence of benzene ring and —OH group is attached with aliphatic carbon.  and  are phenols.

15. In the Rosenmund's reaction, acid chlorides are converted to corresponding aldehydes by catalytic reduction. The reaction is carried out by passing through a hot solution of the acid chloride in the presence of Pd deposited over $BaSO_4$. Here, barium sulphate decrease the activity of palladium.

$$RCOCl + H_2 \xrightarrow{Pd/BaSO_4} RCHO + HCl$$

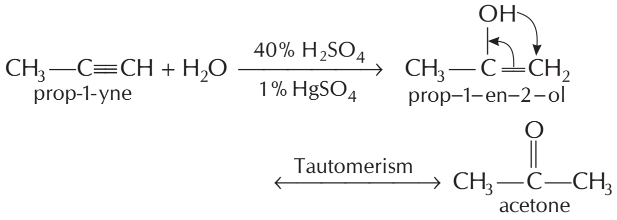
16.



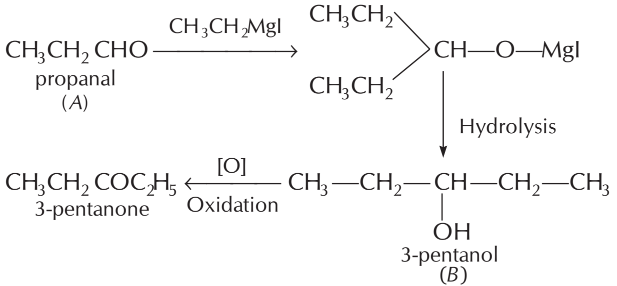
phenol benzoyl chloride phenylbenzoate

17. Acetone (ketone) and benzaldehyde (aromatic aldehyde) both do not react with Fehling solution. With aliphatic aldehydes, Fehling solution give red precipitate of cuprous oxide.

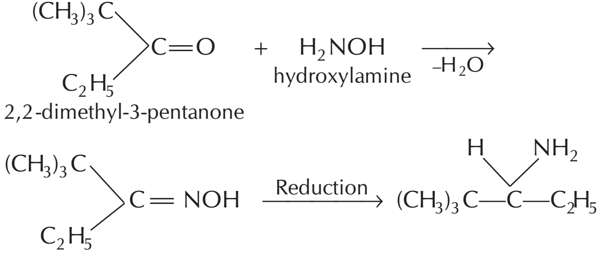
18.



19.

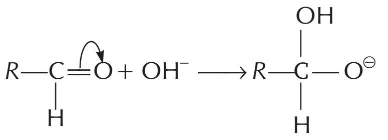


20.

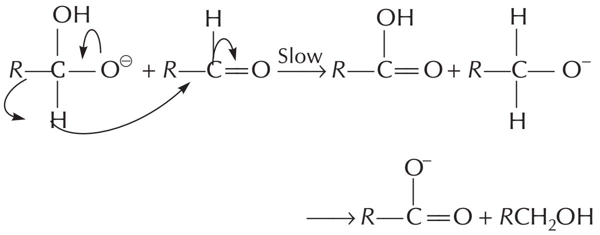


21. Cannizzaro reaction involves oxidation as well as reduction of aldehydes having lack of α-H atom. The mechanism of this reaction is as

(i) Attack of OH^- on carbonyl carbon



(ii) Transfer of hydride ion

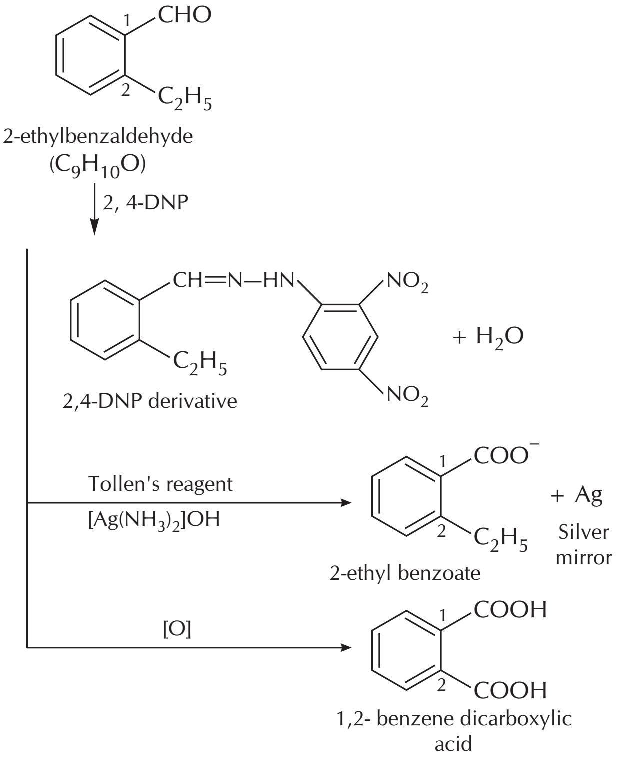


22. (i) The compound with molecular formula $C_9H_{10}O$ forms a 2,4-DNP derivative and reduces Tollen's reagent, so it is an aldehyde.

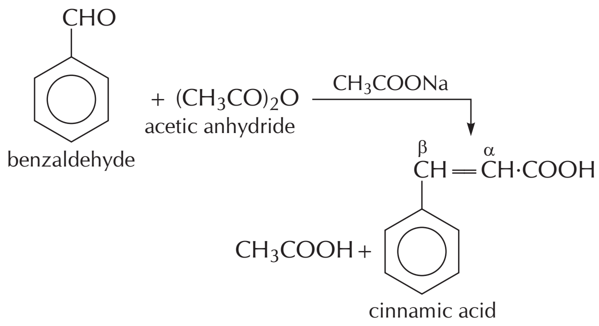
(ii) It undergoes Cannizzaro reaction, so the aldehyde group should be directly attached to the benzene ring.

(iii) On vigorous oxidation, it gives 1,2-benzene dicarboxylic acid, so it should be an *ortho* substituted benzaldehyde. For molecular formula $C_9H_{10}O$, the possibility is only *o*-ethyl benzaldehyde.

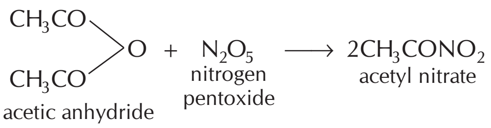
(iv) The equations for all the reactions are given below



23. 
24. Perkin reaction is the condensation reaction in which aromatic aldehyde is heated with an anhydride of an aliphatic acid in the presence of sodium salt of the same acid to form α, β-unsaturated acid.



25. Acetyl nitrate is formed, when acetic anhydride reacts with nitrogen pentoxide.



$$\underset{\text{acetic anhydride}}{(CH_3CO)_2O} + \underset{\text{nitrogen pentoxide}}{N_2O_5} \longrightarrow \underset{\text{acetyl nitrate}}{2CH_3CONO_2}$$

26. $\underset{\text{acetic acid}}{CH_3COOH} \xrightarrow{NH_3} \underset{\text{ammonium acetate}}{CH_3COONH_4} \xrightarrow[-H_2O]{\Delta} \underset{\text{acetamide}}{CH_3CONH_2}$

The isomers of CH_3CONH_2 is

(I) NH_2CH_2CHO (II) $CH_3—CH═NOH$

(III) $HCONH—CH_3$

27.

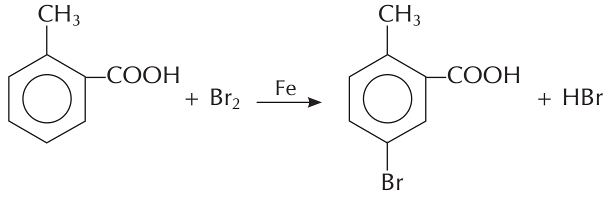
Column I	Column II
(A) CH_3CONH_2 and PCl_5	Acetonitrile
(B) $—NO_2$ group	Acid strengthening
(C) Lactic acid	Optically active compound
(D) CH_3COOH and Na	Hydrogen gas is liberated.

28. 
$$CH_3CH_2OH \xrightarrow[\text{Dehydrogenation}]{\text{Cu, 573 K}} \underset{(X)}{CH_3CHO} \xrightarrow[\text{Oxidation}]{[O]} \underset{(Y)}{CH_3COOH} \xrightarrow[\text{Substitution}]{Br_2/P} \underset{Br}{\underset{|}{CH_2}}—COOH$$

29. $\underset{\text{formic acid}}{2HCOOH} + \underset{\text{sodium carbonate}}{Na_2CO_3} \longrightarrow 2HCOONa + CO_2 + H_2O$

$HCOOH + \underset{\text{Tollen's reagent}}{Ag_2O} \longrightarrow H_2O + CO_2 + \underset{\text{black ppt. (silver mirror)}}{2Ag}$

30. —COOH is *meta*-directing group.

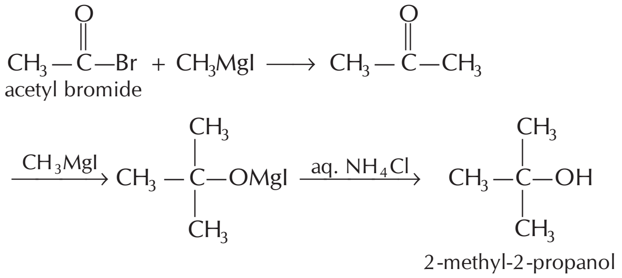


31. Aqueous NaCl is neutral hence, there is no reaction between ethyl acetate and aqueous NaCl.

$$CH_3COOC_2H_5 + NaCl(aq) \longrightarrow \text{No reaction}$$

32. Formic acid has $-\overset{\overset{O}{\|}}{C}-H$ (aldehyde) group. It reduces Tollen's reagent to silver mirror like other aldehydes.

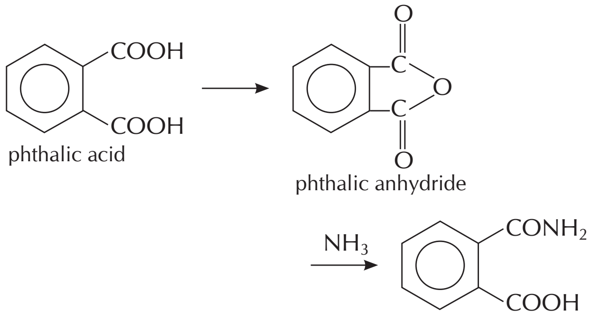
33.



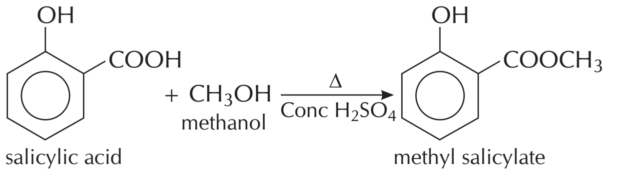
$$\underset{\text{acetyl bromide}}{CH_3-\overset{\overset{O}{\|}}{C}-Br} + CH_3MgI \longrightarrow CH_3-\overset{\overset{O}{\|}}{C}-CH_3$$

$$\xrightarrow{CH_3MgI} CH_3-\underset{\underset{CH_3}{|}}{\overset{\overset{CH_3}{|}}{C}}-OMgI \xrightarrow{aq.\ NH_4Cl} \underset{\text{2-methyl-2-propanol}}{CH_3-\underset{\underset{CH_3}{|}}{\overset{\overset{CH_3}{|}}{C}}-OH}$$

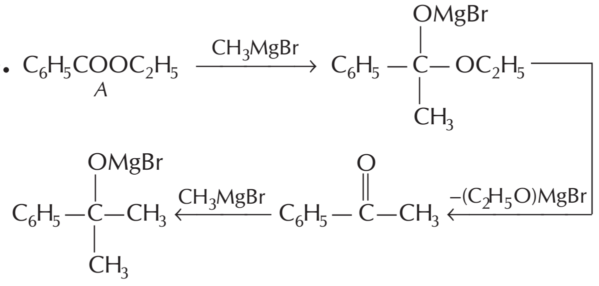
34.



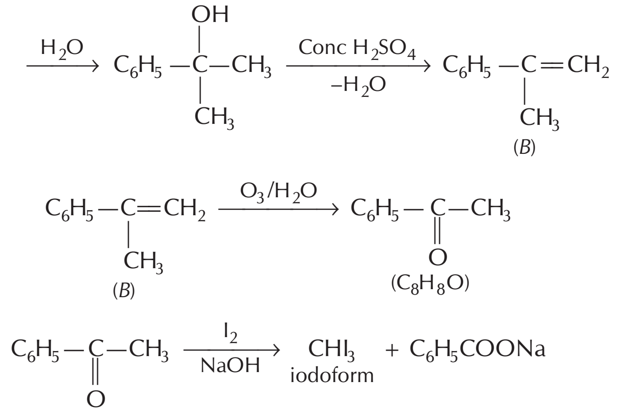
35. Methanol reacts with salicylic acid in the presence of a few drops of conc. H_2SO_4 to give methyl salicylate having the smell of oil of winter green.



36.



$$\underset{A}{C_6H_5COOC_2H_5} \xrightarrow{CH_3MgBr} C_6H_5-\underset{\underset{CH_3}{|}}{\overset{\overset{OMgBr}{|}}{C}}-OC_2H_5 \xrightarrow{-(C_2H_5O)MgBr} C_6H_5-\overset{\overset{O}{\|}}{C}-CH_3 \xrightarrow{CH_3MgBr} C_6H_5-\underset{\underset{CH_3}{|}}{\overset{\overset{OMgBr}{|}}{C}}-CH_3$$

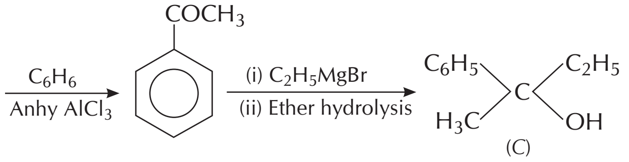


$$\xrightarrow{H_2O} C_6H_5-\underset{\underset{CH_3}{|}}{\overset{\overset{OH}{|}}{C}}-CH_3 \xrightarrow[-H_2O]{Conc\ H_2SO_4} \underset{(B)}{C_6H_5-\underset{\underset{CH_3}{|}}{C}=CH_2}$$

$$\underset{(B)}{C_6H_5-\underset{\underset{CH_3}{|}}{C}=CH_2} \xrightarrow{O_3/H_2O} \underset{(C_8H_8O)}{C_6H_5-\underset{\underset{O}{\|}}{C}-CH_3}$$

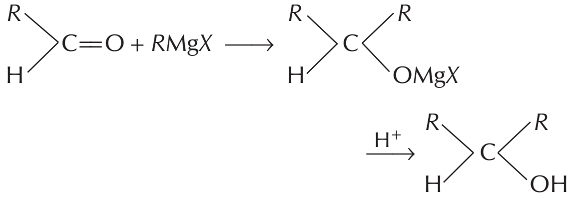
$$C_6H_5-\underset{\underset{O}{\|}}{C}-CH_3 \xrightarrow[NaOH]{I_2} \underset{\text{iodoform}}{CHI_3} + C_6H_5COONa$$

37. $CH_3COOH + PCl_5 \longrightarrow \underset{(A)}{CH_3COCl}$

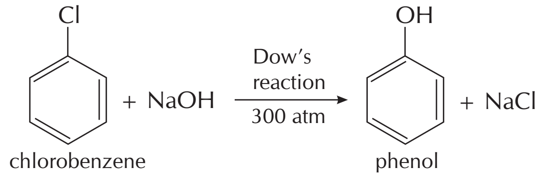


38. $RCHO \xrightarrow{\text{Reduction}} RCH_2OH$

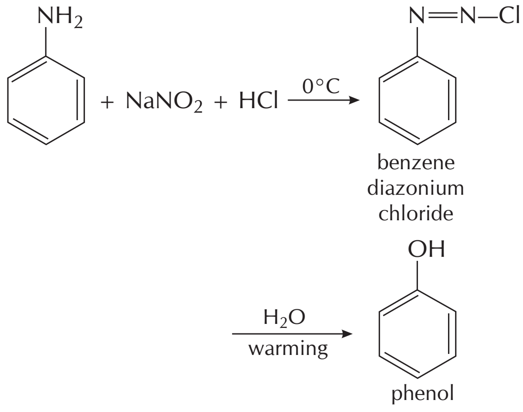
$H_2/Pd, LiAlH_4, NaBH_4$ reduce aldehyde into alcohol having same number of alcohol whereas $RMgX$ followed by hydrolysis reduces aldehyde into alcohol having extra R from Grignard reagent.



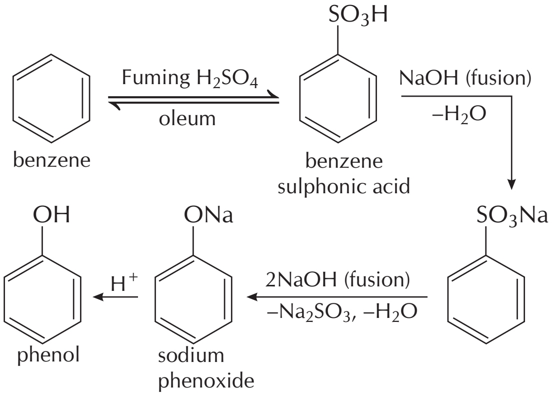
39. (a)



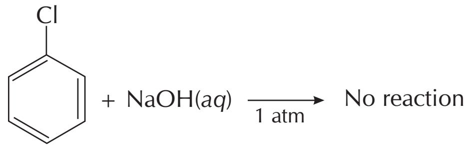
(b)



(c)



(d)



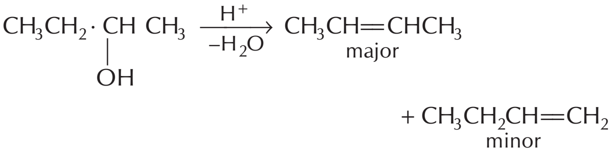
40. Compound having α-H-atom, undergo aldol condensation.

Therefore, CH_3—CHO and $CH_3-\overset{\overset{O}{\|}}{C}-CH_3$ cannot show this condensation.

41. In Clemmensen reduction, $>C{=}O$ group of carbonyl compounds is reduced into methylene group (—CH_2—) in the presence of zinc amalgam and conc.HCl.

42. Upon gently heating β-keto acids, *gem*-dicarboxylic acids lose CO_2.  though is a β-keto acid, but it does not lose CO_2 since —COOH group is present at bridge and produces unstable transition state or intermediate (carbanion) after losing CO_2.

43.

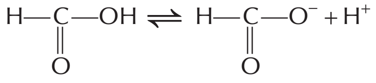


$$CH_3CH_2\cdot\underset{\underset{OH}{|}}{CH}\,CH_3 \xrightarrow[-H_2O]{H^+} \underset{\text{major}}{CH_3CH{=}CHCH_3} + \underset{\text{minor}}{CH_3CH_2CH{=}CH_2}$$

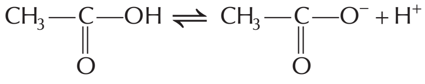
Dehydration leading to conjugation occurs faster.

44. CH_3CO— group in acetophenone being electron withdrawing reduces the electron-density at the benzene ring, thereby preventing further electrophilic substitution.

45. Formic acid is stronger than acetic acid.

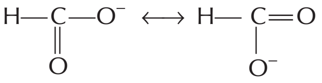


$$H-\underset{\underset{O}{\|}}{C}-OH \rightleftharpoons H-\underset{\underset{O}{\|}}{C}-O^- + H^+$$



$$CH_3-\underset{\underset{O}{\|}}{C}-OH \rightleftharpoons CH_3-\underset{\underset{O}{\|}}{C}-O^- + H^+$$

46. In formate ion, resonance gives rise to identical bond lengths.



$$H-\underset{\underset{O}{\|}}{C}-O^- \longleftrightarrow H-\underset{\underset{O^-}{|}}{C}{=}O$$

47. In ethers, two bond pairs and two lone pairs of electrons on oxygen are arranged approximately in tetrahedral manner. The bond angle is slightly greater than tetrahedral angle due to the repulsive forces between the two bulky alkyl groups.

48. $CH_3CH_2Br + CH_3ONa \longrightarrow CH_3CH_2OCH_3$ is an example of S_N2 reaction.

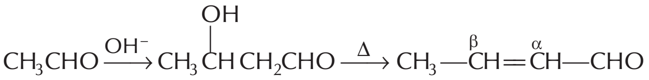
49. Williamson's ether synthesis reaction follows S_N2 mechanism.

Thus, the order of reactivity is

$$\underset{(C)}{ClCH_2CH_3CH_3} > \underset{(D)}{BrCH_2CH_2CH_3} > \underset{(B)}{ClCH_2CH{=}CH_2} > \underset{(A)}{(CH_3)_3CCH_2Br}$$

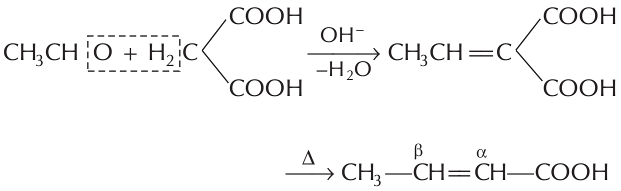
50. Williamson's synthesis is an example of nucleophilic substitution reaction.

51. In first test tube



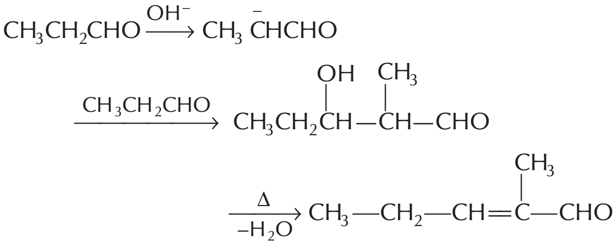
$$CH_3CHO \xrightarrow{OH^-} CH_3\overset{\overset{OH}{|}}{C}H\,CH_2CHO \xrightarrow{\Delta} CH_3-\overset{\beta}{C}H{=}\overset{\alpha}{C}H-CHO$$

In second test tube



52. Diels' Alder reaction is the addition between conjugated dienes (1, 3-butadiene) and a dienophile (compound containing a double bond and a – *M* group in conjugation). Hence, the products from both the test tubes can show Diels'-Alder reaction.

53. Aldol condensation involves only the α-hydrogen of aldehyde.



$$CH_3CH_2CHO \xrightarrow{OH^-} CH_3\overset{-}{C}HCHO \xrightarrow{CH_3CH_2CHO} CH_3CH_2\overset{\overset{OH}{|}}{C}H-\overset{\overset{CH_3}{|}}{C}H-CHO \xrightarrow[-H_2O]{\Delta} CH_3-CH_2-CH{=}\overset{\overset{CH_3}{|}}{C}-CHO$$

54. The HVZ reaction brings about halogenation only at the α- carbon of the fatty acid. In case the acid has two α-hydrogens, α-dihalo product will be formed when 2 equivalents of halogen are used.

55. The α-halogen comes from halogen (Cl_2 or Br_2) whatever might be the nature of PX_3 which is used for converting acid to acid chloride.

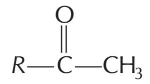
56. To undergo HVZ reaction, the carboxylic acid must have at least one α-hydrogen at sp^3 hybridised α-carbon atom.

57. Iodoform is formed from

(i) CH_3CH_2OH

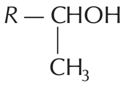
(ii) CH_3CHO

(iii) All carbonyl compounds of the type

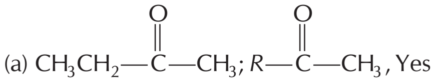


$R—\overset{\overset{O}{\|}}{C}—CH_3$

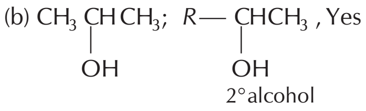
(iv) 2° alcohol



$R—\underset{\underset{CH_3}{|}}{C}HOH$

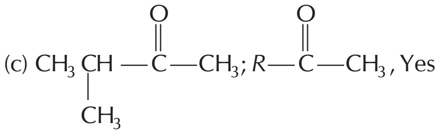


(a) $CH_3CH_2—\overset{\overset{O}{\|}}{C}—CH_3; R—\overset{\overset{O}{\|}}{C}—CH_3$, Yes

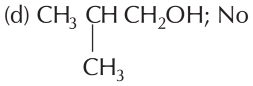


(b) $CH_3\underset{\underset{OH}{|}}{C}HCH_3;\ R—\underset{\underset{OH}{|}}{C}HCH_3$, Yes

2° alcohol

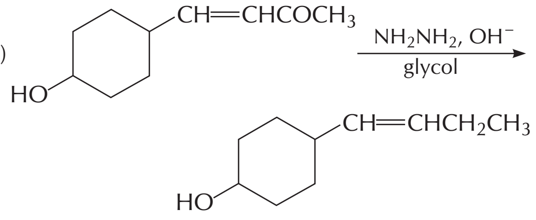


(c) $CH_3\underset{\underset{CH_3}{|}}{C}H—\overset{\overset{O}{\|}}{C}—CH_3; R—\overset{\overset{O}{\|}}{C}—CH_3$, Yes



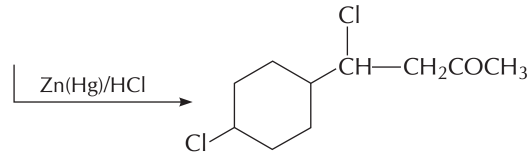
(d) $CH_3\underset{\underset{CH_3}{|}}{C}HCH_2OH$; No

58. (a)



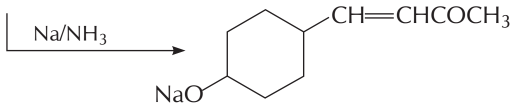
(Wolff-Kishner)

(b)



HCl attacks 2° alcohol as well as (C═C) bond.

(c)

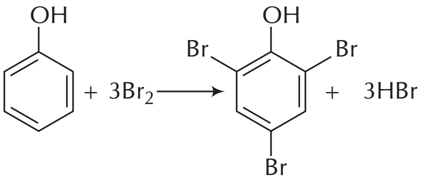


(d) $\xrightarrow{NaBH_4}$ low yield

59. Br_2 is formed by a redox reaction

$$5Br^- + BrO_3^- + 6H^+ \longrightarrow 3Br_2 + 3H_2O$$

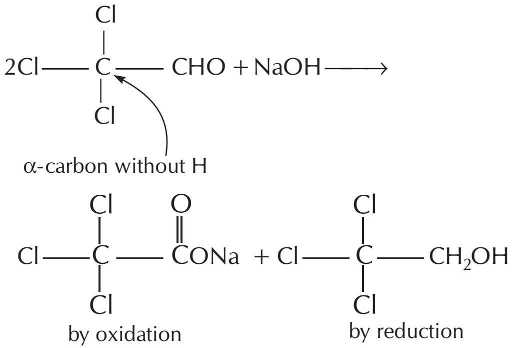
—OH group is the activating group and there is S_E at *o*-and *p*-positions giving yellowish white precipitate of 2,4,6-tribromophenol.



60.

	Reagent	Phenol	Benzoic acid	Conclusion
(a)	Aqueous NaOH	Salt formation	Salt formation	No specific colour change
(b)	Tollen's reagent	No effect	No effect	
(c)	Molisch reagent	No effect	No effect	
(d)	Neutral $FeCl_3$	Violet colour	Buff-coloured precipitate	Thus, $FeCl_3$ can be used to make distinction

61. Cannizzaro's reaction is given by aldehydes (*R*CHO) lacking H at α-carbon or lacking α-carbon (as in HCHO). With NaOH, there is formation of acid salt ($RCOO^-$) by oxidation and alcohol (RCH_2OH) by reduction.



(2,2,2-trichloroethanol)

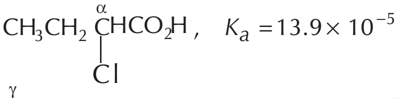
62. Electron withdrawing group (– *I* effect) stabilises the anion, and thus increases acidic nature.

Thus, (c), (d) > (a) acidic

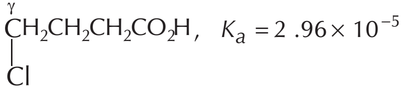
Farther the electron withdrawing group from the —COOH group, acid strength decreases thus (c) with Cl at α-position is stronger than (d) with Cl at γ-position.

CH_3COOH, $K_a = 1.75 \times 10^{-5}$

$HCOOH$, $K_a = 17.7 \times 10^{-5}$



$CH_3CH_2\underset{\underset{Cl}{|}}{\overset{\alpha}{C}}HCO_2H$, $K_a = 13.9 \times 10^{-5}$



$\underset{\underset{Cl}{|}}{\overset{\gamma}{C}}H_2CH_2CH_2CO_2H$, $K_a = 2.96 \times 10^{-5}$

But from the K_a values, it is clear that HCOOH is the strongest acid. This can be explained on the basis of absence of + *I* showing group.

63. 
$$CH_3-\overset{O}{\overset{\|}{C}}-Cl \rightleftharpoons CH_3-\overset{O^-}{\overset{|}{C^{\oplus}}}-Cl \xrightarrow{C_2H_5O^-} CH_3-\overset{O^-}{\overset{|}{\underset{OC_2H_5}{\underset{|}{C}}}}-Cl \quad CH_3-\overset{O}{\overset{\|}{C}}-OC_2H_5 + Cl^-$$

This is by S_N reaction. Cl^- is a better leaving group than $C_2H_5O^-$ and the ethyl ethanoate is formed.

64. All aldehydes including reducing sugar (as glucose, fructose) give **silver-mirror test** (with Tollen's reagent)

$$RCHO + 2[Ag(NH_3)_2]^+ + 3OH^- \xrightarrow{\Delta} RCOO^- + \underset{\text{silver mirror}}{2Ag\downarrow} + 4NH_3 + 2H_2O$$

$$(R = H, CH_3)$$

Thus (a) and (c) give silver-mirror test.

65. I. 
Acidic due to resonance stabilisation of phenoxide ion.

II. 
—CH_3 group releases electrons, destabilises the phenoxide ion, thus acidic nature is decreased hence II < I (acidic)

III. 
—NO_2 withdraws electrons, stabilises the phenoxide ion, hence acidity is increased.

IV. Lower acidity in case of *meta*-isomer as compared to *para*-isomer is explained by the fact that *m*-nitrophenoxide is stabilised by inductive effect only and no resonance effect operates with –NO_2 group.

Thus, $\underset{\text{(III)}}{m\text{-nitrophenol}} < \underset{\text{(IV)}}{p\text{-nitrophenol}}$ (acidic)

Thus, correct order is IV > III > I > II

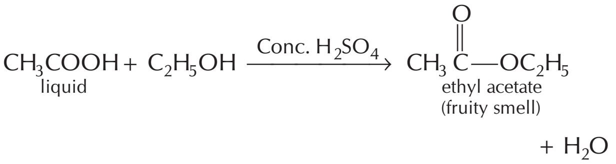
66. 
(a), (b), (d) may be formed but (c) is never formed.

67. The reaction of alcohol with conc. HCl and anhydrous $ZnCl_2$ follows S_N1 pathway, so greater the stability of carbocation formed, faster is the reaction.

2-methylpropan-2-ol gives 3° carbocation. Hence, it reacts rapidly with conc. HCl and anhydrous $ZnCl_2$ (Lucas reagent).

68. 
69. A liquid + $C_2H_5OH \xrightarrow{\text{Conc. } H_2SO_4} \underset{\text{(fruity smell)}}{\text{Compound}}$

Fruity smell is the characteristic property of ester, thus reaction can be considered as follows



$$\underset{\text{liquid}}{CH_3COOH} + C_2H_5OH \xrightarrow{\text{Conc. } H_2SO_4} \underset{\substack{\text{ethyl acetate}\\\text{(fruity smell)}}}{CH_3\overset{O}{\overset{\|}{C}}-OC_2H_5} + H_2O$$

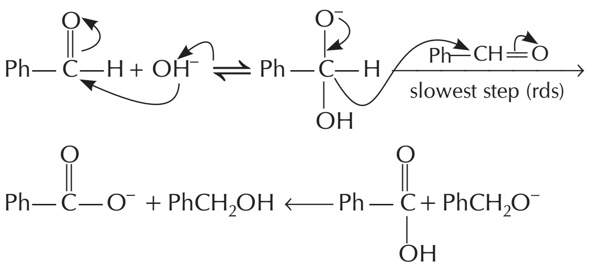
70. 
71. 
$$CH_3-\overset{O}{\overset{\|}{C}}-Cl \xrightarrow{KOH} CH_3-\overset{O}{\overset{\|}{C}}-O^-$$

$$CH_3CH_2Cl \longrightarrow CH_3CH_2OH$$

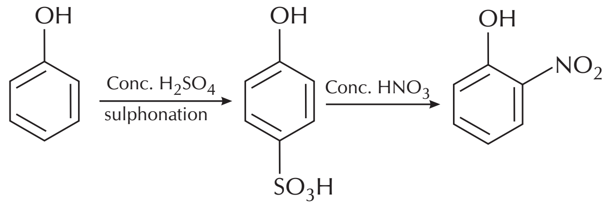
$$ClCH_2-CH_2Cl \longrightarrow HOCH_2-CH_2OH$$

$$CH_3CHCl_2 \longrightarrow \underset{\text{intermediate}}{CH_3-CH(OH)_2} \longrightarrow \underset{\text{acetaldehyde}}{CH_3-CH=O}$$

72. In Cannizzaro reaction, the transfer of H^- to another carbonyl group is difficult and slowest step.

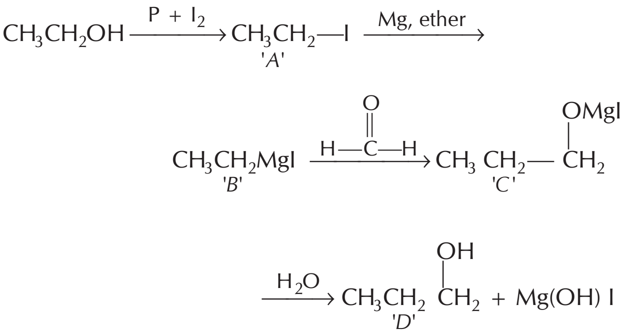


73.



First sulphonation is the means to block *para* position and to reduce the reactivity of phenolic ring against strong oxidising agent HNO_3. (The use of conc. HNO_3 over phenol cause the oxidation of ring mainly). The strong acidic medium in second step cause desulphonation (ipso mechanism) also.

74.



$$CH_3CH_2OH \xrightarrow{P + I_2} \underset{'A'}{CH_3CH_2—I} \xrightarrow{\text{Mg, ether}}$$

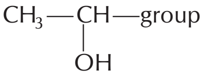
$$\underset{'B'}{CH_3CH_2MgI} \xrightarrow{H—\overset{\overset{O}{||}}{C}—H} \underset{'C'}{CH_3\,CH_2—\overset{\overset{OMgI}{|}}{CH_2}}$$

$$\xrightarrow{H_2O} \underset{'D'}{CH_3CH_2\,\overset{\overset{OH}{|}}{CH_2}} + Mg(OH)\,I$$

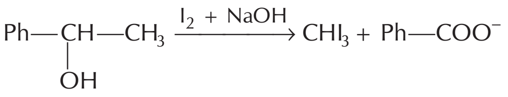
n-propyl alcohol

75. Any aliphatic carbon with hydrogen attached to it, in combination with benzene ring, will be oxidised to benzoic acid by $KMnO_4 / H^+$.

76. For positive iodoform test, alcohol molecule must have

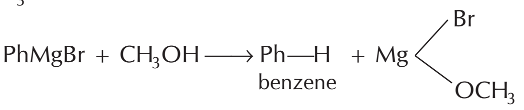


$CH_3—\underset{\underset{OH}{|}}{CH}—\text{group}$



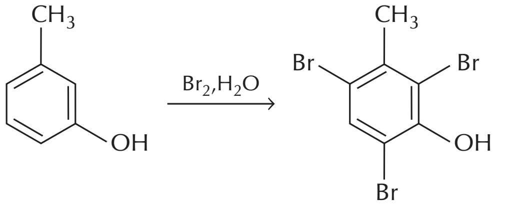
$$Ph—\underset{\underset{OH}{|}}{CH}—CH_3 \xrightarrow{I_2 + NaOH} CHI_3 + Ph—COO^-$$

77. PhMgBr can be protonated by any of the protic solvent e.g., CH_3OH.



$$PhMgBr + CH_3OH \longrightarrow \underset{\text{benzene}}{Ph—H} + Mg\begin{matrix}\diagup Br\\ \diagdown OCH_3\end{matrix}$$

78. *m*-cresol due to phenoxide ion in H_2O solvent, gives tribromo derivative at all *ortho* and *para* positions.

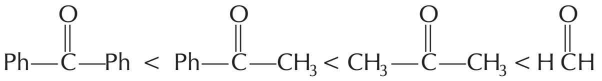


79. $CHCl_3 + OH^{\ominus} \longrightarrow \underset{\text{(unstable)}}{{}^{\ominus}CCl_3} + H_2O$

$${}^{\ominus}CCl_3 \longrightarrow \underset{\text{dichlorocarbene}}{:CCl_2} + Cl^-$$

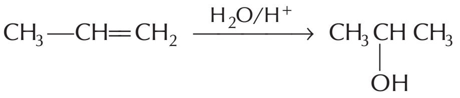
80. Addition of HCN is a nucleophilic reaction. Greater the electron deficiency of carbonyl group, higher the rate of reaction.

Hence,



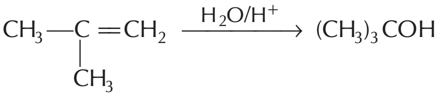
$$Ph—\overset{\overset{O}{||}}{C}—Ph < Ph—\overset{\overset{O}{||}}{C}—CH_3 < CH_3—\overset{\overset{O}{||}}{C}—CH_3 < H\overset{\overset{O}{||}}{C}H$$

81. $CH_2{=}CH_2 \xrightarrow{H_2O/H^+} CH_3CH_2OH$



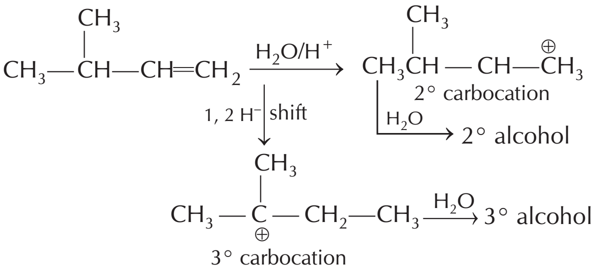
$$CH_3—CH{=}CH_2 \xrightarrow{H_2O/H^+} CH_3\underset{\underset{OH}{|}}{CH}CH_3$$

(2°alcohol) through 2° carbocation $CH_3\overset{\oplus}{C}HCH_3$



$$CH_3—\underset{\underset{CH_3}{|}}{C}{=}CH_2 \xrightarrow{H_2O/H^+} (CH_3)_3COH$$

(3° alcohol) through 3° carbocation $(CH_3)_3\overset{\oplus}{C}$

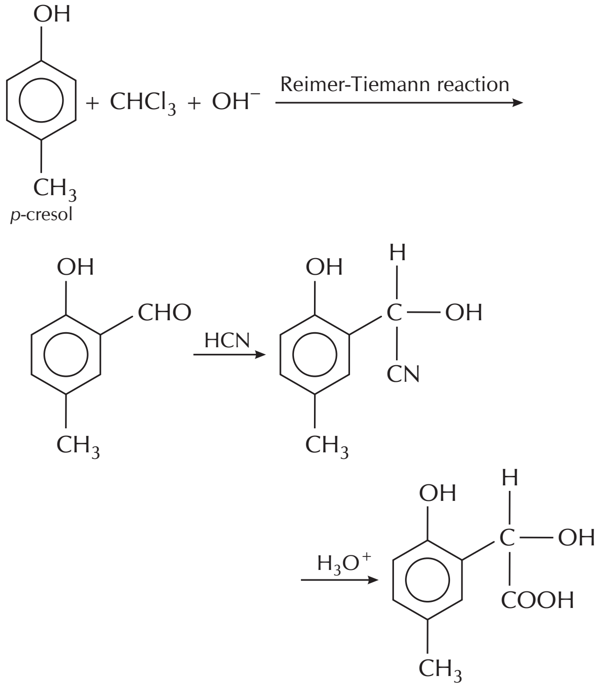


$$CH_3—\overset{\overset{CH_3}{|}}{CH}—CH{=}CH_2 \xrightarrow{H_2O/H^+} CH_3\overset{\overset{CH_3}{|}}{CH}—\underset{2°\text{ carbocation}}{CH}—\overset{\oplus}{CH_3} \xrightarrow{H_2O} 2°\text{ alcohol}$$

$$\downarrow 1,2\,H^-\text{ shift}$$

$$\underset{3°\text{ carbocation}}{CH_3—\underset{\oplus}{\overset{\overset{CH_3}{|}}{C}}—CH_2—CH_3} \xrightarrow{H_2O} 3°\text{ alcohol}$$

82.



(—OH is more activating than —CH_3 in *o*, *p*- directing, thus —CHO goes to *ortho wrt* —OH).

83. 
$$CH_3-\underset{OH}{\overset{2^\circ}{C}H}-CH=CHCH_3 \longrightarrow CH_3-\underset{O}{\underset{\|}{C}}-CH=CHCH_3$$

Only suitable reagent is chromic anhydride in glacial acetic acid. Other will also affect (C═C) bond.

84. $A + NaOH \longrightarrow$ alcohol + acid

Thus, it is Cannizzaro reaction.

A is thus aldehyde without H at α-carbon.

(as C_6H_5CHO, HCHO)

$$2C_6H_5CHO + NaOH \longrightarrow C_6H_5CH_2OH + C_6H_5COONa$$

85. (I) 
(II) 
(III) 
(IV) 
—NO_2 group at any position shows electron withdrawing effect, thus acid strength is increased. But *o*-nitro benzoate ion is stabilised by intramolecular H-bonding like forces, hence its acid strength is maximum. Thus,

the order of acid strength is (II) > (III) > (IV) > (I)

The effect is more at *para* position than *meta*.

86. Protonation of —OH is the first step. It involves conversion of poor leaving group (—OH) into good leaving group $(—\overset{+}{O}H_2)$.

87. $C_nH_{2n}O_2$ is general formula for open chain acids and esters.

$n = 3$ $C_3H_6O_2$

Acid, 
$$CH_3CH_2-\overset{O}{\overset{\|}{C}}-O-H$$

Ester, 
$$CH_3-\overset{O}{\overset{\|}{C}}-O-CH_3$$

88. $LiAlH_4$ reduces —COOH to —CH_2OH without affecting C═C bond.

12

Organic Compounds Containing Nitrogen

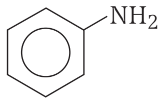
JEE Main MILESTONE

- General Characteristics of Amines
- Methods of Preparation of Aliphatic Amines
- Properties of Aliphatic Amines
- Methods of Preparation of Aromatic Amines
- Properties of Aromatic Amines
- Uses of Amines

12.1 General Characteristics of Amines

Aliphatic and aromatic amines are alkyl and aryl derivatives of ammonia in which one or more hydrogen atoms of ammonia have been replaced by alkyl and aryl groups respectively, *e. g.*,

CH_3NH_2
aliphatic amine



aromatic amine

They occur in nature in protiens, vitamins, hormones and alkaloids. Their synthetic examples include drugs, dyes and polymers.

Amines, diazonium salts, nitro compounds, cyanides all are included in nitrogen containing organic compounds. These are obtained by replacing one or more H*-atoms of hydrocarbons with different groups like* $-NH_2$, $-N_2Cl$, $-NO_2$ *or* $-CN$ *group.*

Classification of Amines

Depending upon the number of alkyl or aryl groups attached to the nitrogen atom, the aliphatic or aromatic amines are classified as primary (1°), secondary (2°) and tertiary (3°) amines. If number of H-atoms attached to the N atoms is n, the degree of amines is obtained by the following formula

Degree of amine = $(3 - n)°$

Table 12.1 **Degree and Functional Group of Various Amines**

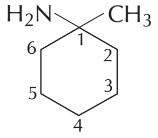
S. N.	Amine	n (no. of H-atoms attached to N)	Degree	Functional group
1.	 $R-\overset{\overset{H}{\vert}}{N}-H$	2	$(3-2)° = 1°$ (primary)	$-NH_2$
2.		1	$(3-1)° = 2°$ (secondary)	$-NH-$
3.		$n = 0$	$(3-0)° = 3°$ (tertiary)	

Quaternary ammonium salts ($R_4N^+X^-$) are the ammonium compounds formed by the replacement of all the four hydrogen atoms with either alkyl or aryl groups. Here X is normally a halogen atom or hydroxyl group. Ammonium salts are quite different from amines in the sense that amines are of basic nature, the salts are not.

Sample **Problem 1** *Which of the following is a* 3° amine? **[NCERT Exemplar]**

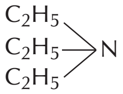
- (a) 1-*methylcyclohexylamine*
- (b) *Triethylamine*
- (c) *tert-butylamine*
- (d) *N-methylaniline*

Interpret (*b*) In order to solve such problems, first draw the structures of the given compounds and then find whether it contains N⩽ group or not. If such a group is present, the amine is tertiary.

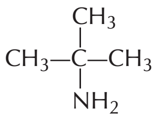


1-methylcyclohexylamine
(—NH_2 group, so 1° amine)

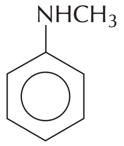
$(C_2H_5)_3N$ or



(>N group, so 3° amine)



tertiary-butylamine
(—NH_2 group, so 1° amine)

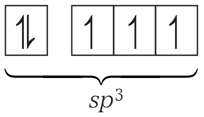


N-methylaniline
(>NH group, so 2° amine)

Hence, among the given compounds, only triethylamine is a 3° (tertiary,) amine.

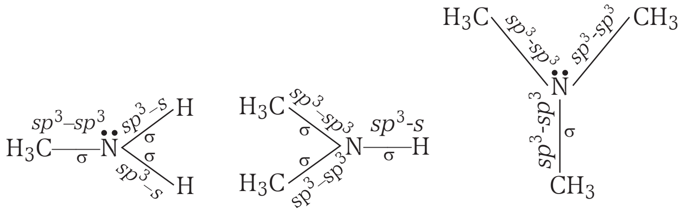
Structure of Amines

$$N_7 = 1s^2, 2s^2\, 2p^3$$



Nitrogen atom possesses four sp^3 hybridised orbitals. In amines, out of these four, three sp^3 hybridised orbitals, overlap either with the sp^3 hybridised orbitals of —CH_3 group (alkyl group) or with the s orbital of –H atom or with both to form three σ bonds. The remaining fourth sp^3 hybridised orbital, being completely filled, does not take part in bond formation. Here it is obvious that there are three σ bonds and one lone pair over nitrogen in amines. Thus, all amines, *i.e.*, 1°, 2° and 3° have pyramidal geometry.

The structures of the amines can be shown as



(primary amine) (secondary amine) (tertiary amine)

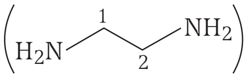
Caution Point *Tertiary amines having three different alkyl groups, generally exist in the form of racemic mixture that cannot be resolved into enantiomers because of the rapid inversion of an enantiomer to its mirror image. This inversion is called amine inversion or nitrogen inversion or flipping.*

Nomenclature of Amines

IUPAC system propossed following rules for nomenclature of amines.

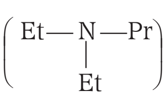
(a) For Alkyl Amine

According to IUPAC system, amines are named as alkanamines, derived by the replacement of '*e*' of alkane by the word amines *e.g.*, CH_3NH_2 is named as methanamine, $C_2H_5NH_2$ as ethanamine and $C_3H_7NH_2$ as propanamine. In case more than one amino groups are present at different positions in the parent chain, their positions are mentioned by giving numbers to the C atom bearing (—NH_2) groups and suitable prefix such as di, tri, etc., is attached to the amine. The word 'e' of alkane is retained, *e.g.*,



is named ethane-1,2-diamine.

Common name An aliphatic amine is named by prefixing alkyl group to amine, *i.e.*, alkylamine as one word, *e.g.*, methylamine. 2° and 3° amines, containing same two or more groups, are named by prefix *di* of *tri* attached before the name of the alkyl group, *e.g.*,



$$\left(\begin{array}{c}\text{Et—}\underset{\displaystyle\text{Et}}{\underset{|}{\text{N}}}\text{—Pr}\end{array}\right)$$

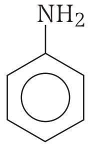
is named diethyl propyl amine.

(b) For Aromatic Amines

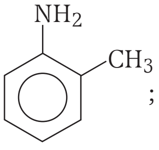
When an (—NH_2) group is directly attached to the benzene ring, the compound formed is called an arylamine; (Ph—NH_2) is the simplest example of arylamine. In the common system, it is called aniline, also an accepted IUPAC name.

According to IUPAC system, suffix '*e*' of arene is replaced with 'amine'. *e.g.*, (Ph—NH_2) is named benzenamine.

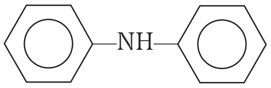
Common names of some aromatic amines are as



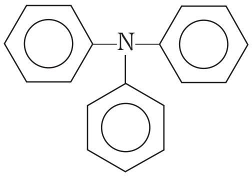
aniline
(phenyl amine)



o-toluidine



diphenyl amine



triphenyl amine

Sample Problem 2 *The correct IUPAC name for* $CH_2{=}CHCH_2NHCH_3$ *is* **[NCERT Exemplar]**

(*a*) *Allylmethylamine* (*b*) *2-amino-4-pentene*
(*c*) *4-aminopent-1-ene* (*d*) *N-methylprop-2-en-1-amine*

Interpret (*d*) $H_2\overset{3}{C}{=}\overset{2}{C}H\overset{1}{C}H_2NHCH_3$

[preference order > NH > =]
N-methylprop-2-en-1-amine

Isomerism in Amines

Amines exhibit chain, position, functional isomerism and metamerism, (For their details see chapter isomerism).

Hot Spot 1

BASIC CHARACTER of Amines

It is a very important topic of this chapter from JEE Main point of view. The question is generally based on 'order of basicity'. The level of question varies from easy to difficult.

All amines are basic due to the presence of lone pair of electron for protonation. Their basicity, *i.e.,* availability of lone pair for protonation is affected by the following three factors

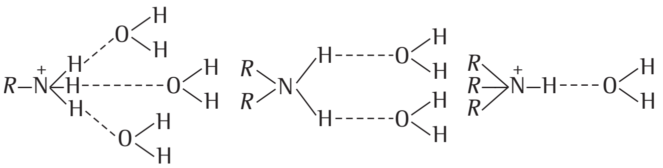
(i) Alkyl group substitution (+ *I* effect)
(ii) Steric effect
(iii) Solvation effect

Alkyl group have +*I* effect, thus as their number increases, the electron density over nitrogen increases. Hence, the lone pair will become more available for protonation and results in increased basicity. An evidence in support of this is that in the gas phase, the basicity of the following amines increases with increase in the number of methyl groups.

$$(CH_3)_3N > (CH_3)_2NH > CH_3NH_2 > NH_3$$

However, in aqueous solution, the third methyl group decreases the basic strength due to steric effect. This is because the size of the methyl group is more than that of hydrogen so it hinders the attack of the acid on the amine and thus, the basic strength tends to decrease. **Greater the number of methyl groups, lesser will be basic strength.** In this case, trimethylamine is expected to be the least basic.

Solvation Effect also affect basicity as amine gets protonated by accepting a H^+ ion from aqueous solution. The protonated amine forms hydrogen bonds with H_2O molecules and gets solvated. Consequently, the cation is stabilised in aqueous solution. **[Greater the solvation of cation, more will be the tendency of amine to change to cation by releasing the electron pair on nitrogen atom. Thus, more will be the basic strength of the amine.]** Since solvation is maximum in primary amine, it is expected to be maximum basic while tertiary amine is the least basic.



Tendency for solvation decreases

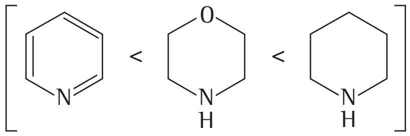
From the above discussion it is clear that the order of basic character in aqueous solution (where steric and solvation effects also work), is

$$(CH_3)_2NH > CH_3NH_2 > (CH_3)_3N > NH_3$$

Presence of an electron withdrawing group (like —CN, >CO etc.) decreases the electron density and thus also the availability of lone pair for donation over nitrogen decreases.

The order of basic strength of other compounds is

(i) $(C_2H_5)_2NH > (C_2H_5)_3N > C_2H_5NH_2 > NH_3$
(ii) $(CH_3)_2CHNH_2 > NH_3 > [(CH_3)_2CH]_2NH > [(CH_3)_2CH]_3N$
(iii) aniline < CH_3NH_2 (due to resonance effect in aniline)
(iv) pyrrole < aniline < pyridine
(v) diphenylamine < aniline < cyclohexylamine
(vi) pyridine < morpholine (– *I* effect of O atom) < piperidine (non-aromatic and sp^3 hybridised)



The basic character of amines can be explained in terms of their K_b or pK_b values. **Larger the K_b or smaller the value of pK_b, stronger is the base.** The pK_b value of NH_3 is 4.75. Aliphatic amines are stronger bases then NH_3, due to the $+I$ effect of alkyl groups leading to high electron density on the N atom. Aromatic amines are weaker bases than NH_3 due to the electron-withdrawing nature of aryl group.

Table 12.2 **pK_b Values of Substituted Anilines**
(pK_b of aniline $= 9.38$)

Substituent	pK_b	Substituent	pK_b
o-CH_3	9.62	*o*-OCH_3	9.51
p-CH_3	9.00	*p*-OCH_3	8.71
m-CH_3	9.33	*m*-OCH_3	9.80
o-OH	9.28	*o*-Cl	13.30
p-OH	8.50	*p*-Cl	10.00
m-OH	9.83	*m*-Cl	11.52
o-NH_2	9.52	*o*-NO_2	14.28
p-NH_2	7.86	*p*-NO_2	13.02
m-NH_2	9.00	*m*-NO_2	11.55

The relative base strength of various aromatic amines in the decreasing order is as

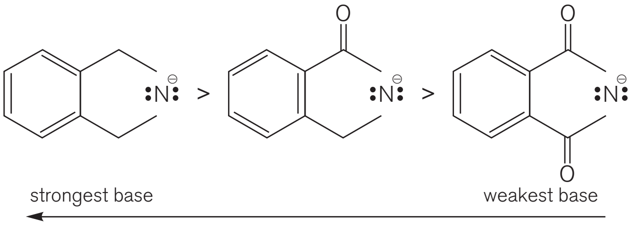
(i) *p*-toluidine > *m*-toluidine > aniline > *o*-toluidine
(ii) aniline > *m*-nitroaniline > *p*-nitroaniline > *o*-nitroaniline
(iii) *p*-methoxyaniline > aniline > *o*-methoxyaniline > *m*-methoxyaniline

The basicity of *o*-substituted anilines (whether the substitutent is electron releasign or electron withdrawing) is generally lower as compared to aniline. This is due to *ortho* effect in which the substituent at the *o*-position hinders the attack of the acid on the amino group.

In general, **more the *s*-character of the hybrid orbital containing lone pair of electrons, lesser is the basic character.** For example, out of , $R\ddot{N}H_2(sp^3)$, $R\ddot{N}{=}CHR_2(sp^2)$ and $RC{\equiv}\ddot{N}(sp)$, RNH_2 is most basic (25% *s*-character of hybrid orbital containing lone pair of electrons) and $RC{\equiv}\ddot{N}$ is least basic (50% *s*-character of the hybrid orbital containing lone pair of electron). Therefore, decreasing order of basicity of these compound is

$$\underset{(25\%\ s\text{-character})}{R\ddot{N}H_2} > \underset{(33.33\%\ s\text{-character})}{R\ddot{N}{=}CHR'} > \underset{(50\%\ s\text{-character})}{RC{\equiv}N\colon}$$

Caution Point *A carbonyl group attached to the nitrogen stabilises its negative charge. The strongest base is the anion that has no carbonyl groups on nitrogen; the weakest base is the phthalimide anion which has two carbonyl groups.*



Sample Problem 3 *Amongst the following, the strongest base in aqueous medium is* **[NCERT Exemplar]**

(a) CH_3NH_2 (b) $NCCH_2NH_2$
(c) $(CH_3)_2NH$ (d) $C_6H_5NHCH_3$

Interpret (c) In aqueous medium, basic tendency is affected by $+I$ effect of alkyl group as well as steric effect. Among the given, $(CH_3)_2NH$ is most basic because of the presence of two electron donating $—CH_3$ groups which increase electron density over N of $—NH_2$ group and thus, facilitate the removal of its lone pair.

Sample Problem 4 *Which of the following is the weakest Bronsted base?* **[NCERT Exemplar]**

(a) 
(b) 
(c) 
(d) CH_3NH_2

Interpret (a) Basic tendency of a Bronsted base is infact the tendency of accepting a proton by donating its lone pair to the proton.

Among the given, aniline  is least basic because of the involvement of its lone pair is resonance and hence its less availability for donation.

12.2 Methods of Preparation of Aliphatic Amines

Several methods can be used to prepare aliphatic amines, out of which some are specific for 1°, 2° and 3° amines while some gives mixtures of all the three.

Methods for Mixtures of Amines

With the help of following methods, mixture of amines can be obtained.

(a) Hofmann's Ammonolysis Method

When alkyl halide is heated with alcoholic solution of ammonia in a sealed tube at about 393 K, a mixture of amines is obtained. This reaction is called Hofmann's ammonolysis method.

$$RI \xrightarrow[-HI]{NH_3/393\ K} \underset{(1^\circ)}{R\ddot{N}H_2} \xrightarrow[-HI]{RI} \underset{(2^\circ)}{R_2\ddot{N}H} \xrightarrow[-HI]{RI} \underset{(3^\circ)}{R_3\ddot{N}}$$
$$\xrightarrow[-HI]{RI} \underset{\substack{\text{quaternary}\\ \text{ammonium}\\ \text{salt}}}{[R_4\overset{+}{N}]I^-}$$

This reaction follows the S_N2 mechanism.

Primary amine is the main product, if excess of ammonia is used.

Caution Point *Aniline is not obtained by this method as* C—*X bond in alkyl halide is quite strong and does not cleave easily. However aryl halides activated by electron withdrawing group at ortho/para position, gives this reaction.*

But when vapours of ammonia are passed through a mixture of chlorobenzene and cuprous oxide at 473 *K under* 60 *atmospheric pressure, aniline is formed.*

$$C_6H_5Cl + 2NH_3 + Cu_2O \xrightarrow{473\ K,\ 60\ atm} C_6H_5NH_2 + Cu_2Cl_2 + H_2O$$

This method is fully described in properties of alkyl halides.

Sample Problem 5 *Benzylamine may be alkylated as shown in the following equation*

$$C_6H_5CH_2NH_2 + R-X \longrightarrow C_6H_5CH_2NHR$$

Which of the following alkyl halides is best suited for this reaction through S_N1 *mechanism?* **[NCERT Exemplar]**

(*a*) CH_3Br (*b*) C_6H_5Br
(*c*) $C_6H_5CH_2Br$ (*d*) C_2H_5Br

Interpret (*c*) S_N1 mechanism involves cleavage of C—*X* bond to give a carbocation intermediate. Thus, the halide that gives more stable carbocation is best suited for the reaction.

The stability order of carbocation obtained from the given halides is

$$C_6H_5CH_2^+ > C_2H_5^+ > CH_3^+ > C_6H_5^+$$

Thus, $C_6H_5CH_2Br$ is best suited for the given reaction.

(b) Reaction of Alcohols with Ammonia

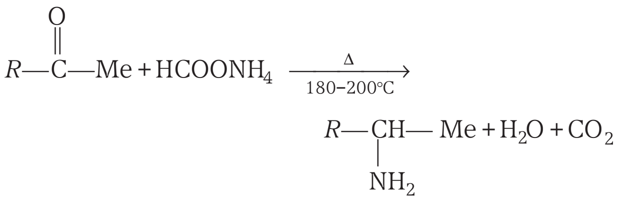
When vapours of a mixture of alcohol and ammonia are passed over heated alumina or thoria (ThO_2) at 620 K, a mixture of amines is obtained, *i.e.*,

$$ROH + NH_3 \xrightarrow[620\ K]{Al_2O_3} RNH_2 + H_2O$$
$$RNH_2 + ROH \longrightarrow R_2NH + H_2O$$
$$R_2NH + ROH \longrightarrow R_3N + H_2O$$
$$R_3N + ROH \longrightarrow R_4\overset{+}{N}OH^-$$

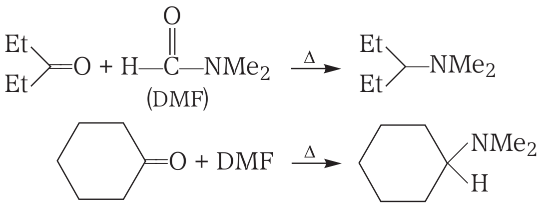
If NH_3 is taken in large excess, RNH_2 is obtained as main product.

(c) Leuckart Reaction

Ketones on reductive amination with $HCOONH_4$ (ammonium formate) or with DMF (dimethylformamide, $H-\overset{\overset{\large O}{\|}}{C}-NMe_2$) give amines. This reaction is called Leuckart reaction.



$$R-\overset{\overset{O}{\|}}{C}-Me + HCOONH_4 \xrightarrow[180-200^\circ C]{\Delta} R-\underset{\underset{NH_2}{|}}{CH}-Me + H_2O + CO_2$$



Methods for Primary Amines Only

With the help of the following methods, only primary amines can be prepared.

(a) Reduction

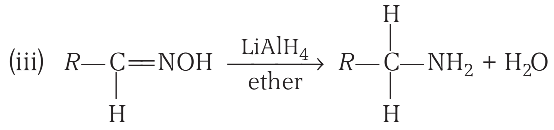
Alkyl nitriles, nitroalkanes, oximes and amides, all on reduction give primary amines as

(i) $$RC\equiv N \xrightarrow[LiAlH_4]{Reduction} RCH_2NH_2$$

(Reduction of nitriles to primary amines by using Na and alcohol is called **Mendius reaction**).

Caution Point *Mendius reaction helps in increasing number of carbon atom in the main chain.*

(ii) $$RNO_2 + 3H_2 \xrightarrow[\substack{\text{or LAH, or } H_2/Pt\\ \text{or metal/acid}}]{Ni/250^\circ} RNH_2 + 2H_2O$$



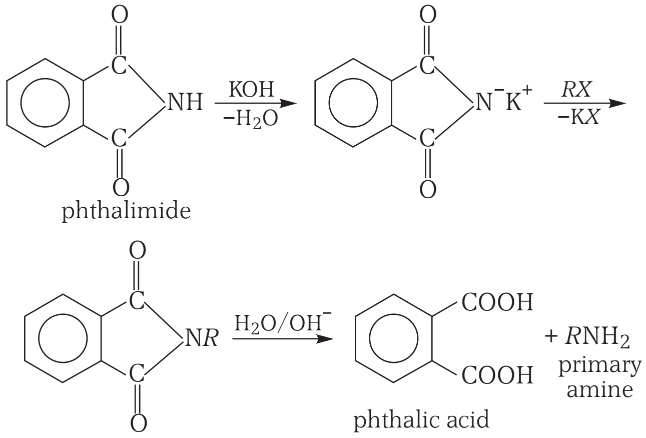
$$\text{(iii)}\quad R\text{—}\underset{\substack{|\\ H}}{C}\text{=NOH} \xrightarrow[\text{ether}]{\text{LiAlH}_4} R\text{—}\overset{\substack{H\\ |}}{\underset{\substack{|\\ H}}{C}}\text{—NH}_2 + H_2O$$

(The best reducing agent for the purpose is LAH but Na/alcohol or H_2 + Ni can also be used).

(iv) $RCONH_2 \xrightarrow{\text{LiAlH}_4} RCH_2NH_2 + H_2O$

(b) Gabriel Phthalimide Synthesis

This reaction is used for the preparation of 1° amine (aliphatic as well as aromatic amines having electron withdrawing group at *o*-and *p*-positions, *e.g.*, —NO_2 group). In this reaction, phthalimide on treatment with ethanolic KOH forms potassium salt of phthalimide which on heating with *RX* followed by either alkaline hydrolysis or hydrazinolysis with hydrazine ($H_2N \cdot NH_2$) produces the corresponding 1° amine. 1° atomatic amine (except those containing electron withdrawing group at *o*- and *p*-positions, *e.g.*, —NO_2 group) cannot be synthesised by this method because Ar*X* does not undergo S_N reaction with anion formed by phthalimide.



Sample **Problem 6** *Which of the following cannot be prepared by Gabriel method from their corresponding halides of tosylates?*

I. t-butylamine,	*II. Neopentylamine*
III. Diethylamine,	*IV. p-toluidine*
V. m-nitroaniline	*VI. Vinylamine,*
VII. p-nitroaniline	*VIII. o-nitroaniline, and*
IX. Allylamine	

The correct answer is

(a) I, II, III, IV, V, VI	*(b) I, II, VI, VII, VIII*
(c) II, III, IV, V, VI, VIII	*(d) All of these*

Interpret (*a*) Halides or tosylates which are unreactive in S_N2 cannot be used.

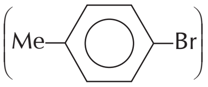
(I) to (VI) cannot be prepared but (VII) to (IX) can be prepared.

I. It cannot be prepared since Me_3C—X is a 3° halide.

II. It cannot be prepared since Me_3C—CH_2—*X* is neopentyl halide and does not undergo S_N2 reaction due to steric hindrance.

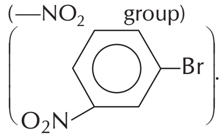
III. It cannot be prepared since 2° amine gives poor yield due to elimination.

IV. It cannot be prepared, since arylhalide



is not activated by electron donating group (Me group). ArSN reaction takes place only when the benzene ring is activated by electron withdrawing group present at *o* - and *p*-positions.

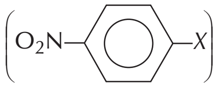
V. It cannot be prepared, since electron with drawing group (—NO_2 group) is present at *m*-position



. ArS_N reaction does not take place.

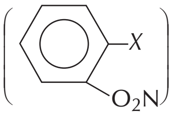
VI. It cannot be prepared, since vinyl halides (CH_2=CH—*X*) are unreactive in S_N2 reactions.

VII. It can be prepared, since benzene ring



is activated by electron withdrawing group (—NO_2 group) at *p*-position and hence ArS_N reaction takes place.

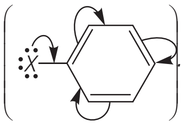
VIII. It can be prepared, since benzene ring



is activated by electron with drawing group (—NO_2 group) at *o*-position and hence ArS_N reaction takes place.

IX. It can be prepared, since allyl halides (CH_2=$CHCH_2X$) can undergo S_N2 reaction.

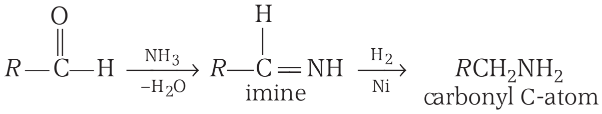
Caution Point *Aryl halides are unreactive towards* S_N2 *reaction, due to resonance stabilisation*



. But, Ar*X containing electron-withdrawing groups at o-and p-positions activates the benzene ring for* ArS_N *reaction. That is why o-and p-nitroaniline can be prepared but* Ar*X containing e-donating groups cannot be used for the preparation of corresponding amines.*

(c) Reductive Amination of Carbonyl Compounds

When a mixture of carbonyl compound, hydrogen and ammonia is passed over Ni catalyst at high temperature, primary amine is formed. The reaction probably goes through the formation of an imine as

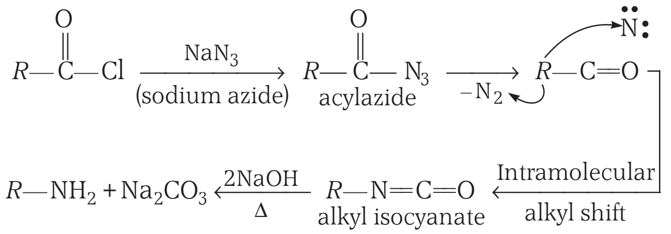


$$R\text{—}\overset{\substack{O\\ \|}}{C}\text{—H} \xrightarrow[-H_2O]{NH_3} \underset{\text{imine}}{R\text{—}\overset{\substack{H\\ |}}{C}\text{=NH}} \xrightarrow[\text{Ni}]{H_2} \underset{\text{carbonyl C-atom}}{RCH_2NH_2}$$

The other catalyst used in place of Ni can be $NaBH_3CN$ (sodium cyanoborohydride).

(d) Curtius Method

In this method, acyl chloride is used to prepare primary amine through acyl azide formation as



$$R-\overset{\overset{\large O}{\|}}{C}-Cl \xrightarrow[\text{(sodium azide)}]{NaN_3} R-\overset{\overset{\large O}{\|}}{C}-N_3 \xrightarrow[-N_2]{} R-C{=}O \xrightarrow{\text{Intramolecular alkyl shift}} R-N{=}C{=}O \xrightarrow[\Delta]{2NaOH} R-NH_2 + Na_2CO_3$$

(e) Hofmann Bromamide Degradation Reaction

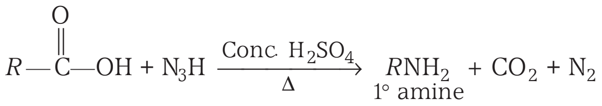
Amides on reaction with Br_2 in an aqueous or ethanolic solution of NaOH give 1° amine with one C atom less than that present in the amide.

$$RCONH_2 + Br_2 + 4KOH \xrightarrow{\Delta} \underset{1^\circ \text{ amine}}{RNH_2} + 2KBr + K_2CO_3 + 2H_2O$$

(The mechanism of this reaction is completely described in the properties of acid amide).

(f) Schmidt Rearrangement

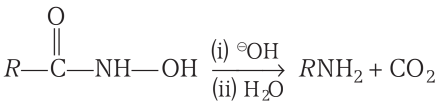
Carboxylic acid, when warmed with hydrazoic acid (N_3H) in the presence of concentrated sulphuric acid, gives a high yield of primary amines.



$$R-\overset{\overset{\large O}{\|}}{C}-OH + N_3H \xrightarrow[\Delta]{\text{Conc. } H_2SO_4} \underset{1^\circ \text{ amine}}{RNH_2} + CO_2 + N_2$$

(g) Lossen Rearrangement Reaction

Hydroxamic acid on reaction with a base followed by hydrolysis gives 1° amine.



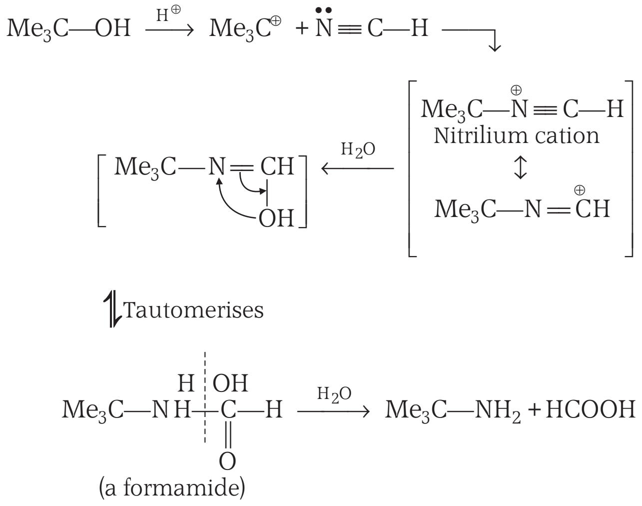
$$R-\overset{\overset{\large O}{\|}}{C}-NH-OH \xrightarrow[\text{(ii) } H_2O]{\text{(i) } ^{\ominus}OH} RNH_2 + CO_2$$

(h) Ritter Reaction

Primary amines having tertiary alkyl group are prepared from tertiary alcohol by using Ritter reaction. In this reaction, Me_3C-OH or $Me_2C{=}CH_2$ is reacted with conc. H_2SO_4 and HCN. In conc. H_2SO_4, these substrates are converted to $Me_3C^{\oplus}$ which then react with HCN.

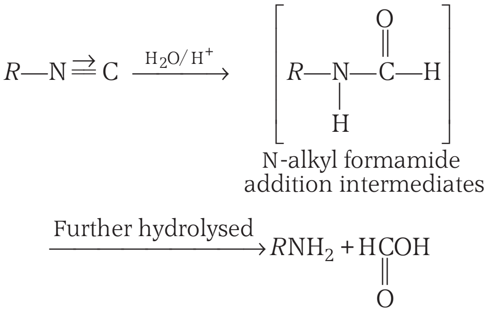
$$Me_3C-OH + HCN + H_2SO_4 \longrightarrow Me_3C-NH_2$$

Mechanism

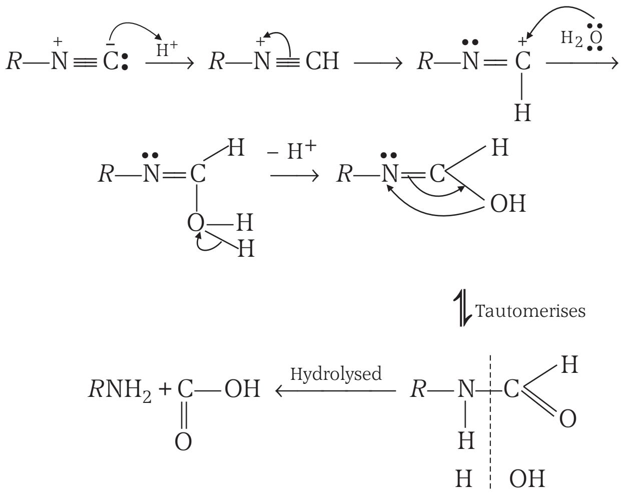


(i) Hydrolysis of Isocyanides

Isocyanides are hydrolysed by dilute acids (but not by alkali) to form a primary amine and formic acid



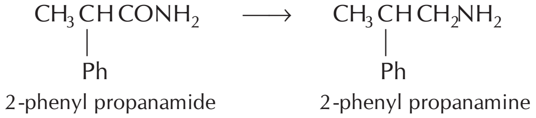
Mechanism



Sample Problem 7 *The best reagent for converting 2-phenylpropanamide into 2-phenylpropanamine is* [**NCERT** Exemplar]

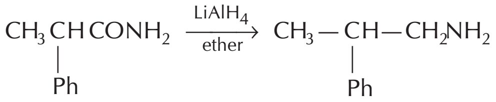
(a) *excess* H_2
(b) Br_2 *in aqueous* NaOH
(c) *iodine in the presence of red phosphorus*
(d) $LiAlH_4$ *in ether*

Interpret (d) First write the conversion in equation form



$$\underset{\text{2-phenyl propanamide}}{CH_3\underset{\substack{|\\ Ph}}{C}HCONH_2} \longrightarrow \underset{\text{2-phenyl propanamine}}{CH_3\underset{\substack{|\\ Ph}}{C}HCH_2NH_2}$$

Find what is converting and into which group, *e.g.*, here $-\overset{\overset{O}{\|}}{C}-$ group is converted into $>CH_2$ group. Now, think about the reagent which bring about this conversion, *e.g.*, For the above conversion, $LiAlH_4$ in ether can be used.



$$CH_3\underset{\substack{|\\ Ph}}{C}HCONH_2 \xrightarrow[\text{ether}]{LiAlH_4} CH_3-\underset{\substack{|\\ Ph}}{C}H-CH_2NH_2$$

Note Br_2 in aqueous NaOH cannot be used as it gives an amine with one less carbon than the parent amide.

Methods for Secondary Amines Only

Following methods are employed for the preparation of secondary amines.

(a) Reaction of *RX* with 1° Amines

Primary amine when heated with an alkyl halide resulting to dialkyl ammonium salt which on treatment with NaOH yields secondary amine.

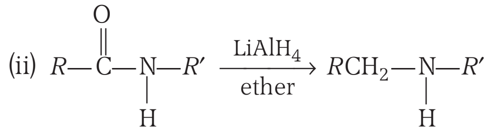
$$RNH_2 + RX \longrightarrow R_2\overset{+}{N}H_2X^- \xrightarrow{NaOH} R_2NH + NaX + H_2O$$

(b) Reduction

Isocyanides and substituted amides on complete reduction give N-substituted amines.

(i) $$\underset{\text{alkyl isocyanide}}{RN\overrightarrow{=}C} + 2H_2 \xrightarrow{\text{Ni or Pt}} \underset{2^\circ\ \text{amine}}{RNHCH_3}$$

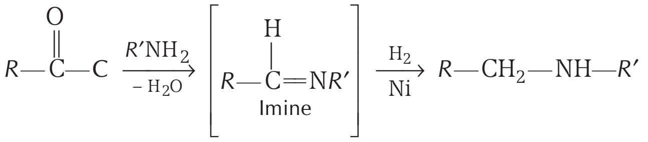
(ii)



$$R-\overset{\overset{O}{\|}}{C}-\underset{\substack{|\\ H}}{N}-R' \xrightarrow[\text{ether}]{LiAlH_4} RCH_2-\underset{\substack{|\\ H}}{N}-R'$$

(c) Reductive Amination of Carbonyl Compounds

A mixture of carbonyl compound, hydrogen and primary amine when passed over Ni catalyst at high temperature, yields secondary amine.



$$R-\overset{\overset{O}{\|}}{C}-C \xrightarrow[-H_2O]{R'NH_2} \left[\underset{\text{Imine}}{R-\overset{\overset{H}{|}}{C}=NR'}\right] \xrightarrow[Ni]{H_2} R-CH_2-NH-R'$$

Caution Point *Reduction of imine is more rapid than that of the starting carbonyl compound.*

Sample Problem 8 *Amongst the given set of reactants, the most appropriate for preparing* 2° *amine is* [**NCERT** Exemplar]

(a) $2^\circ\ R-Br + NH_3$
(b) $2^\circ\ R-Br + NaCN$ *followed by* H_2/Pt
(c) $1^\circ\ R-NH_2 + RCHO$ *followed by* H_2/Pt
(d) $1^\circ\ R-Br$ (2 *mol*) + *potassium phthalimide followed by* H_3O^+/*heat*.

Interpret (c) (a) $2^\circ\ R-Br + NH_3 \longrightarrow \underset{\substack{1^\circ\ \text{amine}\\ \text{(here } R \text{ is } 2^\circ \text{ but}\\ \text{N is not)}}}{2^\circ\ R-NH_2} + HBr$

(b) $2^\circ\ R-Br + NaCN \xrightarrow[-NaBr]{} 2^\circ\ R-CN \xrightarrow{H_2/Pt} \underset{(1^\circ\ \text{amine})}{2^\circ\ R-CH_2NH_2}$

(c) $1^\circ\ RNH_2 + RCHO \longrightarrow RN{=}CHR \xrightarrow{\text{Reduction}} \underset{2^\circ\ \text{amine}}{RNHCH_2R}$

(d) Gabriel phthalimide reaction always gives 1° amine.

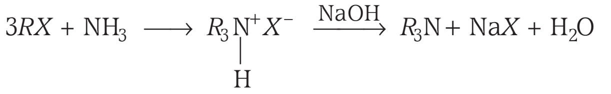
Thus, method given in option (b) is most appropriate to synthesise 2° amine.

Methods for Tertiary Amines Only

Methods for preparation of tertiary amines only are discussed below.

(a) Reaction of *RX* with NH_3

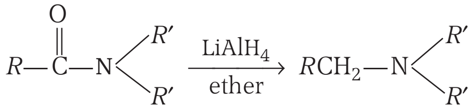
Here, alcoholic NH_3 solution is heated with excess of alkyl halide resulting to trialkyl ammonium halide which on treatment with NaOH gives tertiary amine as



$$3RX + NH_3 \longrightarrow R_3\underset{\substack{|\\ H}}{N^+}X^- \xrightarrow{NaOH} R_3N + NaX + H_2O$$

(b) Reduction of N,N-Disubstituted Amides

N, N-dialkyl alkanamide when reduced from $LiAlH_4$, in the presence of ether, gave a tertiary amine.



$$R-\overset{\overset{O}{\|}}{C}-N\begin{matrix}\diagup R'\\ \diagdown R'\end{matrix} \xrightarrow[\text{ether}]{LiAlH_4} RCH_2-N\begin{matrix}\diagup R'\\ \diagdown R'\end{matrix}$$

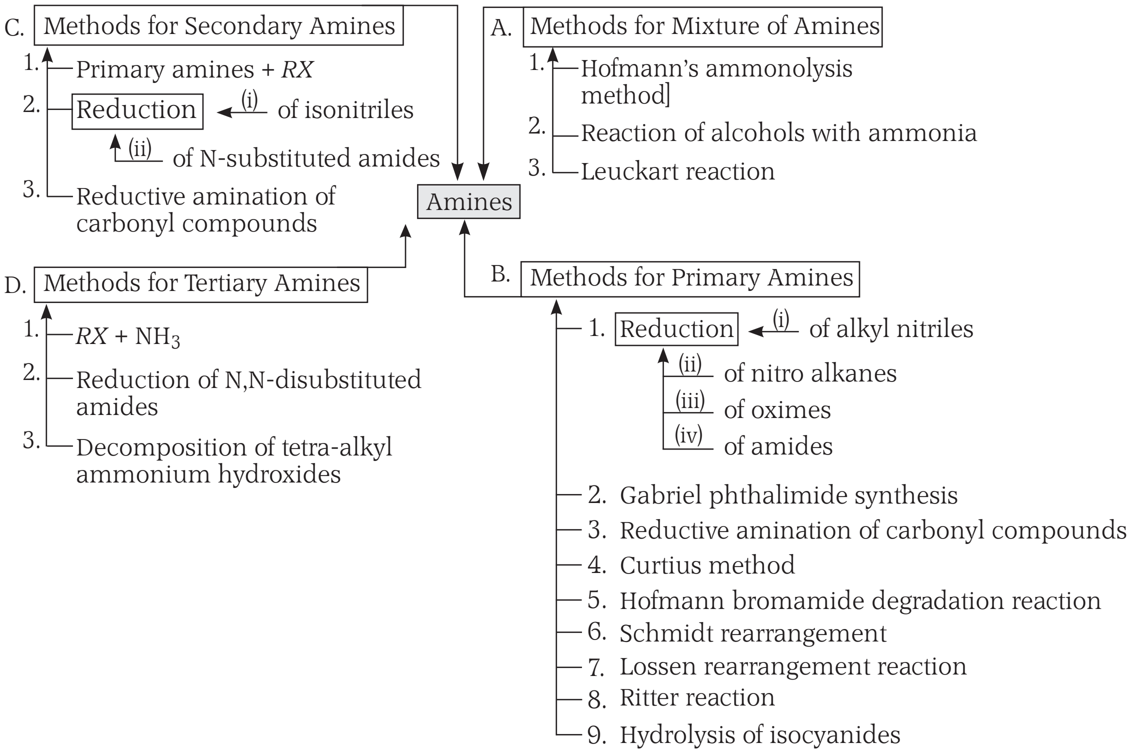
(c) Decomposition of Tetra-alkyl Ammonium Hydroxides

This reaction is called **Hofmann's elimination reaction.** In this reaction, the quaternary ammonium salts when heated, undergo cleavage to form a tertiary amine and an alkene (less substituted).

$$R_4N^+OH^- \xrightarrow{\Delta} R_3N + H_2O + CH_2{=}CH_2 \text{ (Decomposition)}$$

In this reaction, the OH^- abstracts a H^+ from the β-C atom to form water, a molecule of 3° amine and alkene.

The outline of the methods of preparation of amines looks like



12.3 Properties of Aliphatic Amines

Various physical and chemical properties exhibit by amines are dicussed below

Physical Properties

These include

1. Lower amines are gases or low-boiling liquids, with a characteristic ammonia like smell.
2. Their boiling point are higher in comparison to non-polar compounds of same molecular weight (due to intermolecular H-bonding). However, tertiary amines are exceptions of this due to absence of H-bonding.
3. These are miscible with water (due to intermolecular H–bonding with H_2O molecules also).

Chemical Properties

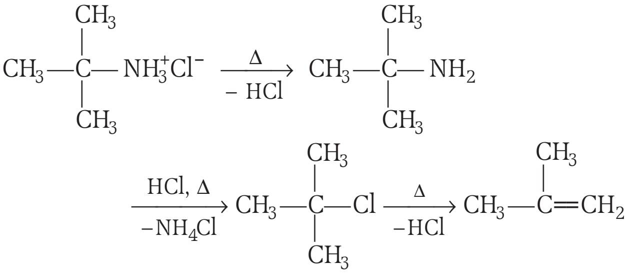
The main reactions exhibited by amines are as follows

(a) With Mineral Acids

Amines being basic in nature, react with acids to form salt.

$$RNH_2 + \underset{\text{hydrochloric acid}}{HCl} \longrightarrow \underset{\text{salt}}{R\overset{+}{N}H_3Cl^-}$$

If a tertiary-alkyl group is present, this is eliminated as an alkene.



$$CH_3-\underset{CH_3}{\overset{CH_3}{C}}-NH_3^+Cl^- \xrightarrow[-\text{ HCl}]{\Delta} CH_3-\underset{CH_3}{\overset{CH_3}{C}}-NH_2 \xrightarrow[-NH_4Cl]{HCl,\ \Delta} CH_3-\underset{CH_3}{\overset{CH_3}{C}}-Cl \xrightarrow[-HCl]{\Delta} CH_3-\overset{CH_3}{C}=CH_2$$

(b) Nature of Aqueous Solution

Amines react with water to give alkyl ammonium hydroxides which ionises into hydroxide ions in solution, *i.e.*, the aqueous solutions of amines are basic in nature.

$$\underset{1^\circ\text{ amine}}{RNH_2} + HOH \rightleftharpoons RNH_3OH^- \rightleftharpoons [RNH_3]^+ + OH^-$$

$$\underset{2^\circ\text{ amine}}{R_2NH} + HOH \rightleftharpoons R_2\overset{+}{N}H_2OH^- \rightleftharpoons [R_2NH_2]^+ + OH^-$$

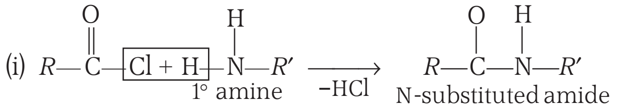
$$\underset{3^\circ\text{ amine}}{R_3N} + HOH \rightleftharpoons R_3\overset{+}{N}HOH \rightleftharpoons [R_3NH]^+ + OH^-$$

The aqueous solutions of amines behave like NH_4OH and give ferric hydroxide precipitate with ferric chloride and blue solution with copper sulphate.

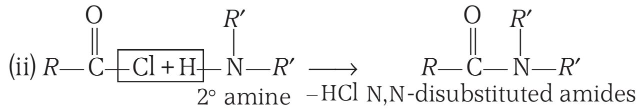
$$3\,RNH_3OH + FeCl_3 \longrightarrow \underset{\text{brown ppt.}}{Fe(OH)_3} \downarrow + 3\,RNH_3Cl$$

(c) Acylation

In this reaction, 1° amines give N-substituted amide while 2° amines give N,N-disubstituted amides.

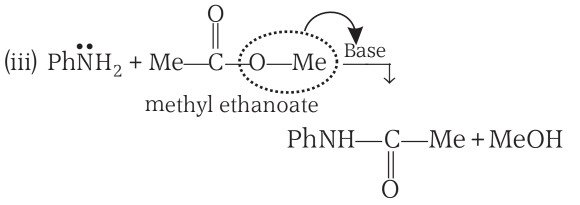


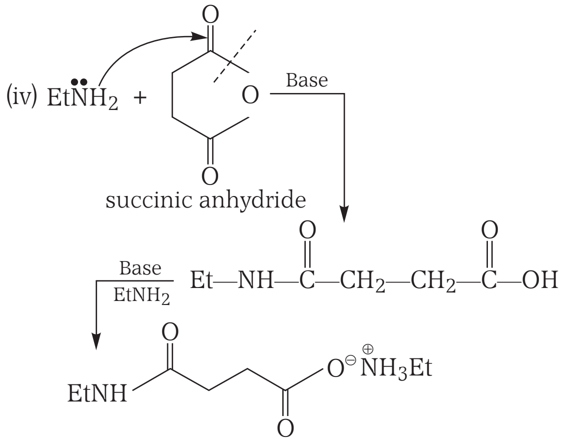
$$\text{(i)}\ R-\overset{\overset{\displaystyle O}{\|}}{C}-\boxed{Cl + H}-\overset{\overset{\displaystyle H}{|}}{\underset{1^\circ\text{ amine}}{N}}-R' \xrightarrow[-HCl]{} \underset{\text{N-substituted amide}}{R-\overset{\overset{\displaystyle O}{\|}}{C}-\overset{\overset{\displaystyle H}{|}}{N}-R'}$$

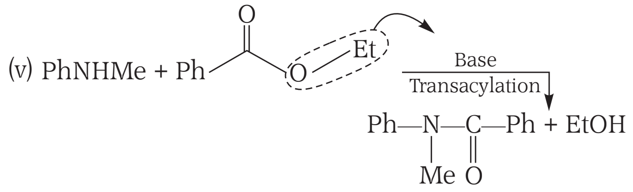


$$\text{(ii)}\ R-\overset{\overset{\displaystyle O}{\|}}{C}-\boxed{Cl + H}-\overset{\overset{\displaystyle R'}{|}}{\underset{2^\circ\text{ amine}}{N}}-R' \xrightarrow[-HCl]{} \underset{\text{N,N-disubstituted amides}}{R-\overset{\overset{\displaystyle O}{\|}}{C}-\overset{\overset{\displaystyle R'}{|}}{N}-R'}$$

There is no active H at 3° amines hence, there is no reaction with them. For acylation, $RCOCl$ or $(RCO)_2O$ can be used. The reaction is carried out in the presence of a base stronger than amine, such as pyridine, which removes HCl so formed and shifts the equilibrium to the right hand side.

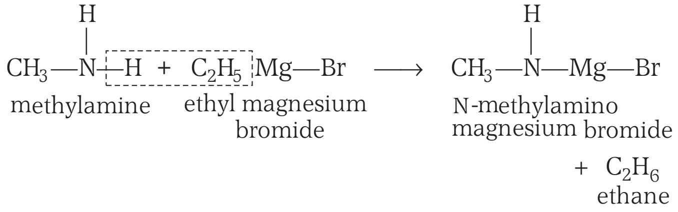




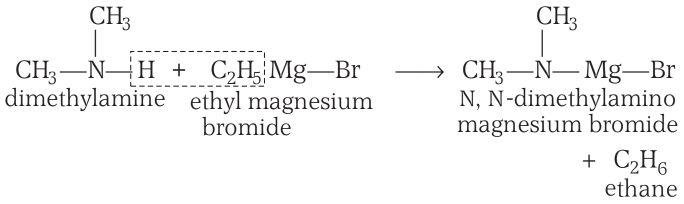


(d) Reaction with Grignard's Reagents

Both primary and secondary amines give alkanes with Grignard's reagents *e.g.*,



$$\underset{\text{methylamine}}{CH_3-\overset{\overset{\displaystyle H}{|}}{N}}-\boxed{H + C_2H_5}\underset{\text{ethyl magnesium bromide}}{Mg-Br} \longrightarrow \underset{\text{N-methylamino magnesium bromide}}{CH_3-\overset{\overset{\displaystyle H}{|}}{N}-Mg-Br} + \underset{\text{ethane}}{C_2H_6}$$



$$\underset{\text{dimethylamine}}{CH_3-\overset{\overset{\displaystyle CH_3}{|}}{N}}-\boxed{H + C_2H_5}\underset{\text{ethyl magnesium bromide}}{Mg-Br} \longrightarrow \underset{\text{N, N-dimethylamino magnesium bromide}}{CH_3-\overset{\overset{\displaystyle CH_3}{|}}{N}-Mg-Br} + \underset{\text{ethane}}{C_2H_6}$$

Tertiary amines do not react with Grignard's reagent, because of the absence of H attached directly with N.

(e) Reaction with Transition Metal Ions

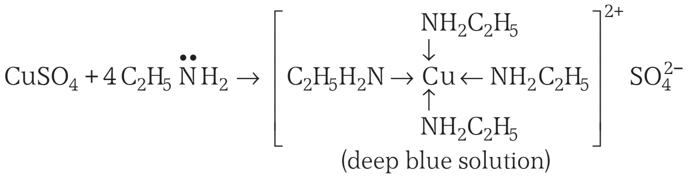
Amines form coordination compounds with transition metal ions such as Ag^+ or Cu^{2+} ions by donating the electron pair present on the nitrogen atom.

Ethylamine dissolves white precipitate of silver chloride to form a complex as

$$\underset{\text{(white precipitate)}}{AgCl} + \underset{\text{ethylamine}}{2C_2H_5\ddot{N}H_2} \longrightarrow$$

$$\underset{\text{(soluble complex)}}{[C_2H_5-H_2N \longrightarrow Ag \longleftarrow H_2N-C_2H_5]^+Cl^-}$$

Similarly, copper sulphate also reacts with amine to give a deep blue solution.

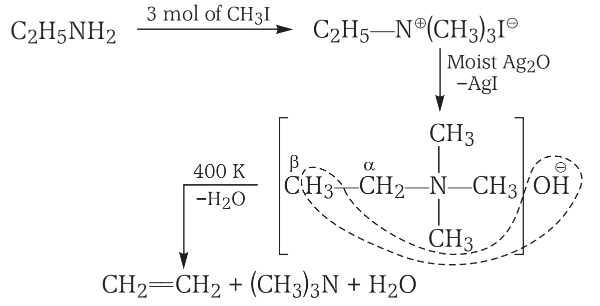


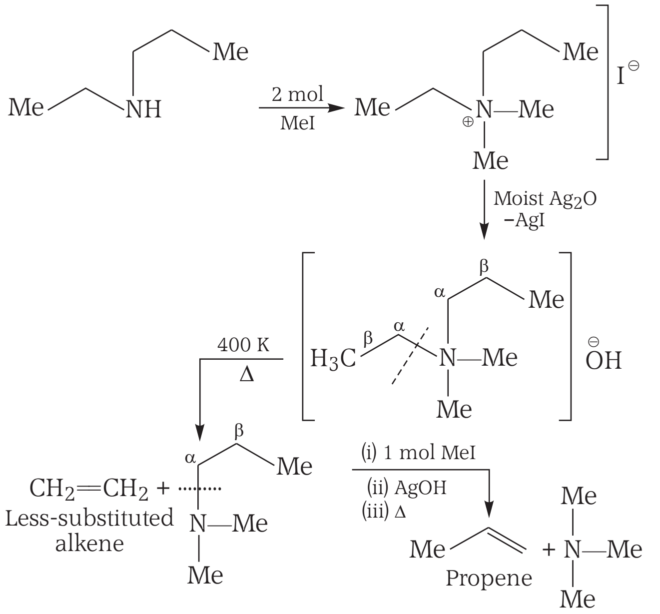
$$CuSO_4 + 4\,C_2H_5\ddot{N}H_2 \rightarrow \left[\begin{array}{c} NH_2C_2H_5 \\ \downarrow \\ C_2H_5H_2N \rightarrow Cu \leftarrow NH_2C_2H_5 \\ \uparrow \\ NH_2C_2H_5 \end{array}\right]^{2+} SO_4^{2-}$$

(deep blue solution)

(f) Hofmann's Exhaustive Methylation and Elimination

The process of converting an amine (1°, 2° or 3°) into quaternary ammonium salt by treating it with excess of CH_3I is called **Hofmann's exhaustive methylation**. This quaternary salt when treated with moist Ag_2O gives silver halide as precipitate and quanternary ammonium hydroxide, which on heating at 400 K or above undergoes an elimination reaction to produce an alkene, trimethylamine and water. This is called **Hofmann's elimination reaction**. In the pyrolysis, less-substituted alkene is formed first, *e. g.*,





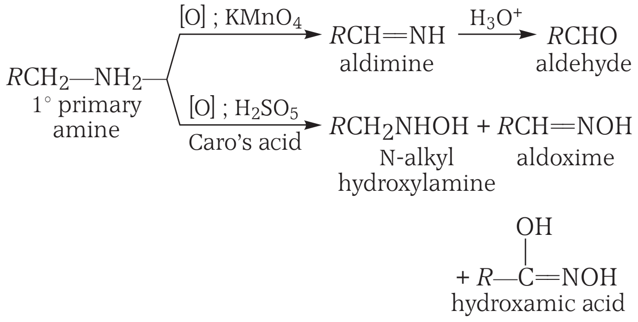
The reaction is E_2 and in last step, the leaving group is NMe_3. $RCH_2CH_2NH_2$ does not undergo E2 elimination as $\overset{\ominus}{N}H_2$ is a poor leaving group.

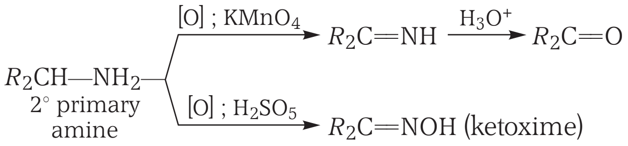
Caution Point *A novel aspect of the Hofmann elimination is its regioselectivity. Elimination in alkyl-trimethyl ammonium hydroxide proceeds in the direction that gives the less substituted alkene, and is opposite to the Saytzeff rule that prefers the formation of more substituted alkene. It is less sterically hindred β-hydrogen that is removed by the base in Hofmann elimination reactions. Methyl* ($—CH_3$) *groups are deprotonated in preference to methylene* ($—CH_2—$) *groups, and methylene groups are deprotonated in preference to methines* ($—\overset{|}{\underset{|}{C}}H$).

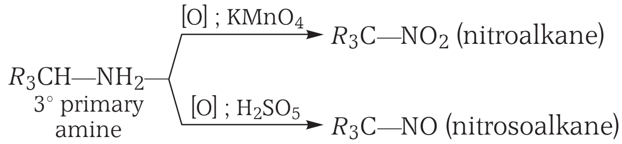
(g) Oxidation of Amines

Oxidative products depend upon the type of amine taken and also on the nature of oxidant used.

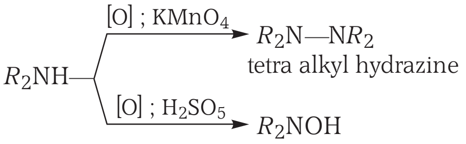
(i) **Oxidation of primary amines**



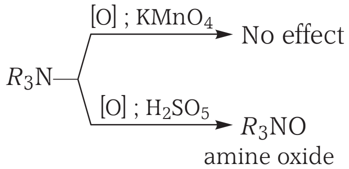




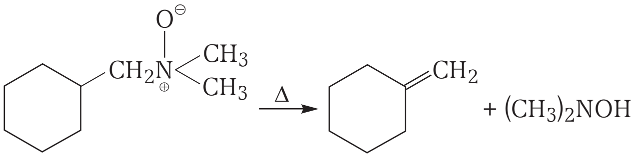
(ii) **Oxidation of secondary amines**



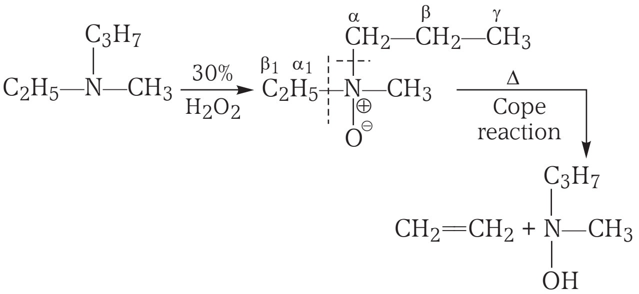
(iii) **Oxidation of tertiary amines**



Cope elimination The tertiary amine oxide containing a β-H atom, on heating forms an alkene. The reaction is called cope elimination, *e. g.*,



In Cope reaction, the alkene formed will be less substituted (not Saytzeff product but Hofmann elimination product). Cope reaction is similar to Hofmann exhaustive methylation and elimination reaction. *e. g.*,

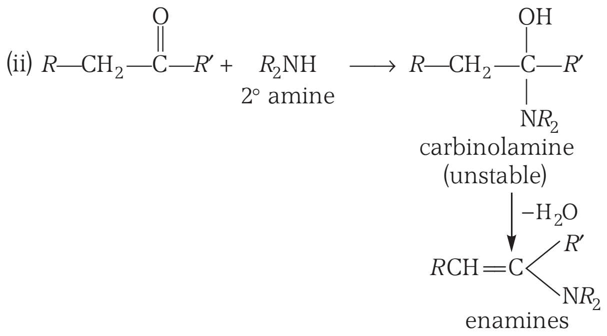


Cope reaction is an E2 reaction in which leaving groups are H and $R_2N—O^{\ominus}$, which form $R_3N—OH$.

(h) With Carbonyl Compounds

Amines form Schiff's base and examine with carbonyl compounds.

(i) $\underset{\text{1° amine}}{R—N\boxed{H_2 + O}}═C\langle \longrightarrow \underset{\text{Schiff's base}}{R—C═N\langle}$



$$R{-}CH_2{-}\overset{O}{\overset{\|}{C}}{-}R' + \underset{2^\circ\text{ amine}}{R_2NH} \longrightarrow \underset{\substack{\text{carbinolamine}\\ \text{(unstable)}}}{R{-}CH_2{-}\overset{OH}{\overset{|}{\underset{\underset{NR_2}{|}}{C}}}{-}R'}$$

(iii) $R_3N + \rangle C{=}O \longrightarrow$ No reaction

Identification of 1°, 2° and 3° Amines

Several reactions can be used to identify 1°, 2° *and* 3° *amines. Some important of these are*

(a) With Nitrous Acid

This reaction is used as the basis of test to distinguish between primary, secondary and tertiary amines *i.e.*,

(i) Primary amine ⟶ N_2 gas bubbled out

$$\underset{1^\circ\text{ amine}}{R{-}NH_2} + HONO \longrightarrow \underset{\text{alcohol}}{ROH} + N_2 + H_2O$$

The reaction takes place through the formation of unstable diazonium salt (diazotisation) which changes to carbocation as one of the intermediates. This carbocation gives variety of products.

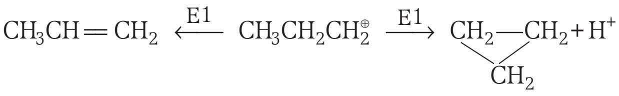
$$CH_3CH_2CH_2NH_2 \xrightarrow[(NaNO_2+HCl)]{HNO_2} \underset{\substack{n\text{-propyl diazonium}\\ \text{chloride}}}{CH_3CH_2CH_2N_2^+Cl^-}$$

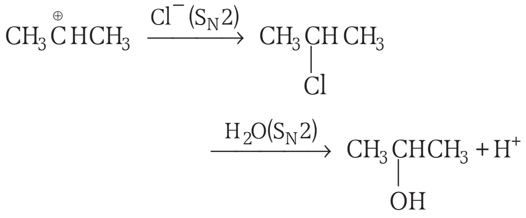
$$CH_3CH_2CH_2N_2^+Cl^- \longrightarrow \underset{1^\circ\text{ carbocation}}{CH_3CH_2CH_2^{\oplus}} + N_2 + \underset{\substack{\text{leaving}\\ \text{group}}}{Cl^-}$$

$$CH_3CH_2\overset{\oplus}{C}H_2 \xrightarrow{\text{1,2-hydride shift}} \underset{\substack{2^\circ\text{ carbocation}\\ \text{(more stable than } 1^\circ)}}{CH_3\overset{\oplus}{C}HCH_3}$$

$$CH_3CH_2\overset{\oplus}{C}H_2 \xrightarrow{Cl\,(S_N2)} CH_3CH_2CH_2Cl$$

$$\xrightarrow{H_2O,\,(S_N2)} CH_3CH_2CH_2OH + H^+$$



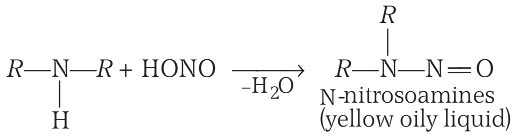


$$CH_3\overset{\oplus}{C}HCH_3 \xrightarrow{Cl^-\,(S_N2)} CH_3\underset{\underset{Cl}{|}}{C}HCH_3$$

$$\xrightarrow{H_2O(S_N2)} CH_3\underset{\underset{OH}{|}}{C}HCH_3 + H^+$$

All these side-products have been isolated. Since, nitrogen-free products result from the formation and decomposition of diazonium ions, these reactions are also called **deamination reactions.**

(ii) Secondary amine ⟶ Yellow oily layer



$$R{-}\underset{\underset{H}{|}}{N}{-}R + HONO \xrightarrow[-H_2O]{} \underset{\substack{\text{N-nitrosoamines}\\ \text{(yellow oily liquid)}}}{R{-}\overset{R}{\overset{|}{N}}{-}N{=}O}$$

The N-nitrosoamines on warming with a crystal of phenol and a few drops of conc. H_2SO_4 form a green solution which when made alkaline with *aq.* NaOH turns deep blue and then red on dilution. This reaction is called **Liebermann's nitroso reaction** and used as a test for secondary amines.

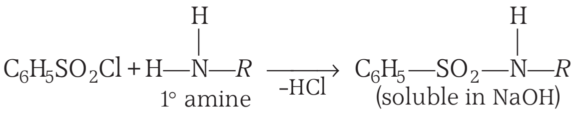
(iii) Tertiary amine ⟶ Trialkyl ammonium nitrite

$$R_3N + HONO \longrightarrow \underset{\text{soluble in water}}{R_3\overset{+}{N}HNO_2^-}$$

(b) With Benzene Sulphonyl Chloride, *i.e.*, Hinsberg Reagent

Hinsberg reagent is also used to distinguish between 1°, 2° and 3° amines.

(i) Primary amines + $C_6H_5SO_2Cl \longrightarrow$ Sulphonamide (soluble in NaOH)



$$C_6H_5SO_2Cl + \underset{1^\circ\text{ amine}}{H{-}\overset{H}{\overset{|}{N}}{-}R} \xrightarrow[-HCl]{} \underset{\text{(soluble in NaOH)}}{C_6H_5{-}SO_2{-}\overset{H}{\overset{|}{N}}{-}R}$$

The solubility of sulphonamide of primary amine is due to the presence of replaceable acidic H present in them, which is eliminated by $—OH^-$ of base.

(ii) Secondary amine + $C_6H_5SO_2Cl \longrightarrow$ Sulphonamide (insoluble in NaOH)

$$C_6H_5SO_2Cl + H{-}NR_2 \xrightarrow[-HCl]{} \underset{\text{(insoluble in NaOH)}}{C_6H_5{-}SO_2{-}NR_2}$$

(iii) Tertiary amine + $C_6H_5SO_2Cl \longrightarrow$ No reaction

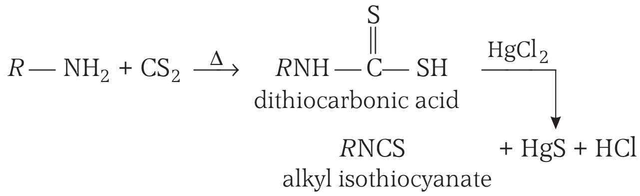
(c) Carbylamine Reaction

This reaction is given by only primary amines (both aliphatic and aromatic). Primary amines when warmed with chloroform and alcoholic KOH, give extremely bad smelling compounds called **carbylamines** or **isocyanides.**

$$RNH_2 + CHCl_3 + 3KOH(alc) \longrightarrow \underset{\substack{\text{phenyl}\\ \text{carbylamine}}}{RN \overset{\rightarrow}{=} C} + 3KCl + 3H_2O$$

(d) Hofmann Mustard Oil Reaction

1° amines on warming with CS_2 from a dithiocarbamic acid. This is decomposed by $HgCl_2$ to give alkyl isothiocyanate and black precipate of HgS. This is called **Hofmann mustard oil reaction** (a test for 1° amines.)



$$R-NH_2 + CS_2 \xrightarrow{\Delta} \underset{\text{dithiocarbonic acid}}{RNH-\overset{\overset{\large S}{\|}}{C}-SH} \xrightarrow{HgCl_2} \underset{\text{alkyl isothiocyanate}}{RNCS} + HgS + HCl$$

Sample Problem 9 *Methylamine reacts with* HNO_2 *to form* **[NCERT Exemplar]**

(a) $CH_3-O-N=O$

(b) CH_3-O-CH_3

(c) CH_3OH

(d) CH_3CHO

Interpret (a,b,c)

$$CH_3NH_2 + HONO \xrightarrow[\text{ice cold}]{HCl} \underset{\text{unstable}}{CH_3N_2^+Cl^-} + 2H_2O$$

$$\downarrow$$

$$CH_3^+ + N_2 + Cl^-$$

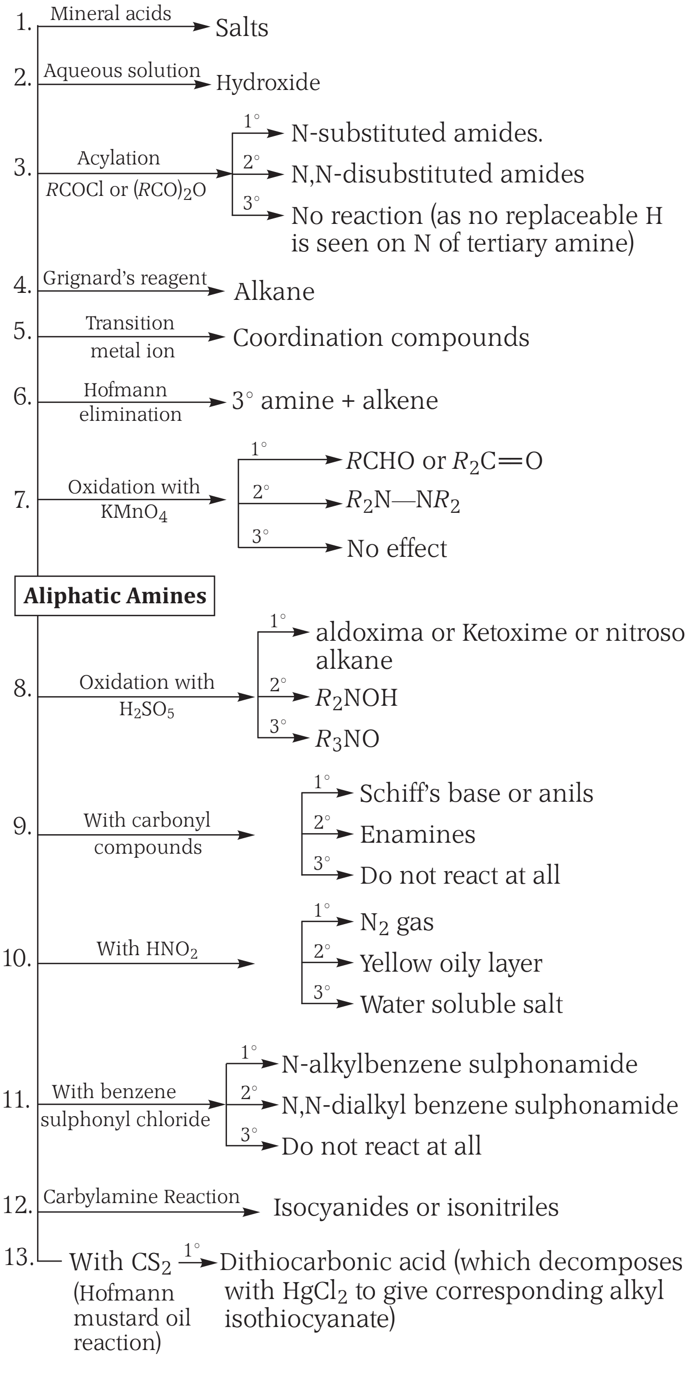
$$\downarrow HONO$$

$$CH_3-O-CH_3 + CH_3ONO + H^+ + CH_3OH$$

Check Point 1

1. Tertiary amine has the lowest boiling point in a group of isomeric amines. Explain, why?
2. Why is silver chloride soluble in methylamine?
3. The sulphonamide of 1° amine is soluble in water while that of 2° amines is not. Explain with appropriate reason.
4. Why amines are more basic than amides?
5. In gas phase, $(CH_3)_3N$ is more basic than $(CH_3)_2NH$ but in aqueous solution, reverse is true. Explain, why?

The outline of chemical properties of amines looks like



Separation of 1°, 2° and 3° Amines

Separation of 1°, 2° *and* 3° *amines can be done through following methods*

(a) Fractional Distillation

Easy to apply as their boiling points are quite different.

(b) Hinsberg Method

In this method, mixture is treated with $C_6H_5SO_2Cl$ and the solution is made alkaline with aqueous NaOH. On distillation, this alkaline solution gives **tertiary amine** and remaining mixture is filtered. The filtrate on acidification gives sulphonamide of **primary amine,** while the solid residue is **sulphonamide of secondary amine.** The two sulphonamides thus isolated, are hydrolysed with conc. HCl and distilled over NaOH to yield the respective amines.

(c) Hofmann Method

Here, mixture is treated with diethyl oxalate

(i) **Primary amines** form a solid compound called dialkyloxamide $\left(\begin{array}{l}\text{CONH}R\\ |\\ \text{CONH}R\end{array}\right)$.

(ii) **Secondary amines** form on oily liquid called dialkyloxamic ester $\left(\begin{array}{l}\text{CO—N}R_2\\ |\\ \text{COOC}_2\text{H}_5\end{array}\right)$.

(iii) Tertiary amines do not react at all.

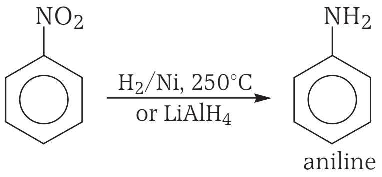
Now, the mixture is fractionally distilled. Unreacted tertiary amines come out as first fraction, followed by oily oxamic ester as second fraction, oxamide (solid) remains in the distillation flask. Oxamic ester and oxamide gave respective amines back on treatment with KOH.

12.4 Methods of Preparation of Aromatic Amines

Aromatic amines can be prepared the following methods.

1. Reduction of Nitro Compounds

The reaction looks like



Infact, reduction of nitro compounds gives different products as

$$R\text{—NO}_2 \xrightarrow[-H_2O]{+2H} \underset{\text{nitroso compounds}}{R\text{—N=O}} \xrightarrow{+2H} R\text{—}\underset{\mathrm{H}}{\underset{|}{\mathrm{N}}}\text{—OH} \xrightarrow[-H_2O]{+2H} R\text{—NH}_2$$

The final product of reduction depends upon pH of the reaction medium and nature of reducing agent, *i.e.*.

(i) Both aromatic as well as aliphatic nitro compounds can be reduced to corresponding primary amine by metal/acid reducing agent combination.

(ii) **Hydroxylamines** are produced in neutral medium (Zn dust and NH_4Cl solution) by both aliphatic and aromatic nitrocompounds.

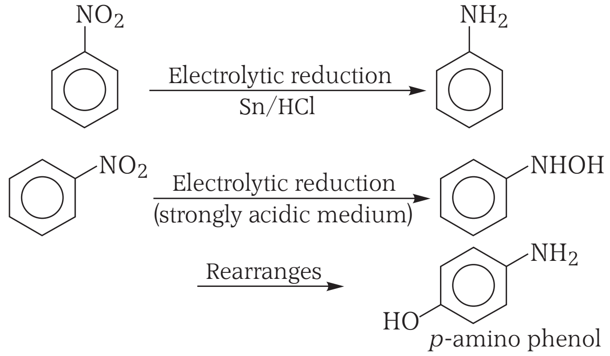
(iii) In alkaline medium, different products are produced under different conditions as

I. Azoxybenzene $\left(C_6H_5\text{—}\overset{\overset{\displaystyle O}{\uparrow}}{N}\text{=N—}C_6H_5\right)$ with Na_3AsO_3 / NaOH

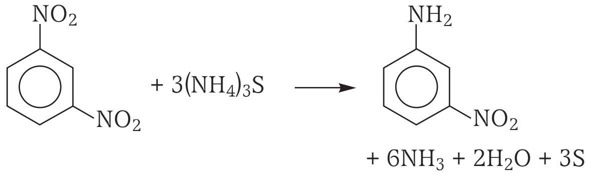
II. Azobenzene $(C_6H_5N{=}NC_6H_5)$ with Zn/NaOH in CH_3OH.

III. Hydrazobenzene $\left(C_6H_5\ \underset{\mathrm{H}}{\underset{|}{\mathrm{N}}}\text{—}\underset{\mathrm{H}}{\underset{|}{\mathrm{N}}}\text{—}C_6H_5\right)$ with Zn/NaOH, in C_2H_5OH (cold conc. HCl).

(iv) Electrolytic reduction of nitrobenzene in weakly acidic medium gives **aniline** while electrolytic reduction in strongly acidic medium produces ***p*-amino phenol** as

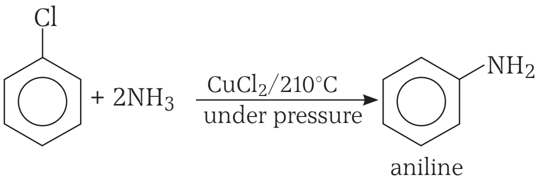


(v) If two or more nitro groups are present on benzene ring, it is possible to reduce one of them without affecting the other **(selective reduction)** as



This reduction with sulphides and polysulphides is called **Zinin reduction.**

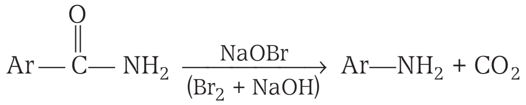
2. Ammonolysis of Aryl Chlorides



The method can be carried out conveniently under ordinary conditions if a strong electron withdrawing group (*e. g.*, —NO_2) is present at *ortho* or *para*-position to —Cl.

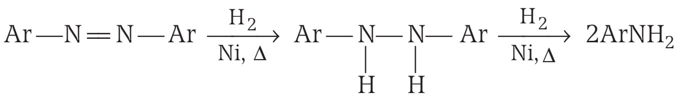
3. Hofmann's Bromamide Degradation Reaction

This reaction involves intramolecular phenyl migration, the rate of which is increased by the presence of electron releasing substituents.



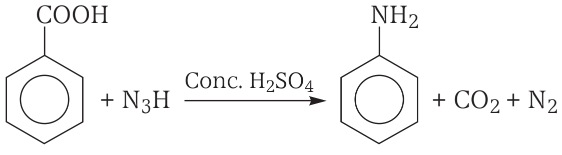
$$Ar—\overset{\overset{\large O}{\|}}{C}—NH_2 \xrightarrow[(Br_2 + NaOH)]{NaOBr} Ar—NH_2 + CO_2$$

4. Reduction of Azo Compounds



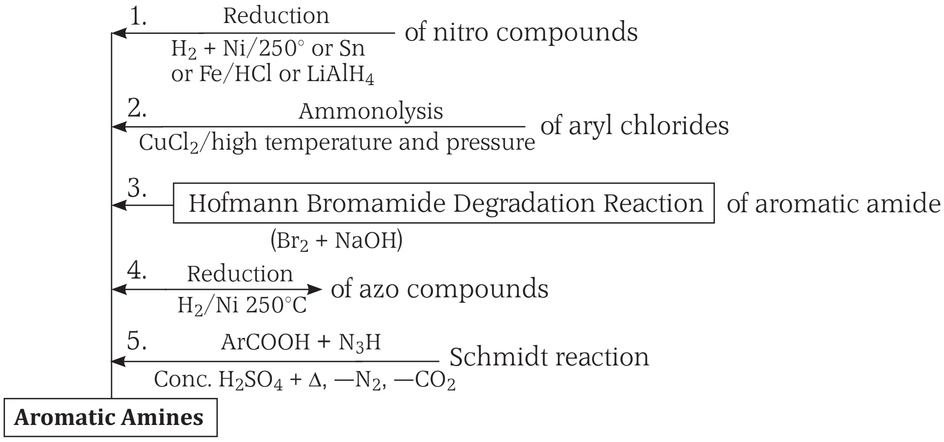
$$Ar—N{=}N—Ar \xrightarrow[Ni,\,\Delta]{H_2} Ar—\underset{\underset{H}{|}}{N}—\underset{\underset{H}{|}}{N}—Ar \xrightarrow[Ni,\,\Delta]{H_2} 2ArNH_2$$

5. Schmidt Reaction



Some other methods are very similar to those used for aliphatic amines

The outline of methods of preparation of aromatic amines looks like



12.5 Properties of Aromatic Amines

Various physical and chemical properties of aromatic amines are discussed below

Physical Properties

1. These are colourless liquids or solids having characteristic odour.
2. They turn brown in air due to oxidation.
3. They have high boiling point (due to intermolecular H-bonding) and are sparingly soluble in water but more soluble in organic solvents, steam volatile, toxic substances and carcinogenic in nature.
4. They are less basic as compared to aliphatic amines. Generally, the presence of electron releasing groups like —CH_3, —OCH_3 etc., increases the basic strength of aromatic amines while presence of electron withdrawing groups like —NO_2, —*X*, —CN etc., decreases the same. (The electron releasing or withdrawing groups are more effective at *para* position or their effect is more pronounced at *para* position).

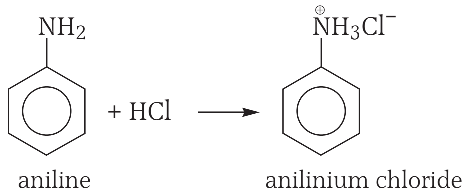
Between diphenyl amine and aniline, aniline is more basic because of the presence of two electron withdrawing phenyl groups in diphenylamine (Here, lone pair of N-atom is used up by two benzene nucleus).

Chemical Properties

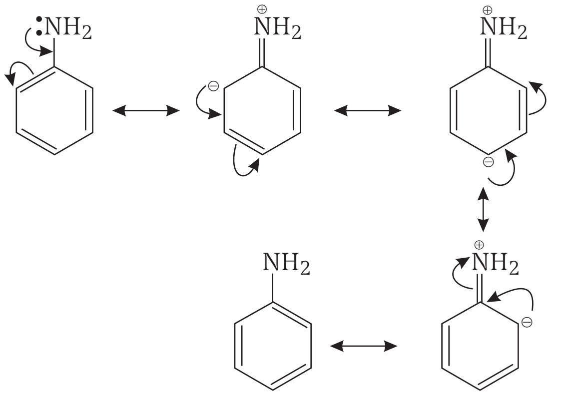
Important reactions exhibited by aromatic amines are as follows

(a) **Salt Formation**

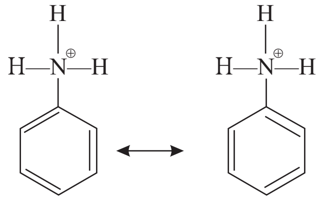
Like aliphatic amines, aromatic amines also form salt with acids, this shows their basic nature. However, these are less basic as compared to aliphatic amines due to delocalisation of electrons. The reaction looks as



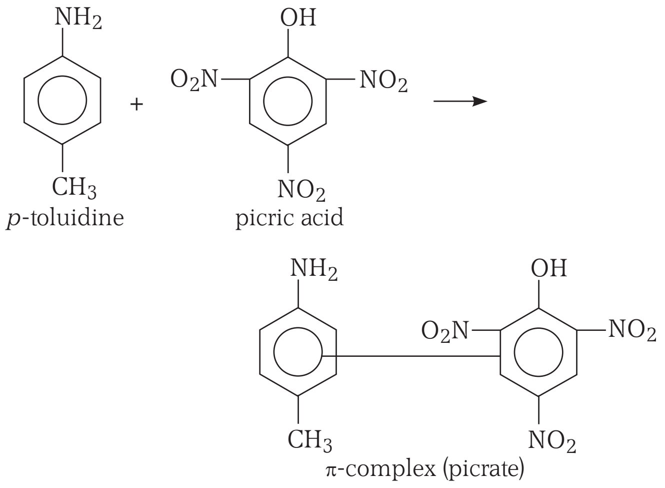
Anilinium ion is less resonance stabilised as compared to aniline, *i.e.*, the following resonating structures are possible for aniline and anilinium ion.



(Resonance structures of aniline)

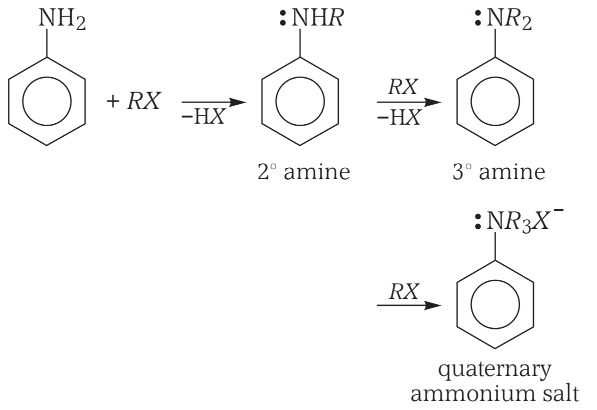


(Resonance structures of anilinium ion)



(b) **Alkylation**

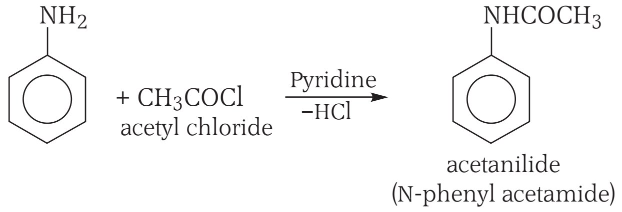
Like primary aliphatic amines, aromatic amines also react with alkyl halides to give respective secondary and tertiary amines. The reaction looks as

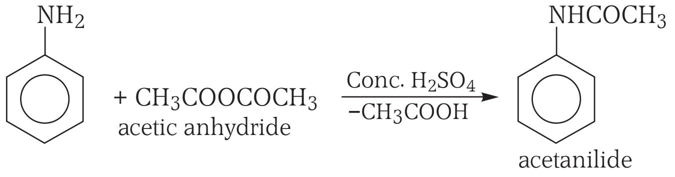


The process of conversion of a 1° amines into quarternary ammonium salt is called **Hofmann exhaustive alkylation.**

(c) **With Acids and Acid Derivatives**

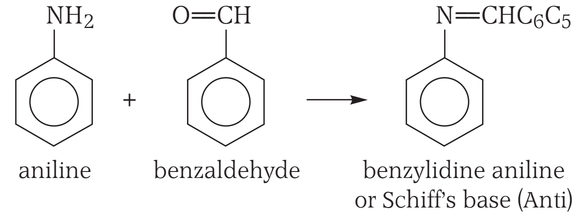
N-aryl amide are formed in this reaction. The reaction looks like





(d) **With Aldehydes**

The reaction is as

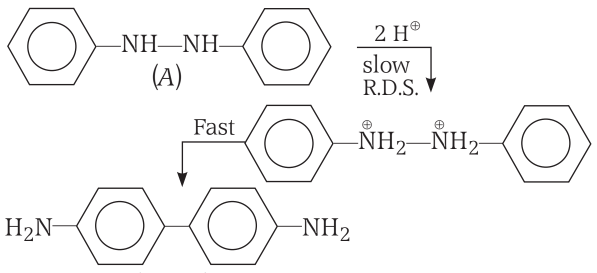


On catalytic hydrogenation, Schiff's base gives secondary amines

$$C_6H_5N{=}CHC_6H_5 + H_2 \xrightarrow{Ni} \underset{\text{N-phenyl benzylamine}}{C_6H_5CH_2NHC_6H_5}$$

(e) Benzidine Rearrangement Reaction

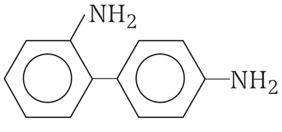
In stronglty acidic solution, hydrazobenzene (PhNHNHPh) intramolecular rearranges to benzidine.



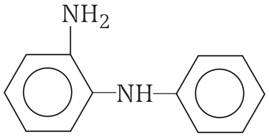
benzidine
(major) (70%)

$$\text{Rate} = k[A][H^+]^2$$

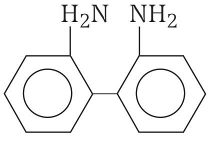
The other products formed are



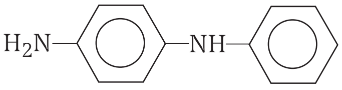
diphenyline
(~30%)



o-semidine
(minor)

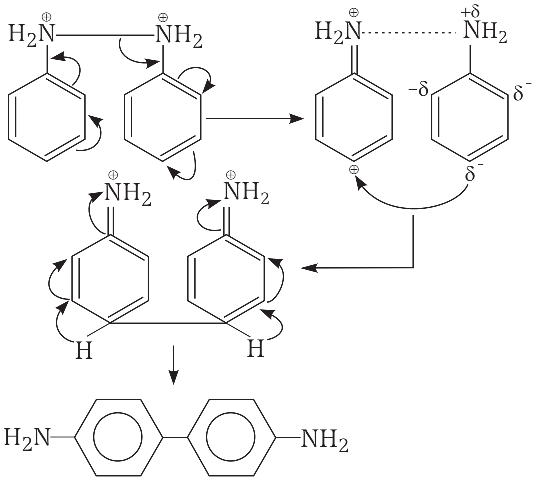


o-benzidine
(minor)



p-semidine
(minor)

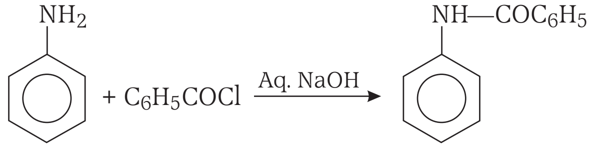
Mechanism The two independent mechanisms can operate in this reaction, a one-proton and a two-proton mechanism. The latter is described here



This mechanism leads to a C—C linking and can give rise to 4, 4′-product (benzidine) and/or to 2, 4′-product (diphenyline). Aromatic nuclei lie in approximately parallel planes.

(f) Benzoylation or Schotten Baumann Reaction

The reaction looks like

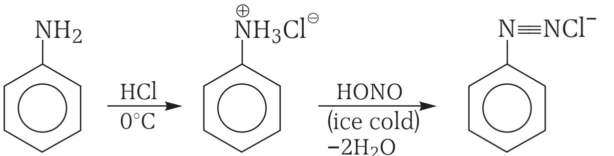


benzanilide
or N-phenyl benzamide

(g) With HNO_2

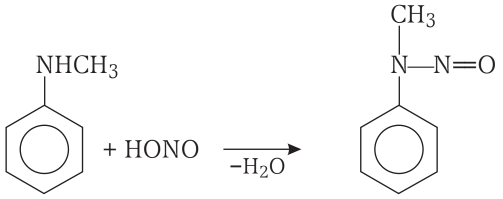
1°, 2° and 3° aromatic amines react differently with HNO_2.

(i) Primary aromatic amines, like aniline when react with HNO_2 (nitrous acid) under ice cold conditions form benzene diazonium chloride. The reaction is called **diazotisation reaction.**



aniline
aniline
hydrogen chloride
benzene
diazonium chloride

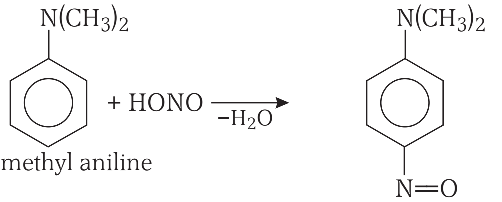
(ii) Secondary aromatic amines, like aliphatic 2° amines, form a yellow oily layer of nitroso derivatives.



2° amine

N-nitroso-N-methylaniline
(yellow oily liquid)

(iii) Tertiary aromatic amines, on the other hand, form a coloured nitroso derivative (*p*-product). The reaction is called **nitrosation.**



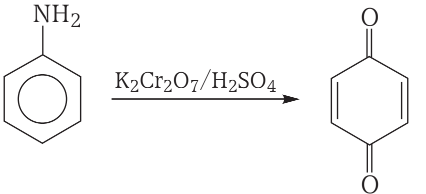
dimethyl aniline

p-nitroso-N, N-dimethylaniline

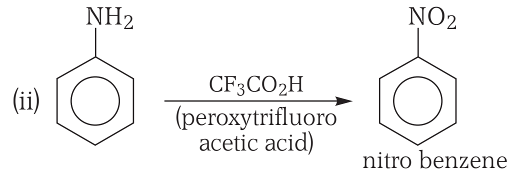
(h) Oxidation

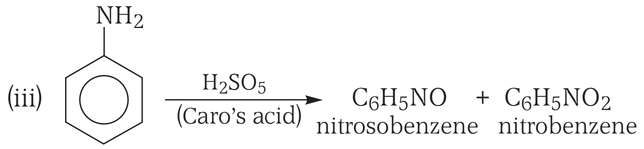
Aniline is quite sensitive to oxidation and gives different products with different oxidising agents. *e.g.,*

(i)



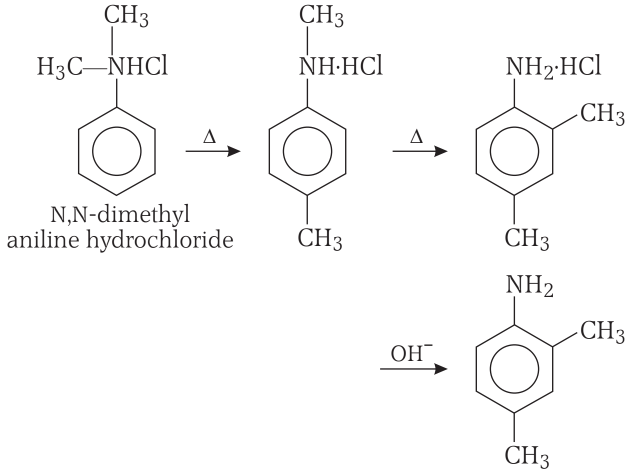
p-benzoquinone





(i) Hofmann Martius Rearrangement

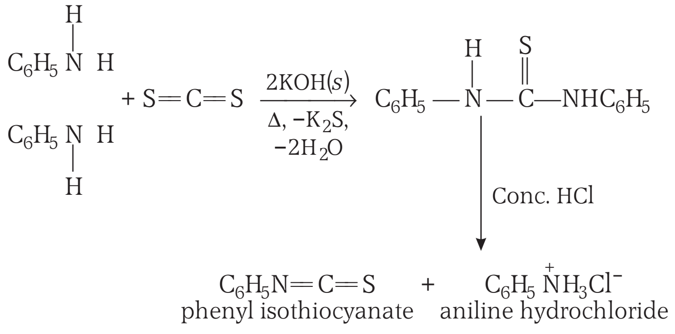
By this reaction, a 2° aromatic amine (in the form of salt) rearrange itself to give a 1° aromatic amine.



(Here, the alkyl group preferentially migrates to *p*-position and if it is occupied then to *o*-position).

(j) Hofmann Mustard Oil Reaction

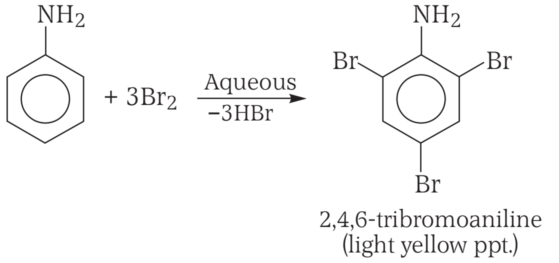
Primary aromatic amines, like aniline when heated with ethanolic solution of CS_2 and solid KOH, give N,N-diphenylthiourea which reacts with conc. HCl to give phenyl isothiocyanate (having a smell of mustard oil).



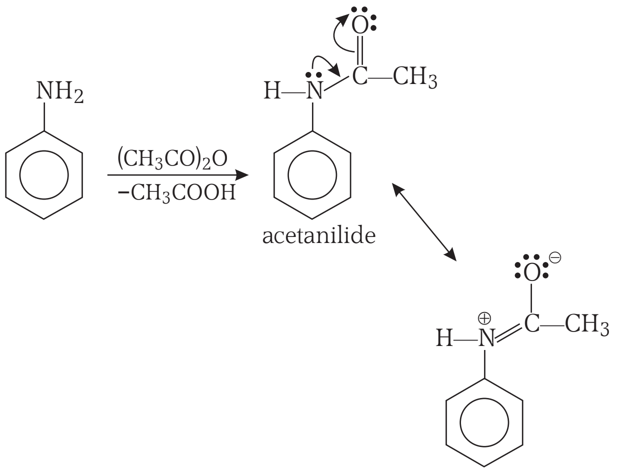
(k) Electrophilic Substitution Reactions

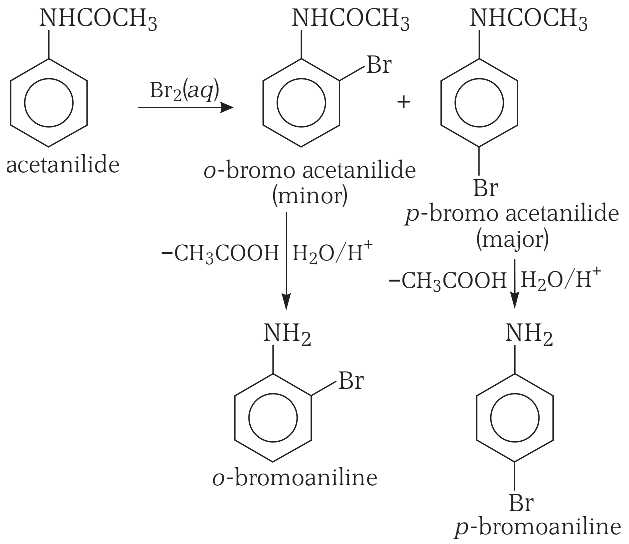
—NH_2 is an *ortho/para* directing group and activates the ring strongly so that the substitution takes place readily even under mild conditions.

(i) On halogenation, in aqueous medium, aniline gives a trisubstituted product.

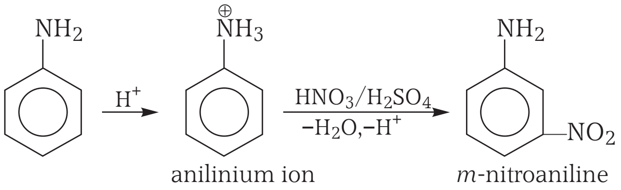


However, in order to prepare monohalo aniline derivative, the —NH_2 group of aniline is first protected by reacting it with acetyl chloride or acetic anhydride and after that it is subjected to halogenation.

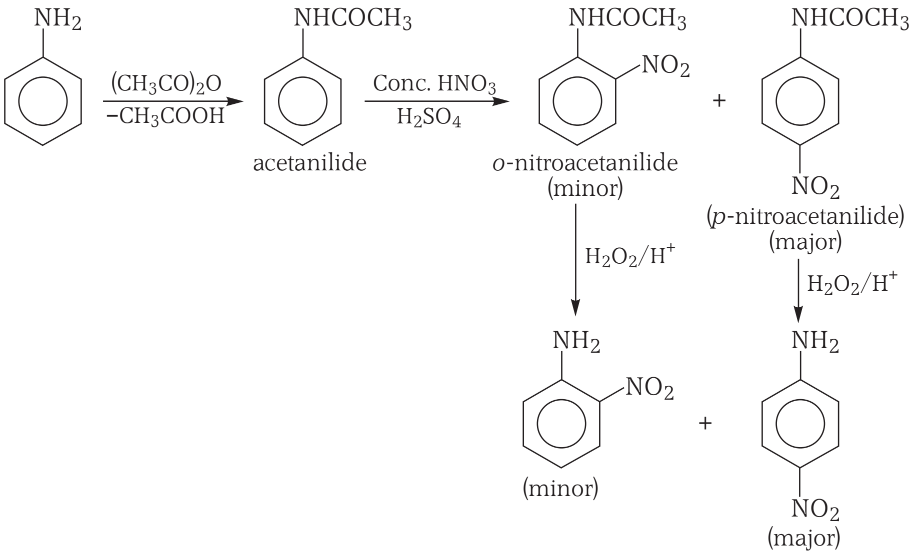




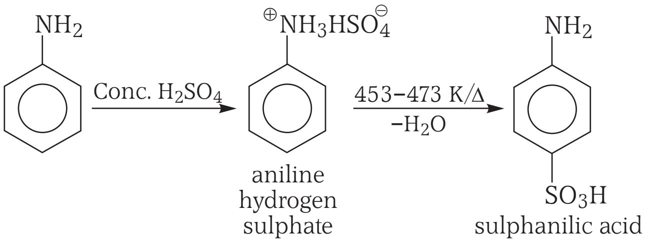
(ii) On nitration (with nitrating mixture, *i.e.,* Conc. HNO_3 / Conc. H_2SO_4), aniline, gets converted into black tarry mass and a itro product is obtained in very poor yield. However, in the presence of strongly acidic medium, aniline gets converted into anilinium ion which being electron deficient, deactivates the *o/p* position and thus, a *meta*-nitro derivative is obtained.



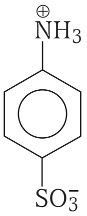
Hence, to obtain *o/p* products, first aniline is deactivated by treating it with acetic anhydride (or acetyl chloride) and then subjected to nitration. The obtained *o/p*-nitro acetanilide upon hydrolysis give *o/p*-nitro aniline.



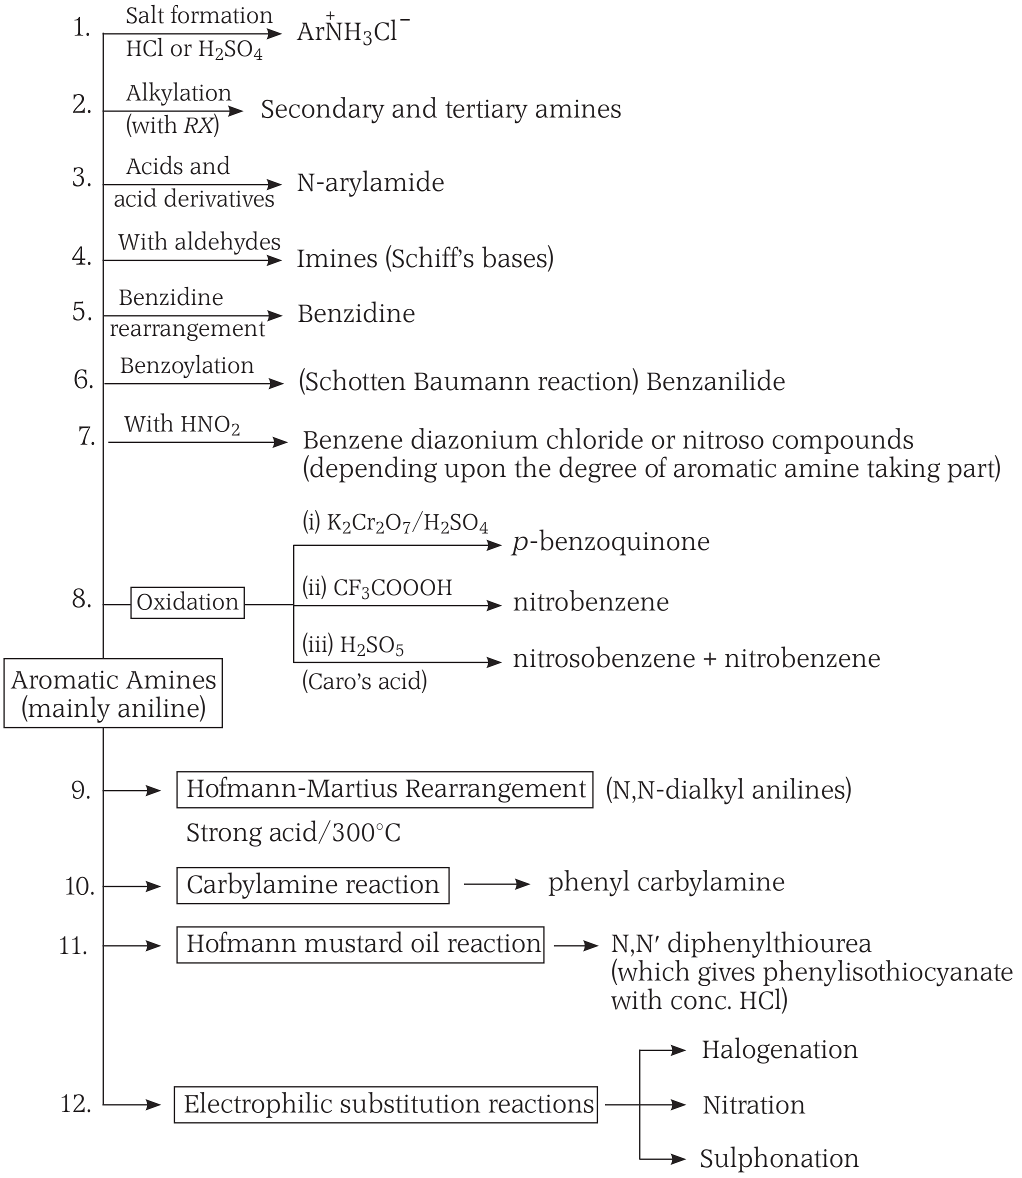
(iii) Aniline, when subjected to sulphonation (*i.e.,* treated with conc. H_2SO_4), form anilinium hydrogen sulphate, a salt, which on heating at 453–473 K gives *p*-aminobenzene sulphonic acid (also called sulphanilic acid).



Sulphanilic acid, usually, exists in the form of a dipolar ion, called **Zwitter ion** as



The outline of the chemical properties of aromatic amines looks like



12.6 Use of Amines

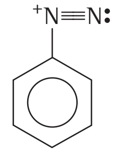
1. Amines are the important consituents of proteins, enzymes, many harmones. Thus, these play an important role in human life.
2. Lower members of the aliphatic amines such as ethylamine, diethylamine etc., are used as reagents in the synthesis of organic compounds and also as solvents both in the laboratory and industry.
3. Quaternary ammonium salts derived from long chain tertiary amines are used as detergents.
4. Aniline and other aromatic amines used in the manufacture of dyes and drugs.
5. Aniline is used to synthesise diazonium salts which are of synthetic importance.

Hot Spot 2

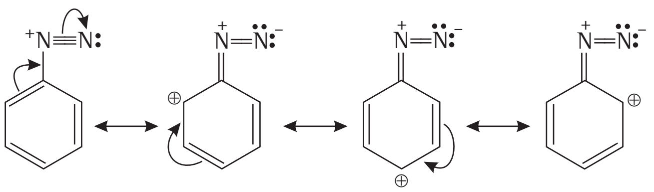
BENZENE Diazonium Salts

It is the most important topic of this chapter for JEE Main examination. The questions are generally based on its synthetic reactions and in the type of sequence reactions. The level of questions vary from easy to average.

All benzene diazonium salts contain benzene diazonium ion, which has the following structure.



This ion is stabilised by resonance (involved between the benzene nucleus and N atom) as

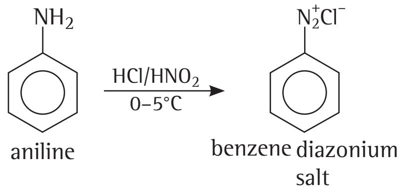


(Resonance structures of benzene diazonium ion)

Presence of electron releasing group like —NR_2, — OR etc., at *ortho/para* position in the benzene ring stabilises the benzene diazonium ion (or salts).

Method of Preparation

Primary aromatic amines when reacts with HNO_2 form diazonium salts at low temperatures (0–5°C). The reaction is called **diazotisation.**



Physical Properties

1. Diazonium salts are colourless crystalline solids but get colour when exposed to air.
2. Due to their ionic nature, they are water soluble.
3. In aqueous solution, these are good conductors of electricity.

Chemical Properties

Due to better leaving ability of diazonium group, it is substituted by other groups such as $Cl^{\ominus}$, $Br^{\ominus}$, $I^{\ominus}$, $CN^{\ominus}$ and $OH^{\ominus}$, which displaces nitrogen from the aromatic ring. The nitrogen formed escaped from the reaction mixture as a gas.

Moreover, benzene diazonium salts being weak electrophiles, react with strongly activated ring (like phenol, naphthols, aromatic amines) to form coupling products. Thus, these reactions are called coupling reactions.

The conditions for coupling reactions are

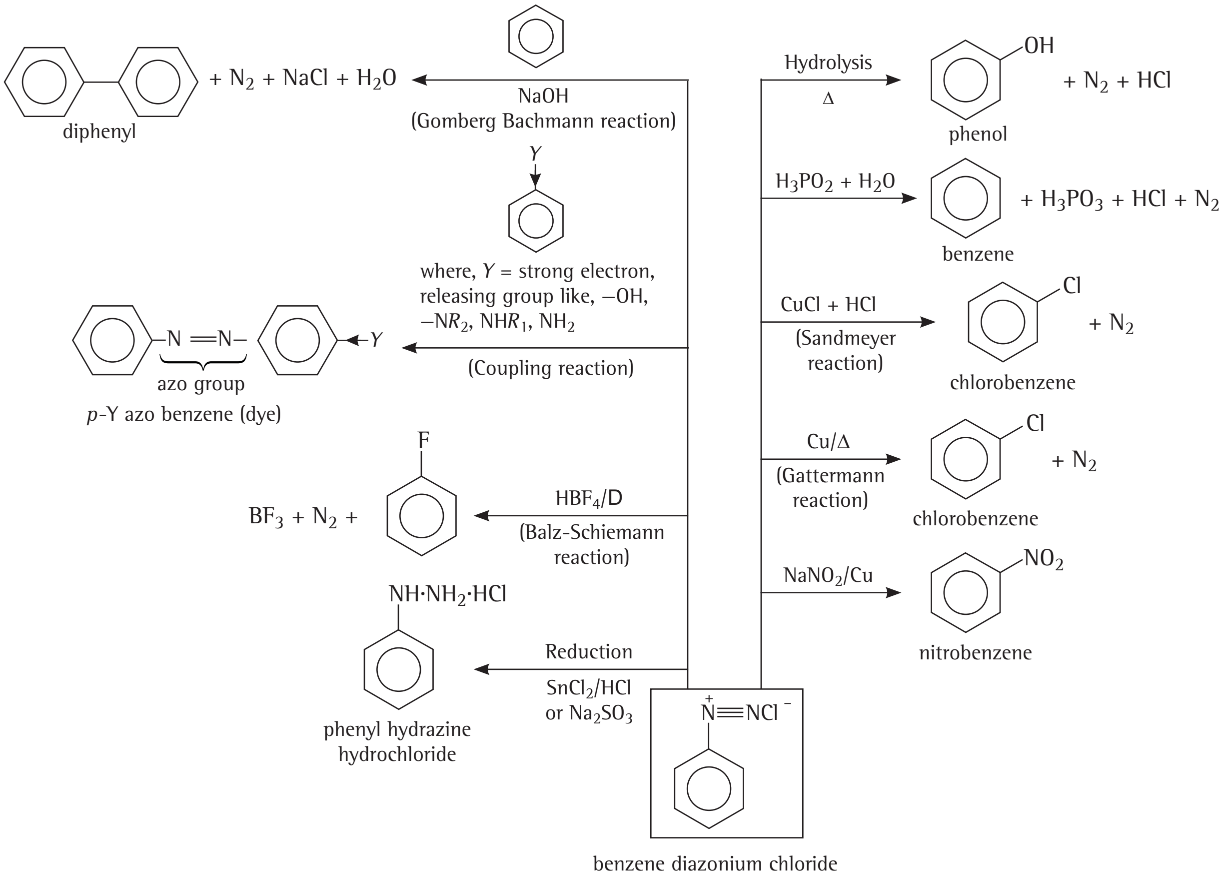
1. The solution must be so alkaline that the concentration of diazonium ion is too low.
2. It must not be so acidic that the concentration of free amine or phenoxide ion is too low.

That is why amines couple fastest in mild acidic solution and phenols couple fastest in mild alkaline solution.

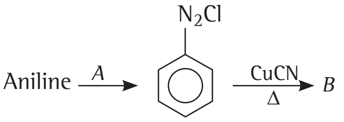
Coupling is better in the following cases.

1. The more electron withdrawing group in diazonium ion, the faster the coupling is.
2. The more electron donating group in coupling compound, the faster the coupling is.
3. $ArN_2^{\oplus}$ is weak alectrophile which undergoes diazo coupling only with the ring activated by (— OH), (—NH_2), (—NHR), or (—NR_2) groups.

Diazonium salt have very wide synthetic activities that are summarised as



Sample Problem 9



A and B respectively are

(a) HNO_2/H^+ and methylcyanide

(b) $NaNO_2$/HCl and benzonitrile

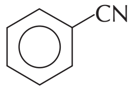
(c) HNO_3 and benzonitrile

(d) Phenol and methyl nitrile

Interpret (b) $NaNO_2$/HCl (or HNO_2) causes diazotisation of aniline and results in the formation of diazonium salt which when react with CaCN gives benzonitrile.

Thus, $A = HNO_2$ or $NaNO_2/HCl$

$B =$



Check Point 2

1. Why is it necessary to convert aniline into acetanilide before subjected to halogenation or nitroation to get monoderivative?
2. Diphenyl amine is less basic while N-methyl aniline is more basic as compared to aniline. Explain.
3. Why does diazonium salt give coupling reaction?
4. $CH_3C_6H_4CONH_2$ undergoes Hofmann bromamide reaction readily as compared to $C_6H_5CONH_2$. Explain.

WORKED **OUT**
Examples

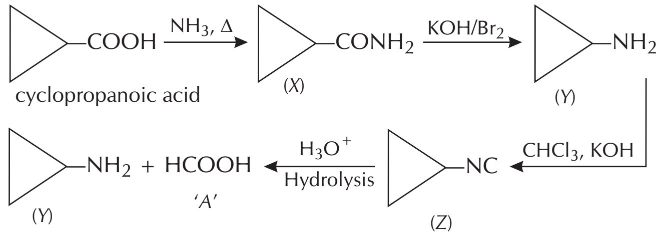
Example 1 *Cyclopropanoic acid* $\xrightarrow{NH_3,\ heat} X \xrightarrow{KOH/Br_2} Y$

$\xrightarrow{CHCl_3/KOH} Z \xrightarrow{H_3O^+} \underset{(A)}{\text{Carboxylic acid}}$

The final products of the above sequence of steps are

(a) *X and Z*
(b) HCOOH *and Y*
(c) CH_3NH_2 *and A*
(d) *A and X*

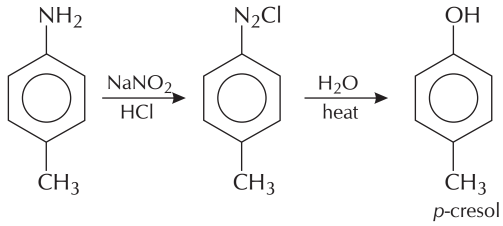
Solution (*b*) The chemical reactions involved in the above sequence of steps are as follows



Example 2 *p-toluidine is treated with an ice cold solution of sodium nitrite and hydrochloric acid. The crystalline precipitate so formed is boiled with water. The resulting product is*

(a) *toluic acid*
(b) *phenol*
(c) *p-cresol*
(d) *p-nitro toluene*

Solution (*c*)



Example 3 *An aliphatic amine with molar mass 73 g mol*$^{-1}$ *on heating with excess of* CH_3I *gave a quaternary salt. The amine can be*

I. N,N-diethyl ethanamine
II. N-methyl propanamine
III. 2-butanamine
IV. Neo-pentylamine

(a) *II and III*
(b) *II only*
(c) *I and III*
(d) *IV only*

Solution (*a*) Let the amine be $C_nH_{2n+3}N$.

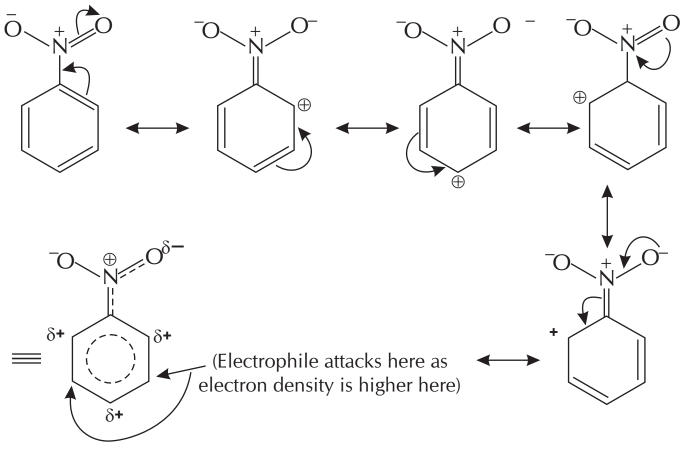
$$\text{The molar mass} = (14n + 17)$$
$$14n + 17 = 73 \quad \text{or} \quad n = 4$$

Among the given amines only II and III correspond to the given data and also have four carbons.

Example 4 *When nitrobenzene is treated with* Br_2 *in the presence of* $FeBr_3$*, the major product formed is m-bromo nitrobenzene. Which of the following statements is/are related to the process?*

(a) *Electron density on m-carbon is more than that on ortho or para carbons*
(b) *Loss of aromaticity occurs, when* Br^+ *attacks at the ortho or para positions and not at meta position*
(c) *Intermediate carbocation formed after initial attack of* Br^+ *at the meta position is least stabilised*
(d) *Easier loss of* H^+ *to regain aromaticity from meta position than from ortho and para position*

Solution (*a*) Nitrobenzene has the following resonating structures



Example 5 *Benzylamine may be alkylated as shown in the following equation*

$$C_6H_5CH_2NH_2 + R\text{—}X \longrightarrow C_6H_5CH_2NHR$$

(pyridine is used to scavage HX *produced here)*

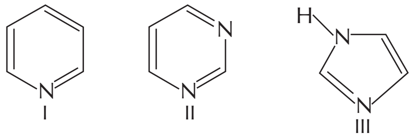
Which of the following alkyl halides is best suited for this reaction?

(a) $(CH_3)_3CCH_2Br$
(b) C_6H_5Br
(c) $C_6H_5CH_2Br$
(d) $(CH_3)_3CCl$

Solution (*c*) The given reaction proceeds through S_N2 mechanism, thus, 1° alkyl halide is the most preferred site.

Example 6 *Three heterocyclic amines are shown below :*

I. *Pyridine*, II. *Pyrimidine* III. *Imidazole.*



What is the order of increasing basicity?

(*weaker base* < *stronger base*)

(*a*) II < I < III (*b*) II < III < I

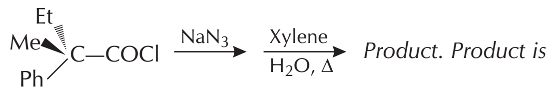
(*c*) I < II < III (*d*) III < II < I

Solution (*a*) Among the given, imidazole is most basic as it is non-aromatic and has one nitrogen atom in sp^3 hybrid state.

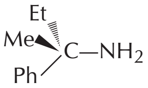
Between pyridine and pyrimidine, pyridine is more basic as in it, the lone pair of electrons is relatively more free for donation. Thus, the order of basic character is

$$II < I < III$$

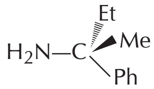
Example 7 *Consider the following reaction*



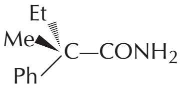
(*a*)



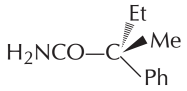
(*b*)



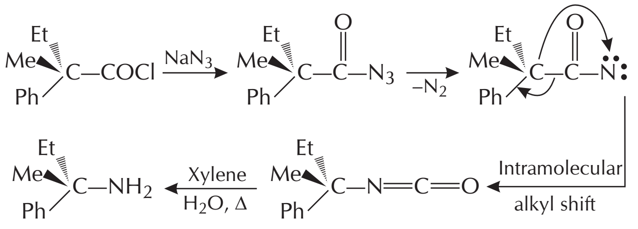
(*c*)



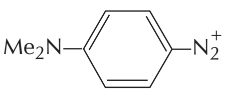
(*d*)



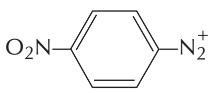
Solution (*a*) Curtius rearrangement involves retention of configuration of the migratory group. Thus,



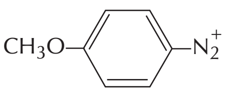
Example 8 *Consider the following diazonium ions*



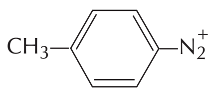
(I)



(II)



(III)



(IV)

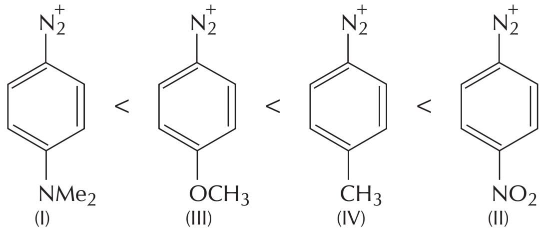
The order of reactivity towards diazo-coupling with phenol in the presence of dil. NaOH *is*

(*a*) I < IV < II < III (*b*) I < III < IV < II

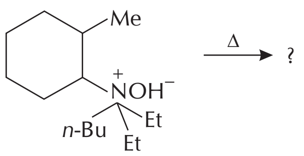
(*c*) III < I < II < IV (*d*) III < I < IV < II

Solution (*b*) Diazonium ion acts as an electrophile in coupling reactions. Greater the electron withdrawing power, higher the electrophilicity.

Thus, the order of reactivity towards diazo-coupling with phenol in the presence of dilute NaOH is



Example 9

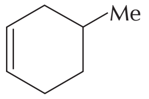


The alkene formed as a major product in this elimination reaction is

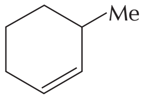
(*a*)

(*b*) $CH_2{=}CH_2$

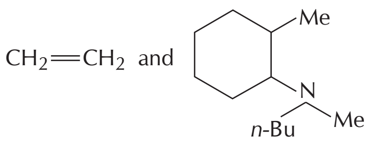
(*c*)



(*d*)



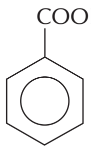
Solution (*b*) The heating involves Hofmann elimination giving least substituted alkene along with 3° amine. The products are



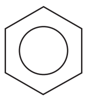
Example 10 $C_6H_6 \xrightarrow[\text{(ii) Zn/HCl }\Delta]{\text{(i) HNO}_3/\text{H}_2\text{SO}_4} X \xrightarrow[\text{HCl}]{\text{NaNO}_2} Y \xrightarrow[\text{H}_2\text{O}]{\text{H}_3\text{PO}_2} Z$

Z in the following sequence of reactions is

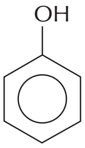
(*a*)



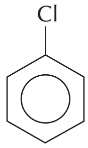
(*b*)



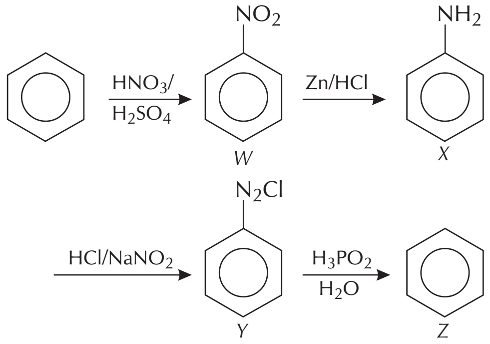
(*c*)



(*d*)



Solution (*b*)

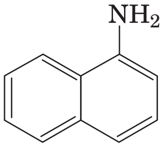


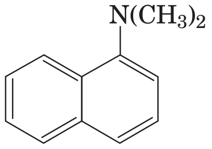
Start Practice for JEE Main

Round I (Topically Divided Problems)

General Introduction

1. How many of these are primary amines? **[NCERT]**





$(C_2H_5)_2CHNH_2$ $(C_2H_5)_2NH$

(a) 1 (b) 2
(c) 3 (d) 4

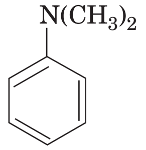
2. How many isomeric amines corresponds to the molecular formual $C_4H_{11}N$? **[NCERT]**

(a) 4 (b) 6
(c) 8 (d) 10

3. What is the structure and IUPAC name of the compound, allyl amine? **[NCERT Exemplar]**

(a) Propanamine (b) 2-methyl propanamine
(c) Prop-1-ene-1-amine (d) Prop-2-ene-1-amine

4. Write down the IUPAC name of **[NCERT Exemplar]**



(a) N-methyl-N-benzyl methanamine
(b) dimethyl phenyl amine
(c) N-phenyl-N-methyl methanamine
(d) N, N-dimethyl benzenamine

5. IUPAC name of the compound $(C_2H_5)_2NCH_3$ is **[NCERT]**

(a) 2,2-diethyl methanamine
(b) N,N-diethyl methanamine
(c) N-ethyl-N-methyl ethanamine
(d) N-methyl butanamine

6. *Iso*-propyl amine is a

(a) primary amine (b) secondary amine
(c) tertiary amine (d) quaternary amine

Methods of Preparation of Amines

7. Production of amines by ammonia and alkyl halides is called

(a) Frankland reaction
(b) Hofmann's ammonolysis
(c) Hofmann's mustard oil reaction
(d) Hofmann's bromamide reaction

8. Which of the following cannot be used for the following conversion?

$$CH_3CN \longrightarrow CH_3CH_2NH_2$$

(a) Pt/H_2 (b) $LiAlH_4$
(c) Na/C_2H_5OH (d) $SnCl_2/HCl$

9. $>C=O$ compounds reacts with NH_3 or amines followed by H_2 / Ni. The reaction is called

(a) Mendius reaction
(b) Hofmann bromamide
(c) Reductive amination
(d) Gabriel's phthalimide

10. The source of nitrogen in Gabriel synthesis of amines is **[NCERT Exemplar]**

(a) sodium azide, NaN_3
(b) sodium nitrite, $NaNO_2$
(c) potassium cyanide, KCN
(d) potassium phthalimide, $C_6H_4(CO)_2N^-K^+$

11. Best method for preparing primary amines from alkyl halides without changing the number of carbon atoms in the chain is **[NCERT Exemplar]**

(a) Hofmann bromamide reaction
(b) Gabriel phthalimide synthesis
(c) Sandmeyer reaction
(d) reaction with NH_3

12. Hofmann bromamide degradation reaction is shown by **[NCERT Exemplar]**

(a) $ArNH_2$ (b) $ArCONH_2$

(c) $ArNO_2$ (d) $ArCH_2NH_2$

13. Which of the following methods of preparation of amines will give same number of carbon atoms in the chain of amines as in the reactant? **[NCERT Exemplar]**

(a) Reaction of nitrite with $LiAlH_4$

(b) Reaction of amide with $LiAlH_4$ followed by treatment with water

(c) Heating alkylhalide with potassium salt of phthalimide followed by hydrolysis

(d) Treatment of amide with bromine in aqueous solution of sodium hydroxide

14. Which of the following reagents would not be a good choice for reducing an aryl nitro compound to an amine? **[NCERT Exemplar]**

(a) H_2 (excess)/Pt (b) $LiAlH_4$ in ether

(c) Fe and HCl (d) Sn and HCl

15. In the reaction,

$RCONH_2 + X \longrightarrow RNH_2$, the reagent X is

(a) soda lime (b) PCl_5

(c) NaOBr (d) All of these

16. Nitrobenzene is reduced by Zn and alcoholic potash mixture to get

(a) $C_6H_5—NH_2$

(b) $C_6H_5—NH—NH—C_6H_5$

(c) $C_6H_5—N—N=C_6H_5$

(d) $C_6H_5—NH—CO—C_6H_5$

17. Given the following sequence of reactions,

$$CH_3CH_2I \xrightarrow{NaCN} A \xrightarrow[\text{Partial hydrolysis}]{OH^-} B \xrightarrow{Br_2/NaOH} C$$

The major product 'C' is

(a) $CH_3CH_2NH_2$

(b) $CH_3CH_2\underset{\underset{O}{\|}}{C}—NHBr$

(c) $CH_3CH_2—COONH_4$

(d) $CH_3CH_2—\underset{\underset{O}{\|}}{C}—NBr_2$

18. $A \xrightarrow{H_2NOH} B \xrightarrow{\text{Reduction}} C \xrightarrow{NOCl} CH_3CH_2Cl$

In the above sequence A and C are

(a) methanal, methyl amine

(b) acetone, ethaneamine

(c) ethanal, dimethyl amine

(d) acetaldehyde, ethyl amine

19. Amine is not formed in the reaction

I. hydrolysis of RCN

II. reduction of $RCH=NOH$

III. hydrolysis of RNC

IV. hydrolysis of $RCONH_2$

The correct answer is

(a) I, II, IV (b) I, IV

(c) II, III (d) I, II, III

20. Ethyl isocyanide on hydrolysis in acidic medium generates

(a) ethyl amine salt and methanoic acid

(b) propanoic acid and ammonium salt

(c) ethanoic acid and ammonium salt

(d) methyl amine salt and ethanoic acid

21. $\xrightarrow{NH_2OH} X \xrightarrow{LiAlH_4} Y$. In the above sequence, Y is

(a) tertiary amine (b) secondary amine

(c) primary amine (d) 2-nitropropane

22. Reduction of aromatic nitro compounds using Fe and HCl gives **[NCERT Exemplar]**

(a) aromatic oxime

(b) aromatic hydrocarbon

(c) aromatic primary amine

(d) aromatic amide

23. In order to prepare a 1° amine from an alkyl halide with simultaneous addition of one CH_2 group in the carbon chain, the reagent used as source of nitrogen is **[NCERT Exemplar]**

(a) sodium amide, $NaNH_2$

(b) sodium azide, NaN_3

(c) potassium cyanide, KCN

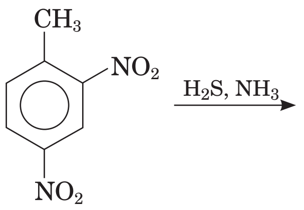
(d) potassium phthalimide, $C_6H_4(CO)_2N^-K^+$

24. The best reagent for converting, 2-phenylpropanamide into 1- phenylethanamine is **[NCERT Exemplar]**

(a) excess H_2/Pt (b) $NaOH/Br_2$

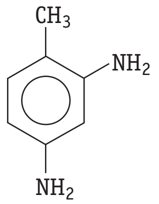
(c) $NaBH_4$/methanol (d) $LiAlH_4$/ether

25. The product obtained in the reduction

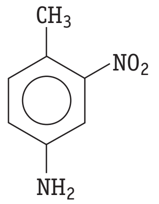


is

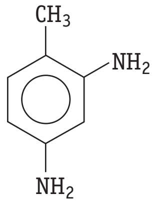
(a)



(b)



(c)



(d) The compound is not reduced

26. Match the following.

	Reactions		Name
A.	$(CH_3)_3C-OH + HCN \xrightarrow{H^+} (CH_3)_3C-NH_2$	1.	Grignard
B.	$CH_3CONH_2 + Br_2 + KOH \longrightarrow RNH_2$	2.	Mendius
C.	$CH_3CN + 4H \xrightarrow[alc.]{Na} CH_3CH_2NH_2$	3.	Hofmann bromamide
D.	$CH_3MgBr + ClNH_2 \longrightarrow CH_3NH_2$	4.	Ritter

Codes

	A	B	C	D		A	B	C	D
(a)	1	2	3	4	(b)	4	3	2	1
(c)	2	3	4	1	(d)	4	2	3	1

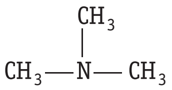
27. In which reaction, nitrene is not the intermediate?
(a) Schmidt
(b) Curtius
(c) Hofmann bromamide
(d) Gabriel's phthalimide

Basicity and Physical Properties of Amines

28. Which of the following statements are correct?
(a) Aniline is a stronger base than ethyl amine
(b) Aniline is a stronger base than *p*-methoxyaniline
(c) Aniline must be acetylated before nitration with an acid mixture
(d) Aniline is soluble in an ammonium hydroxide solution

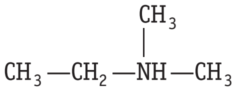
29. Choose the incorrect statement.
(a) In the case of primary, secondary and tertiary amines, the basic strength depends on the extent of hydrogen bonding in the protonated amines
(b) The presence of groups like $-OCH_3$ and $-CH_3$ increases the basic strength of amines
(c) The presence of groups like $-NO_2$, $-CN$ and halogens reduces the basic strength of amines
(d) The basic strength of amines depends on their concentration

30. Which of the following is the most basic in aqueous medium?
(a) $CH_3CH_2CH_2CH_2NH_2$
(b) $CH_3-CH_2-CH_2-NH_2$
(c)



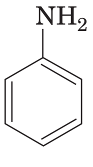
$CH_3-\underset{}{\overset{CH_3}{\overset{|}{N}}}-CH_3$

(d)

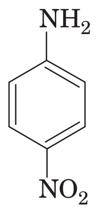


$CH_3-CH_2-\overset{CH_3}{\overset{|}{N}H}-CH_3$

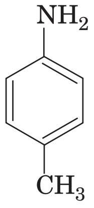
31. The correct increasing order of basic strength for the following compounds is **[NCERT Exemplar]**



(I)



(II)

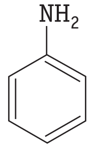


(III)

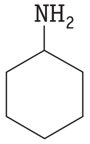
(a) II < III < I
(b) III < I < II
(c) III < II < I
(d) II < I < III

32. Which of the following compounds is the weakest Bronsted base? **[NCERT Exemplar]**

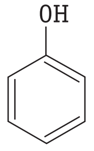
(a)



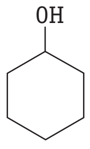
(b)



(c)



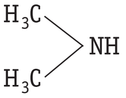
(d)



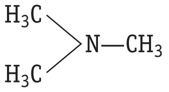
33. The most reactive amine towards dilute hydrochloric acid is **[NCERT Exemplar]**

(a) CH_3-NH_2

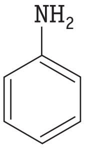
(b)



(c)



(d)



34. Arrange the following in the decreasing order of pK_b values

I. $C_2H_5NH_2$, II. $C_6H_5NHCH_3$,
III. $(C_2H_5)_2NH$ IV. $C_6H_5NH_2$ **[NCERT]**

(a) IV > II > I > III
(b) IV > II > III > I
(c) I > III > IV > II
(d) I > III > II > IV

35. Among the following amines, the strongest Bronsted base is

(a) 
(b) NH_3

(c) 
(d) 
36. Among the following, the weakest base is
(a) $C_6H_5CH_2NH_2$ (b) $C_6H_5CH_2NHCH_3$
(c) $O_2NCH_2NH_2$ (d) CH_3NHCHO

37. Correct order of basic nature of $CH_3NH_2(A)$, CH_3CN (B) and $CH_3N{=}CHCH_3$ (C) is
(a) $A > B > C$ (b) $B > C > A$
(c) $A > C > B$ (d) $C > A > B$

38. The compound, N-ethyl-N-methylpropanamine forms non-superimposable mirror images but does not show optical activity. This is due to
(a) absence of a chiral N-atom
(b) presence of a chiral N-atom
(c) presence of lone pair on N-atom
(d) rapid flipping of one form into another

39. Which of the following should be most volatile? **[NCERT Exemplar]**

I. $CH_3CH_2CH_2NH_2$ II. $(CH_3)_2N$

III. $(CH_3CH_2)(CH_3)NH$

IV. $CH_3CH_2CH_3$

(a) II (b) IV (c) I (d) III

40. In pyridine, the state of hybridisation of the nitrogen atom is
(a) sp^2 (b) sp^3
(c) sp (d) None of these

41. Which of the following amines form maximum hydrogen bonds within themselves?
(a) CH_3NH_2 (b) $(CH_3)_2NH$
(c) $(CH_3)_3N$ (d) None of these

42. Which among the following has the highest boiling point?
(a) $CH_3CH_2CH_2NH_2$

(b) $CH_3CH_2{-}NH{-}CH_3$

(c) $CH_3{-}N(CH_3){-}CH_3$

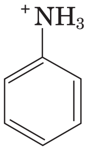
(d) CH_3NH_2

43. Which of the following statements is not correct?
(a) Primary amines show intermolecular hydrogen bonding
(b) Secondary amines show intermolecular hydrogen bonding
(c) Tertiary amines show intermolecular hydrogen bonding
(d) Amines have lower boiling points as compared to those of alcohols and carboxylic acids of comparable molar masses

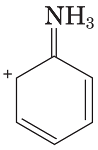
44. Which of the following will have larger dipole moment?

(a) 
(b) 
(c) 
(d) 
45. The basicity of aniline is less than that of cyclohexylamine. This is due to
(a) $+R$-effect of $-NH_2$ group
(b) $-I$-effect of $-NH_2$ group
(c) $-R$-effect of $-NH_2$ group
(d) hyperconjugation effect

46. Examine the following two structures for the anilinium ion and choose the correct statement from the ones given below



(I)



(II)

(a) II is not acceptable as canonical structure because carbonium ions are less stable than ammonium ions
(b) II is not an acceptable canonical structure because it is non-aromatic
(c) II, is not an acceptable canonical structure because in it, N has 10 valence electrons
(d) II is an acceptable canonical structure

Chemical Properties of Amines

47. The compound that will react most readily with NaOH to form methanol is
(a) $(CH_3)_4N^+I^-$ (b) CH_3OCH_3
(c) $(CH_3)_3S^+I^-$ (d) $(CH_3)_3CCl$

48. Acid anhydrides on reaction with primary amines give **[NCERT Exemplar]**
(a) amide (b) imide
(c) secondary amine (d) imine

49. What is the role of pyridine in the acylation reaction of amines? **[NCERT Exemplar]**
(a) Pyridine dissolves the product formed
(b) Pyridine makes CH_3COCl more reactive
(c) Pyridine removes side product
(d) None of the above

50. 1 mole of ethyl amine on reaction with HNO_2 gives at NTP
(a) 11.2 L of N_2 (b) 5.6 L of N_2
(c) 22.4 L of N_2 (d) 1 L of N_2

51. The gas evolved when methylamine reacts with nitrous acid is **[NCERT Exemplar]**
(a) NH_3 (b) N_2
(c) H_2 (d) C_2H_6

52. Which of the following reactions is given by only primary amines?
(a) Reaction with HONO
(b) Reaction with chloroform and alcoholic KOH
(c) Reaction with acetyl chloride
(d) Reaction with Grignard reagent

53. Isopropylamine $\xrightarrow{KMnO_4} X \xrightarrow{H_3O^+} Y$.
In the above sequence, X and Y are respectively
(a) acetaldimine, ethanal
(b) ethanal, ketimine
(c) ketimine, acetone
(d) acetone, propan-2-ol

54. Which of the following is an enamine?

(a) 
(b) 
(c) 
(d) 
55. A positive carbylamine test is given by
(a) N,N-dimethylaniline
(b) 2,4-dimethylaniline
(c) N-methyl-*o*-methylaniline
(d) N-methylbenzylamine

56. *Iso*-propyl amine, with excess of acetyl chloride will give
(a) $(CH_3CO)_2N—C—(CH_3)_3$
(b) $(CH_3)_2CH—\underset{H}{\underset{|}{N}}—COCH_3$
(c) $(CH_3)_2CHN(COCH_3)_2$
(d) $CH_3CH_2CH—\underset{H}{\underset{|}{N}}—COCH_3$

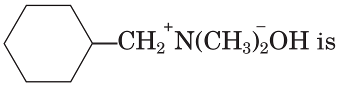
57. Which of the following compounds will undergo carbylamine reaction?
(a) $(CH_3CH_2)_2NH$ (b) $(CH_3)_2NH$
(c) $C_6H_5NH_2$ (d) $(CH_3)_3N$

58. The oxidation of aniline with per acetic acid in the presence of acetic acid by refluxing gives

(a) 
(b) 
(c) 
(d) None of these

59. Amine oxide, when heated forms alkene. The reaction is known as
(a) Curtius
(b) Cope elimination
(c) Mannich
(d) Hofmann elimination

60. The product of Hofmann elimination of



(a) 
(b) 
(c) 
(d) 
61. Reaction of benzaldehyde with methylamine gives
(a) C_6H_5COOH (b) $C_6H_5N{=}NCl$
(c) $C_6H_5—CH{=}N—CH_3$ (d) $C_6H_5NH_2$

62. The end product in the below reaction is

$$C_2H_5NH_2 \xrightarrow{HNO_2} A \xrightarrow{PCl_5} B \xrightarrow{NH_3} C$$

(a) ethyl cyanide (b) ethyl amine
(c) methyl amine (d) acetamide

63. The reaction of chloroform with alcoholic KOH and *p*-toluidine form

(a) 
(b) 
(c) 
(d) 
64. When $\left[CH_3CH_2CH_2-\overset{\overset{CH_3}{|}}{\underset{\underset{CH_3}{|}}{\overset{+}{N}}}-CH_2CH_3\right]OH^-$
is heated, then

(a) propene is the major product
(b) ethene and $C_3H_7N(CH_3)_2$ are the only product
(c) ethene and propene are obtained while ethene as the major product
(d) equimolar amounts of ethene and propene are obtained

65. $Y \underset{Z}{\overset{\text{Reduction}}{\rightleftharpoons}} [R_2C{=}NH] \xrightarrow{H_3O^+} X$

In the above sequence of reactions *X*, *Y*, *Z* are respectively

(a) aldehyde, ketone, NH_3
(b) ketone, 1° amine, $KMnO_4$
(c) ketone, 2° amine, $KMnO_4$
(d) ketimine, 1° amine, H_2SO_5

66. In the following reaction, *X* is

$X \xrightarrow{\text{Bromination}} Y \xrightarrow[+\,HCl]{NaNO_2} Z \xrightarrow[C_2H_5OH]{\text{Boiling}}$ Tribromo benzene

(a) benzoic acid
(b) salicylic acid
(c) phenol
(d) aniline

67. $C_6H_5NH_2 \xrightarrow[180°C]{H_2SO_4} H_2NC_6H_4(SO_3H)$ (*para*)

The true statement about the product is

(a) It does not exist as Zwitter ion
(b) $—NH_2$ displays a powerful basic character
(c) It does not act as inner salt
(d) $—SO_3$ dimminishes the basic character of $—NH_2$

68. 
The final product '*C*' in the above reaction is

(a) 
(b) 
(c) 
(d) 
69. 
What is [*B*]?

(a) 
(b) 
(c) 
(d) 
70. Identify the product Z in the following reaction scheme

$$C_6H_5NH_2 \xrightarrow{Ac_2O} X \xrightarrow{Br_2/CCl_4} Y \xrightarrow{HOH} Z$$

(a) *p*-bromoaniline
(b) *p*-bromoacetophenone
(c) *p*-bromoacetanilide
(d) *o*-bromoacetophenone

71.  $[X]$; here X is

(a) 
(b) 
(c) 
(d) 
72. Match the following.

	Column I		Column II
A.	$RNH_2 \xrightarrow{NaNO_2 + HCl}$	1.	R_2NNO
B.	$\phi NH_2 \xrightarrow{NaNO_2 + HCl}$	2.	$ROH + N_2$
C.	$\phi N(CH_3)_2 \xrightarrow{NaNO_2 + HCl}$	3.	$\phi NNCl$
D.	$R_2NH \xrightarrow{NaNO_2 + HCl}$	4.	
Codes

	A	B	C	D		A	B	C	D
(a)	2	3	4	1	(b)	1	3	4	2
(c)	2	4	3	1	(d)	1	2	3	4

73. Which of the following reagents will be useful as the basic for a simple chemical test to distinguish between?

 and 
(a) $C_6H_5SO_2Cl$ and OH^- in H_2O
(b) HONO, then β-naphthol
(c) Dilute HCl
(d) $AgNO_3$ in H_2O

74. Name of method use to separate primary, secondary and tertiary amines is
(a) Hofmann method
(b) Lucas method
(c) Victor Meyer method
(d) Kolbe method

75. RNH_2 reacts with $C_6H_5SO_2Cl$ in aqueous KOH to give a clear solution. On acidification, a precipitate is obtained which is due to the formation of

(a) $R-\overset{H}{\underset{H}{N^+}}-SO_2C_6H_5OH^-$

(b) $R-N^-SO_2C_6H_5K^+$
(c) $C_6H_5SO_2NH_2$
(d) $R-NH-SO_2-C_6H_5$

76. A compound of molecular formula C_3H_9N when reacts with benzene sulphonyl chloride gives a product soluble in dilute NaOH solution. The compound should be

(a) $(CH_3)_3N$
(b) $(CH_3)_2CH-NH_2$
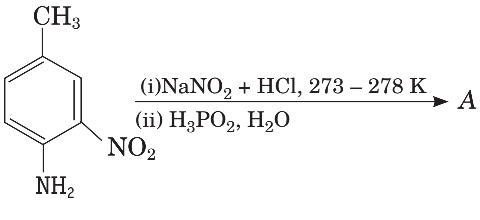
(c) $\begin{matrix} CH_3 \\ C_2H_5 \end{matrix}\!\!>NH$
(d) All of these

77. A compound Z with molecular formula C_3H_9N reacts with $C_6H_5SO_2Cl$ to give a solid, insoluble in alkali. Identify Z. **[NCERT Exemplar]**
(a) propylamine
(b) N-methylethanamine
(c) 2-amino propane
(d) N,N-dimethyl methanamine

78. When aniline reacts with benzoyl chloride, the product obtained is **[NCERT]**
(a) acetanilie
(b) benzanilide
(c) phenyl amine
(d) N-methyl benzamide

79. Give the structure of 'A' in the following reaction. **[NCERT Exemplar]**



(a) 
(b) 
(c) 
(d) 
80.  ? Product is

(a) 
(b) 
(c) 
(d) 
81. The reagents used (incorrect sequence) to convert benzene into N,N-dimethyl aniline is **[NCERT]**

(a) HNO_3/H_2SO_4, Sn/HCl, C_2H_5I
(b) HNO_3/H_2SO_4, Sn/HCl, CH_3I (2 mol)
(c) Sn / HCl, HNO_3 /H_2SO_4, CH_3I (2 mol)
(d) None of the above

82. An organic amino compound reacts with aqueous nitrous acid at low temperature to produce an oily nitroso amine. The compound is

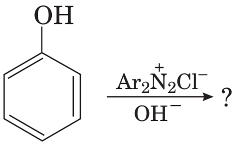
(a) CH_3NH_2 (b) $CH_3CH_2NH_2$
(c) $(CH_3CH_2)_3N$ (d) $CH_3CH_2—NHCH_2CH_3$

83. Although amino group is *o*/p directing in aromatic electrophilic substitution, aniline on nitration gives a substantial amount of *m*-nitroalinine. This is because **[NCERT]**

(a) electron density becomes lower at *m*-position
(b) *m*-directing anilinium ion is formed
(c) aniline becomes deactivated in acidic medium
(d) All of the above

Benzene Diazonium Salts

84. Complete the following reaction. **[NCERT Exemplar]**



(a) 
(b) 
(c) 
(d) 
85. The reaction $\mathrm{Ar}\overset{+}{\mathrm{N}}_2\,\mathrm{Cl}^- \xrightarrow{\mathrm{Cu/HCl}} \mathrm{ArCl} + \mathrm{N}_2 + \mathrm{CuCl}$ is named as **[NCERT Exemplar]**

(a) Sandmeyer reaction (b) Gattermann reaction
(c) Claisen reaction (d) Carbylamine reaction

86. Which of the following compound will not undergo azo coupling reaction with benzene diazonium chloride? **[NCERT Exemplar]**

(a) Aniline (b) Phenol
(c) Anisole (d) Nitrobenzene

87. Which one of the following is not the correct reaction of aryl diazonium salts?

(a) $C_6H_5N_2^+Cl^- + Cu_2Cl_2 \longrightarrow C_6H_5Cl$
(b) $C_6H_5N_2^+Cl^- + HBF_4 \xrightarrow{\text{Heat}} C_6H_5F$
(c) $C_6H_5N_2^+Cl^- + H_3PO_2 \longrightarrow C_6H_5PO_4$
(d) $C_6H_5N_2^+Cl^- + SnCl_2/HCl \longrightarrow C_6H_5NHNH_2$

88. Which of the following reactions is an example of Sandmeyer reaction?

(a) 
(b) 
(c) 
(d) 
89. Benzene diazonium chloride on reaction with phenol in weakly basic medium gives
(a) diphenyl ether
(b) *p*-hydroxyazobenzene
(c) chlorobenzene
(d) benzene

90. During coupling reaction of benzene diazonium chloride and aniline, the pH of reaction medium should be approximately
(a) 1–2
(b) 9–10
(c) 4–5
(d) 7–8

91. During diazotisation of benzenamine with sodium nitrite and hydrochloric acid, the excess of hydrochloric acid is used primarily to
(a) check the hydrolysis of φ —OH
(b) ensure a stoichiometric amount of nitrous acid
(c) check the concentration of free aniline
(d) neutralise any base formed during reaction

92. Which of the following reaction will not occur?
(a) $\phi N_2^+ + CuBr \xrightarrow{HBr} \phi - Br$
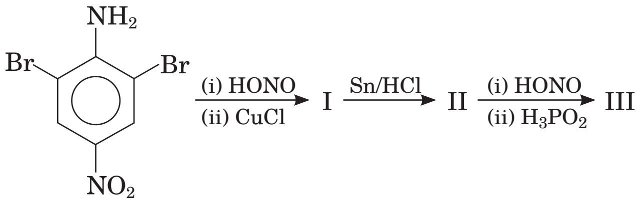
(b) (c) $\phi N_2^+ \xrightarrow[HOH]{H_3PO_2} \phi H$
(d) $\phi N_2^+ + I^- \longrightarrow \phi - I$

93. $C_6H_5NH_2 \xrightarrow[HCl]{NaNO_2} X \xrightarrow{Cu_2(CN)_2} Y \xrightarrow{H_2O/H^+} Z$

Z is identified as
(a) $C_6H_5-NH-CH_3$
(b) C_6H_5-COOH
(c) $C_6H_5-CH_2-NH_2$
(d) $C_6H_5-CH_2COOH$

94. The final product (III) obtained in the reaction sequence



is

(a) 
(b) 
(c) 
(d) None of these

95. 
In the above sequence, *B* is

(a) 
(b) 
(c) 
(d) 
Round II (Mixed Bag)

Only One Correct Option

1. CH_3CONH_2, Br_2 and KOH give CH_3NH_2 as the product. The intermediates of the reaction are

I. $CH_3-\overset{\overset{O}{\|}}{C}-NHBr$

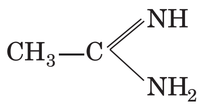
II. $CH_3-Nz{=}C{=}O$

III. CH_3NHBr

IV. CH_3CONBr_2

The correct answer is
(a) I, II
(b) I, III
(c) III, IV
(d) II, IV

2. The correct order of basicities of the following compounds is



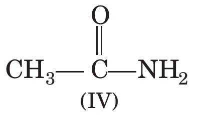
(I)

$CH_3CH_2NH_2$

(II)

$(CH_3)_2NH$

(III)

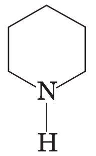


$CH_3-\overset{\overset{O}{\|}}{C}-NH_2$

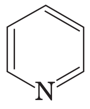
(IV)

(a) II > I > III > IV
(b) I > III > II > IV
(c) III > I > II > IV
(d) I > II > III > IV

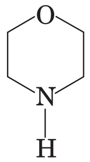
3. Arrange the following compounds in the increasing order of basic strength



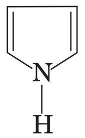
(I)



(II)



(III)



(IV)

(a) IV > I > III > II (b) III > I > IV > II
(c) II > I > III > IV (d) I > III > II > IV

4. Choose the incorrect comparision(s).

(a) $H_3C-C(CH_3)_2-NH_2 < CH_3-NHCH_3$

(basicity in the aqueous medium)

(b) $CH_3CH_2CH_2NH_2 > (CH_3)_3N$
(basicity in the aqueous medium)

(c) $CH_3-CH(CH_3)-NH_2 < CH_3-NHCH_2CH_3$

(basicity in the gaseous state)

(d) N(1) > N(3)
(basicity in the aqueous medium)

5. $(CH_3)_3N \xrightarrow[\text{(ii) } H_2O, \Delta]{\text{(i) BrCN}} [X]$, here $[X]$ is

(a) CH_3NH_2 (b) $(CH_3)_2NH$
(c) $(CH_3)_3NO$ (d) $(CH_3)_2NNO$

6. In the reaction of (S) 2-phenylpropanamide with NaOBr/H_2O to give 1-phenylethylamine

(a) there is retention of configuration
(b) there is inversion of configuration
(c) a mixture of two products is obtained
(d) there is no reaction

7. I. $C_2H_5NH_2 \xrightarrow[\text{(ii) } AgNO_2]{\text{(i) NOCl}} [W]$

II. $(CH_3)_2CHNH_2 \xrightarrow[\text{(ii) } AgNO_2]{\text{(i) NOCl}} [X]$

III. $(CH_3)_3CNH_2 \xrightarrow[\text{(ii) } AgNO_2]{\text{(i) NOCl}} [Y]$

IV. $CH_3CH(NH_2)C_2H_5 \xrightarrow[\text{(ii) } AgNO_2]{\text{(i) NOCl}} [Z]$

Which product will not show tautomerism?

(a) W (b) X
(c) Y (d) Z

8. Match the following column.

	Column I		Column II
A.	$RNH_2 \xrightarrow{KMnO_4}$	1.	$R_3N \rightarrow O$
B.	$R_2NH \xrightarrow{H_2SO_5}$	2.	R_3CNO_2
C.	$R_3N \xrightarrow{H_2SO_5}$	3.	R_3CHO
D.	$R_3CNH_2 \xrightarrow{H_2SO_5}$	4.	R_2NOH

Codes

	A	B	C	D
(a)	3	1	4	2
(b)	2	3	4	1
(c)	3	2	1	4
(d)	1	2	3	4

9. Benzaldehyde condenses with N,N-dimethylaniline in the presence of anhydrous $ZnCl_2$ to give

(a) azo dye
(b) malachite green
(c) michler's ketone
(d) buffer yellow

10. N_2 gas is liberated when [HCl + $NaNO_2$] react with the following compounds

I. $CH_3CH_2NH_2$ II. urea
III. CH_3CONH_2 IV. $C_6H_5NH_2$

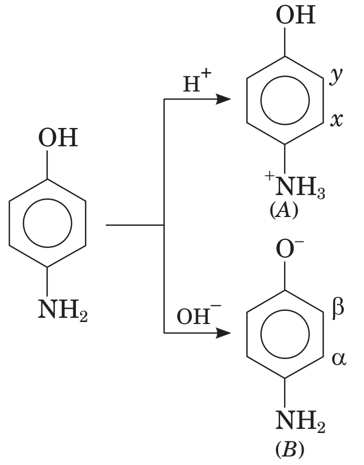
The answer is

(a) I, II, III (b) II, III, IV
(c) I, III, IV (d) I, II, IV

11. Dichlorocarbene does not form as an intermediate in this reaction

(a) phenol + $CHCl_3$ + 4KOH
(b) ethyl amine + $CHCl_3$ + KOH
(c) phenol + CCl_4 + 4KOH
(d) $CHCl_3$ + KOH

12. Consider *p*-aminophenol



Which positions are activated for coupling reaction in acidic and basic media respectively?

(a) x in A and β in B (b) x in A and α in B

(c) y in A and α in B (d) y in A and β in B

13. The correct set of the products obtained in the following reactions is

I. $R\text{CN} \xrightarrow{\text{Reduction}}$ II. $R\text{CN} \xrightarrow[\text{(ii) } H_2O]{\text{(i) } CH_3MgBr}$

III. $R\text{NC} \xrightarrow{\text{Hydrolysis}}$ IV. $R\text{NH}_2 \xrightarrow{HNO_2}$

	I.	II.	III.	IV
(a)	2° amine	methyl ketone	1° amine	alcohol
(b)	1° amine	methyl ketone	1° amine	alcohol
(c)	2° amine	methyl ketone	2° amine	acid
(d)	2° amine	methyl ketone	2° amine	aldehyde

14. m-fluoronitrobenzene is best synthesised by using the reaction

(a) nitrobenzene $\xrightarrow[H_2SO_4\text{, heat}]{\text{Fuming } HNO_3} [\quad] \xrightarrow[H_2S]{NH_3} [\quad] \xrightarrow[\text{(ii) } HBF_4,\ \Delta]{\text{(i) HONO}}$

(b) aniline $\xrightarrow[\text{heat}]{F_2}$

(c) fluorobenzene $\xrightarrow[H_2SO_4\text{, heat}]{HNO_3}$

(d) $m\text{-}C_6H_4(NH_2)_2 \xrightarrow[\text{(ii) } CuNO_2,\ \text{(iii) } HBF_4]{\text{(i) HONO}}$

15. Pyrolysis of  would give

(a) mixture of $CH_2{=}CH{-}CD_3$ and $CH_3{-}CH{=}CD_2$

(b) $CH_3{-}CH{=}CD_2$

(c) $Me_2N^+{=}C(CD_3)(CH_3)$

(d) $CH_2{=}CH{-}CD_3$

16. Aromatic diazonium group can be replaced by various groups/atoms. In this context, match. Column I with Column II and select the correct answer using the codes given below the columns.

	Column I (Reaction/reaction type)		Column II (Replacement)
A.	H_3PO_2	1.	Hydrogen
B.	Sandmeyer reaction	2.	Hydroxyl group
C.	Boiling with water	3.	Aryl group
D.	Gomberg reaction	4.	Chlorine

Codes

	A	B	C	D
(a)	4	3	2	1
(b)	1	4	2	3
(c)	1	2	3	4
(d)	2	3	4	1

17. An aromatic compound 'A' on treatment with aqueous ammonia and heating forms compound 'B' which on heating with Br_2 and KOH forms a compound 'C' of molecular formula C_6H_7N. Compound A is

(a) benzoic acid (b) benzamide

(c) aniline (d) benzene

18. A hydrocarbon 'A' (C_4H_8) on reaction with HCl gives a compound 'B' (C_4H_9Cl), which on reaction with 1 moles of a NH_3 gives a compound 'C' ($C_4H_{11}N$). On reacting with $NaNO_2$ and HCl followed by the treatment with water, compound 'C' yields an optically active alcohol, 'D'. Ozonolysis of 'A' gives 2 moles of acetaldehyde. **[NCERT Exemplar]**

The structure of compound C is

(a) $CH_3CH_2CH_2CH_2NH_2$ (b) 
$CH_3N\begin{smallmatrix}C_2H_5\\ CH_3\end{smallmatrix}$

(c) $(C_2H_5)_2NH$ (d) $C_2H_5CH(NH_2)CH_3$

19. The best method to synthesise m-dibromobenzene is by using the reaction

(a) Benzene $\xrightarrow{Br_2/FeBr_3/\text{heat}}$

(b) Aniline $\xrightarrow{Br_2,\ H_2O} [\quad] \xrightarrow[\text{(ii) CuBr}]{\text{(i) HONO}}$

(c) Nitrobenzene

$\xrightarrow[H_2SO_4,\ \Delta]{\text{Fuming } HNO_3} [\quad] \xrightarrow[C_2H_5OH\text{, heat}]{Fe/HCl} [\quad] \xrightarrow[\text{(ii) CuBr}]{\text{(i) HONO}}$

(d) Bromobenzene

$\xrightarrow[H_2SO_4]{HNO_3} [\quad] \xrightarrow[C_2H_5OH\text{, heat}]{Fe/HCl} [\quad] \xrightarrow[\text{(ii) CuBr}]{\text{(i) HONO}}$

20. In the following reactions, reactants A, B and C are

$$C_2H_5NH_2 + A \longrightarrow C_2H_5N{=}CH{-}C_6H_5 + H_2O$$
$$\text{urea} + B \longrightarrow H_2N{-}NHCONH_2 + NH_3$$
$$C_2H_5NH_2 + C \longrightarrow C_2H_5Cl + H_2O + N_2$$

(a) CH_3CHO, $NH_2{-}NH_2$ and PCl_5

(b) C_6H_5CHO, $NH_2{-}NH_2$ and $SOCl_2$

(c) C_6H_5CHO, $NH_2{-}NH_2$ and NOCl

(d) CH_3CHO, $NH_2{-}NH_2$ and PCl_3

21. Aniline is reacted with Br_2 water and the resulting product is treated with an aqueous solution of sodium nitrite in the presence of dilute HCl. The compound so formed is converted into tetrafluoroborate which is subsequently heated dry. The end product is

(a) p-bromofluorobenzene

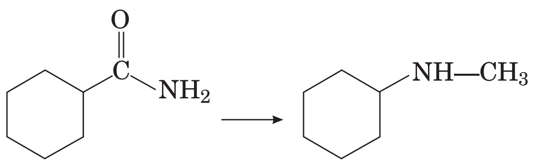
(b) p-bromoaniline

(c) 2,4,6-tribromofluoro benzene

(d) 1,3,5-tribromobenzene

22. A colourless substance '*A*' (C_6H_7N) is sparingly soluble in water and gives a water soluble compound '*B*' on treating with mineral acid. On reacting with $CHCl_3$ and alcoholic potash, '*A*' produces an obnoxious smell due to the formation of compound '*C*'. Reaction of '*A*' with benzene sulphonyl chloride gives compound '*D*' which is soluble in alkali. With $NaNO_2$ and HCl, '*A*' forms compound '*E*' which reacts with phenol in alkaline medium to give an orange dye '*F*'. Compound *F* is [**NCERT** Exemplar]

(a) 
(b) 
(c) 
(d) 
23. Suggest a route by which the following conversion can be accomplished? [**NCERT** Exemplar]



(a) (i) Br_2 / KOH (ii) $CHCl_3$ / KOH (iii) H_2 / Pd

(b) (i) $LiAlH_4$ (ii) AgCN, (iii) H_2 / Pd

(c) (i) $LiAlH_4$ (ii) KCN (iii) H_2 / Pd

(d) (i) Br_2 /KOH (ii) AgCN (iii) H_2/Pd

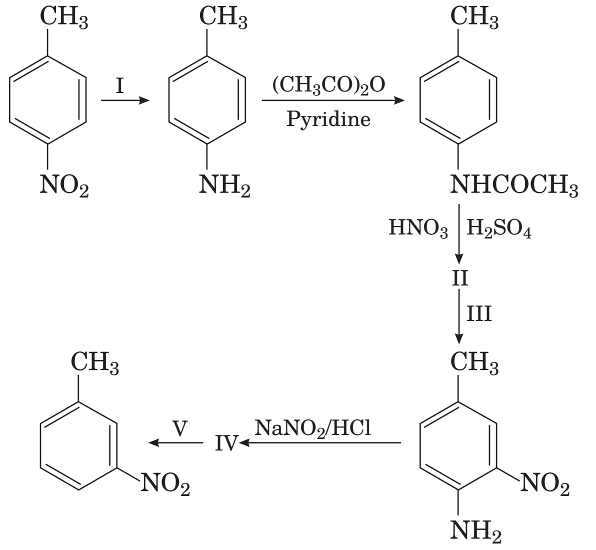
24. Match the following.

	Column I		Column II
A.	$\phi NO_2 \xrightarrow{Zn/NH_4Cl}$	1.	$\phi-N=N-\phi$
B.	$\phi NO_2 \xrightarrow[NaOH]{Zn/alc.}$	2.	$\phi-NH_2$
C.	$\phi NO_2 \xrightarrow{LAH}$	3.	$\phi NHOH$
D.	$\phi NO_2 \xrightarrow{Na_3AsO_3/NaOH}$	4.	$\phi-N=\overset{\overset{O}{\uparrow}}{N}-\phi$

Codes

	A	B	C	D		A	B	C	D
(a)	1	2	3	4	(b)	2	3	1	4
(c)	3	1	2	4	(d)	2	4	3	1

25. Consider the following reaction sequence. [**NCERT** Exemplar]



Reagent I and V are respectively

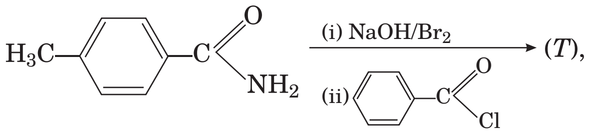
(a) H_2O / H^+, H_3PO_2 / H_2O

(b) Zn/ HCl, H_2O / H^+

(c) Sn/ HCl, H_3PO_2 / H_2O

(d) None of the above is correct

26. In the reaction,



the structure of the product (*T*) is

(a) 
(b) 
(c) 
(d) 
27. 
[X] and [Y] are

(a) 
(b) 
(c) 
(d) 
28. Match the following columns.

	Column I		Column II
A.	Aniline	1.	Sulpha drug
B.	TNT	2.	Solvent in Friedel-Craft
C.	Sulphanilamide	3.	Explosive
D.	Nitrobenzene	4.	Used in azo dyes

Codes

	A	B	C	D
(a)	1	2	3	4
(b)	4	3	2	1
(c)	2	3	4	1
(d)	4	3	1	2

More than One Correct Option

29. $(A) \xrightarrow[\text{[H]}]{\text{Reduction}}$ Primary amine

The compound (A) may be

(a) alkyl isocyanide
(b) alkyl cyanide
(c) acidamide
(d) 1° nitroalkane

30. Under which of the following reaction conditions, aniline gives p-nitro derivative as the major product? **[NCERT Exemplar]**

(a) Acetyl chloride/pyridine followed by reaction with conc. H_2SO_4 + conc. HNO_3
(b) Acetic anhydride/pyridine followed by conc. H_2SO_4 + conc. HNO_3
(c) Dil. HCl followed by reaction with conc. H_2SO_4 + conc. HNO_3
(d) Reaction with conc. HNO_3 + conc. H_2SO_4

31. Which of the following reactions belong to electrophilic aromatic substitution? **[NCERT Exemplar]**

(a) Bromination of acetanilide
(b) Coupling reaction of aryldiazonium salts
(c) Diazotisation of aniline
(d) Acylation of aniline

32. Which of the following amines will show positive Liebermann's nitroso test?

(a) 
(b) 
(c) $CH_3-\overset{CH_3}{\overset{|}{C}}-H$

(d) None of these

33. 
on reaction with HNO_2 forms

(a) 
(b) 
(c) 
(d) 
34. Arenium ion involved in the bromination of aniline is **[NCERT Exemplar]**

(a) 
(b) 
(c) 
(d) 
35. Which of the following cannot be prepared by Sandmeyer's reaction? [**NCERT** Exemplar]

(a) Chlorobenzene (b) Bromobenzene
(c) Iodobenzene (d) Fluorobenzene

Assertion and Reason

Directions (Q. Nos. 36 to 40) *Each of these questions contains two statements : Statement* I *(Assertion) and Statement* II *(Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*), (*d*) *given below :*

(a) Statement I is true; Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true; Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

36. **Statement I** Only a small amount of HCl is required in the reduction of nitro compounds with iron scrap and HCl in the presence of steam.

Statement II $FeCl_3$ formed gets hydrolysed to release HCl during the reaction. [**NCERT** Exemplar]

37. **Statement I** Hofmann degradation and Curtius degradation methods are used to prepare 1° amines.

Statement II Both involves intermolecular alkyl shift.

38. **Statement I** Tertiary amine is less basic than secondary amine in aqueous solution.

Statement II Over crowding due to I^+ effect of three alkyl groups increases strain.

39. **Statement I** Hofmann's bromamide reaction is given by primary amines.

Statement II Primary amines are more basic than secondary amines. [**NCERT** Exemplar]

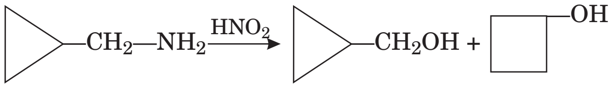
40. **Statement I** Acylation of amines gives a monosubstituted product whereas alkylation of amines gives polysubstituted product.

Statement II Acyl group sterically hinders the approach of further acyl groups. [**NCERT** Exemplar]

Comprehension Based Questions

Directions (Q. Nos. 41 to 43) Nitrous acid reacts with all classes of amines. The products obtained from their reactions depend on whether the amine is primary, secondary or tertiary and whether the amine is aliphatic or aromatic.

Aliphatic primary amines reacts with nitrous acid ($NaNO_2$ + HCl) to form alcohol as a major product. In addition to alcohol, alkene and alkyl halides are also formed as minor products. Certain cyclic primary amines can undergo either ring expansion or ring contraction reactions on treatment with nitrous acid. The reaction is called Demjanor ring expansion or contraction.

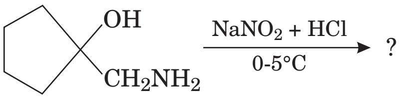


Answer the following questions.

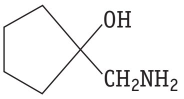
41. What will be the major product when 2-amino propane is treated with nitrous acid?

(a) 1-propanol
(b) 2-propanol
(c) Propene
(d) Cyclopropane

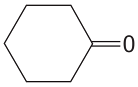
42. The product(s) obtained in the following reaction will be



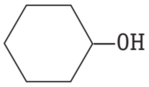
(a)



(b)

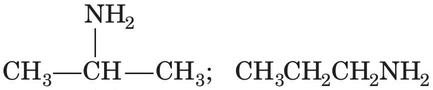


(c)



(d) All of these

43. Two compounds (*A*) and (*B*) are treated with nitrous acid,



$CH_3—\underset{}{\overset{NH_2}{\overset{|}{C}H}}—CH_3$; $CH_3CH_2CH_2NH_2$

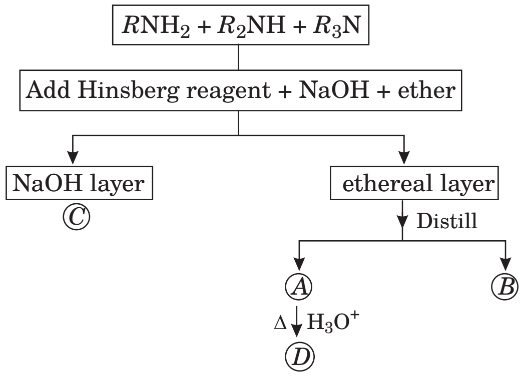
(*A*) (*B*)

The corresponding stable carbocation intermediates are

	(From *A*)	(From *B*)
(a)	$CH_3—CH_2—\overset{+}{C}H_2$	$CH_3—CH_2—\overset{+}{C}H_2$
(b)	$CH_3—\overset{+}{C}H—CH_3$	$CH_3—\overset{+}{C}H—CH_3$
(c)	$CH_3—\overset{+}{C}H—CH_3$	$CH_3—CH_2—\overset{+}{C}H_2$

(d) None of the above

Directions (Q. Nos. 44 to 46) When alkyl halide and ammonia react, there is always formation of 1°, 2° and 3° amines even under controlled conditions. Given outline describes the technique to separate the mixture. Go through it and properties of the amines to answer the questions at the end.



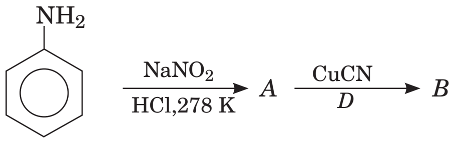
44. NaOH layer (C) contains
(a) sodium salt of 1° amine N-alkyl benzene sulphonamide
(b) sodium salt of 2° amine N,N-dialkyl benzene sulphonamide
(c) Both (a) and (b)
(d) None of the above

45. Distillation of ethereal layer gives
(a) A (N,N-dialkyl benzene sulphonamide) and B (3° amine)
(b) A (sodium salt of N-alkyl benzene sulphonamide) and B (3° amine)
(c) A (2° amine) and B (3° amine)
(d) None of the above

46. D is
(a) 1° amine
(b) 2° amine
(c) 3° amine
(d) mixture of 1° and 2° amine

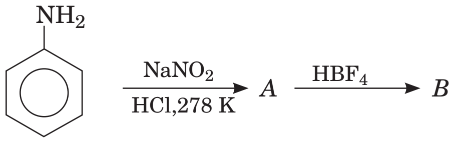
Previous Years' Questions

47. In the chemical reactions



Compounds A and B respectively are **[AIEEE 2011]**
(a) fluorobenzene and phenol
(b) benzene diazonium chloride and benzonitrile
(c) nitrobenzene and chlorobenzene
(d) phenol and bromobenzene

48. In the chemical reactions,



Compounds A and B respectively are **[AIEEE 2011]**
(a) nitrobenzene and fluorobenzene
(b) phenol and benzene
(c) benzene diazonium chloride and fluorobenzene
(d) nitrobenzene and chlorobenzene

49. Toluene is nitrated and the resulting product is reduced with tin and hydrochloric acid. The product so obtained is diazotised and then heated with cuprous bromide. The reaction mixture so formed contains **[AIEEE 2008]**
(a) mixture of *o*-and *p*-bromotoluenes
(b) mixture of *o*-and *p*-dibromobenzenes
(c) mixture of *o*-and *p*-bromoanilines
(d) mixture of *o*-and *m*-bromotoluenes

50. Which one of the following is the strongest base in aqueous solution? **[AIEEE 2007]**
(a) Trimethylamine (b) Aniline
(c) Dimethylamine (d) Methylamine

51. In the chemical reaction,
$CH_3CH_2NH_2 + CHCl_3 + 3KOH \longrightarrow (A) + (B) + 3H_2O$
The compounds (A) and (B) are respectively. **[AIEEE 2007]**
(a) C_2H_5CN and 3KCl
(b) $CH_3CH_2CONH_2$ and 3KCl
(c) C_2H_5NC and K_2CO_3
(d) C_2H_5NC and 3KCl

52. Fluorobenzene (C_6H_5F) can be synthesized in the laboratory **[AIEEE 2006]**
(a) by heating phenol with HF and KF
(b) from aniline by diazotisation followed by heating the diazonium salt with HBF_4
(c) by direct fluorination of benzene with F_2 gas
(d) by reacting bromobenzene with NaF solution

53. Which one of the following methods is neither meant for the synthesis nor for the separation of amines? **[AIEEE 2005]**
(a) Curtius reaction (b) Wurtz reaction
(c) Hofmann method (d) Hinsberg method

54. Amongst the following, the most basic compound is **[AIEEE 2005]**
(a) *p*-nitroaniline
(b) acetanilide
(c) aniline
(d) benzylamine

55. Reaction of cyclohexanone with dimethylamine in the presence of catalytic amount of an acid forms a compound. Water during the reaction is continuously removed. The compound formed is generally known as **[AIEEE 2005]**

(a) an amine (b) an imine
(c) an enamine (d) a Schiff 's base

56. Which of the following is the strongest base? **[AIEEE 2004]**

(a) 

(b) 
(c) 
(d) 
57. The correct order of increasing basic nature for the bases NH_3, CH_3NH_2 and $(CH_3)_2NH$ is **[AIEEE 2003]**

(a) $CH_3NH_2 < NH_3 < (CH_3)_2NH$
(b) $(CH_3)_2NH < NH_3 < CH_3NH_2$
(c) $NH_3 < CH_3NH_2 < (CH_3)_2NH$
(d) $CH_3NH_2 < (CH_3)_2NH < NH_3$

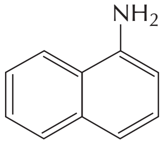
the Guidance

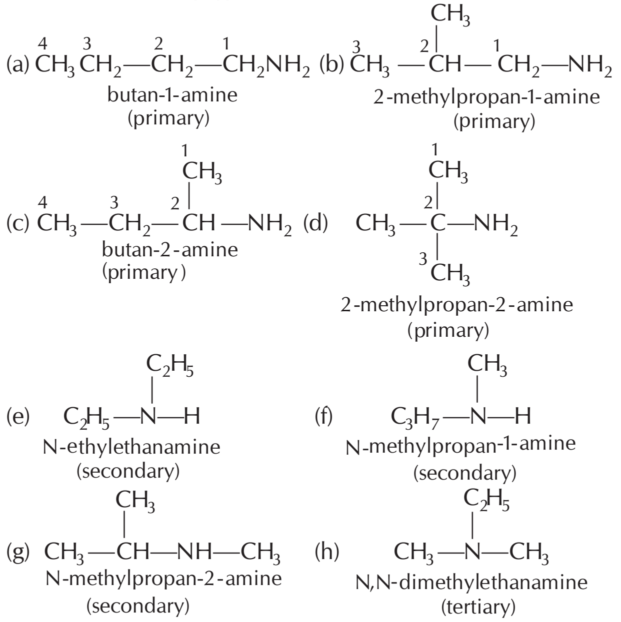
Round I

1. Primary amines have characteristic —NH_2 group, thus among the given, only



and $(C_2H_5)_2NH_2$ are primary amines.

2. Eight isomers of $C_4H_{11}N$ are



(a) $\overset{4}{C}H_3\overset{3}{C}H_2-\overset{2}{C}H_2-\overset{1}{C}H_2NH_2$ butan-1-amine (primary)

(b) $\overset{3}{C}H_3-\overset{2}{C}H(CH_3)-\overset{1}{C}H_2-NH_2$ 2-methylpropan-1-amine (primary)

(c) $\overset{4}{C}H_3-\overset{3}{C}H_2-\overset{2}{C}H(\overset{1}{C}H_3)-NH_2$ butan-2-amine (primary)

(d) $CH_3-\overset{2}{C}(\overset{1}{C}H_3)(\overset{3}{C}H_3)-NH_2$ 2-methylpropan-2-amine (primary)

(e) $C_2H_5-N(C_2H_5)-H$ N-ethylethanamine (secondary)

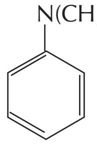
(f) $C_3H_7-N(CH_3)-H$ N-methylpropan-1-amine (secondary)

(g) $CH_3-CH(CH_3)-NH-CH_3$ N-methylpropan-2-amine (secondary)

(h) $CH_3-N(C_2H_5)-CH_3$ N,N-dimethylethanamine (tertiary)

3. $\overset{3}{C}H_2=\overset{2}{C}H-\overset{1}{C}H_2-NH_2$
prop-2-ene-1-amine

4.

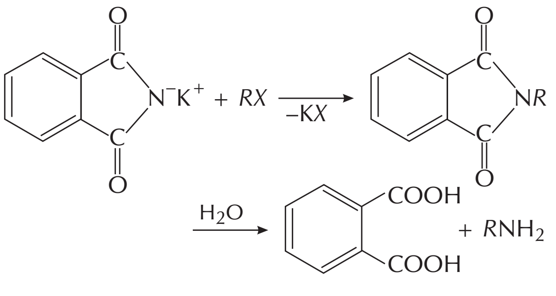


IUPAC name isN,N-dimethyl benzenamine.

5. $CH_3-CH_2-NCH_3-CH_3-CH_2$
IUPAC name is N-ethyl-N-methyl ethanamine (tertiary).

8. The mixture of $SnCl_2$ + HCl, reduces, —CN group partially.

10. The Gabriel synthesis reactions is



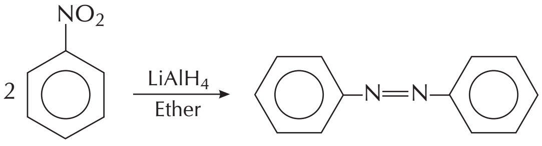
From the above reaction, it is clear that the N of amine comes from $C_6H_4(CO)_2N^-K^+$, so it is the source of nitrogen in this reaction.

11. Gabriel phthalimide synthesis is the best method for preparing primary amine from alkyl halides without changing the number of C atoms in the chain.

12. Hofmann bromamide degradation reaction is shown by only 1° amides like $RCONH_2$, $ArCONH_2$.

13. Gabriel phthalimide reaction, *i.e.*, heating of alkyl halide with potassium salt of phthalimide followed by hydrolysis is the best method for preparing amine with same number of C atom as that were in the parent alkyl halide.

14. $LiAlH_4$ in either is not a good reagent for reducing aryl intro compound into amine as it reduces aryl nitro compound to azo compound.



nitrobenzene azobenzene

other given reagents reduce aryl nitro compound to amine (aniline).

15. $RCONH_2 + \underset{'X'}{NaOBr} \longrightarrow RNH_2 + NaBr + Na_2CO_3 + 2H_2O$

16. Nitrobenzene is reduced by Zn and alcoholic KOH into hydrazobenzene.

$$2C_6H_5NO_2 + 10H \xrightarrow{Zn\ +\ alc.\ KOH} \underset{\text{hydrazobenzene}}{C_6H_5-NH-NH-C_6H_5} + H_2O$$

17. $CH_3CH_2I \xrightarrow{NaCN} CH_3CH_2CN \xrightarrow{OH^-} CH_3CH_2CONH_2 \xrightarrow{Br_2/NaOH} CH_3CH_2NH_2$

18. $\underset{\substack{\text{acetaldehyde}\\(A)}}{CH_3CHO} \xrightarrow{H_2NOH} \underset{(B)}{CH_3CH=OH} \xrightarrow{\text{Reduction}} \underset{\substack{\text{ethyl amine}\\(C)}}{CH_3CH_2NH_2} \xrightarrow[-N_2,\ -H_2O]{NOCl} \underset{\text{ethyl chloride}}{CH_3CH_2Cl}$

19.

$$RCN \xrightarrow{\text{Hydrolysis}} RCOOH + NH_3$$

$$RCH{=}NOH \xrightarrow{\text{Reduction}} RCH_2NH_2 + H_2O$$

$$RNC + 2H_2O \xrightarrow{\Delta} RNH_2 + HCOOH$$

$$RCONH_2 \xrightarrow{\text{Hydrolysis}} RCOOH + NH_3$$

20. Ethyl isocyanide on hydrolysis in acidic medium gives methanoic acid and ethyl amine salt.

$$C_2H_5NC + H_2O \xrightarrow{H^+} \underset{\text{methanoic acid}}{HCOOH} + C_2H_5NH_2$$

$$\underset{\text{ethylamine}}{C_2H_5NH_2} + H^+ \longrightarrow \underset{\text{ethylamine salt}}{C_2H_5NH_3^+}$$

21. 
1° amine
2-aminopropane

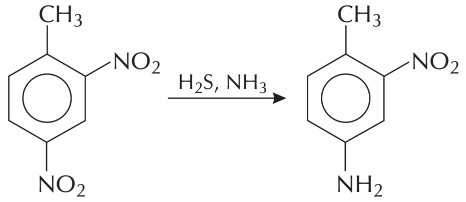
23. 
$$RX + \underset{\text{potassium cyanide}}{KCN} \longrightarrow RCN + KX \xrightarrow{\text{Reduction}} RCH_2NH_2$$

(having one more C atom as compared to parent halide)

24. 
$$\underset{\text{2-phenylpropanamide}}{CH_3\underset{|}{\underset{Ph}{C}}HCONH_2} \longrightarrow \underset{\text{1-phenylethanamine}}{CH_3\underset{|}{\underset{Ph}{C}}HNH_2}$$

Here —$CONH_2$ group is converted into —NH_2 group, so best reagent is $NaOH/Br_2$.

25. By using H_2S,NH_3 as reagents, selective reduction takes place.

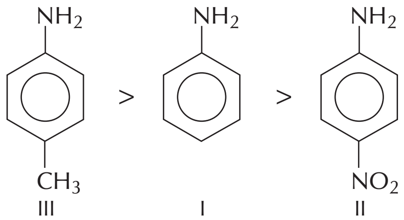


27. Nitrene is not the intermediate of Gabriel's phthalimide reaction.

29. Concentration does not affect the basic strength of amines.

30. The amines are basic in nature due to the presence of lone pair of electron on nitrogen. The 2° amines are most basic among 1°, 2° and 3° amines because of steric effect and hydration effect.

31. Presence of electron releasing group like —CH_3, —$COCH_3$ solvation increases electron density over N of —NH_2 group, and hence, makes it more basic. On the other hand electron withdrawing groups like —NO_2 reduces the basicity of aniline by decreasing electron density over N atom. Thus, the correct order of basic strength is



32. Phenol because of the resonance stabilisation of phenoxide ion, have higher tendency to give a proton instead of accepting it so, it is the weakest Bronsted base or strongest Bronsted acid.

33. Lone pair of —NH_2 group is responsible for the reaction of amine with dilute HCl. Thus, the amine with greater tendency of donating lone pair to proton of acid is more reactive towards dilute acid.

Among the given $(CH_3)_2NH$ is most reactive because of the presence of of two electron releasing group.

Note $(CH_3)_3N$ although have there electron releasing methyl groups but it is less reactive because of steric effect.

34. (a) Presence of electron donating methyl group increases the basicity of amines. However, 3° amines in aqueous solution are less basic due to steric hindrance.

(b) Aliphatic amines are more basic than aromatic amines because in later, lone pair takes part in delocalization, so less available for donation.

$$C_6H_5NH_2 > C_6H_5NHCH_3 > C_2H_5NH_2 > (C_2H_5)_2NH.$$

35. In (a) and (c), lone pair involves in resonance so less available for protonation. In (d), lone pair is more available than NH_3 for protonation. So, (d) is the strongest Bronsted base.

36. Presence of electron withdrawing groups like —CN, —CHO, —NO_2 etc., decreases the electron density over N-atom of amines, and thus decreases their basic character as lone pair is less available for donation.

39. $CH_3CH_2CH_3$ have less boiling point than the corresponding amines because of the absence of H-bonding. That's why it is most volatile.

41. Primary amines have higher tendency of forming H-bonds.

42. As the molecular mass increases, boiling point increases. In case of isomeric amines, however, as the number of H-atoms attached directly to N-atom decreases, boiling point decreases because tendency to form H-bonds decreases. Hence, the order of boiling points of given amines is

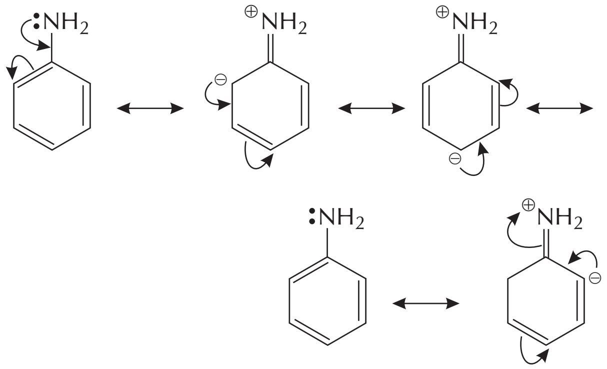
$$CH_3NH_2 < (CH_3)_3N < CH_3CH_2NH(CH_3) < CH_3CH_2CH_2NH_2$$

43. In tertiary amines, no H-atom is attached directly to the more electronegative N-atom. Hence, it has no tendency to form H-bond.

44. Usually symmetrical molecules have less dipole moment in comparision to unsymmetrical molecules.

Hence,  (*m*-nitroaniline) will show the highest dipole moment among the given.

45. —NH_2 has +*R* effect, it donates electrons to the benzene ring. As a result, the lone pair of electrons on the N-atom get delocalized over the benzene ring and thus less readily available for protonation. Hence, aniline is a weaker base than cyclohexylamine.



Resonance structure of aniline

48. $RNH_2 + \underset{\text{acid anhydride}}{O(OCR)_2} \xrightarrow[-RCOOH]{} \underset{2° \text{ amide}}{RNHCOR}$

49. Pyridine being a base, is used to remove the side product *i.e.*, HCl form reaction mixture.

50. $\underset{\substack{\text{ethyl amine}\\ \text{one mole}}}{CH_3CH_2NH_2} + HNO_2 \longrightarrow C_2H_5OH + H_2O + \underset{\substack{\text{one mole}\\ \text{22.4 L at NTP}}}{N_2}$

51. $CH_3NH_2 + HONO \longrightarrow CH_3OH + N_2\uparrow + H_2O$

52. In carbylamine reaction, when a primary amine reacts with chloroform in presence of alc. KOH, it gives iso-cyanide which has abnoxious odour. This reaction is given by primary amine.

$$\underset{\substack{\text{primary}\\ \text{amine}}}{RNH_2} + CHCl_3 + \underset{\text{(alc.)}}{3KOH} \xrightarrow{\Delta} \underset{\substack{\text{alkyl}\\ iso\text{-cyanide}}}{RNC} + 3KCl + 3H_2O$$

53. $\underset{iso\text{-propylamine}}{(CH_3)_2CHNH_2} \xrightarrow{KMnO_4[O]} \underset{\substack{'X'\\ \text{ketimine}}}{(CH_3)_2C{=}NH} \xrightarrow[-NH_3]{H_2O/H^+} \underset{\substack{'Y'\\ \text{acetone}}}{(CH_3)_2C{=}O}$

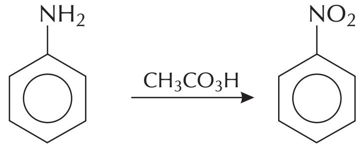
55. Only primary amines give positive carbylamine test.

56. $\underset{\substack{iso\text{-propyl amine}\\ \text{(primary amine)}}}{(CH_3)_2CH \cdot NH_2} + 2CH_3COCl \xrightarrow[-\,HCl]{} \underset{\text{tertiary-amine}}{(CH_3)_2CHN(COCH_3)_2}$

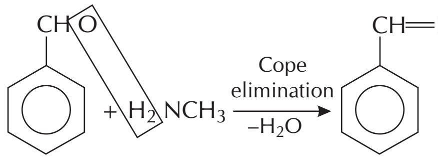
57. Carbylamine reaction is given by only primary amines (both aliphatic and aromatic). In this reation, a primary amine reacts with chloroform in basic medium, to form a very bad smelling compound, called carbylamine.

$$C_6H_5NH_2 + CHCl_3 + KOH \longrightarrow C_6H_5NC + KCl + H_2O$$

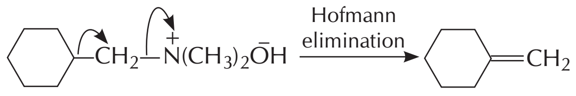
58. Aniline on oxidation with per acetic acid, CH_3CO_3H gives nitrobenzene.



59.



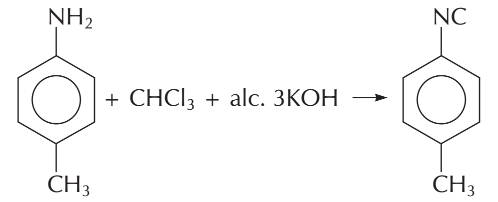
60.



+ $(CH_3)_2NOH$

62. $\underset{\text{ethyl amine}}{C_2H_5NH_2} \xrightarrow{HNO_2} \underset{\substack{\text{ethyl alcohol}\\ (A)}}{C_2H_5OH} \xrightarrow{PCl_5} \underset{\substack{\text{ethyl chloride}\\ (B)}}{C_2H_5Cl} \xrightarrow{NH_3} \underset{\substack{\text{ethyl amine}\\ (C)}}{C_2H_5NH_2}$

63.

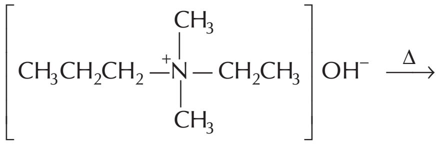


p-toluidine

+ 3KCl + $3H_2O$

It is a example of carbylamine reaction.

64. In Hofmann elimination reaction, less substituted alkene is the main product.

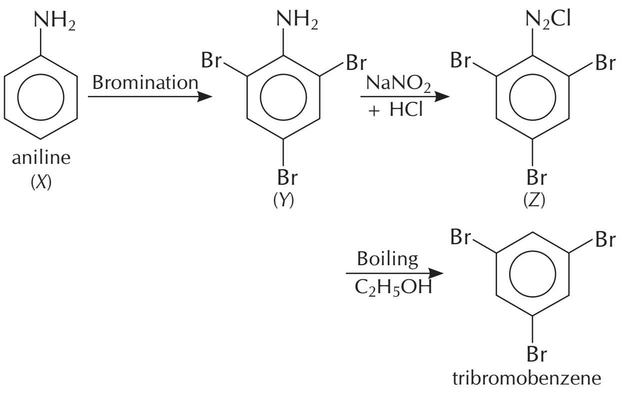


$$\left[CH_3CH_2CH_2-\overset{\substack{CH_3\\ |}}{\underset{\substack{|\\ CH_3}}{\overset{+}{N}}}-CH_2CH_3\right]OH^- \xrightarrow{\Delta}$$

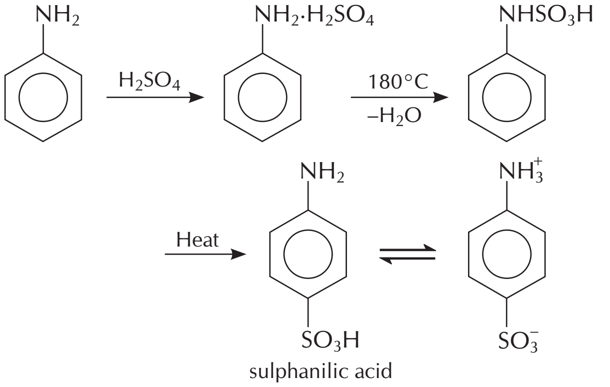
$$CH_3CH_2CH_2{-}N(CH_3)_2 + \underset{\text{(minor)}}{CH_3CH{=}CH_2} + \underset{\text{major}}{CH_2{=}CH_2}$$

65. $\underset{\substack{1° \text{ amine}\\ (Y)}}{R_2CHNH_2} \underset{}{\overset{[O]\ KMnO_4}{\rightleftharpoons}} [R_2C{=}NH] \xrightarrow{H_3O^+} \underset{\substack{\text{ketone}\\ (X)}}{R_2C{=}O}$

66.

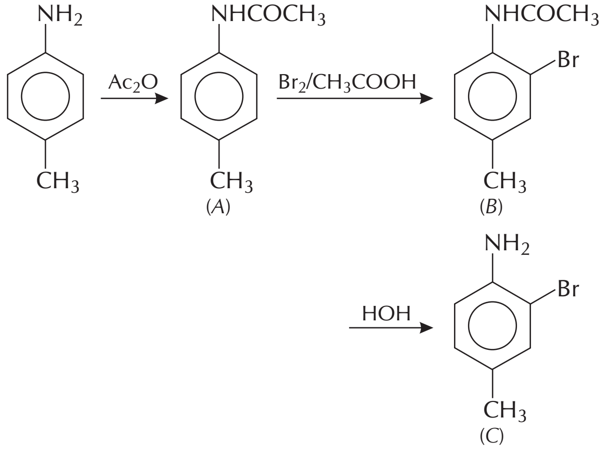


67.

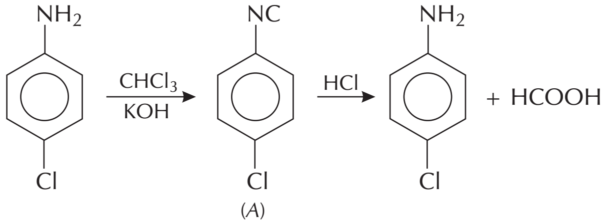


Sulphanilic acid exists as a dipolar ion which has acidic and basic groups in the same molecule. Such ions are called Zwitter ions or inner salts.

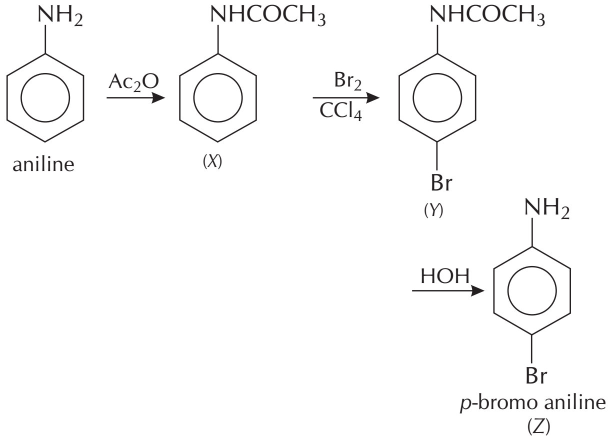
68.



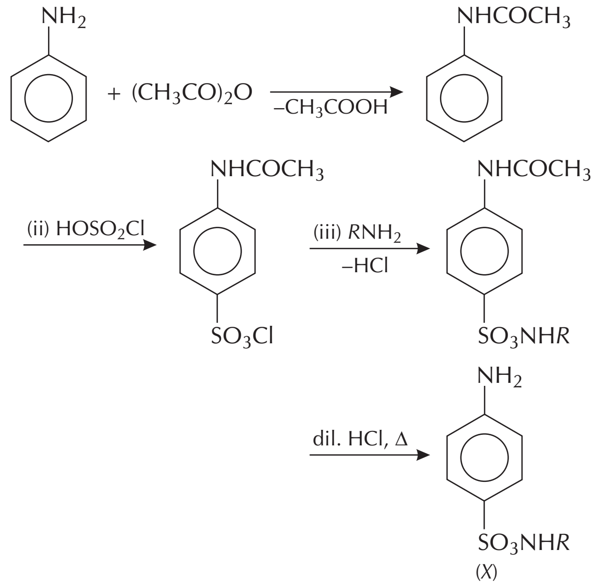
69.



70.



71.

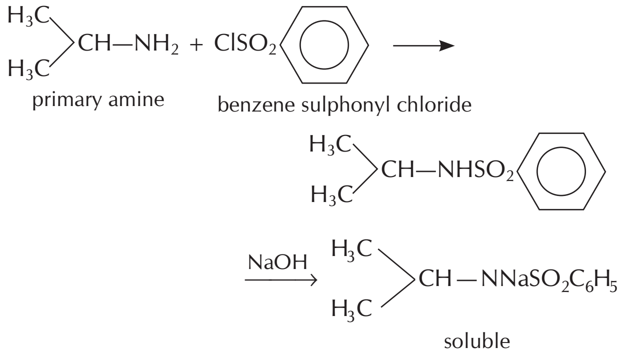


74. Hence, Hofmann method is used to separate a mixture of 1°, 2° and 3° amines.

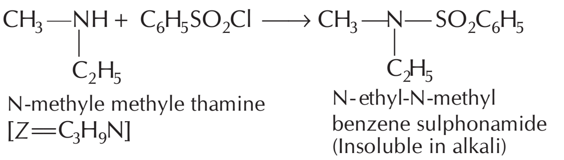
75.

$$\underset{\text{benzene sulphonyl chloride}}{C_6H_5SO_2Cl} + RNH_2 \longrightarrow \underset{\text{N-alkyl benzene sulphonamide}}{RNHSO_2C_6H_5} \xrightarrow{KOH} \underset{\text{soluble in KOH}}{R — NKSO_2C_6H_5}$$

76.

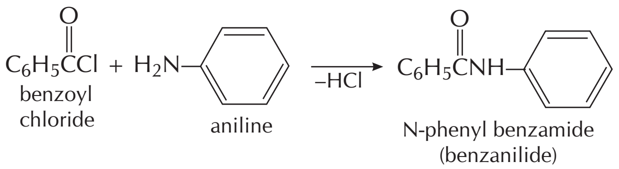


77. Z (C_3H_9N) is an aliphatic amine. On reaction with $C_6H_5SO_2Cl$ (Hinsberg's reagent), it gives a product insoluble in alkali. It means that the product does not have a replaceable H-atom attached to the N-atom. So, compound Z is a secondary amine (Ethyl methyl amine).

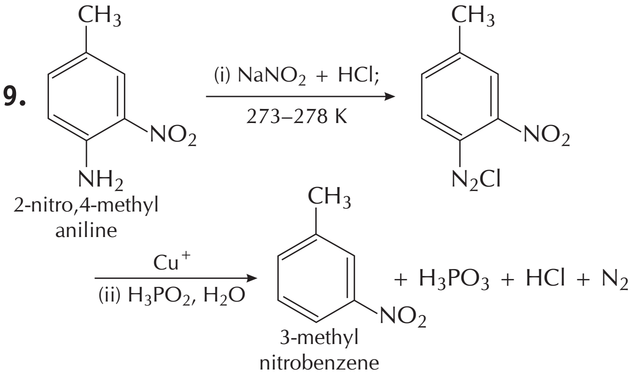


$$\underset{\substack{\text{N-methyle methyle thamine}\\ [Z{=}C_3H_9N]}}{CH_3—\underset{\substack{|\\ C_2H_5}}{NH}} + C_6H_5SO_2Cl \longrightarrow \underset{\substack{\text{N-ethyl-N-methyl}\\ \text{benzene sulphonamide}\\ \text{(Insoluble in alkali)}}}{CH_3—\underset{\substack{|\\ C_2H_5}}{N}—SO_2C_6H_5}$$

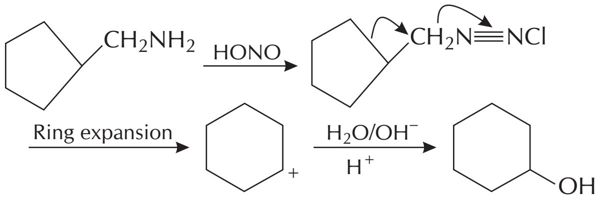
78.



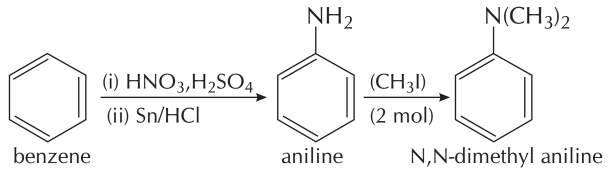
79.



80.



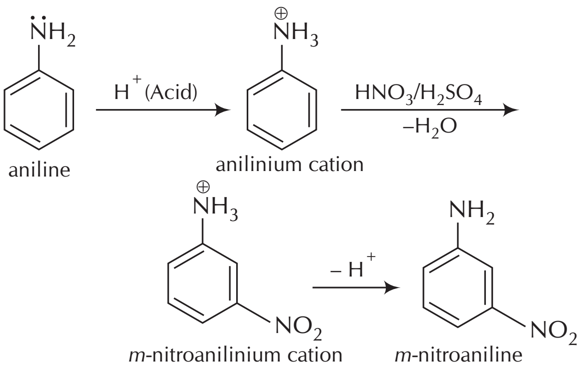
81. Benzene may be converted into N, N-dimethyl aniline as follows

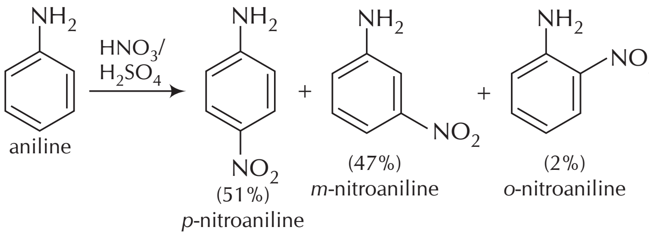


82. Secondary amines give oily nitrosoamine with nitrous acid.

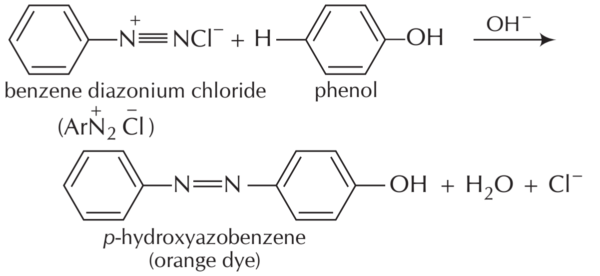
$$\underset{\text{secondary amine}}{(CH_3CH_2)_2NH} + \underset{\text{nitrous acid}}{HNO_2} \longrightarrow \underset{\text{oily nitrosoamine}}{(CH_3CH_2)_2N-NO} + H_2O$$

83. In the presence of conc. HNO_3 and conc. H_2SO_4, most of aniline gets protonated to form anilinium ion. Now aniline and anilinium ions both are present in the reaction mixture. In aniline, —NH_2 group is *o*- and *p*-directing but anilinium ion is *m*-directing. Because of more amount of anilinium ion, a lot of *m*-nitroaniline is formed.



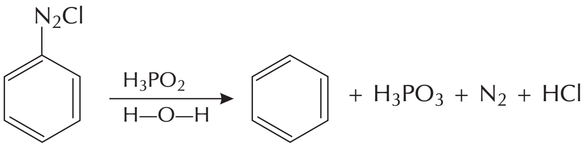


84. The reaction exhibits azo-coupling reaction of phenols. Benzene diazonium chloride reacts with phenol in such a manner that the *para* position of phenol is coupled with diazonium salt to form *p*-hydroxy azobenzene.

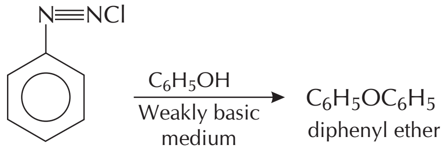


86. Only benzene derivative having electron releasing group are capable for undergoing coupling reaction. Nitrobenzene because of the presence of electron with drawing —NO_2 group is not capable to give coupling reaction.

87.

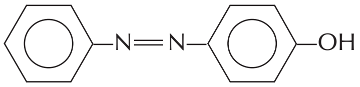


89.



92. $\phi N_2^+ + \phi OH \longrightarrow \phi N_2 \phi OH$

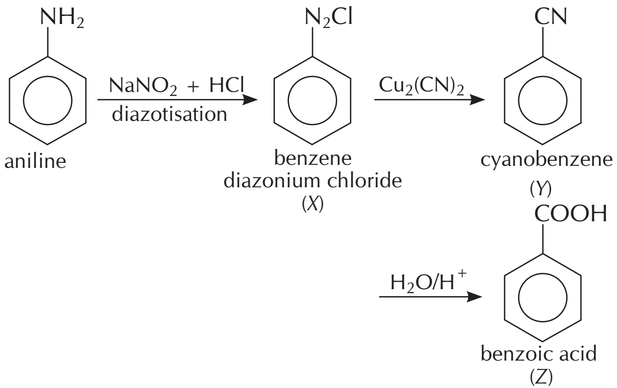
or



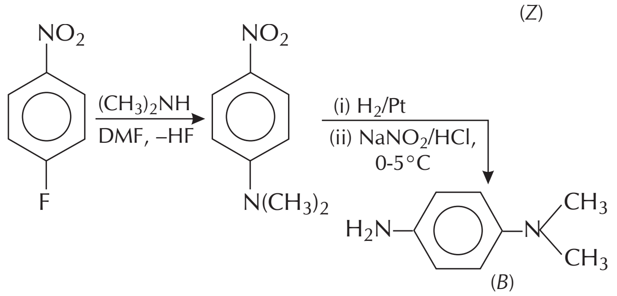
coupling product

Here reagent used is $\phi\ N_2^+$ instead of $\phi\ N_2$.

93.

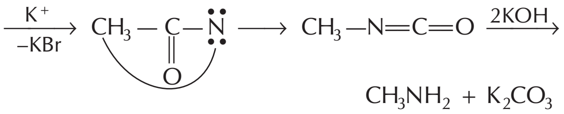


95.



Round II

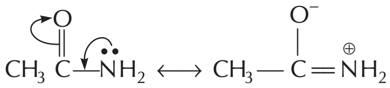
1. $CH_3CONH_2 \xrightarrow[-HBr]{Br} CH_3CONHBr \xrightarrow[-H_2O]{OH^-} CH_3CONBr^-$



$$\xrightarrow[-KBr]{K^+} CH_3-\underset{\underset{\displaystyle O}{\|}}{C}-\ddot{\underset{\cdot\cdot}{N}} \longrightarrow CH_3-N{=}C{=}O \xrightarrow{2KOH}$$

$$CH_3NH_2 + K_2CO_3$$

2. In $CH_3C\begin{array}{l}\diagup NH\\ \diagdown NH_2\end{array}$, lone pair of —$NH_2$ remains more available for donation and its conjugate acid is resonance stabilised thus, its is most basic. Between $CH_3CH_2NH_2$ and $(CH_3)_2NH$, the later is more basic because of the presence of two alkyl group which facilitates the donation of lone pair easier. $CH_3\overset{\overset{\displaystyle O}{\|}}{C}—NH_2$ is least basic as in it lone pair of N involves in resonance.



$$CH_3\overset{\overset{\displaystyle O}{\|}}{C}—\ddot{N}H_2 \longleftrightarrow CH_3—\overset{\overset{\displaystyle O^-}{|}}{C}{=}\overset{\oplus}{N}H_2$$

Thus, the correct order of basicity is I > III > II > IV.

3. Piperidine and morpholine both are non-aromatic and N atom is sp^3 hybridised so these are more basic as compare to other two (which are aromatic and have sp^2 hybridised N atom). – *I* effect of O atom in morpholine makes it less basic as compared to piperidine. So, the order of basic character is

$$\underbrace{I > III}_{\text{Non-aromatic}} > \underset{\substack{\text{(lone pair does}\\ \text{not involves in}\\ \text{resonance but}\\ \text{N is } sp^2 \text{ hybridised)}}}{II} > \underset{\substack{\text{(least basic as}\\ \text{lone pair take}\\ \text{part in resonance)}}}{IV}$$

4. 
(less basic in aqueous medium as lone pair are delocalised)

5. $(CH_3)_3N \xrightarrow[\text{(ii) } H_2O, \Delta]{\text{(i) BrCN}} (CH_3)_2NH + CH_3Br + HCN$

6. Hofmann bromamide reaction proceeds with the retention of configuration.

7. Presence of α-H atom is the main condition for exhibiting tautomerism.

The reactant taken in reaction (*C*) does not contain any α-H atom, thus the product (*Y*) will also show the absence of α-H atom. Hence, *Y* will not show tautomerism.

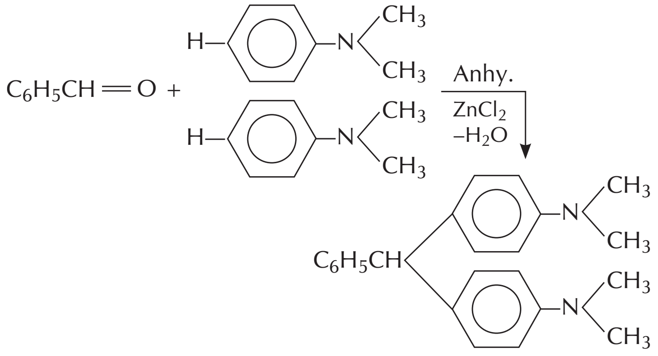
8. $RNH_2 \xrightarrow{KMnO_4} \underset{\text{aldimine}}{RCH{=}NH} \xrightarrow{H^+} RCHO$

$R_2NH \xrightarrow{H_2SO_5} R_2N—OH$

$R_3N \xrightarrow{H_2SO_5} R_3N \longrightarrow O$

$R_3C—NH_2 \xrightarrow{H_2SO_5} R_3C—NO_2$

9. Benzaldehyde condenses with N,N-dimethyl aniline in the presence of anhydrous $ZnCl_2$ to give malachite green.



malachite green

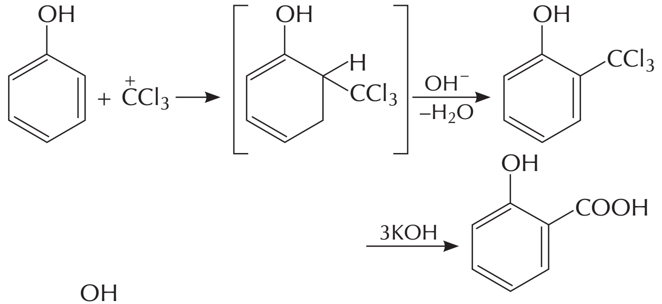
10. $\underset{\text{ethylamine}}{CH_3CH_2NH_2} \xrightarrow{NaNO_2 + HCl} CH_3CH_2OH + N_2 + H_2O + NaCl$

$\underset{\text{urea}}{NH_2CONH_2} \xrightarrow{NaNO_2 + HCl} 2N_2 + H_2O + CO_2 + NaCl$

$\underset{\text{acetamide}}{CH_3CONH_2} \xrightarrow{NaNO_2 + HCl} CH_3COOH + N_2 + H_2O + NaCl$

$\underset{\text{aniline}}{C_6H_5NH_2} \xrightarrow{NaNO_2 + HCl} C_6H_5N_2^+Cl^- + H_2O + NaCl$

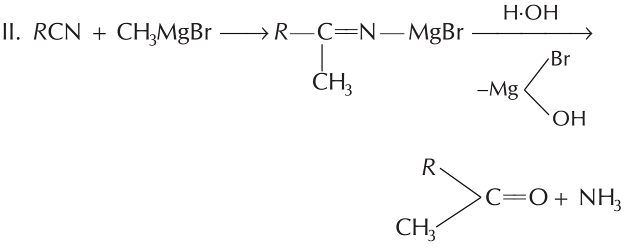
11. $CCl_4 + K^+ \longrightarrow \underset{\substack{\text{trichloromethyl}\\ \text{carbonium ion}}}{\overset{+}{C}Cl_3} + KCl$



12. 
electron rich site, so $C_6H_5\overset{+}{N_2}$ attacks there.

13. I. $RCN \xrightarrow{\text{Reduction}} \underset{1^\circ\text{ amine}}{RCH_2NH_2}$

II. $RCN + CH_3MgBr \longrightarrow R—\underset{CH_3}{C}=N—MgBr \xrightarrow{H\cdot OH}$

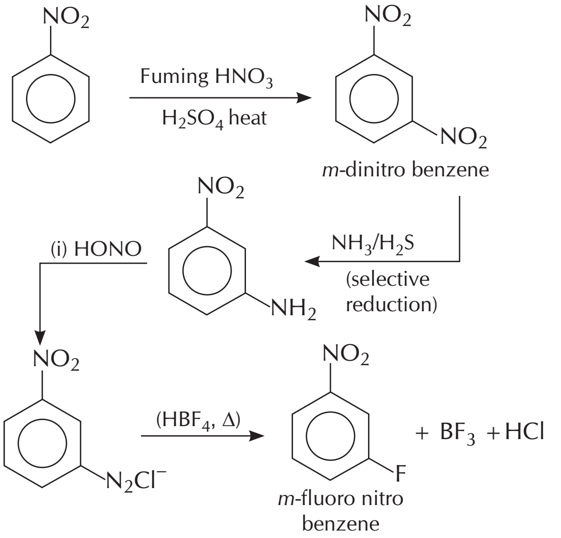


methyl ketone

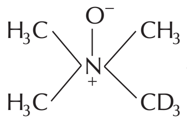
III. $RNC \xrightarrow{\text{Hydrolysis}} HCOOH + \underset{1^\circ\text{ amine}}{RNH_2}$

IV. $RNH_2 \xrightarrow{HNO_2} ROH + N_2 + H_2O$

14.



15.



$\longrightarrow (CH_3)_2NO + CH_2=CH—CD_3$

$+ CH_3CH=CD_2$

16. (A) H_3PO_2 converts—$N_2^+\bar{C}l$ into –H.

(B) Sandmeyer reaction converts $-N_2^+Cl^-$ into $-Cl^-$

(C) Boiling with water introduces –OH group in place of $-N_2^+Cl^-$.

(D) Gomberg reaction introduces –Ar group in place of $-N_2^+Cl^-$.

17. (i) **To determine the structures of *B* and *C***

Compound '*B*' on heating with Br_2 and KOH forms compound '*C*'. So, '*B*' is amide and '*C*' is amine. Molecular formula C_6H_7N of '*C*' tells us that it is aniline ($C_6H_5NH_2$).

$$\underset{\substack{\text{benzamide}\\ [B]}}{C_6H_5CONH_2} \xrightarrow{Br_2/KOH} \underset{[C]\ C_6H_7N}{C_6H_5NH_2}$$

(ii) **To determine the structure of *A***

Compound '*A*' on treatment with aqueous ammonia forms '*B*' so '*A*' is benzoic acid.

$$\underset{\substack{\text{benzoic acid}\\ [A]}}{C_6H_5COOH} \xrightarrow[\text{Heat}]{\text{Aqueous } NH_3} \underset{\substack{\text{benzamide}\\ [B]}}{C_6H_5CONH_2}$$

18. (i) Addition of HCl to compound '*A*' shows that compound '*A*' is alkene. Compound '*B*' is C_4H_9Cl.

(ii) Compound '*B*' reacts with NH_2, it forms amine '*C*'.

$$\underset{[A]}{C_4H_8} \xrightarrow{HCl} \underset{[B]}{C_4H_9Cl} \xrightarrow{NH_3} \underset{[C]}{C_4H_{11}N \text{ or } C_4H_9NH_2}$$

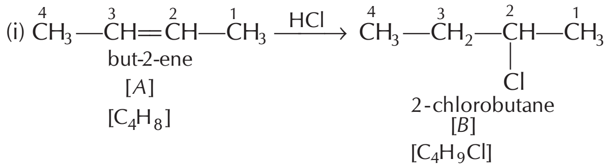
(iii) '*C*' gives diazonium salt with $NaNO_2$ / HCl, which yields an optically active alcohol. So, '*C*' is an aliphatic amine.

(iv) '*A*' on ozonolysis produces 2 moles of CH_3CHO.

So, '*A*' is $CH_3—CH=CH—CH_3$ (But-2-ene).

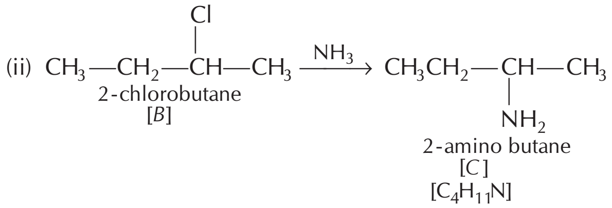
Reactions

(i)



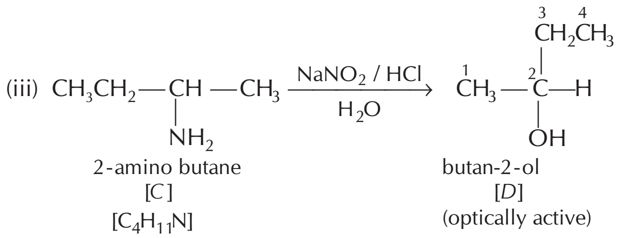
$$\underset{\substack{\text{but-2-ene}\\ [A]\\ [C_4H_8]}}{\overset{4}{C}H_3—\overset{3}{C}H=\overset{2}{C}H—\overset{1}{C}H_3} \xrightarrow{HCl} \underset{\substack{\text{2-chlorobutane}\\ [B]\\ [C_4H_9Cl]}}{\overset{4}{C}H_3—\overset{3}{C}H_2—\underset{Cl}{\overset{2}{C}H}—\overset{1}{C}H_3}$$

(ii)



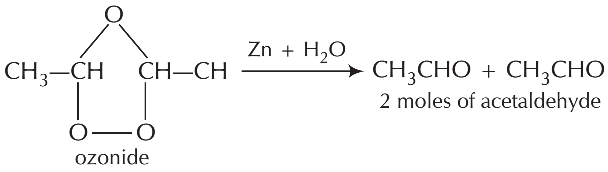
$$\underset{\substack{\text{2-chlorobutane}\\ [B]}}{CH_3—CH_2—\overset{Cl}{CH}—CH_3} \xrightarrow{NH_3} \underset{\substack{\text{2-amino butane}\\ [C]\\ [C_4H_{11}N]}}{CH_3CH_2—\underset{NH_2}{CH}—CH_3}$$

(iii)

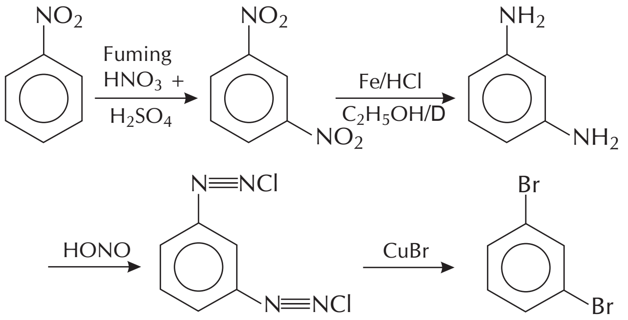


$$\underset{\substack{\text{2-amino butane}\\ [C]\\ [C_4H_{11}N]}}{CH_3CH_2—\underset{NH_2}{CH}—CH_3} \xrightarrow[H_2O]{NaNO_2\ /\ HCl} \underset{\substack{\text{butan-2-ol}\\ [D]\\ \text{(optically active)}}}{\overset{1}{C}H_3—\underset{OH}{\overset{\overset{3\ \ 4}{CH_2CH_3}}{\overset{2}{C}}}—H}$$

(iv) $\underset{\substack{\text{but-2-ene}\\ [A]}}{CH_3–CH=CH–CH_3} + O_3 \longrightarrow$



19.



m-dibromobenzene

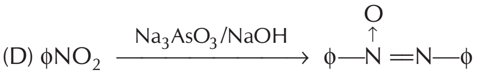
24. (A) $\phi NO_2 \xrightarrow{Zn/NH_4Cl} \phi NHOH$

(B) $\phi NO_2 \xrightarrow[NaOH]{Zn/al} \phi\ N{=}N\phi$ azobenzene

(C) $\phi NO_2 \xrightarrow{LAH} \phi NH_2$

(D)

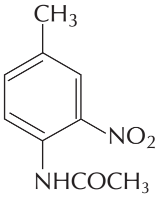


$\phi NO_2 \xrightarrow{Na_3AsO_3/NaOH} \phi{-}\overset{O \atop \uparrow}{N}{=}N{-}\phi$

azoxybenzene

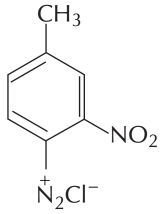
25. I= Sn/HCl

II=



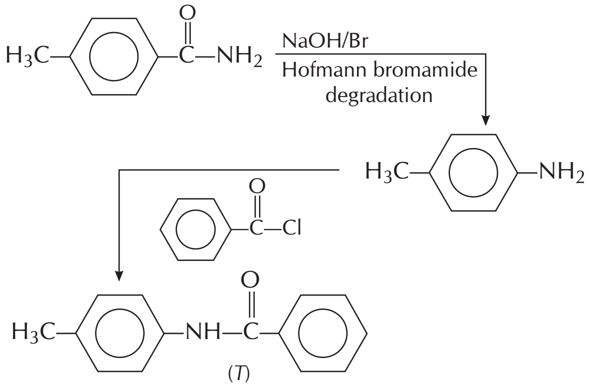
$III{=}H_2O/H^+$

IV=

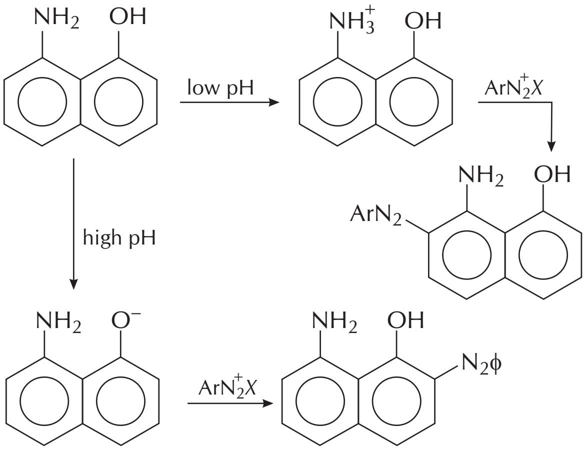


$V{=}H_3PO_2/H_2O$

26.



27. At low pH, it exist as cation whereas at high pH as anion



28. (A) Aniline is used for making azo dyes.

(B) TNT (trinitrotoluene) is an explosive.

(C) sulphanilamide is a sulpha drug.

(D) Nitrobenzene being inert towards Friedel-Crafts reaction, is used as a solvent for this reaction.

29. (a) $\underset{\text{alkyl isocyanide}}{RNC} \xrightarrow[{[H]}]{LiAlH_4} \underset{2^\circ\text{ amine}}{RNHCH_3}$

(b) $\underset{\text{alkyl cyanide}}{RCN} \xrightarrow[{[H]}]{LiAlH_4} \underset{1^\circ\text{ amine}}{RCH_2NH_2}$

(c) $\underset{\text{acid amide}}{RCONH_2} \xrightarrow[{[H]}]{LiAlH_4} \underset{1^\circ\text{ amine}}{RCH_2NH_2}$

(d) $\underset{1^\circ\text{ nitroalkane}}{RNO_2} \xrightarrow{Sn/HCl} \underset{1^\circ\text{ amine}}{RNH_2}$

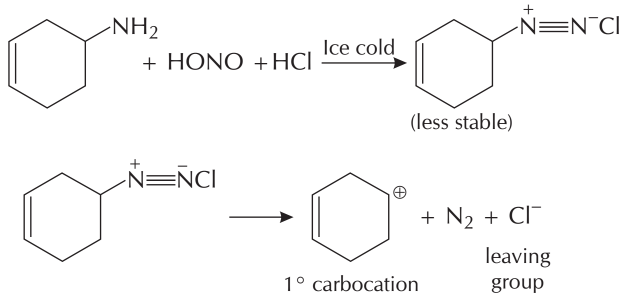
Thus, (*A*) can be alkyl cyanide or acid amide or 1° nitroalkane.

30. CH_3COCl and $(CH_3CO)_2O$ form acetanilide with aniline and thus, reduces the activety of $-NH_2$ group. Hence, treatment with these reagents result in the formation *p*-nitro derivative as major product. In the absence of these reagents, 2,4,6 trisubstituted derivative is the major product.

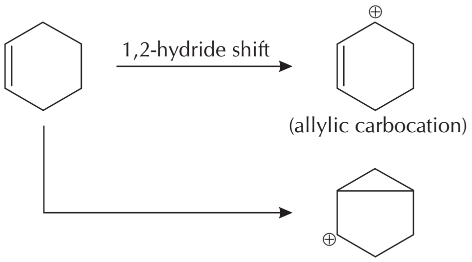
31. Bromination of acetanilide and coupling reactions of diazonium salts both are the examples of electrophilic substitution reaction.

32. 3° amines because of the absence of H-atoms, attached directly to N-atom, will not show positive Liebermann's nitroso test. Thus, $C_6H_5N(CH_3)_2$ being a 3° amine, does not show positive Liebermann's nitroso test.

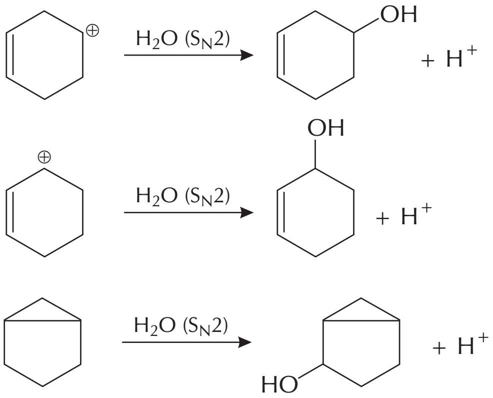
33.



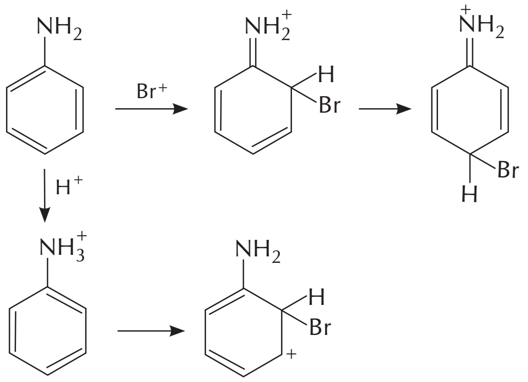
The carbocation formed rearranges itself to give more stable carbocation in the following manners,



Now, all these carbocation are converted into alcohols as



34.



35. Only chlorobenzene and bromobenzene are obtained by Sandmeyer's reaction, as for fluorobenzene, the reaction is explosive and in case of iodobenzene, the reaction is reversible.

36. For the reduction of nitro compounds, only a small amount of HCl is required along with Fe scrap. This is because $FeCl_3$ formed hydrolysed to give HCl which is utilised in the further reaction.

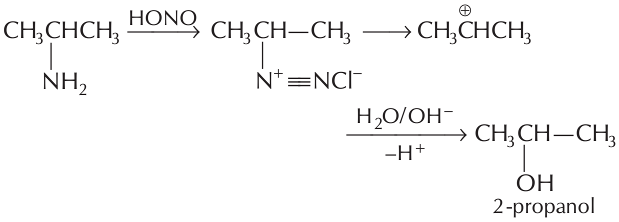
37. Hofmann bromamide degradation and Curtius degradation both involve the intramolecular alkyl shift and, thus result in the formation of 1° amines.

38. Alkyl group is +*I* showing group. In general, it increases the electron density over nitrogen, thus increase the availability of lone pair for donation. But in case of tertiary amines, in aqueous solution, the over crowding of three bulkier alkyl group results in increased strain, which decreases the availability of lone pairs for donation and thus results in decreased basicity. Hence, in aqueous solution, 3° amines are less basic as compared to 2° amines.

39. Primary amines are less basic as compared to secondary amines because of less electron density over N of $–NH_2$ in case of primary amines.

40. Acyl group being deactivating given only monosubstituted product whereas alkyl group is an activating group so it results in the formation of polysubstituted product.

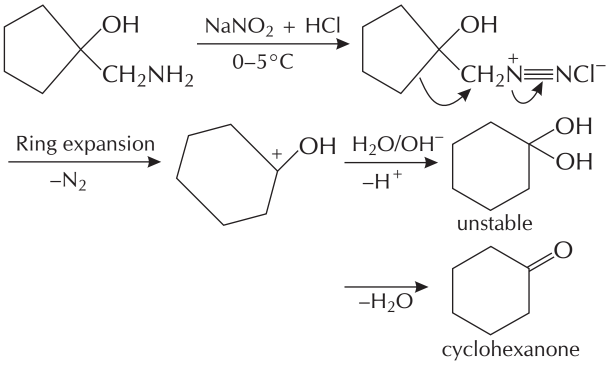
41.



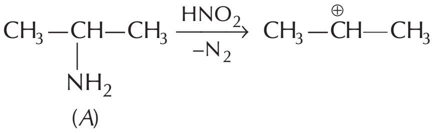
$$CH_3\underset{NH_2}{CH}CH_3 \xrightarrow{HONO} CH_3\underset{N^+\equiv NCl^-}{CH}—CH_3 \longrightarrow CH_3\overset{\oplus}{C}HCH_3 \xrightarrow[-H^+]{H_2O/OH^-} CH_3\underset{OH}{CH}—CH_3$$

2-propanol

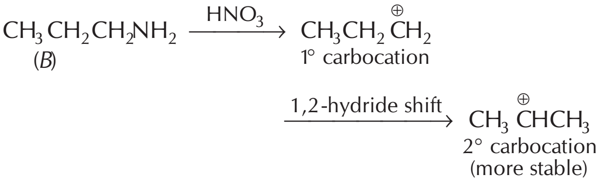
42.



43.



$$\underset{(A)}{CH_3—\underset{NH_2}{CH}—CH_3} \xrightarrow[-N_2]{HNO_2} CH_3—\overset{\oplus}{C}H—CH_3$$



$$\underset{(B)}{CH_3CH_2CH_2NH_2} \xrightarrow{HNO_3} \underset{1° \text{ carbocation}}{CH_3CH_2\overset{\oplus}{C}H_2} \xrightarrow{1,2\text{-hydride shift}} \underset{\substack{2° \text{ carbocation} \\ \text{(more stable)}}}{CH_3\overset{\oplus}{C}HCH_3}$$

***P*$_{44–46}$**

The mixture of amines when reacts with Hinsberg reagent, form the following products

$$RNH_2 + C_6H_5SO_2Cl \xrightarrow[-HCl]{} \underset{\text{soluble in NaOH}}{C_6H_5SO_2NHR}$$

$$\xrightarrow{NaOH} \underset{\substack{\text{(present in NaOH layer)} \\ (C)}}{C_6H_5SO_2N(Na)R}$$

$$R_2NH + C_6H_5SO_2Cl \xrightarrow[-HCl]{} \underset{\text{insoluble in NaOH}}{C_6H_5SO_2N\cdot R_2}$$

(thus, present in ethereal layer)

$$\underset{(A)}{C_6H_5SO_2N\cdot R_2} + H_3O^+ \xrightarrow{\Delta} \underset{\substack{2° \text{ amine} \\ (D)}}{R_2NH}$$

$$R_3N + C_6H_5SO_2Cl \longrightarrow \text{No reaction}$$

(thus, present in ethereal layer)

Hence,

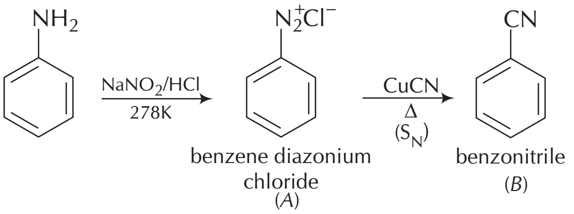
A = N,N-dialkyl benzene sulphonamide

B = R_3N

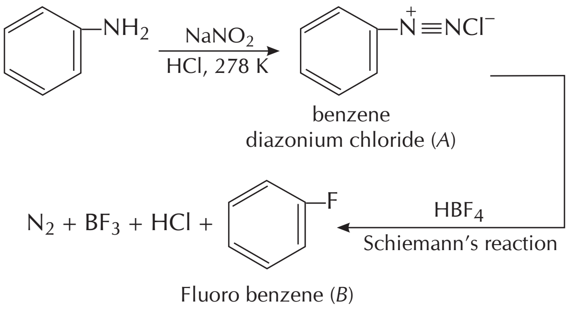
C = sodium salt of 1° amine (N-alkyl benzene sulphonamide)

D = 2° amine (R_2NH)

47. Formation of *A* is by diazotisation and formation of *B* form *A* is by S_N reaction.



48.



49. 
50. In aqueous solution, basicity order is $\underset{2^\circ}{\text{Dimethylamine}} > \underset{1^\circ}{\text{methylamine}} > \underset{3^\circ}{\text{trimethylamine}} > \text{aniline}$.

51. $CH_3CH_2NH_2 + CHCl_3 + KOH \rightarrow A + B + 3H_2O$

$$CHCl_3 + KOH \longrightarrow :CCl_2 + \underset{(B)}{KCl} + H_2O$$

$$CH_3CH_2NH_2 + :CCl_2 \longrightarrow \underset{\text{carbylamine }(A)}{CH_3CH_2NC} + 2HCl$$

52. 
53. Wurtz reaction is used to prepare alkanes from alkyl halides.

$$2R-X + 2Na \xrightarrow{\text{Dry ether}} R-R + 2NaX$$

54. (a) 
; $-NO_2$ group (electron withdrawing) decreases basic nature of aniline

(b) $CH_3\overset{O}{\overset{\|}{C}}NH_2$;

$CH_3\overset{O}{\overset{\|}{C}}-$ group is also electron withdrawing group.

(c) 
; phenyl group is also electron withdrawing.

(d) Benzyl is electron repelling group increases basic nature.

Thus, most basic compound is benzylamine.

55. 
56. $-CH_3$ group [an electron releasing (+*I*) group] increases electron density at N-atom, hence basic nature is increased.

(a) 
(b) 
(c) 
(d) 
$-C_6H_5$ decreases electron density at N-atom, thus basic nature is decreased. (Lone pair on N in aniline compounds is delocalised alongwith π-electrons in benzene).

57. $NH_3CH_3NH_2, (CH_3)_2NH$

$$(CH_3)_2NH + H_2O \overset{K_1}{\rightleftharpoons} (CH_3)_2\overset{+}{N}H_2 + OH^-$$

I^+ effect maximum, stabilisation more, H-bond stability high hence most basic.

$$CH_3NH_2 + H_2O \overset{K_2}{\rightleftharpoons} CH_3\overset{+}{N}H_3 + OH^-$$

$$NH_3 + H_2O \overset{K_3}{\rightleftharpoons} NH_4^+ + OH^-$$

$$K_1 > K_2 > K_3$$

Hence, basicity order is

$$(CH_3)_2NH > CH_3NH_2 > NH_3$$

13.1 Various Terms Related to Polymers

In order to understand the composition, structure and characteristics of polymers, it is necessary to become aware with the following terms.

Monomers

The small molecules that combine together to give a polymer, are called monomers. *e.g.,* when a large number of ethene molecules combine together (under suitable conditions), a high molecular weight substance, called the **polymer**, is obtained. It is named as polyethene as it contains several ethene units.

$$n\mathrm{CH_2{=}CH_2} \xrightarrow[\text{Pressure}]{\mathrm{O_2},\ \text{heat}} \text{- - -}\mathrm{CH_2{-}CH_2{-}CH_2{-}CH_2{-}CH_2{-}CH_2}\text{- - -}$$

$$\text{or } \underset{\text{polyethylene}}{(\mathrm{-CH_2{-}CH_2-})_n}$$

The term polymer is coined from two Greek words : 'poly' means many and 'mer' means units or parts. Thus, ***polymers may be defined as the high molecular mass compounds which are prepared by the combination of a large number of one or more types of simple molecules or units.***

Repeating Units

The unit or part of a polymer, which is repeated at a regular interval is called **repeating unit**. Repeating unit may or may not be same as monomer, *e. g.*, in case of $(A)_n$ type polymer repeating unit, A is same as monomer and in case of $(AB)_n$ type polymer repeating unit, AB is different from monomers A and B.

Macromolecules

High molecular weight compounds are called macromolecules. Polymers because of their high molecular mass are also considered as macromolecules but *all macromolecules are not polymers*. The main difference between macromolecules and polymers is that the later have a repeating unit whereas the former may or may not, *e.g.*, polythene and chlorophyll both are macromolecules but only polythene due to the presence of $\left[CH_2-CH_2\right]$ repeating unit, is a polymer whereas chlorophyll due to the absence of repeating unit, is not a polymer.

Functionality of a Polymer

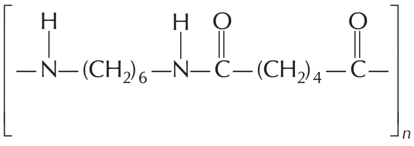
It is the number of reacting sites present in a molecule (monomer) that leads to the formation of polymer. *e.g.*, ethene ($CH_2=CH_2$) contains only one double bond, so it is monofunctional. $NH_2(CH_2)_4NH_2$ contains two reacting $-NH_2$ groups, so it is bifunctional.

Telomers

Polymers which contain foreign molecules such as *A* and *B* in addition to the repeating unit, are called telomers, *e.g.*, $A-M_n-B$.

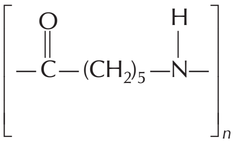
Sample Problem 1 *Which is not a polymer of only single monomer?* **[NCERT]**

(*a*)



$$\left[-\overset{H}{\overset{|}{N}}-(CH_2)_6-\overset{H}{\overset{|}{N}}-\overset{O}{\overset{\|}{C}}-(CH_2)_4-\overset{O}{\overset{\|}{C}}-\right]_n$$

(*b*)



$$\left[-\overset{O}{\overset{\|}{C}}-(CH_2)_5-\overset{H}{\overset{|}{N}}-\right]_n$$

(*c*) $\left[CF_2-CF_2\right]_n$

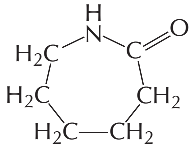
(*d*) *All of the above*

Interpret (c) (a) Since amide linkage —CONH— is present in (a), it is a polymer of diamine having 6C atoms and diacid having 6C atoms. Thus, its monomers are

(i) Hexamethylene diamine [$H_2N-(CH_2)_6-NH_2$] and

(ii) Adipic acid [$HOOC-(CH_2)_4-COOH$]

(b) also contains amide linkage but within the same molecule, so it contains $>$CO and amine group within a ring. Hence, its monomer is caprolactam.

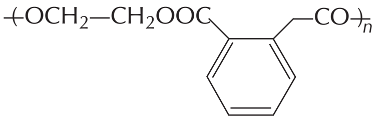


(c) contains the same monomer and repeating unit, so it is an addition polymer of a monomer containing double bond. Moreover, absence of functional group also shows the unsaturation. Hence, its monomer is tetrafluoroethene [$F_2C=CF_2$].

From the above it is clear that polymer given in option (a) have two monomers.

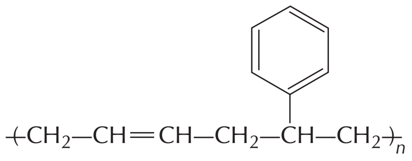
Sample Problem 2 *In which of the following polymers ethylene glycol is one of the monomer units?* **[NCERT Exemplar]**

(*a*)

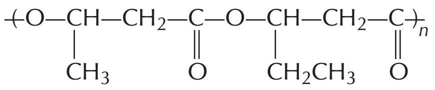


(*b*) $\left(CH_2-CH_2\right)_n$

(*c*)



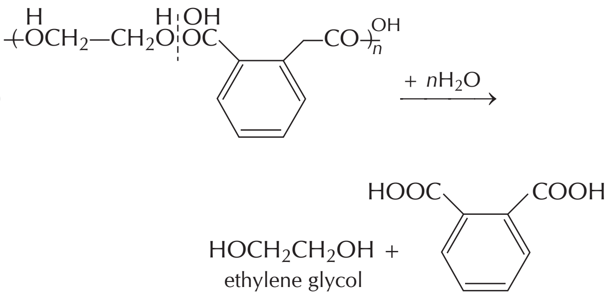
(*d*)



$$\left(O-\underset{CH_3}{\underset{|}{CH}}-CH_2-\underset{O}{\underset{\|}{C}}-O-\underset{CH_2CH_3}{\underset{|}{CH}}-CH_2-\underset{O}{\underset{\|}{C}}\right)_n$$

Interpret (*a*) Since, in general, polymers are formed by the loss of small molecules like H_2O or without the loss of any molecule. So try to add H_2O or find unsaturation, to find the structures of monomers.

(a)



Hence, its one monomer unit is ethylene glycol.

(b) $(CH_2-CH_2)_n$ cannot be hydrolysed because of the absence of functional group, so its monomer must be unsaturated, *i.e.*, $CH_2=CH_2$.

(c) Similarly, $\left(CH_2-CH=CH-CH_2-\overset{C_6H_5}{\overset{|}{CH}}-CH_2\right)_n$ is a polymer of $CH_2=CH-CH=CH_2$ and $\overset{C_6H_5}{\overset{|}{CH}}=CH_2$ (styrene).

(d) Also, the given polymer on adding H_2O gives $HO-\underset{CH_3}{\underset{|}{CH}}CH_2-COOH$ and $HO-\underset{CH_2CH_3}{\underset{|}{CH}}CH_2COOH$ units.

Hence, only the polymer given in option (a) have ethylene glycol as monomer.

13.2 Classification of Polymers

Polymers are classified on different basis which are as follows

Classification on the Basis of Source of Availability

On this basis polymers are classified into following three catagories

(a) Natural Polymers

These are obtained from plants and animals. Some of these such as polysaccharides, proteins and nucleic acids are essential for the existence of life, so these are also known as **biopolymers**. These are generally biodegradable. Examples of such polymers are

(i) **Nucleic acids** (such as DNA, RNA) These are the polymers of nucleotides (*i.e.,* base + sugar + phosphate).

(ii) **Proteins** These are the polymers of amino acids, which are joined together by peptide bonds.

(iii) **Natural rubber** These are the polymers of derivatives of buta-1, 3-diene.

(iv) **Polysaccharides** (such as starch and cellulose) These are the polymers of monosaccharides, which are joined together through glycosidic linkages.

Caution Point *Enzymes are generally proteins, so these are also the polymers of amino acid monomers.*

(b) Semisynthetic Polymers

These are derived from natural polymers by chemical modifications. These are also called man made polymers. Their examples includes

(i) **Cellulose acetate** It is obtained by the acetylation of cellulose followed by partial hydrolysis. It is less inflammable and used in making photographic films, lacquers and varnishes.

(ii) **Rayon** It contains purified cellulose in the form of long fibres. When cellulose is treated with NaOH and CS_2, viscose, a colloidal dispersion, is obtained and when the viscose is forced through fine holes into dilute sulphuric acid, rayon is obtained. Rayon, a biodegradable polymer, absorbs moisture and is used for making textiles, carpets, tyre-cord etc. It has a shine like silk, so also known as artificial silk.

(iii) **Cellophane** When the viscose, obtained above, is forced through a long narrow slit into an acid bath and then, softens with glycerol, cellophane is obtained. Unlike plastics, it absorbs moisture.

(iv) **Cellulose nitrate** (gun cotton) These are obtained by the nitration of cellulose.

(c) Synthetic Polymers

These are man made polymers. Such polymers have high tensile strength. Due to their extensive use in daily life as well as in industry, these are of great importance, *e.g.,* polythene $-\!\!\left[CH_2-CH_2 \right]\!\!-_n$, polyvinyl chloride $-\!\!\left[CH_2-CHCl \right]_n$, polystyrene $-\!\!\left[CH_2-CHC_6H_5 \right]\!\!-_n$, nylon-66, bakelite, synthetic rubber etc.

Sample Problem 3 *Which of the following is not a semisynthetic polymer?* **[NCERT Exemplar]**

(a) *Cis-polyisoprene*
(b) *Cellulose nitrate*
(c) *Cellulose acetate*
(d) *Vulcanised rubber*

Interpret (a) *Cis*-polyisoprene is natural rubber which is obtained from rubber tree (natural source). So, it is a natural polymer, not a semisynthetic one.

Classification on the Basis of Structure

On this basis polymers are classified into following classes

(a) Linear Polymers

In linear polymers monomers are combined together in the form of long and straight chains. These chains are closely packed, due to which, these polymers have high melting points, high densities and high tensile strength, *e.g.,* high density polythene, polyvinyl chloride (PVC), polystyrene, polypropylene etc.

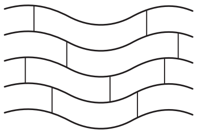
(b) Branched Chain Polymers

They contain linear chains with some branches. Due to branching, the molecules of polymer do not pack well. Consequently, these have low density, low melting point and low tensile strength, *e.g.,* low density polythene etc.

(c) Cross-linked or Network Polymers

These polymers usually are obtained from bi-or-tri functional monomers. In such polymers, the linear polymer chains are linked together through strong covalent bonds and results in a three dimensional network or cross-linked structure. Due to cross-linking, these polymers are hard, rigid and brittle, *e.g.,* bakelite, melamine etc.

(a) Linear chain (b) Branched chain



(c) Cross-linked

Fig. 13.1 General structure of different polymers

Classification on the Basis of Mode of Polymerisation

On this basis polymers are divided into following two classes

(a) Addition Polymers

These are usually obtained from unsaturated monomer molecules, *i.e.,* the molecules having double or triple bond. These are formed by successive addition of repeated monomers without the elimination of small molecules. The molecular mass of such polymers is whole number multiple of monomer. These are obtained by addition or chain growth polymerisation, so also known as **chain growth polymers**.

On the basis of monomers involved, these are further of two types

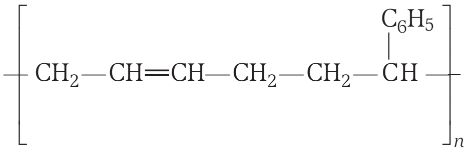
1. **Addition homopolymers** which are obtained by the repeated addition of single monomer unit, *e.g.,*

$$\underset{\text{ethene}}{nCH_2{=}CH_2} \longrightarrow \underset{\text{polyethene}}{\left[CH_2{-}CH_2\right]_n}$$

$$\underset{\text{vinyl chloride}}{nCH_2{=}CHCl} \longrightarrow \underset{\text{polyvinyl chloride}}{\left[CH_2{-}CHCl\right]_n}$$

2. **Addition copolymers** which are obtained by the repeated addition of more than one monomer units, *e.g.,*

$$\underset{\substack{\text{1,3-butadiene}\\(75\%)}}{nCH_2{=}CH{-}CH{=}CH_2} + \underset{\substack{\text{styrene}\\(25\%)}}{nC_6H_5CH{=}CH_2} \longrightarrow$$



$$\left[CH_2{-}CH{=}CH{-}CH_2{-}CH_2{-}\overset{\displaystyle C_6H_5}{\overset{|}{CH}}\right]_n$$

butadiene-styrene copolymer
(buna-S)

(b) Condensation Polymers

These are obtained when monomer molecules combine together with the loss of small molecules such as ammonia, water, alcohol etc. The molecular mass of such polymers is not a whole number multiple of monomer. These are the products of condensation polymerisation which generally occurs amongst the molecules possessing bi- or tri- functional groups, so are also called **step growth polymers**. These are usually copolymers but a few homopolymers are also known.

1. **Condensation copolymers** are obtained by the condensation of more than one monomer units, *e.g.,*

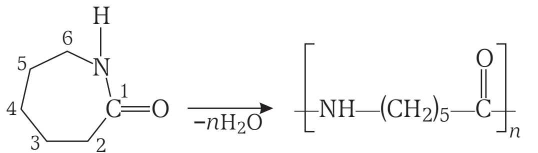
$$\underset{\substack{\text{hexamethylene}\\\text{diamine}}}{nH_2N(CH_2)_6NH_2} + \underset{\text{adipic acid}}{nHOOC(CH_2)_4COOH} \longrightarrow$$

$$\underset{\substack{\text{nylon-66}\\\text{(condensation copolymer)}}}{\left[NH(CH_2)_6NHCO(CH_2)_4CO\right]_n} + nH_2O$$

$$nHOOC{-}C_6H_4{-}COOH + nHO{-}(CH_2)_2{-}OH \xrightarrow[-nH_2O]{}$$

$$\underset{\text{terylene (dacron)}}{\left[OC{-}C_6H_4{-}COO{-}CH_2{-}CH_2{-}O\right]_n}$$

2. **Condensation homopolymers** are prepared by the condensation reaction between molecules of only one kind, *e.g.,*



caprolactum

nylon-6 or perlon
(condensation homopolymer)

Hot Spot 1

CLASSIFICATION ON THE BASIS of Magnitude of Intermolecular Forces

Although the chapter itself is not very important for JEE Main examination but question, if asked, may be from this topic as it is more important than the others. The level of question is easy and the question is generally direct.

On the basis of intermolecular forces polymers are classified into following classes

(a) Elastomers

As the name implies, these are the polymers that have elastic character (*i.e.,* have a property to regain their original shape after stretching). In such polymers, the polymer chains are held together by weak intermolecular forces which are responsible for their elastic character, *e.g.,* natural rubber, neoprene etc. In order to increase their elastic character, a few cross-links are also introduced in between the chains, *e.g.,* vulcanised rubber.

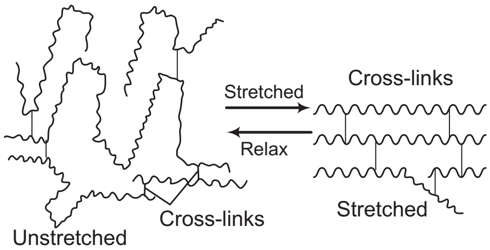


Fig. 13.2 Unstretched and stretched forms of an elastomer

(b) Fibres

These are long threads having high tensile strength, high modulus and less elasticity. These can be woven into fabric. These polymers have strong intermolecular forces such as hydrogen bonding, dipole-dipole interaction etc. Due to the presence of such strong forces of attraction, the polymer chains get closely packed and impart crystalline nature to polymers.

Thus, polymers show sharp melting points. As the crystalline nature increases, the polymers become denser, harder and more resistant to heat, *e.g.,* polyamides (nylon-66), polyesters (terylene) etc. However, in the presence of substituents as in poly (methyl methacrylates) or branches, no such close packing occurs, thus density gets reduced.

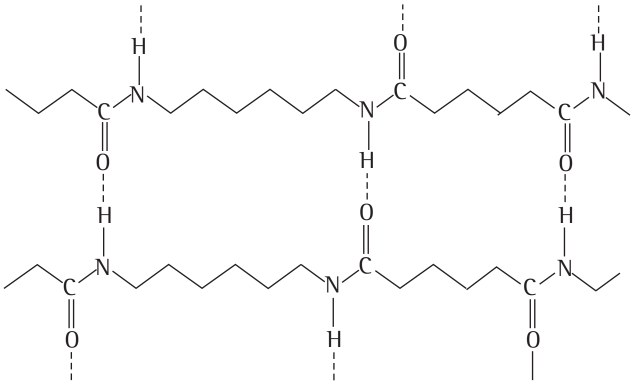

Fig. 13.3 Hydrogen bonding in nylon-6,6

(c) Thermoplastic Polymers

These are the linear or slightly branched polymers in which the intermolecular forces of attraction are intermediate between elastomers and fibres. These polymers soften on heating and become rigid on cooling. This is because of the absence of cross-linking between chains of such polymers. The process of softening, moulding and cooling can be repeated as often as, desired. These polymers are soluble in many organic solvents, *e.g.,* nitrocellulose, vinyl polymers such as polythene, perspex, polystyrene etc.

(d) Thermosetting Polymers

When heavily branched molecules or chains are heated, they result in hard infusible and insoluble three dimensional or extensively cross-linked products. These three dimensional or extensively cross-linked products are referred to as **thermosetting polymers**. Due to extensive cross-linking, these polymers have strongest intermolecular forces and are brittle as cross-linking reduces the mobility of polymer chains. On heating, such polymers result in chemical decomposition, thus these cannot be remelted or reused after hardening once *e.g.,* bakelite, urea-formaldehyde resin, melamine-formaldehyde etc. Remember that rigidity of polymers increases with cross-linking.

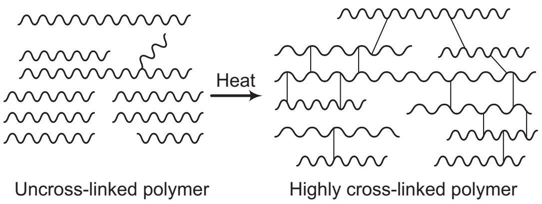

Fig. 13.4

(e) Oriented Polymers

There is an another class of polymers, termed as oriented polymers, which are stronger than steel and can conduct electricity almost like copper.

Sample **Problem 4** *Arrange the following polymers in increasing order of their intermolecular forces. Nylon-66, buna-S, polythene, neoprene.*

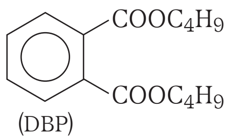
- (a) *Neoprene < buna-S < polythene < nylon-66*
- (b) *Neoprene < buna-S < nylon-66 < polythene*
- (c) *Polythene < nylon 66 < buna-S < neoprene*
- (d) *Polythene < buna-S < nylon-66 < neoprene*

Interpret (*a*) The order of intermolecular forces in different polymers is elastomers < plastics < fibres. So, in order to solve such problem first classify the given polymer into the above classes and then arrange them in increasing order of forces. Neoprene (synthetic rubber) is an elastomer, buna-S is also an elastomer, polythene is plastic and nylon 66 is a fibre. So, the increasing order of intermolecular forces of the given polymer is

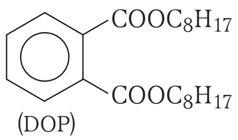
Neoprene < buna-S < polythene < nylon-66

13.3 Plasticizers

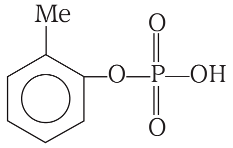
This name is given to those compounds, which when added to such plastics which do not soften very much with rise in temperature, make them soft and easily pliable. They do this because they lower the melting point (softening point) of the polymer thereby reducing the interparticle forces. Generally high boiling esters or high boiling haloalkanes are used as plasticizers. The plasticizers evaporate when exposed to air and light for a long time, leaving behind a hard and brittle plastic article, *e.g.,* tricresyl phosphate (TCP), dioctylphthalate (DOP), dibutylphthalate (DBP) and chlorinated paraffin wax (CPW) etc. *e.g.,* polyvinyl chloride (PVC) is a hard, stiff and glass like plastic. When a plasticizer such as dioctylphthalate (DOP) is added to it, it becomes soft and rubber like.



(DBP)



(DOP)



o-cresyl phosphate

Check Point 1

1. Is haemoglobin a polymer? Explain your answer.
2. Can we consider enzymes as polymer? [**NCERT**]
3. Explain, why do the melting point and tensile strength of polymers increase with rise in molecular mass?
4. Why does nylon-66 has a sharp melting point?
5. When dioctylphthalate is added to polyvinylchloride, it becomes soft. Explain, why?
6. Branched chain polymers have low melting point and low density. Explain, why?
7. Why elastomers have elastic property?

13.4 Polymerisation

The process or technique through which monomer units combine to give a polymer is known as **polymerisation**. The polymerisation reaction can't be controlled easily. According to **Carothers** (1931) polymerisation is best defined as "intermolecular combinations that are functionally capable of proceeding indefinitely".

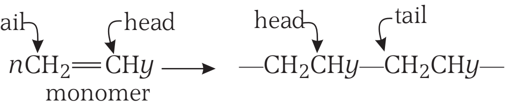
There are two principal methods through which monomers combine to give polymers. These are addition polymerisation and condensation polymerisation. Copolymerisation and coordination polymerisation, however, also are the methods of polymerisation.

Addition Polymerisation

It is the process in which molecules of same or different monomers combine together to give a polymer without the elimination of small molecules. Since, there is an increase in the length of chain (*i.e.,* chain grows) by this mode of polymerisation, it is also known as **chain growth polymerisation.** This mode of polymerisation is observed in molecules having multiple bonds, mainly in $CH_2{=}CHy$ type molecules (where, y may be —H, —X, —CO_2R, —CN etc.)

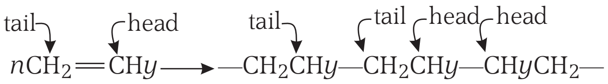
In chain growth polymerisation, there are three possible ways through which monomers can combine, *viz.*

(i) Head to tail manner



$$nCH_2{=}CHy \longrightarrow —CH_2CHy—CH_2CHy—$$

(ii) Head to head and tail to tail manner



$$nCH_2{=}CHy \longrightarrow —CH_2CHy—CH_2CHy—CHyCH_2—$$

(iii) In random manner which includes (i) and (ii) both.

Among these ways, 'Head to tail addition' is preferred for steric reasons because propagating unit attacks the less sterically hindered carbon. Moreover, groups that stabilise adjacent radicals also favour "head to tail addition".

The addition or chain growth polymerisation can proceed by the following two mechanisms (i) By the formation of free radicals, *i.e.,* free radical polymerisation and (ii) By the formation of ionic species, *i.e.,* ionic polymerisation. On the basis of structure of monomer and initiator used, each mechanism involve following three steps

(i) Initiation step, in which process starts,
(ii) Propagation step, in which chain grows,
(iii) Termination step, in which process terminates.

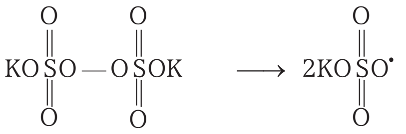
(a) Free Radical Addition Polymerisation

In this way of polymerisation there is generation of free radicals by free radical generators, called **initiator**. Any compound which readily undergoes homolytic cleavage to give such radicals that are sufficiently energetic to convert an alkene into radical, can act as a radical generator (initiator) for free radical polymerisation. Most commonly used free radical generators are organic and inorganic peroxides and salts of per acids. Examples of some free radical generators are summarised below

$$\underset{\text{benzoyl peroxide}}{(C_6H_5COO)_2} \longrightarrow 2C_6H_5COO^\bullet$$

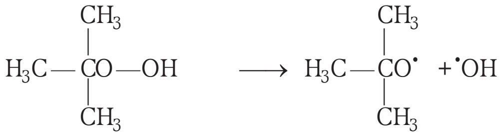
$$\underset{\text{acetyl peroxide}}{(CH_3COO)_2} \longrightarrow 2CH_3COO^\bullet$$

$$\underset{\text{hydrogen peroxide}}{H_2O_2} \longrightarrow 2\overset{\bullet}{O}H$$



$$\mathrm{KO}\overset{\overset{O}{\|}}{\underset{\underset{O}{\|}}{S}}\mathrm{O-O}\overset{\overset{O}{\|}}{\underset{\underset{O}{\|}}{S}}\mathrm{OK} \longrightarrow 2\mathrm{KO}\overset{\overset{O}{\|}}{\underset{\underset{O}{\|}}{S}}\mathrm{O}^\bullet$$

potassium perdisulphate



$$H_3C-\overset{\overset{CH_3}{|}}{\underset{\underset{CH_3}{|}}{C}}O-OH \longrightarrow H_3C-\overset{\overset{CH_3}{|}}{\underset{\underset{CH_3}{|}}{C}}O^\bullet + {}^\bullet OH$$

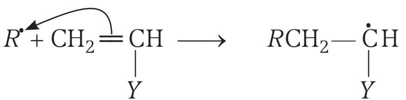
t-butyl hydrogen peroxide

Some free radicals are also generated in the presence of light.

This mode of polymerisation involves following three steps

Step I **Initiation step** In this step, a monomer unit gets excited either by exposing to light or by small amount of free radical generator, *e.g.,*

$$\underset{\text{(alkyl peroxide)}}{(RCOO)_2} \longrightarrow 2RCOO^\bullet \longrightarrow \underset{\substack{\text{(free radical}\\\text{generator)}}}{R^\bullet} + CO_2$$

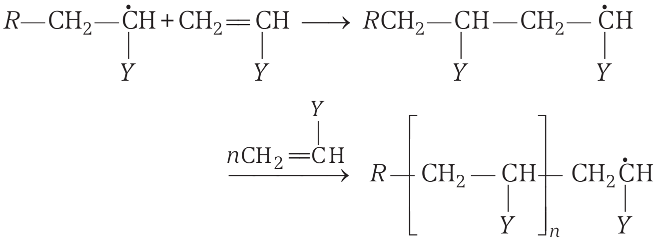


$$R^\bullet + CH_2{=}\underset{\underset{Y}{|}}{CH} \longrightarrow RCH_2-\underset{\underset{Y}{|}}{\dot{C}H}$$

excited monomer unit (free radical)

(where, Y = H, Cl, CN, —R etc.)

Step II **Propagation step** The excited monomer unit (or generated free radical) combines with another monomer unit, in this step and generate another free radical. This process of addition and generation continues and chain length increases, *e.g.,*



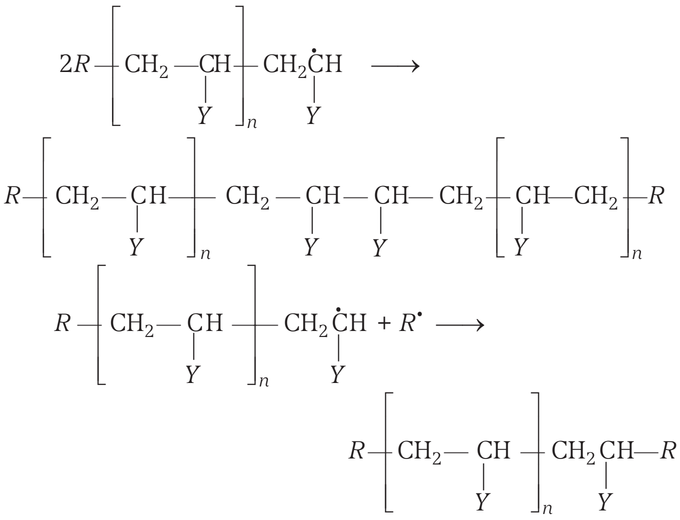
$$R-CH_2-\underset{\underset{Y}{|}}{\dot{C}H} + CH_2{=}\underset{\underset{Y}{|}}{CH} \longrightarrow RCH_2-\underset{\underset{Y}{|}}{CH}-CH_2-\underset{\underset{Y}{|}}{\dot{C}H}$$

$$\xrightarrow{nCH_2=\overset{\overset{Y}{|}}{C}H} R\left[CH_2-\underset{\underset{Y}{|}}{CH}\right]_n CH_2\underset{\underset{Y}{|}}{\dot{C}H}$$

(Because of the high molecular weight of polymers, the terminal groups are relatively unimportant in determining their physical properties. It is the rest part of polymers that determines their physical properties).

Step III **Termination step** In this step the growing chain is terminated by one of the following methods.

(i) When there is a coupling between the growing chains or between a growing chain and free radical generator, the chain gets terminated, *e.g.,*



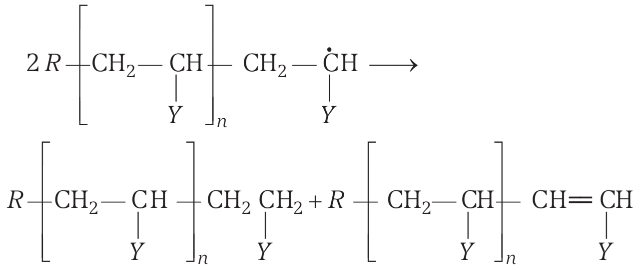
$$2R\left[CH_2-\underset{\underset{Y}{|}}{CH}\right]_n CH_2\underset{\underset{Y}{|}}{\dot{C}H} \longrightarrow$$

$$R\left[CH_2-\underset{\underset{Y}{|}}{CH}\right]_n CH_2-\underset{\underset{Y}{|}}{CH}-\underset{\underset{Y}{|}}{CH}-CH_2\left[\underset{\underset{Y}{|}}{CH}-CH_2\right]_n R$$

$$R\left[CH_2-\underset{\underset{Y}{|}}{CH}\right]_n CH_2\underset{\underset{Y}{|}}{\dot{C}H} + R^\bullet \longrightarrow$$

$$R\left[CH_2-\underset{\underset{Y}{|}}{CH}\right]_n CH_2\underset{\underset{Y}{|}}{CH}-R$$

(ii) When the growing chain undergoes disproportionation, the chain gets terminated, *i.e.,*

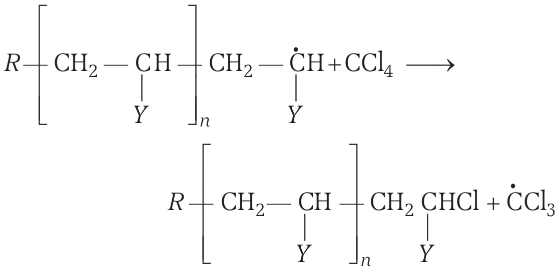


$$2R\left[CH_2-\underset{\underset{Y}{|}}{CH}\right]_n CH_2-\underset{\underset{Y}{|}}{\dot{C}H} \longrightarrow$$

$$R\left[CH_2-\underset{\underset{Y}{|}}{CH}\right]_n CH_2\underset{\underset{Y}{|}}{CH_2} + R\left[CH_2-\underset{\underset{Y}{|}}{CH}\right]_n CH{=}\underset{\underset{Y}{|}}{CH}$$

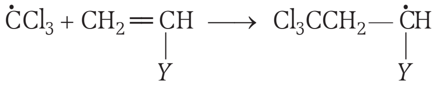
(iii) When reagents such as CCl_4 or CBr_4 are added, the growing chain gets terminated. These reagents are called **chain transfer agents** and the process is called

chain transfer. The molecular mass of a polymer can be controlled by this process. These reagents do not affect the rate of polymerisation but yield a polymer with lower average molecular mass and a small amount of chlorine, *e.g.,*



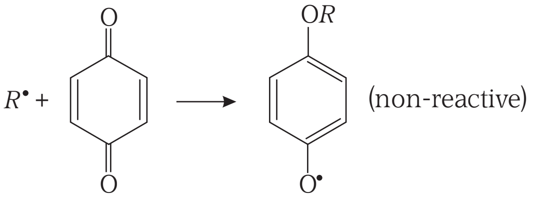
$$R\left[CH_2-\underset{Y}{\underset{|}{CH}}\right]_n CH_2-\underset{Y}{\underset{|}{\dot{C}H}}+CCl_4 \longrightarrow R\left[CH_2-\underset{Y}{\underset{|}{CH}}\right]_n CH_2\,\underset{Y}{\underset{|}{CHCl}}+\dot{C}Cl_3$$

The obtained free radical again generates excited monomer unit.



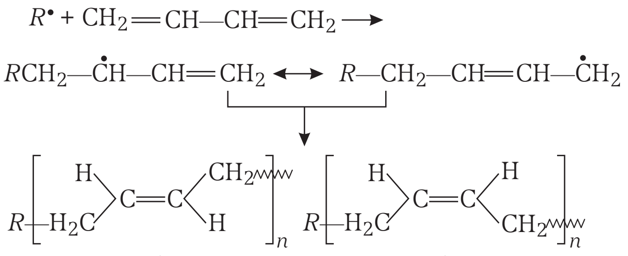
$$\dot{C}Cl_3+CH_2{=}\underset{Y}{\underset{|}{CH}} \longrightarrow Cl_3CCH_2-\underset{Y}{\underset{|}{\dot{C}H}}$$

When the radical, generated from chain transfer agent, is highly stable and unreactive, the original reaction chain gets terminated without the initiation of new one. Consequently, the process of polymerisation is inhibited. Therefore, these reagents are termed as **chain inhibitors**. Several amines, phenols, quinones act as chain inhibitor, *e.g.,* free radical polymerisation of a vinyl derivative is inhibited in the presence of benzoquinone.



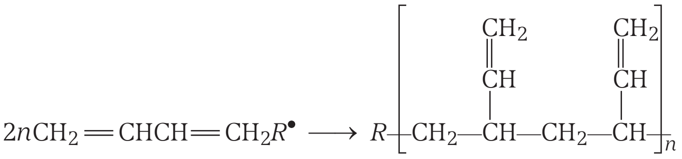
Conjugated dienes such as 1, 3-*butadiene can polymerise by one of the following two ways*

(i) **1,4-addition** When addition takes place at terminal carbon atoms (*i.e.,* at C_1 and C_4 in case of butadiene), the result is an unbranched polymer with a repeating unit having double bond. Therefore, the polymers can exist as *cis* form or trans form or a mixture of both, *e.g.,*



trans form *cis* form

(ii) **1,2-addition** When addition takes place at successive carbon atoms (*i.e.,* at C_1 and C_2 in case of butadiene), the result is a branched polymer.



$$2nCH_2{=}CHCH{=}CH_2R^\bullet \longrightarrow R\left[CH_2-\overset{\overset{\overset{CH_2}{\|}}{CH}}{\overset{|}{CH}}-CH_2-\overset{\overset{\overset{CH_2}{\|}}{CH}}{\overset{|}{CH}}\right]_n$$

(b) Ionic Addition Polymerisation

In this mode of polymerisation, there is generation of ionic species (as intermediate) such as cations and anions, instead of free radicals. Depending upon the nature of ionic species formed, ionic addition polymerisation further may be of two types.

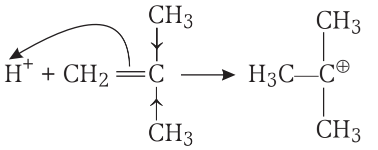
(i) **Cationic addition polymerisation** is the process, which involves formation of a carbocation as intermediate. The carbocation is generated by an initiator. Any compound which readily undergoes heterolytic cleavage to give a proton or cation that is able to convert an alkene into carbocation, can act as initiator for cationic polymerisation reaction. Commonly used carbocation generators or initiators are Lewis acids such as BF_3, $AlCl_3$ or $SnCl_4$ etc., and protonic acids such as H_2SO_4, HF etc.

Cationic addition polymerisation is facilitated in monomers having electron releasing groups such as CH_3, C_2H_5 etc. *Higher the stability of carbocation intermediate, more is the reactivity of monomer towards cationic addition polymerisation.* Like free radical addition polymerisation, cationic addition polymerisation also involves following three steps

Step I **Initiation step** In this step, the proton generated from either Lewis acid or protonic acid, attacks on monomer unit and a carbocation is formed.

$$H_2SO_4 \rightleftharpoons H^+ + HSO_4^-$$

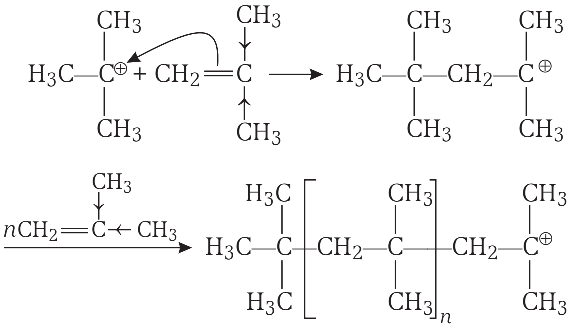
$$BF_3 + H_2O \rightleftharpoons H^+ + BF_3(OH^-)$$



$$H^+ + CH_2{=}\underset{CH_3}{\overset{CH_3}{C}} \longrightarrow H_3C-\underset{CH_3}{\overset{CH_3}{C^\oplus}}$$

carbocation (intermediate)

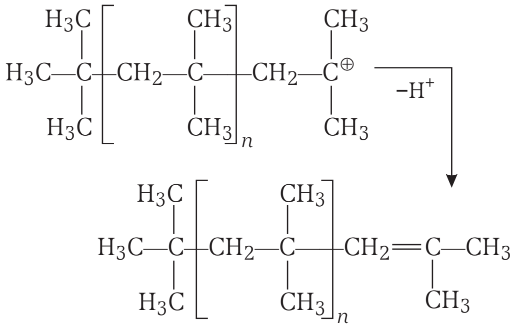
Step II **Propagation step**



$$H_3C-\underset{CH_3}{\overset{CH_3}{C^\oplus}}+CH_2{=}\underset{CH_3}{\overset{CH_3}{C}} \longrightarrow H_3C-\underset{CH_3}{\overset{CH_3}{C}}-CH_2-\underset{CH_3}{\overset{CH_3}{C^\oplus}}$$

$$\xrightarrow{nCH_2=\overset{CH_3}{C}\leftarrow CH_3} H_3C-\underset{H_3C}{\overset{H_3C}{C}}\left[CH_2-\underset{CH_3}{\overset{CH_3}{C}}\right]_n CH_2-\underset{CH_3}{\overset{CH_3}{C^\oplus}}$$

Step III **Termination step** The growing chain is generally terminated by the loss of a hydrogen ion (*i. e.*, proton).



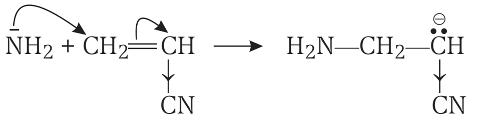
(ii) **Anionic addition polymerisation** is the process, in which intermediate formed is a carbanion. The initiator for this process are strong bases such as potassium amide (KNH_2), *n*-butyl lithium etc. Monomers (olefins) containing electron withdrawing groups (such as CN, C_6H_5 etc.) readily undergo anionic addition polymerisation.

The monomers that give more stable carbanion intermediate, readily undergo anionic addition polymerisation.

It involves the following three steps

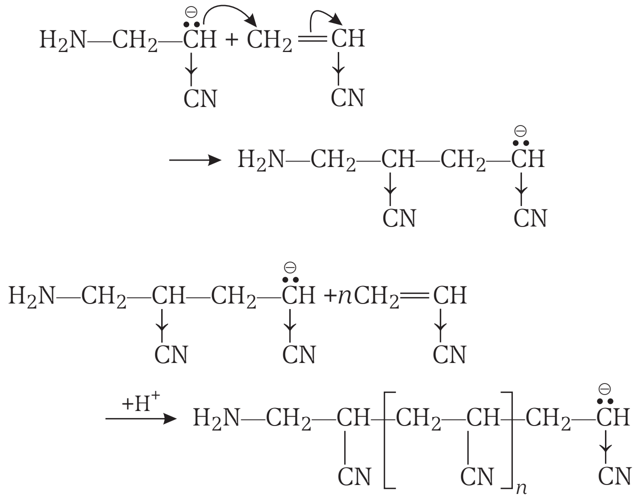
Step I **Initiation step** In this step, the nucleophiles, generated from strong bases, attack on monomer and generate carbanion.

$$KNH_2 \longrightarrow K^+ \bar{N}H_2$$

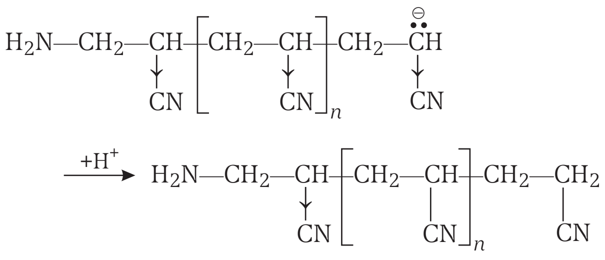


carbanion (intermediate)

Step II **Propagation step**



Step III **Termination step** The growing chain is terminated by the addition of a proton or a Lewis acid, present in the reaction mixture.



Check Point 2

1. Explain, why 'head to tail addition' is preferred in vinyl chloride?
2. Why does styrene undergo anionic polymerisation easily?
3. Will you prefer to polymerise acrylonitrile under anionic or cationic polymerisation condition? Explain your answer.
4. Which substances act as a radical initiator?

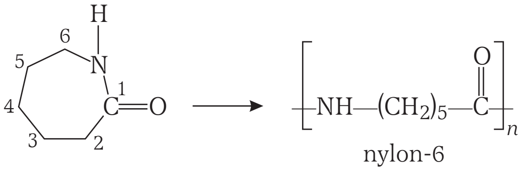
Condensation Polymerisation

In this mode of polymerisation, there is combination of molecules of same or different monomers in a controlled stepwise manner with the elimination of small molecules such as water, ammonia, alcohol etc., as by product. The monomers involved in this mode of polymerisation are not the same as those in addition polymerisation.

These monomers have functional groups such as alcohol, amine or carboxylic acid groups, instead of double bonds. The monomers having at least two functional groups, may be same or different, (*i.e.,* bifunctional monomers), polymerise by this mode of polymerisation. The product of each step is again a bifunctional molecule which can react with other monomer and dimer molecules until a long polymer chain is formed. Since, there is a repetitive condensation reaction between bifunctional monomers, the process is also known as **step growth polymerisation**.

On the basis of functional groups, there are two possible ways through which condensation polymerisation takes place.

(i) When monomer has two kinds of functional groups, it undergoes self polymerisation. *e.g.,*



caprolactum　　　　nylon-6

(ii) But if both the functional groups of monomer are same, an another monomer bearing different functional groups is required for condensation polymerisation, *e.g.,*

$$\underset{\text{adipic acid}}{HOOC(CH_2)_4COOH} + \underset{\text{hexamethylene diamine}}{H_2N\text{-}(CH_2)_6\text{-}NH_2} \xrightarrow[-H_2O]{} \underset{\text{nylon-66}}{\text{-}[NH(CH_2)_6NHCO(CH_2)_4CO]_n\text{-}}$$

The condensation polymerisation for two monomers A and B may be expressed as

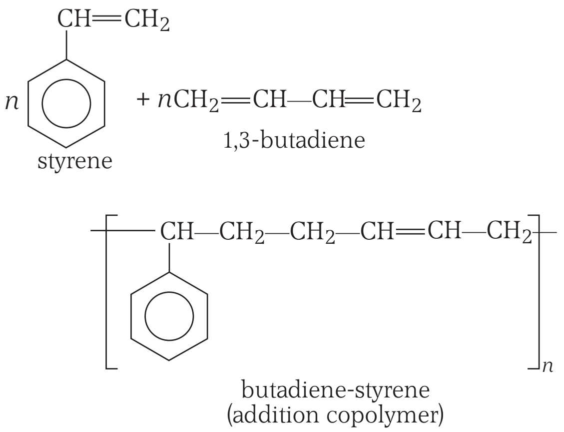
$$A + B \xrightarrow{\text{condense}} A-B$$
$$A-B+A \longrightarrow A-B-A$$
$$A-B-A+B \longrightarrow A-B-A-B$$

While in stepwise manner, it takes place in the following manner

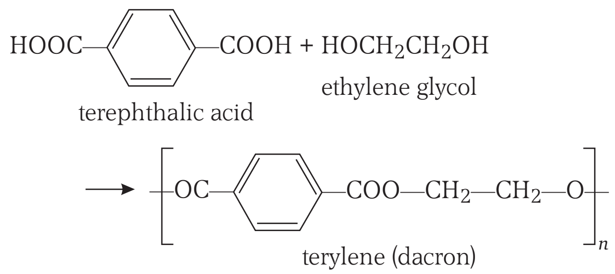
$$A + B \longrightarrow A-B$$
$$A-B+A-B \longrightarrow A-B-A-B$$
$$A-B-A-B+A-B-A-B \longrightarrow (A-B)_n$$

Copolymerisation

When two or more different monomer units are allowed to polymerise, a copolymer is formed which contains multiple units of each monomer used, in the same polymeric chain. The process by which copolymers are formed is referred to as **copolymerisation**. Indeed, it is not a distinct method from addition and condensation polymerisation. When two or more different monomer units combine through either addition or condensation polymerisation, an addition or condensation copolymer is obtained and the process is termed as **addition** (or chain growth) **copolymerisation or condensation** (or step growth) **copolymerisation**, *e.g.,*



butadiene-styrene
(addition copolymer)



The properties of copolymers are quite different from those of homopolymers (polymers that have only one type monomer units), *e.g.,* polystyrene, a homopolymer obtained from styrene, is a good insulator and can be easily moulded into toys, combs, radio parts etc., while styrene butadiene rubber (SBR), a copolymer of sytrene and butadiene (in 1 : 3 ratio), possesses high abrasion resistance, high load bearing capacity, thus used in manufacturing auto tyres, cable insulations etc. Moreover, it is very tough and a good substitute for natural rubber.

On the basis of arrangement of monomer units in the polymer chain during copolymerisation, the copolymers can be of the following four types

(i) **Random copolymers** are obtained when the monomer units are arranged randomly in the polymer chain, *e.g.,*

$$nA + nB \longrightarrow -A-A-A-B-B-A-B-B-B-A-A-$$

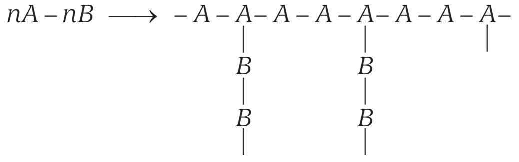
(ii) **Alternating copolymers** are obtained, when monomer units are at the alternate positions, in the polymer chain, *e.g.,*

$$nA + nB \longrightarrow -A-B-A-B-A-B-A-B-A-$$

(iii) **Block copolymers** are obtained, when different blocks of identical monomer units are at the alternate positions with each other, *e.g.,*

$$nA + nB \longrightarrow -(A-A-A)-(B-B-B)-(A-A-A)-$$

(iv) **Graft copolymers** are obtained, when homopolymer chains of one monomer units are grafted on the homopolymer chains of another monomer units, *e.g.,*

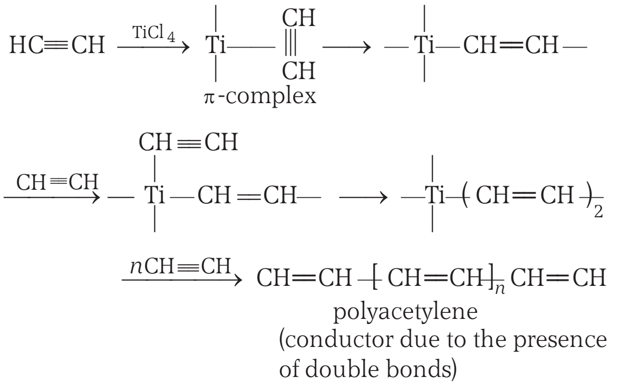


$$nA-nB \longrightarrow -A-\underset{\substack{| \\ B \\ | \\ B \\ |}}{A}-A-A-\underset{\substack{| \\ B \\ | \\ B \\ |}}{A}-A-A-\underset{|}{A}-$$

(Graft copolymers are prepared by radiating gamma rays on a completed homopolymer chain in the presence of an another monomer.)

Coordination Polymerisation

There is an another kind of polymerisation, which proceeds with the formation of coordination compound as intermediate. Thus, this polymerisation is called coordination polymerisation, *e.g.*, on treating with aluminium-titanium initiator $[(C_2H_5)_3Al + TiCl_4]$, monomer first forms a coordination complex with titanium by donating its π-electrons. The π-complex, thus, formed reacts with a large number of monomer units stepwise and leads to the formation of polymer.



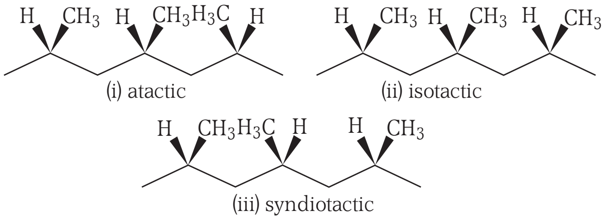
This process was found by Ziegler and Natta, that's why it is also known as *Ziegler-Natta* polymerisation and the catalyst used is called *Ziegler-Natta* catalyst.

The major advantage of this polymerisation is that the polymer obtained has specific stereochemistry, *e.g.*, propene can polymerise to give any of the three possible stereochemical arrangements

(i) **Atactic** (or random arrangement) in which methyl groups are arranged randomly.

(ii) **Isotactic** (or same arrangement), in which methyl groups are present on same side of *zig-zag* backbone.

(iii) **Syndiotactic** (or alternate arrangement), in which methyl groups lie alternately on the opposite sides of *zig-zag* backbone.



(i) atactic
(ii) isotactic
(iii) syndiotactic

Sample **Problem 5** *Which form of polypropene exist as enantiomer?*

(*a*) *Isotactic*
(*b*) *Syndiotactic*
(*c*) *Atactic*
(*d*) *All of these*

Interpret (*d*) All forms of polypropene (PP) would exist in equal amount of enantiomers, with net specific rotation of zero. So each form would exist as racemates.

Check Point 3

1. Which type of monomers undergo condensation polymerisation?
2. By which mode of polymerisation, caprolactum polymerises and why?
3. Which type of copolymers are largely found?

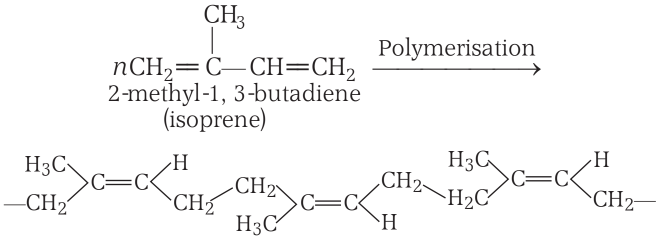
Some Important Polymers

13.5 Rubber

Rubbers are the polymer of derivatives of buta-1, 3-diene. These have elastic properties due to which these are also included in class 'elastomers'. On the basis of origin, rubbers can be of two types.

Natural Rubber

Because of its origin from natural sources, it is a natural polymer. It is prepared from rubber latex (contains 35% rubber) which is a colloidal dispersion of rubber in water and is obtained from rubber trees (*Hevea brasiliensis*). On treating latex with acids such as acetic acid, formic acid etc., crude rubber coagulates which either on masticating or on adding necessary agents gives natural rubber. Natural rubber is linear 1, 4-polymer of isoprene (2-methyl-1, 3-butadiene). In other words, natural rubber is *cis*-polyisoprene or *cis*-1,4-polyisoprene.



cis-1,4-polyisoprene (natural rubber)

The weight average molecular weight $(\overline{M}_w)$ of rubber is in the range 1,30,000–3,40,000. *Its trans form is known as gutta percha.*

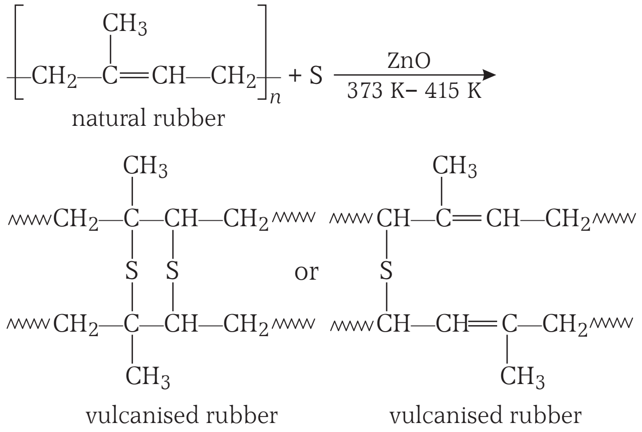
Properties of Natural Rubber

Natural rubber is insoluble in water, dilute acids and alkalies but soluble in organic solvents such as benzene, chloroform, petrol etc. It absorbs a large amount of water and has low tensile strength and elasticity.

Vulcanisation

To improve the undesirable properties, natural raw rubber is heated with sulphur or sulphur compounds at 373 K to 415 K in the presence of ZnO. The process is called **vulcanisation of rubber** and was introduced by **Charles Goodyear.** On vulcanisation, sulphur introduces cross-links at the reactive sites of double bonds and makes the rubber stiffened, more elastic and resistant to oxidation and organic solvents. The stiffness of rubber depends upon the amount of sulphur added, *e.g.,* when 5% sulphur is used as a cross-linking agent, the obtained vulcanised rubber is used for manufacturing tyres but if 30% sulphur is used, the obtained vulcanised rubber (ebonite) is used in making battery case.

Zinc oxide used in the vulcanisation process, is an additive which accelerates the rate of vulcanisation because vulcanisation originally is a slow process.



$$\underset{\text{natural rubber}}{\left[-CH_2-\overset{\overset{\large CH_3}{|}}{C}=CH-CH_2-\right]_n} + S \xrightarrow[373\text{ K}-\ 415\text{ K}]{ZnO}$$

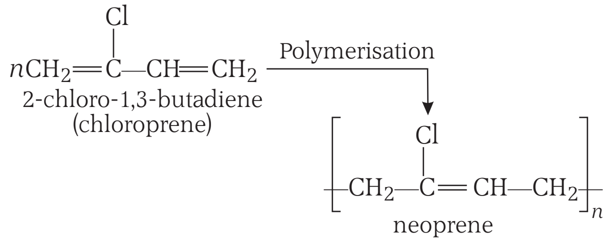
To protect rubber from deterioration on exposure to air, an additive such as diphenyl amine is also added.

Synthetic Rubbers

These are synthesised from certain organic compounds. These are either homopolymer of buta-1, 3-diene derivatives or copolymer of buta-1, 3-diene or its derivatives with another unsaturated organic monomers, such as acrylonitrile, styrene etc. These are more resistant and have high tensile strength. *e.g.,*

(a) Neoprene

It is the most commonly used synthetic rubber. It is a homopolymer of chloroprene (2-chloro-1, 3-butadiene). It is also known as **duprene** and is obtained by the free radical polymerisation or *Ziegler-Natta* polymerisation of chloroprene.



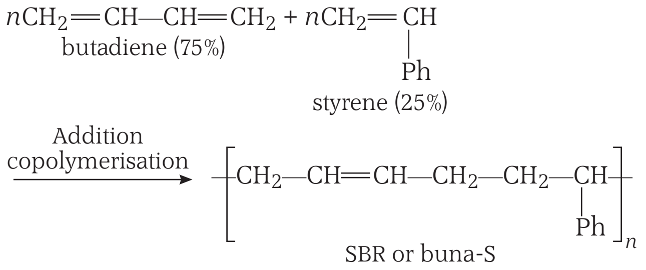
$$\underset{\substack{\text{2-chloro-1,3-butadiene}\\ \text{(chloroprene)}}}{nCH_2=\overset{\overset{\large Cl}{|}}{C}-CH=CH_2} \xrightarrow{\text{Polymerisation}} \underset{\text{neoprene}}{\left[-CH_2-\overset{\overset{\large Cl}{|}}{C}=CH-CH_2-\right]_n}$$

It is a thermoplastic and need not to be vulcanised. As it is resistant towards air, heat, light, chemicals, acids below 50% strength, it is superior to natural rubber.

It is used in manufacture of gaskets, hoses and conveyor belts etc.

(b) **Buna-S** (Styrene-butadiene rubber, SBR)

It is also called GRS (general purpose styrene rubber). It is obtained by the copolymerisation of 75% butadiene and 25% styrene in the presence of sodium metal.



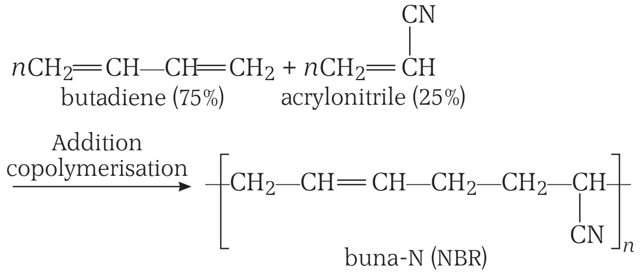
$$\underset{\text{butadiene (75\%)}}{nCH_2=CH-CH=CH_2} + \underset{\text{styrene (25\%)}}{nCH_2=\underset{\underset{\large Ph}{|}}{CH}} \xrightarrow[\text{copolymerisation}]{\text{Addition}} \underset{\text{SBR or buna-S}}{\left[-CH_2-CH=CH-CH_2-CH_2-\underset{\underset{\large Ph}{|}}{CH}-\right]_n}$$

It is an elastomer.

It is generally compounded with carbon black and vulcanised with sulphur. It is extremely resistant to wear and tear and finds use in manufacture of tyres and other mechanical rubber goods.

(c) **Buna-N** (NBR or GRA)

It is obtained by the copolymerisation of 75% butadiene and 25% acrylonitrile (vinyl cyanide) in the presence of peroxide catalyst or sodium metal.



$$\underset{\text{butadiene (75\%)}}{nCH_2=CH-CH=CH_2} + \underset{\text{acrylonitrile (25\%)}}{nCH_2=\overset{\overset{\large CN}{|}}{CH}} \xrightarrow[\text{copolymerisation}]{\text{Addition}} \underset{\text{buna-N (NBR)}}{\left[-CH_2-CH=CH-CH_2-CH_2-\underset{\underset{\large CN}{|}}{CH}-\right]_n}$$

It is more rigid, responds less to heat and very resistant to swelling action of petrol, oils and other organic solvents.

(d) Thiokol or Polysulphide Rubber

It is obtained by the condensation copolymerisation of ethylene dichloride and sodium tetrasulphide (Na_2S_4).

(e) Butyl Rubber

It is obtained by the copolymerisation of iso-butylene and isoprene.

13.6 Polythene or Polyethylene

It is a polymer of ethene ($CH_2 {=\!=} CH_2$). Depending upon the conditions of temperature, pressure and nature of catalyst.

Polythene are of two types.

Low Density Polythene

It is prepared by free radical addition polymerisation of ethene at 350 to 570 K, under 1000–2000 atm pressure and in the presence of traces of oxygen or a peroxide.

$$\underset{\text{ethene}}{nCH_2{=}CH_2} \xrightarrow[\text{350–570 K; 1000–2000 atm}]{\text{Traces of oxygen or peroxide}} \text{low density polythene (highly branched)}$$

The branching does not allow the polymer to undergo close packing and thus, the density of the polymer is low.

It is inert, tough but flexible and poor conductor of electricity. Therefore, it is used for insulating electric wires, for manufacturing squeeze bottles and toys.

High Density Polythene

It is also inert but relatively tough and hard with high tensile strength, hence used for manufacturing containers, house wares etc. It is formed by the polymerisation of ethene in the presence of catalyst, such as triethyl aluminium and titanium tetrachloride, at 330–350 K and atmospheric pressure.

$$\underset{\text{ethene}}{nCH_2{=}CH_2} \xrightarrow[\text{catalyst}]{\text{330–350 K, 1 atm}} \text{high density polythene}$$

(with linear chains)

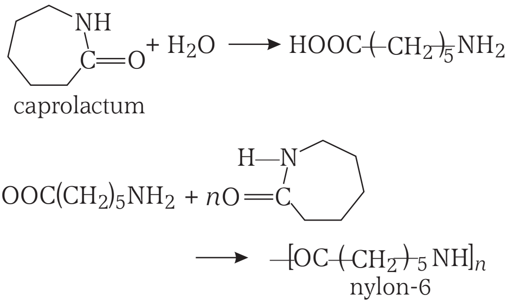
The polymer, thus, obtained consists of practically linear molecules which get packed closely and thus, density is high.

13.7 Polyamides

Polymers having amide linkages —(CONH)— are called nylons (or polyamides) [here, Ny=Newyork and Lon=London] as nylon-66 was simultaneously prepared in New York and London. These are prepared by condensation copolymerisation of diamines with dicarboxylic acids or by condensation homopolymerisation of lactam.

Nylon-6 or Perlon

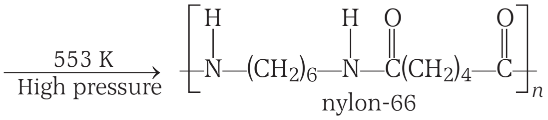
It is prepared by the polymerisation of amino caproic acid at high temperature and is used for manufacturing fabrics, tyre cords etc. Since, caprolactum is more easily available, it is widely used for preparing nylon-6. For this, it is first hydrolysed with water to form amino acid.



Nylon-66

It is prepared by the condensation copolymerisation of hexamethylenediamine and adipic acid under high pressure and at high temperature.

$$nH_2N{-}(CH_2)_6{-}NH_2 + nHOOC{-}(CH_2)_4{-}COOH$$



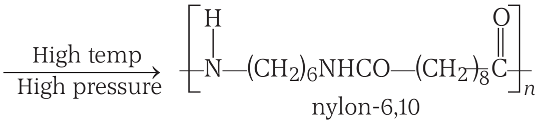
$$\xrightarrow[\text{High pressure}]{\text{553 K}} \underset{\text{nylon-66}}{\left[\overset{H}{\overset{|}{N}}{-}(CH_2)_6{-}\overset{H}{\overset{|}{N}}{-}\overset{O}{\overset{\|}{C}}(CH_2)_4{-}\overset{O}{\overset{\|}{C}} \right]_n}$$

It is used in making bristles for brushes and in textile industry.

Nylon-6, 10

It is prepared by the condensation copolymerisation of hexamethylenediamine and sebaic acid under high pressure and at high temperature.

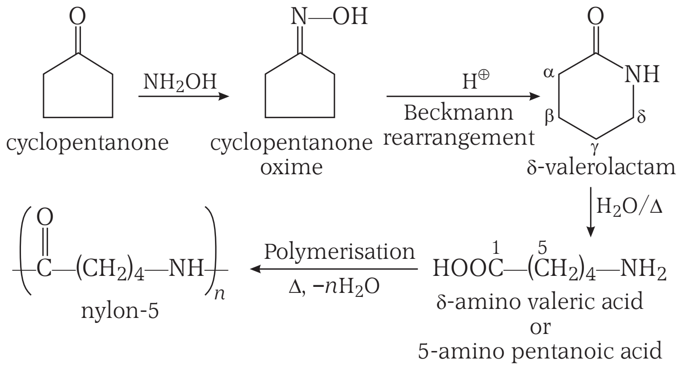
$$nH_2N(CH_2)_6NH_2 + HOOC{-}(CH_2)_8{-}COOH$$



$$\xrightarrow[\text{High pressure}]{\text{High temp}} \underset{\text{nylon-6,10}}{\left[\overset{H}{\overset{|}{N}}{-}(CH_2)_6NHCO{-}(CH_2)_8\overset{O}{\overset{\|}{C}} \right]_n}$$

It is used in mountaineering ropes, tyre cords and fabrics,

Nylon-5



It is used in the manufacture of fabrics and mountaineering ropes.

Naming the Nylons

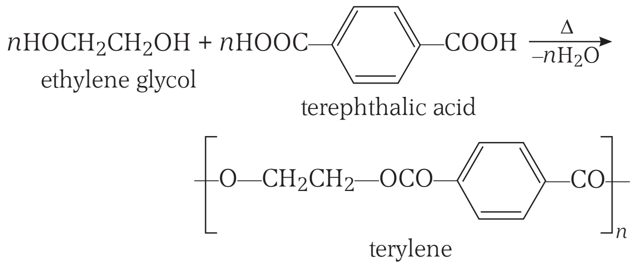
To write the name of nylon, first the number of carbon atoms of amines are written followed by the number of carbon atoms of acid, *e.g.,* in nylon-6, 10 amine contains six carbon atoms and the acid contains ten carbon atoms.

13.8 Polyesters

Polymers having ester linkage (—COO—) are called polyesters. These are prepared by the condensation reaction between dialcohols and diacids.

Terylene or Dacron

It is obtained by heating a mixture of ethylene glycol and terephthalic acid at 420–460 K and in the presence of catalyst such as mixture of zinc acetate and antimony trioxide.

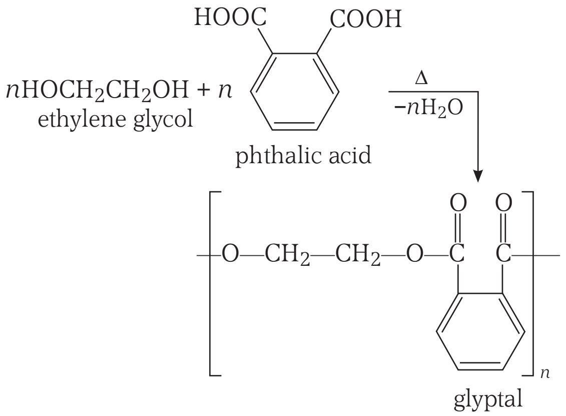


It is a crease resistant fibre, so used in blending with cotton and wool fibres, in making wash and wear fabrics, safety belts etc.

Caution Point *The film mode of terylene is called mylar.*

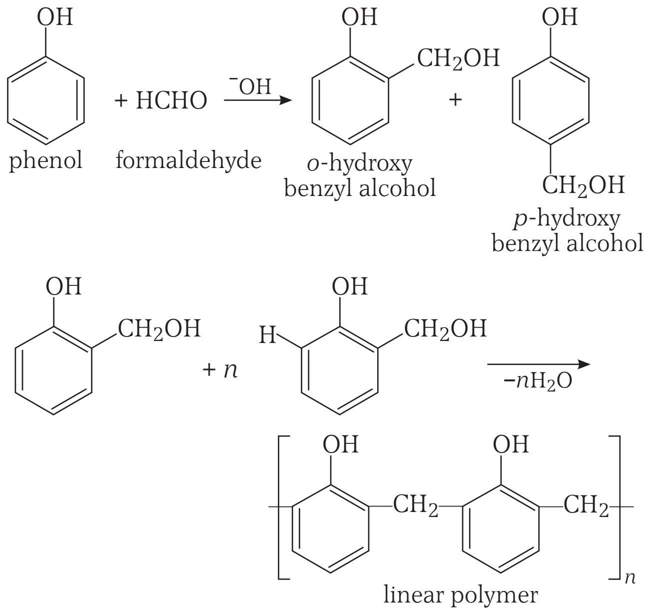
Glyptal or Alkyd Resin

It is a polymer of ethylene glycol and phthalic acid and is used in making paints and lacquers.

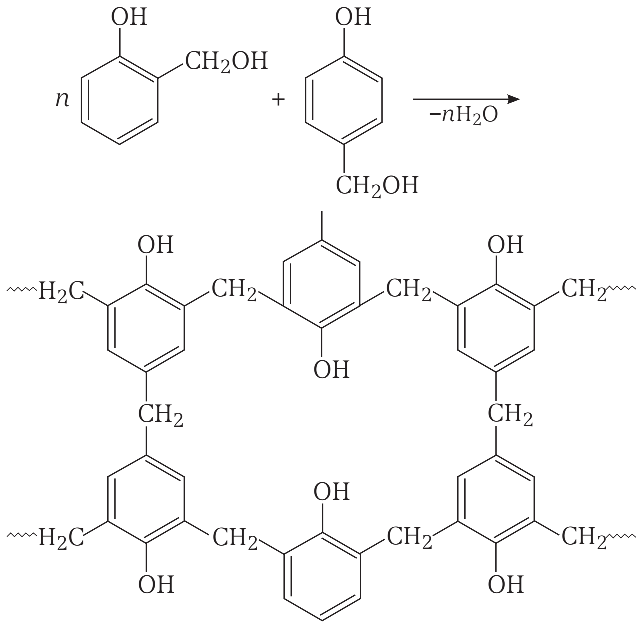


13.9 Bakelite

It is a condensation polymer of phenol and formaldehyde. When phenol is condensed with formaldehyde in the presence of a base, initially a mixture of *o*- and *p*-hydroxy benzyl alcohol is obtained. Out of which, *o*- forms again undergo self-condensation to give a linear polymer, called **novolac.**



Here, both the isomers again undergo condensation polymerisation and a highly cross-linked polymer, called 'bakelite' is obtained.



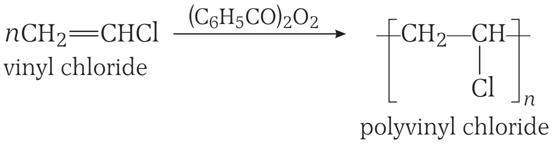
bakelite

Bakelite with low degree of polymerisation is used in making glues, in varnishes and lacquers. Bakelite with high degree of polymerisation is widely used for making electrical goods, fountain pen barrels, combs etc.

13.10 Others Important Polymers

Polyvinyl Chloride (PVC)

It is prepared by heating vinyl chloride in an inert solvent in the presence of benzoyl peroxide.



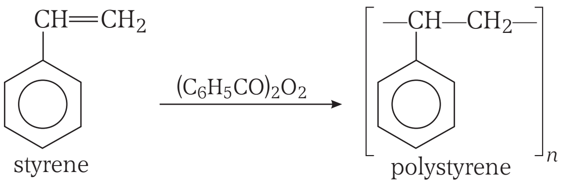
$$nCH_2{=}CHCl \xrightarrow{(C_6H_5CO)_2O_2} \left[-CH_2-\underset{\displaystyle Cl}{\underset{|}{CH}}- \right]_n$$

It is a thermoplastic and its plasticity can be increased by addition of a plasticiser (ester of phthalic acid). It is an electrical insulator and is resistant to fire and chemicals.

It is used for making sheets, pipes, waterproof outer clothing (rain coats), table clothes, plastic dolls, gramophone records, floor covering and electrical insulating coating on electrical cables.

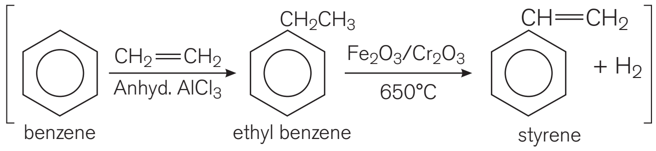
Polystyrene (Styron)

It is manufactured by polymerisation of styrene in the presence of benzoyl peroxide.



Polystyrene is used in the manufacture of food containers, cosmetic bottles, television and radio cabinets, plastic cups, packaging and toys.

Caution Point *Styrene is obtained from benzene as follows :*



Teflon or Polytetrafluoroethylene (PTFE)

It is manufactured by heating tetrafluoroethylene under pressure in the presence of ammonium peroxydisulphate.

$$nCF_2{=}CF_2 \xrightarrow[\text{High pressure}]{(NH_4)_2S_2O_8} \underset{\text{teflon (PTFE)}}{[-CF_2-CF_2-]_n}$$

It is chemically inert and heat resistant polymer. It is very tough and electrical resistant. It is used for making seals and gaskets which have to withstand high temperature. It is also used for insulation of electrical items and for making non-stick surface coating and lubricant particularly for cooking utensils.

Caution Point *Polymonochlorotrifluoroethylene (PCTFE) can also be used at the place of teflon.*

$$\underset{\text{chlorotrifluoroethylene}}{nClFC{=}CF_2} \longrightarrow \underset{\text{PCTFE}}{[-ClFC-CF_2-]_n}$$

13.11 Molecular Mass of Polymers

Polymerisation is quite complicated in nature. During the formation of polymers, the degree of polymerisation or the length of the polymer chain depends upon the availability of the monomer molecules near the growing polymer chain and also the reaction conditions employed. As a result in the synthetic polymers, the chains of different lengths may unite with one another. Hence, an average value of molecular mass is taken. But the same is not true for the natural polymers such as proteins, where the chains are of identical lengths and hence, their molecular masses are singular and not average in nature.

There are two ways of expressing molecular mass of a polymer. These are number average molecular mass and weight average molecular mass.

Number Average Molecular Mass

When the total mass of all the molecules of a sample is divided by the total number of molecules, the result obtained is called the number-average molecular mass.

It is obtained by following expression,

$$\overline{M}_n = \frac{\Sigma N_i M_i}{\Sigma N_i}$$

Osmotic pressure method is used to determine number average molecular mass.

Weight Average Molecular Mass

It is average of the molecular mass of the groups of the molecules having particular molecular masses multiplied by their respective molecular masses.

The expression for weight average molecular mass is

$$\overline{M}_w = \frac{\Sigma N_i M_i^2}{\Sigma N_i M_i}$$

It is determined by light scattering and ultracentrifugation methods.

where, N_i = number of molecules

M_i = molecular mass

Sample Problem 6 *Calculate the average molecular mass* $\overline{M}_n$ *and* $\overline{M}_w$ *of a polymer sample in which* 30% *molecules have a molecular mass of* 20000, 40% *have* 30000, *and the rest* 30% *have* 60,000.

(a) 36000, 43333
(b) 30000, 44000
(c) 48000, 55566
(d) 35000, 25001

Interpret (a) $\overline{M}_n$ and $\overline{M}_w$ of this sample will be

$$\overline{M}_n = \frac{(30 \times 20000) + (40 \times 30000) + (30 \times 60000)}{(30 + 40 + 30)}$$

$$= 36000$$

$$\overline{M}_w = \frac{30(20000)^2 + 40(30000)^2 + 30(60000)^2}{30 \times 20000 + 40 \times 30000 + 30 \times 60000} = 43333$$

Polydispersity Index (PDI)

The ratio of weight average molecular mass and number average molecular mass is called poly dispersity index (PDI).

$$\text{PDI} = \frac{\overline{M}_w}{\overline{M}_n}$$

For natural polymers, PDI = 1,

$\therefore$ $\overline{M}_w = \overline{M}_n$ and polymer is monodispersed.

For synthetic polymers, PDI > 1,

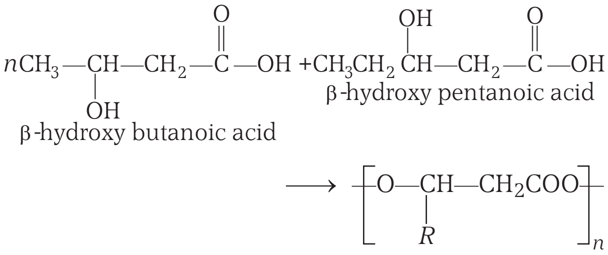
$\therefore$ $\overline{M}_w > \overline{M}_n$ and polymer is polydispersed.

Caution Point *Polymers with narrrow range of molecular masses are called monodisperse and that with wide range are called polydisperse polymers.*

13.12 Biodegradable Polymers

The polymers that can be dissociated into small segments by enzymes, (produced by microorganisms) are called biodegradable polymers. These are developed to reduce environmental problems caused by solid non-biodegradable polymer wastes. Chain growth polymers, because of the presence of inert C—C bond (towards enzyme catalysed reactions), usually are non-biodegradable but step growth polymers having functional groups may be biodegradable, *e. g.*,

(i) **PHBV** (poly β-hydroxy butyrate-co-β-hydroxy-valerate), a polyester, is a copolymer of 3-hydroxybutanoic acid and 3-hydroxypentanoic acid.



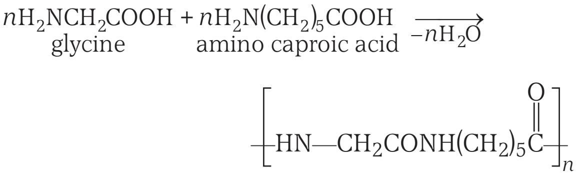
$$\underset{\beta\text{-hydroxy butanoic acid}}{n\text{CH}_3\text{—}\underset{\text{OH}}{\text{CH}}\text{—CH}_2\text{—}\overset{\text{O}}{\overset{\|}{\text{C}}}\text{—OH}} + \underset{\beta\text{-hydroxy pentanoic acid}}{\text{CH}_3\text{CH}_2\overset{\text{OH}}{\text{CH}}\text{—CH}_2\text{—}\overset{\text{O}}{\overset{\|}{\text{C}}}\text{—OH}} \longrightarrow \left[\text{O—}\underset{R}{\text{CH}}\text{—CH}_2\text{COO}\right]_n$$

PHBV

(where, $R = CH_3$, C_2H_5 etc.)

β-hydroxy butanoic acid gives stiffness and β-hydroxy pentanoic acid imparts flexibility to PHBV. It is used in orthopaedic devices and in controlled drug release.

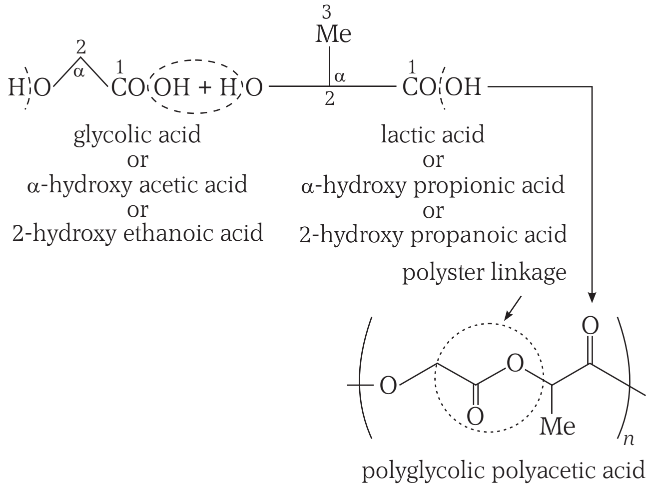
(ii) **Nylon-2-nylon-6** is a polyamide copolymer of glycine H_2NCH_2—COOH and amino caproic acid $[H_2N(CH_2)_5COOH]$.



$$\underset{\text{glycine}}{n\text{H}_2\text{NCH}_2\text{COOH}} + \underset{\text{amino caproic acid}}{n\text{H}_2\text{N(CH}_2)_5\text{COOH}} \xrightarrow[-n\text{H}_2\text{O}]{} \left[\text{HN—CH}_2\text{CONH(CH}_2)_5\overset{\text{O}}{\overset{\|}{\text{C}}}\right]_n$$

nylon-2-nylon-6

(iii) **Polyglycolic acid and polyacetic acid** comprise commercially successful biodegradable polymers such as sutures. Dextron was the first bioabsorbable or biodegradable suture prepared from the biodegradable polyesters. It is used for post-operative stitches.



Check Point 4

1. Why is polyacetylene a conducting polymer?
2. How do double bonds in rubber molecules influence their structure and reactivity?
3. What does 66 indicate in nylon-66? In what way it is different from nylon-6?
4. What is the PDI value of proteins?

13.13 Monomers and Uses of Some Common Polymers

Some polymers with their monomer units and uses are tabulated below.

Table 13.1 **Polymers, Their Monomers and Uses**

S.N.	Polymer name and structure	Monomer	Nature of polymer	Uses
1.	Polythene $\left(CH_2-CH_2\right)_n$	$CH_2=CH_2$ (ethene)	Addition homopolymer	As insulator, anticorrosive, packing material, for household and laboratory wares.
2.	Polystyrene  $\left(CH(C_6H_5)-CH_2\right)_n$	 $CH(C_6H_5)=CH_2$ (styrene)	Addition homopolymer	As insulator, wrapping material, manufacture of toys and household articles.
3.	Polyvinyl chloride (PVC)  $\left(CH_2-CH(Cl)\right)_n$	$CH_2=CHCl$ (vinyl chloride)	Addition homopolymer	In manufacture of raincoats, hand bags, vinyl flooring and leather clothes.
4.	Polytetrafluoro ethylene (PTFE) or teflon $\left(CF_2-CF_2\right)_n$	$CF_2=CF_2$ (tetra fluoroethene)	Addition homopolymer	As lubricant, insulator, and in making cooking wares.
5.	Polymethyl methacrylate (PMMA or Plexi glass)  $\left(CH_2-C(CH_3)(COOCH_3)\right)_n$	 $CH_2=C(CH_3)COOCH_3$ (methyl methacrylate)	Addition homopolymer	As substitute of glass and making decorative materials.
6.	Polyacrylonitrile (Orlon)  $\left(CH_2-CH(CN)\right)_n$	$CH_2=CHCN$ (vinyl cyanide)	Addition homopolymer	In making synthetic fibres and synthetic wool.
7.	Neoprene  $\left(CH_2-C(Cl)=CH-CH_2\right)_n$	 $CH_2=C(Cl)-CH=CH_2$ (2-chloro-but-1,3-diene)	Addition homopolymer	As insulator, making conveyor belts and printing rollers.

S.N.	Polymer name and structure	Monomer	Nature of polymer	Uses
8.	Buna-S (Styrene-butadiene rubber, SBR)  $\left(\text{CH}_2\text{—CH=CH— CH}_2\text{CH(C}_6\text{H}_5\text{)—CH}_2\right)_n$	(a) $CH_2{=}CH—CH{=}CH_2$ (buta-1,3-diene) (b)  $CH{=}CH_2(C_6H_5)$ (styrene)	Addition copolymer	In making automobile tyres, footwear and bubble gums.
9.	Buna-N (nitrile rubber, NBR)  $\left(\text{CH}_2\text{—CH=CHCH}_2\text{—CH(CN)—CH}_2\right)_n$	(a) $CH_2{=}CH—CH{=}CH_2$ (buta-1,3-diene) (b)  $CH{=}CH_2(CN)$ (acrylonitrile)	Addition copolymer	In making oil seals, manufacture of hoses and tank linings.
10.	Terylene or dacron 	(a) $HO—CH_2—CH_2—OH$ ethylene glycol or ethane-1,2-diol and (b)  terephthalic acid or benzene-1,4-dicarboxylic acid	Codensation or step growth copolymer, linear polymer	For making wash and wear fabrics, tyres cords, safety belts, tents, sea belts and sails.
11.	Glyptal or alkyd resin 	(a) $HO—CH_2—CH_2—OH$ ethylene glycol (b)  phthalic acid	Condensation copolymer, thermoplastic	As binding material in preparation of mixed plastics and paints.
12.	Nylon-6 or perlon  $\left(\text{NH—(CH}_2)_5\text{—}\overset{\text{O}}{\overset{\Vert}{\text{C}}}\right)_n$	Caprolactum	Condensation homopolymer, linear polymer	In making fibres, plastics, tyre cords and ropes.
13.	Nylon-66 $\left(\text{NH(CH}_2)_6\text{NHCO(CH}_2)_4\text{CO}\right)_n$	(a)  $\text{HO—}\overset{\text{O}}{\overset{\Vert}{\text{C}}}\text{(CH}_2)_4\overset{\text{O}}{\overset{\Vert}{\text{C}}}\text{—OH}$ adipic acid (b) $H_2N—(CH_2)_6—NH_2$ hexamethylene diamine	Condensation copolymer, linear polymer	In making bristles for brushes, synthetic fibres, parachutes, ropes and carpets, as a substitute for metal in bearings and gears. Crincked nylon is used for making elastic hosiery.
14.	Bakelite 	(a) HCHO formaldehyde (b) C_6H_5OH phenol	Condensation copolymer, crosslink or network polymer, thermosetting polymer	For making gears, protective coating and electrical fittings.
15.	Urea formaldehyde resin $\left(\text{NHCO—NH—CH}_2\right)_n$	(a) HCHO formaldehyde (b) NH_2CONH_2 urea	Condensation copolymer	For making unbreakable cups and laminated sheets.

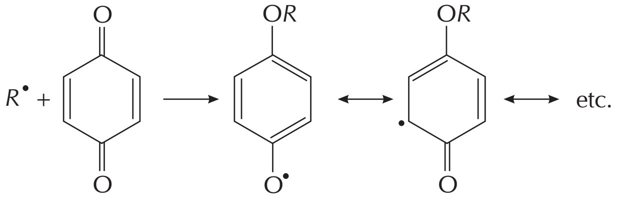
S.N.	Polymer name and structure	Monomer	Nature of polymer	Uses
16.	Melamine-formaldehyde resin or melmac 	(a)  melamine (b) HCHO formaldehyde	Condensation copolymer, highly branched thermosetting polymer	In making plastic crockery, unbreakable cups and plates.
17.	Poly-β-hydroxy butyrate-co-β-hydroxy valerate (PHBV)  $\left(\text{O}-\underset{R}{\text{CH}}-\text{CH}_2-\overset{}{\underset{\text{O}}{\underset{\Vert}{\text{CH}}}}\right)_n$	(a)  $\text{CH}_3\overset{\text{OH}}{\overset{\vert}{\text{CH}}}\text{CH}_2\text{COOH}$ β-hydroxy butanoic acid (b)  $\text{CH}_3\text{CH}_2\overset{\text{OH}}{\overset{\vert}{\text{CH}}}\text{CH}_2\text{COOH}$ β-hydroxy pentanoic acid	Condensation copolymer, biodegradable polymer	As packaging material in orthopaedic devices and for controlled drug release
18.	Kevlar (nylon polymer)	(a)  terephthalic acid (b)  1,4-diamino benzene	Condensation copolymer	For making bullet proof vests.
19.	Lexan or polycarbonate (polyester)	(a) diethyl carbonate (b) bisphenol-*A*	Condensation copolymer	In making bullet proof windows and safety helmets
20.	Polyurethanes	(a) toluene diisocyanate (b) ethylene glycol	Condensation copolymer	For making washable and long lasting mattresses, cushions.
21.	VINYON	(a) $CH_2{=\!=}CHCl$ vinyl chloride 90% (b) $CH_2{=\!=}CHCOOCH_3$ vinyl acetate (10%)	Addition copolymer	
22.	DYNEL	(a) acrylonitrile (b) vinyl chloride	Copolymer	For making synthetic hair wigs.
23.	SARAN	(a) vinyl chloride (b) vinylidine chloride ($CH_2{=\!=}CCl_2$)	Copolymer	For wrapping food materials.
24.	ABS rubber	(a) acrylonitrile (b) buta-1,3-diene (c) styrene	Copolymer	Bumpers, crash helmets, telephones, luggage.
25.	SAN rubber	(a) $CH_2{=\!=}CHC_6H_5$ (styrene) (b) $CH_2{=\!=}CHCN$ acrylonitrile	Addition copolymer	In dish washer safe objects, vacuum cleaner parts.

WORKED OUT Examples

Example 1 *How does the presence of benzoquinone inhibit the free radical polymerisation of a vinyl derivative?*

(a) *By trapping radical intermediate*
(b) *By forming less reactive radical*
(c) *Both (a) and (b)*
(d) *None of the above*

Solution (a) Benzoquinone traps the radical intermediate to form a non-reactive radical, which is highly stabilised by resonance. Due to the lack of reactivity of this intermediate, further progress of the chain reaction is interrupted and the reaction stops.

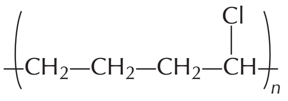


Example 2 *A copolymer of ethene and vinyl chloride contains alternate monomers of each type. What is the mass percentage of vinyl chloride in this copolymer?*

(a) 75% (b) 69% (c) 82% (d) 39%

Solution (b) The structure of copolymer is

$$n(CH_2{=}CH_2) + n(CH_2{=}CHCl) \longrightarrow$$



$$\left(\!-CH_2-CH_2-CH_2-\overset{\overset{\large Cl}{|}}{CH}-\!\right)_n$$

Molecular mass of ethene = 28

Molecular mass of vinyl chloride = 62.5

Empirical formula mass of copolymer = 28 + 62.5 = 90.5

Mass percentage of vinyl chloride in the copolymer

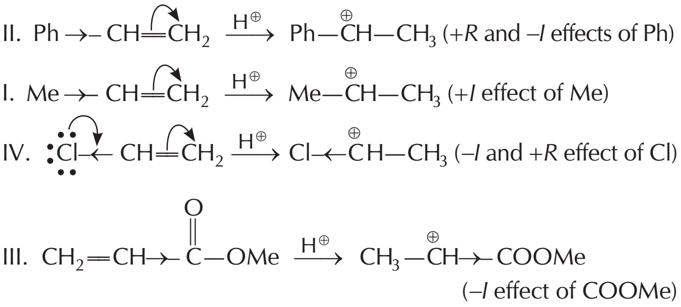
$$= \frac{62.5 \times 100}{90.5} = 69.06$$

Example 3 *Give the decreasing order of reactivities of the following monomers towards cationic addition polymerisation.*

I. $MeCH{=}CH_2$ *II.* $PhCH{=}CH_2$
III. $CH_2{=}CH{-}COOMe$ *IV.* $CH_2{=}CH{-}Cl$

(a) *I > II > III > IV* (b) *II > I > IV > III*
(c) *II > I > III > IV* (d) *I > II > IV > III*

Solution (b) Cationic polymerisation is favoured by the presence of electron donating group (*e.g.*, Me group). The more the electron donating group, the more stable is the intermediate carbocation, and as a result more favoured is the cationic polymerisation. Stability of $(\rightarrow\!C^{\oplus})$ is



$$\text{II. } Ph \rightarrow\!- CH{=}CH_2 \xrightarrow{H^{\oplus}} Ph-\overset{\oplus}{C}H-CH_3 \text{ (+}R\text{ and }–I\text{ effects of Ph)}$$

$$\text{I. } Me \rightarrow\!- CH{=}CH_2 \xrightarrow{H^{\oplus}} Me-\overset{\oplus}{C}H-CH_3 \text{ (+}I\text{ effect of Me)}$$

$$\text{IV. } :\!\ddot{Cl}\!\leftarrow\!- CH{=}CH_2 \xrightarrow{H^{\oplus}} Cl\!\leftarrow\!-\overset{\oplus}{C}H-CH_3 \text{ (}–I\text{ and +}R\text{ effect of Cl)}$$

$$\text{III. } CH_2{=}CH\!\rightarrow\!-\overset{\overset{\large O}{\|}}{C}-OMe \xrightarrow{H^{\oplus}} CH_3-\overset{\oplus}{C}H\!\rightarrow\!-COOMe$$

(–*I* effect of COOMe)

The decreasing reactivity order towards cation polymerisation is (II) > (I) > (IV) > (III).

Example 4 *Give the decreasing order of reactivities of the following monomers towards anionic addition polymerisation.*

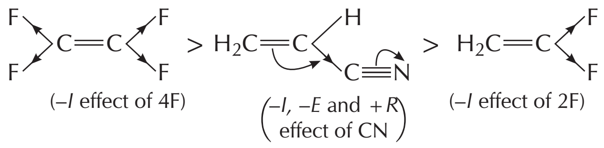
I. $Me{-}CH{=}CH_2$ *II.* $PhCH{=}CH_2$
III. $CH_2{=}CH{-}CN$ *IV.* $H_2C{=}CCl_2$
V. $H_2C{=}CF_2$ *VI.* $F_2C{=}CF_2$

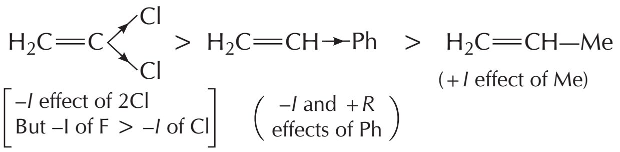
The correct order is

(a) *VI > III > V > IV > II > I*
(b) *VI > V > III > IV > II > I*
(c) *VI > IV > V > III > II > I*
(d) *VI > V > IV > II > I > III*

Solution (a) Anionic polymerisation is favoured by the presence of electron donating group (*e.g.*, —*X*, —COO*R*, —CN, etc.). The more the electron donating group, the more stable is the intermediate carbanion, and consequently more favoured is the anionic polymerisation.

Stability of $\left(\rightarrow\!C^{\ominus}\right)$ is





$$H_2C{=}CCl_2 > H_2C{=}CH \rightarrow Ph > H_2C{=}CH{-}Me$$

$\left[\begin{array}{l}-I \text{ effect of 2Cl}\\ \text{But } -I \text{ of F} > -I \text{ of Cl}\end{array}\right]$ $\left(\begin{array}{c}-I \text{ and } +R\\ \text{effects of Ph}\end{array}\right)$ $(+I \text{ effect of Me})$

The decreasing reactivity order towards anionic polymerisation is (VI) > (III) > (V) > (IV) > (II) > (I).

Example 5 *Propene polymerises in isotactic, snydiotactic, and atactic forms, while vinylidene chloride* ($CH_2{=}CCl_2$) *does not, this is because*

(*a*) *polyproprene is chiral but vinylidene chloride does not*

(*b*) *polypropprene contains conjugated double bonds but vinylidene chloride does not*

(*c*) *polypropprene is reactive but vinylidene chloride is inert*

(*d*) *All of the above*

Solution (*a*) Polypropene has chiral C atoms and, therefore, exists in different forms as mentioned. Polyethylidene chloride, on the other hand, does not have chiral C atom and thus, does not exist in the forms mentioned.

Example 6 *A polydisperse mixture of a polymer can be described by the following composition of molar mass data*

(Mass %)	25.0	50.0	25.0
M (kg mol^{-1})	1.00	1.20	1.40

Calculate the polydispersity index for the mixture.

(*a*) 1 (*b*) 1.02

(*c*) 2.02 (*d*) 0.03

Solution (*b*) $$\overline{M}_n = \frac{\Sigma N_i M_i}{\Sigma N_i} \qquad \text{...(i)}$$

and $$\overline{M}_w = \frac{\Sigma N_i M_i^2}{\Sigma N_i M_i} \qquad \text{...(ii)}$$

Each of the mass% values must be converted to value of N_i. Assuming 100.0 g of the mixture, the amounts of each polymer are

$$\text{Moles} = \frac{\text{Wt.}}{\text{M}},$$

$$N_1 = \frac{25}{1000} = 2.50 \times 10^{-2} \text{ mol}$$

$$N_2 = \frac{50}{1200} = 4.17 \times 10^{-2} \text{ mol}$$

$$N_3 = \frac{25}{1400} = 1.79 \times 10^{-2} \text{ mol}$$

Substituting the values in Eq. (i) and (ii), we get

$$\overline{M}_n = \frac{\left[\begin{array}{l}(2.50 \times 10^{-2} \text{ mol})(1.00 \text{ kg mol}^{-1})\\ + (4.17 \times 10^{-2} \text{ mol})(1.20 \text{ kg mol}^{-1})\\ + (1.79 \times 10^{-2} \text{ mol})(1.40 \text{ kg mol}^{-1})\end{array}\right]}{2.50 \times 10^{-2} \text{ mol} + 4.17 \times 10^{-2} \text{ mol} + 1.79 \times 10^{-2} \text{ mol}}$$

$$= 1.18 \text{ kg mol}^{-1}$$

$$\overline{M}_w = \frac{\left[\begin{array}{l}(2.50 \times 10^{-2} \text{ mol})(1.00)^2 + (4.17 \times 10^{-2})\,(1.20)^2\\ + (1.79 \times 10^{-2})(1.40)^2 \text{ kg}^2 \text{ mol}^{-1}\end{array}\right]}{\left[\begin{array}{l}(2.50 \times 10^{-2})(1.00) + (4.17 \times 10^{-2})(1.20)\\ + (1.79 \times 10^{-2})(1.40)\end{array}\right] \text{kg}}$$

$$= 1.20 \text{ kg mol}^{-1}$$

Polydispersity index = $\overline{M}_w / \overline{M}_n$.

Substituting the results gives

$$\text{Polydispersity index} = \frac{1.20 \text{ kg mol}^{-1}}{1.18 \text{ kg mol}^{-1}}$$

$$= 1.02$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

General Terms and Classification of Polymers

1. A high molecular weight molecule, made up of a large number of smaller units, is known as
(a) monomer (b) macromolecule
(c) polymer (d) Both (b) and (c)

2. With increase in which of the following factors, tensile strength of a polymer increases?
(a) Crystallinity (b) Melting point
(c) Molecular weight (d) All of these

3. Which is not true about polymers?
(a) Polymers have high viscosity
(b) Polymers scatter light
(c) Polymers do not carry any charge
(d) Polymers have low molecular weight

4. 
$\left(-CH_2-\overset{CH_3}{\underset{CH_3}{C}}-CH_2-\overset{CH_3}{\underset{CH_3}{C}}- \right)_n$ is a polymer having monomer units. **[NCERT Exemplar]**

(a) (b) 
(c) 
(d) 
5. Which factor imparts crystalline nature to a polymer like nylon? **[NCERT Exemplar]**
(a) Hydrogen bonding (b) Covalent bonding
(c) Ionic bonding (d) All of these

6. Which of the following polymers of glucose is stored by animals? **[NCERT Exemplar]**
(a) Cellulose (b) Amylose
(c) Amylopectin (d) Glycogen

7. Which of the following is not a biopolymer?
(a) Proteins (b) Rubber
(c) Cellulose (d) RNA

8. Teflon is an example of polymer which is a/an
(a) polyamide (b) addition polymer
(c) polyester (d) formaldehyde resin

9. Which of the following are addition polymers? **[NCERT Exemplar]**
(a) Nylon
(b) Melamine formaldehyde resin
(c) Orlon
(d) All of the above

10. Which of the following polymers are condensation polymers? **[NCERT Exemplar]**
(a) Bakelite (b) Teflon
(c) Butyl rubber (d) None of these

11. Which among the following is step-growth polymer?
(a) PTFE (b) PVC
(c) Polyester (d) Polythene

12. Which of the following is an elastomer?
(a) Vulcanised rubber (b) Dacron
(c) Polystyrene (d) Malamine

13. Which of the following polymers are used as fibre?
1. Polytetrafluoroethane
2. Polychloroprene
3. Nylon
4. Terylene

The correct answer is **[NCERT Exemplar]**
(a) 1 and 2 (b) 2 and 3
(c) 3 and 4 (d) All of these

14. Nylon-66 is not a
(a) condensation polymer (b) polyamide
(c) homopolymer (d) copolymer

15. The strongest molecular forces are present in
(a) elastomers (b) thermoplastics
(c) fibres (d) thermosetting polymers

16. The compound which cannot be used as a plasticizer, is
(a) di-*n*-butylphthalate
(b) tricresyl phosphate
(c) di-*n*-octyphthalate
(d) diethyl phthalate

17. The functionality of propene and adipic acid are respectively. **[NCERT]**
(a) 1, 1 (b) 0, 1
(c) 0, 2 (d) 1, 2

Polymerisation, Its Mechanism and Types

18. When two or more chemically different monomers take part in polymerisation, it is called
(a) addition polymerisation
(b) copolymerisation
(c) chain polymerisation
(d) homopolymerisation

19. Nylon-66 is obtained by the condensation polymerisation of
(a) adipic acid and hexamethylene diamine
(b) phenol and formaldehyde
(c) terephthalic acid and ethylene glycol
(d) sebacic acid and hexamethylene

20. Low density polythene is prepared by
(a) free radical polymerisation
(b) cationic polymerisation
(c) anionic polymerisation
(d) Ziegler-Natta polymerisation

21. The compound that inhibits the growth of polymer chain during vinyl polymerisation, is
(a) carbon tetrachloride (b) *p*-benzoquinone
(c) benzophenone (d) carbon dioxide

22. A chain transfer agent is
(a) C_6H_5OH (b) $NH(C_6H_5)_2$
(c) CCl_4 (d) CH_3OH

23. The best way to prepare polyisobutylene is
(a) coordination polymerisation
(b) cationic polymerisation
(c) anionic polymerisation
(d) free radical polymerisation

24. Bakelite is a condensation polymer of phenol and formaldehyde. The initial step between the two compounds is an example of
(a) free radical reaction
(b) aldol condensation
(c) aromatic nucleophilic substitution
(d) aromatic electrophilic substitution

25. Number average molecular mass, $\overline{M}_n$ and weight average molecular mass ($\overline{M}_w$) of synthetic polymers are related as
(a) $\overline{M}_n = (\overline{M}_w)^{1/2}$ (b) $\overline{M}_n = \overline{M}_w$
(c) $\overline{M}_w > \overline{M}_n$ (d) $\overline{M}_w < \overline{M}_n$

26. For natural polymers PDI is generally
(a) 0 (b) 1 (c) 100 (d) 1000

Rubber

27. The chemical name of isoprene is
(a) 2-methyl-1,3-butadiene (b) 2-chloro-1,3-butadiene
(c) 2-methoxypropene (d) None of these

28. Synthetic polymer that resembles natural rubber is
(a) chloroprene (b) isoprene
(c) neoprene (d) glyptal

29. The correct statement about thiokol rubber is that
(a) it is a natural polysulphide rubber
(b) it is resistant to oils and abrasion
(c) it is prepared by addition polymerisation
(d) All of the above are correct

30. Heating of rubber with sulphur is called
(a) vulcanisation (b) galvanisation
(c) sulphonation (d) bessemerisation

31. Which of the following type of forces are present in vulcanised rubber?
(a) Weakest intermolecular forces
(b) Hydrogen bonding
(c) Three dimensional network of bonds
(d) Metallic bonding

32. By the addition of 3% to 10% sulphur in rubber
(a) soft rubber is obtained
(b) hard rubber is obtained
(c) no change takes place
(d) soluble rubber is obtained

33. The main point of difference between buna N and buna S is **[NCERT]**
(a) the former is homopolymer whereas the later is copolymer
(b) former contains buta-1,3-diene but later does not
(c) former contains acrylonitrile but later contains styrene
(d) All of the above

Some Important Polymers

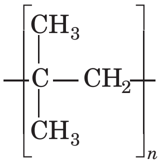
34. Amongst the following the branched chain polymer is
(a) polystyrene
(b) low density polythene
(c) high density polythene
(d) polyester

35. Which of the following statement is not true about low density polythene? [**NCERT** Exemplar]
(a) Tough
(b) Hard
(c) Poor conductor of electricity
(d) Highly branched structure

36. The catalyst used in the polymerisation of high density polythene is
(a) titanium oxide
(b) titanium isoperoxide
(c) lithium tetrachloride and triphenyl aluminium
(d) titanium tetrachloride and trimethyl aluminium

37. The commercial name of polyacrylonitrile is [**NCERT** Exemplar]
(a) dacron (b) orlon (acrilan)
(c) PVC (d) bakelite

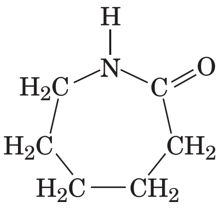
38. Monomer of



$\left[\overset{CH_3}{\underset{CH_3}{C}} - CH_2 \right]_n$ is
(a) 2-methylpropene (b) styrene
(c) propylene (d) ethene

39. Which of the following type of forces are present in nylon-66?
(a) van der Waals' forces of attraction
(b) Hydrogen bonding
(c) Three dimensional network of bonds
(d) Metallic bonding

40. Which of the following polymer can be formed by using the following monomer unit? [**NCERT** Exemplar]



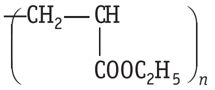
(a) Nylon-66 (b) Nylon 2-nylon 6
(c) Melamine polymer (d) Nylon-6

41. Esterification of terephthalic acid with glycol produces
(a) nylon
(b) buna rubber
(c) polyurethane
(d) terylene

42. In which of the following polymers, empirical formula resembles with monomer?
(a) Bakelite (b) Teflon
(c) Nylon-66 (d) Dacron

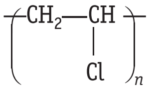
43. Orlon is a hard, horny and a high melting material. Which of the following represents its structure?

(a)



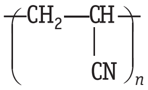
$\left(-CH_2 - \underset{COOC_2H_5}{CH} \right)_n$

(b)



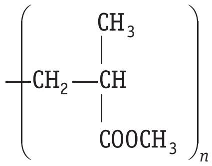
$\left(-CH_2 - \underset{Cl}{CH} - \right)_n$

(c)



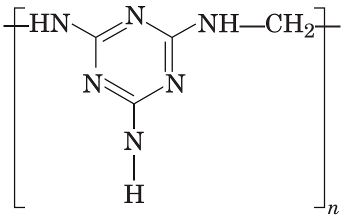
$\left(-CH_2 - \underset{CN}{CH} - \right)_n$

(d)



$\left(-CH_2 - \overset{CH_3}{\underset{COOCH_3}{CH}} \right)_n$

44. The monomers of the following polymer are



(a) hexamethylene diamine and decanedioic acid
(b) hexamethylene diamine and methanal
(c) melamine and methanal
(d) melamine and ethanal

45. Which of the following polymers does not involve cross-linkages?
(a) Vulcanised rubber (b) Melamine
(c) Bakelite (d) Polystyrene

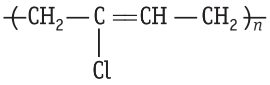
46. Which of the following has an ester linkage?
(a) Nylon-66 (b) Dacron
(c) PVC (d) Bakelite

47. Among the following, the wrong statement is
(a) PMMA is plexiglass
(b) SBR is natural rubber
(c) PTFE is teflon
(d) LDPE is low density polythene

48. Which of the following is a biodegradable polymer?
(a) Cellulose (b) Polythene
(c) Polyvinyl chloride (d) Nylon-6

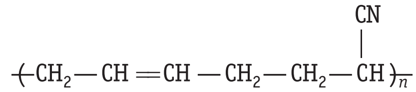
49. Which of the following polymer is biodegradable? [**NCERT** Exemplar]

(a)



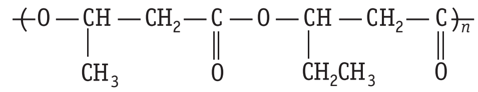
$\left(CH_2 - \underset{Cl}{C} = CH - CH_2 \right)_n$

(b)



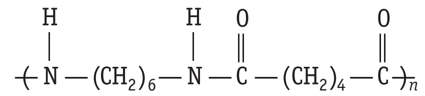
$\left(CH_2 - CH = CH - CH_2 - CH_2 - \overset{CN}{CH} \right)_n$

(c)



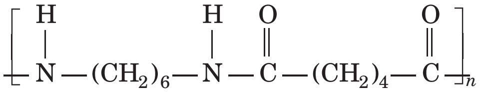
$\left(O - \underset{CH_3}{CH} - CH_2 - \underset{\underset{O}{\|}}{C} - O - \underset{CH_2CH_3}{CH} - CH_2 - \underset{\underset{O}{\|}}{C} \right)_n$

(d)



$\left(\overset{H}{N} - (CH_2)_6 - \overset{H}{N} - \overset{O}{\overset{\|}{C}} - (CH_2)_4 - \overset{O}{\overset{\|}{C}} \right)_n$

50. The monomer of



$$\left[\overset{\overset{H}{|}}{N} - (CH_2)_6 - \overset{\overset{H}{|}}{N} - \overset{\overset{O}{\|}}{C} - (CH_2)_4 - \overset{\overset{O}{\|}}{C} \right]_n$$

is/are **[NCERT]**

(a) sebacic acid and tetramethylenediamine

(b) adipic acid and hexamethylene diamine

(c) sebacic acid and hexamethylene diamine

(d) adipic acid and dimethylenediamine

Round II (Mixed Bag)

Only One Option Correct

1. Which of the following has been used in the manufacture of non-inflammable photographic films?

(a) Cellulose nitrate

(b) Cellulose xanthate

(c) Cellulose perchlorate

(d) Cellulose acetate

2. Polystyrene, dacron and orlon are classified respectively as

(a) chain growth; step growth; step growth

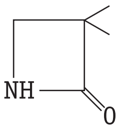
(b) chain growth; chain growth; step growth

(c) chain growth; step growth; chain growth

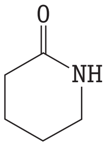
(d) step growth; step growth; chain growth

3. Lactam from which nylon-4 is synthesised, is

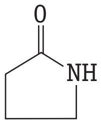
(a)



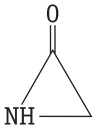
(b)



(c)



(d)



4. Given the polymers,
A = Nylon 6 6; B = Buna-S; C = Polythene.

Arrange these in increasing order of their intermolecular forces (lower to higher).

(a) $A < B < C$ (b) $B > C > A$

(c) $B < C < A$ (d) $A < C < B$

5. Arrange the following monomers in order of decreasing ability to undergo cationic polymerisation

I. $NO_2C_6H_5—CH=CH_2$ II. $CH_2=CH—C_6H_5CH_3$
III. $CH_2=CH—C_6H_5OCH_3$

(a) I > II > III

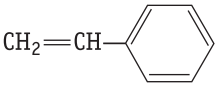
(b) III > II > I

(c) II > I > III

(d) I > III > II

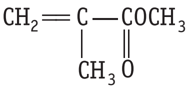
6. Head-to-tail addition takes place in chain-growth polymerisation when monomer is

(a)



(b) $CH_2=CH—CH=CH_2$

(c)



$CH_2 = \underset{CH_3}{\underset{|}{C}} — \underset{O}{\underset{\|}{C}}OCH_3$

(d) $CH_2=CH—C \equiv N$

7. Which of the following vinyl derivatives is most reactive towards anionic polymerisation?

(a) $CH_2=CHCH_3$ (b) $CH_2=CHC_2H_5$

(c) $CH_2=CHCl$ (d) $CH_2=CHC \equiv N$

8. Select the correct statement.

(a) Vinyon is a copolymer of vinyl chloride and vinyl acetate

(b) Saran is a copolymer of vinyl chloride and vinylidine chloride

(c) Butyl rubber is a copolymer of isobutylene and isoprene

(d) All of the above are correct

9. Which is not a polyacrylate?

(a) PMMA (b) Acrilan

(c) Poly acrylonitrile (d) PCTFE

10. The polymer used in making synthetic hair wigs is made up of

(a) $CH_2=CHCl$

(b) $CH_2=CHCOOCH_3$

(c) $C_6H_5CH=CH_2$

(d) $CH_2=CH—CH=CH_2$

11. Which is a polymer of three different monomers?

(a) ABS

(b) SBR

(c) NBR

(d) Nylon-2-nylon-6

12. Which pair of polymers have similar properties?

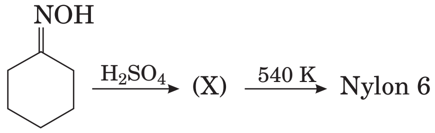
(a) Nylon, PVC

(b) PAN,PTFE

(c) PCTFE, PTFE

(d) Bakelite, alkyl resin

13. In the reaction sequence



(X) is

(a) cyclohexanone
(b) caprolactum
(c) $HO(CH_2)_6NH_2$
(d) hexamethylene diisocyanate

14. Which of the following monomers form biodegradable polymers?

I. 3-hydroxybutanoic acid + 3-hydroxypentanoic acid
II. Glycine + amino caproic acid
III. Ethylene glycol + pthalic acid
IV. Caprolactum

The correct answer is [**NCERT** Exemplar]

(a) I, II only (b) II, III only
(c) I, II and III (d) II, III and IV

15. Which of the following polymers can have strong intermolecular forces?

I. Nylon II. Polystyrene
III. Rubber IV. Polyesters

The correct answer is [**NCERT** Exemplar]

(a) I, IV (b) II, III
(c) I, III (d) All of these

16. Vulcanisation makes rubber

I. more elastic
II. soluble in inorganic solvent
III. crystalline
IV. more stiff

The correct options are [**NCERT** Exemplar]

(a) I and IV only (b) I and III only
(c) II and III only (d) II, III and IV only

17. Match the polymers given in Column I with the preferred mode of polymerisation followed by their monomers.

Column I		Column II	
A.	Nylon-66	1.	Free radical polymerisation
B.	PVC	2.	*Ziegler-Natta* polymerisation or coordination polymerisation
C.	HDP	3.	Anionic polymerisation
		4.	Condensation polymerisation

The correct answer is [**NCERT** Exemplar]

	A	B	C		A	B	C
(a)	4	3	1	(b)	4	2	3
(c)	4	1	2	(d)	4	2	1

18. Match the polymers given in Column I with their commerical names given in Column II.

Column I		Column II	
A.	Polyester of glycol and phthalic acid	1.	Novolac
B.	Copolymer of 1, 3-butadiene and styrene	2.	Glyptal
C.	Phenol and formaldehyde resin	3.	Buna-S
D.	Polyester of glycol and terephthalic acid	4.	Buna-N
E.	Copolymer of 1, 3-butadiene and acrylonitrile	5.	Dacron

[**NCERT** Exemplar]

Codes

	A	B	C	D	E		A	B	C	D	E
(a)	4	3	2	1	5	(b)	2	3	1	5	4
(c)	2	1	3	4	5	(d)	2	1	3	5	4

More than One Option Correct

19. Which of the following polymers have vinylic monomer units? [**NCERT** Exemplar]

(a) Acrilan (b) Polystyrene
(c) Nylon (d) Teflon

20. Which of the following polymers, need atleast one diene monomer for their preparation? [**NCERT** Exemplar]

(a) Dacron (b) Buna-S (c) Neoprene (d) Novolac

21. Which of the following are characteristics of thermosetting polymers? [**NCERT** Exemplar]

(a) Heavily branched cross linked polymers.
(b) Linear slightly branched long chain molecules
(c) Become infusible on moulding so cannot be reused
(d) Soften on heating and harden on cooling, can be reused

22. Which of the following polymers are thermoplastic? [**NCERT** Exemplar]

(a) Teflon (b) Natural rubber
(c) Neoprene (d) Polystyrene

23. Among the following chain transfer reagent are

(a) Carbon tetrachloride (b) Benzoyl peroxide
(c) Benzoquinone (d) Carbon tetrabromide

Assertion and Reason

Directions (Q. No. 24 to 28) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*), (*d*) *given below :*

(a) Statement I is true; Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true; Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

24. **Statement I** Olefinic monomers undergo addition polymerisation.

Statement II Polymerisation of vinylchloride is initiated by peroxides or persulphates. [NCERT Exemplar]

25. **Statement I** Rayon is a semi synthetic polymer and is taken as a better choice than cotton fabric.

Statement II Mechanical and aesthetic properties of cellulose can be improved by acetylation. [NCERT Exemplar]

26. **Statement I** Polyvinyl alcohol is obtained by polymerisation of vinyl alcohol.

Statement II Polyvinyl alcohol is prepared by hydrolysis of polyvinyl acetate.

27. **Statement I** Network polymers are thermosetting.

Statement II Network polymers have high molecular mass. [NCERT Exemplar]

28. **Statement I** PMMA is used for making lenses and light covers.

Statement II It has excellent light transmission properties.

Comprehension Based Questions

Directions (Q. Nos. 29 to 31) A polymer is a large molecule made by linking together repeating units of small molecules called monomers. The process of linking them up is called polymerisation. On the basis of mode of polymerisation, polymers are of two types; Addition polymers and condensation polymers. Addition polymers are formed by repeated addition of monomer molecules possessing double or triple bonds. Addition polymers may be homopolymer (single monomeric species) or copolymers (two different monomers). The condensation polymers are formed by repeated condensation reaction between two different bifunctional or trifunctional monomeric units with the elimination of small molecules such as H_2O, alcohol etc.

29. Which one of the following cannot form addition polymers?

(a) $CH_2{=}CH_2$

(b) 
(c) $HOOC(CH_2)_4COOH$

(d) None of these

30. Condensation polymers are formed from monomers
(a) which have bifunctional groups
(b) which have multiple $(C{=}C)$ or $(C{\equiv}N)$ or $(C{\equiv}C)$ bonds
(c) in which elimination can take place
(d) in which addition can take place

31. Which type of polymer is the Buna-S rubber?
(a) Copolymer
(b) Addition polymer
(c) Condensation polymer
(d) It is not a polymer

Directions (Q. Nos. 32 to 33) Neoprene is synthetic rubber which is obtained by polymerisation of 2-chloro-1,3 butadiene. In it the configuration of polymer is *trans*. Its properties are improved by vulcanisation, which is infact the hardening of rubber by heating is presence of sulphur causes cross-linking of separate polymer chains through disulphide bonds and thus vulcanised chains are locked together in one giant molecule. Cross-linking prevents the polymer from being torn when it is stretched, and the cross-links provide a reference framework for the material to return to when the stretching force is removed.

32. The tensile strength, elasticity and resistance to abrasion can be increased by a process called
(a) diazotisation
(b) vulcanisation
(c) isomerisation
(d) polymerisation

33. In vulcanisation of rubber,
(a) sulphur reacts of form new compound
(b) sulphur crosslinks are introduced
(c) sulphur forms a very thin protective layer over rubber
(d) All of the above

Previous Years' Questions

34. Thermosetting polymer, bakelite is formed by the reaction of phenol with [AIEEE 2008, 2011]
(a) CH_3CH_2CHO
(b) CH_3CHO
(c) $HCHO$
(d) $HCOOH$

35. The polymer containing strong intermolecular forces, *e.g.*, hydrogen bonding, is [AIEEE 2010]
(a) teflon
(b) nylon-66
(c) polystyrene
(d) natural rubber

36. Buna-N synthetic rubber is a copolymer of [AIEEE 2009]

(a) $H_2C{=}CH{-}\overset{\overset{\displaystyle Cl}{|}}{C}{=}CH_2$ and $H_2C{=}CH{-}CH{=}CH_2$

(b) $H_2C{=}CH{-}CH{=}CH_2$ and $H_5C_6{-}CH{=}CH_2$

(c) $H_2C{=}CH{-}CN$ and $H_2C{=}CH{-}CH{=}CH_2$

(d) $H_2C{=}CH{-}N$ and $H_2C{-}\underset{\underset{\displaystyle CH_3}{|}}{C}{=}CH_2$

37. Which of the following is fully fluorinated polymer? [AIEEE 2005]

(a) PVC
(b) Thiokol
(c) Teflon
(d) Neoprene

38. Nylon threads are made up of [AIEEE 2003]

(a) polyvinyl polymer
(b) polyester polymer
(c) polyamide polymer
(d) polyethylene polymer

39. Monomers are converted to polymer by [AIEEE 2002]

(a) hydrolysis of monomers
(b) condensation reaction between monomers
(c) protonation of monomers
(d) None of the above

Answers

Round I

1. (d)	**2.** (c)	**3.** (d)	**4.** (a)	**5.** (a)	**6.** (d)	**7.** (b)	**8.** (b)	**9.** (c)	**10.** (a)
11. (c)	**12.** (a)	**13.** (c)	**14.** (c)	**15.** (d)	**16.** (d)	**17.** (d)	**18.** (b)	**19.** (a)	**20.** (a)

the Guidance

Round I

1. A high molecular weight molecule, made up of a large number of smaller units is called polymer and it is also known as macromolecule However, all macromolecules are not polymers.

2. With increase in molecular weight of a polymer, other properties such as tensile strength, crystallinity, melting point etc., increase.

3. Polymers are large molecules with high molecular weight, and a repeating unit. They do not carry any charge. They have high viscosity and can scatter light.

4. 
$$\left[CH_2-C(CH_3)_2-CH_2-C(CH_3)_2 \right]_n$$

is a polymer having monomer units 
$$CH_2{=}C(CH_3)_2$$

5. Strong intermolecular forces like hydrogen bonding lead to close packing of chains that imparts crystalline character.

6. Glycogen is a polymers of glucose which is stored by animals.

7. Since proteins, cellulose and RNA control various activities of plants and animals, they are called biopolymers.

8. Teflon is prepared by the combination of a large number of tetrafluoroethylene molecules, without the elimination of any small molecule. Therefore, it is an example of addition homopolymer.

$$nCF_2{=}CF_2 \longrightarrow \underset{\text{teflon}}{\left[CF_2-CF_2 \right]_n}$$

9. Orlon is an addition polymer as its molecular mass is integral multiple of molecular mass of its monomer.

12. Among the given, only vulcanised rubber has elastic character, so it is an elastomer.

13. Nylon and terylene are fibres whereas PTFE is a thermoplastic and polychloroprene is an elastomer.

14. Nylon-66 is obtained by the condensation of hexamethylene diamine with adipic acid. Since, two different monomers involve in its preparation, it is a copolymer, not a homopolymer.

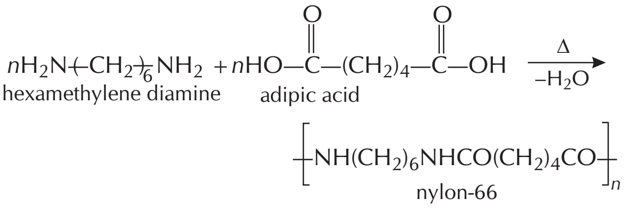
15. Due to the presence of extensive cross-linking, thermosetting polymers have strongest molecular forces.

16. Generally high boiling esters or haloalkanes act as plasticizer.

17. Functionality of a monomer means the number of bonding sites present in it. *e.g.,* functionality of ethene, propene, styrene, acrylonitrile is one and that of ethylene glycol, adipic acid, hexamethylene diamine is two.

18. When two or more chemically different monomers take part in polymerisation, it is called copolymerisation.

19. Nylon-6 6 is obtained by condensation copolymerisation of adipic acid and hexamethylene diamine.

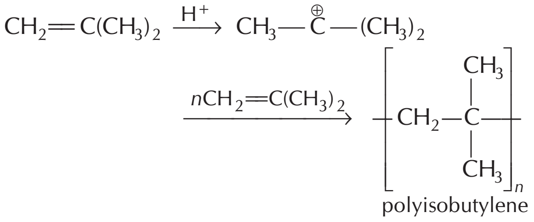


$$nH_2N\text{+}CH_2\text{+}_6NH_2 + nHO-\overset{O}{\overset{\|}{C}}-(CH_2)_4-\overset{O}{\overset{\|}{C}}-OH \xrightarrow[-H_2O]{\Delta} \left[NH(CH_2)_6NHCO(CH_2)_4CO\right]_n$$

20. Ethene on free radical polymerisation gives low density polythene.

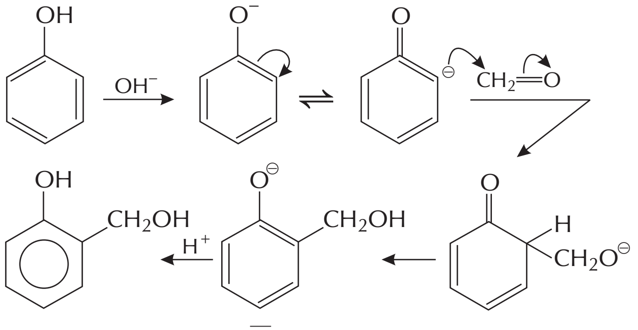
21. Certain amines, phenols and quinones are used to inhibit the growth of polymer chain.

23. Since 3° carbocations are most stable, the best way to obtain polyisobutylene is acid catalysed or cationic polymerisation in the presence of Lewis acid or protonic acid.



$$CH_2{=}C(CH_3)_2 \xrightarrow{H^+} CH_3-\overset{\oplus}{C}-(CH_3)_2 \xrightarrow{nCH_2=C(CH_3)_2} \left[CH_2-\underset{CH_3}{\overset{CH_3}{C}}\right]_n$$

24. It is aromatic electrophilic substitution.



25. $$PDI = \frac{\overline{M}_w}{\overline{M}_n}$$

For synthetic polymer, PDI > 1

$\therefore \quad \overline{M}_w > \overline{M}_n$

26. Polydispersity index (PDI) $= \frac{\overline{M}_w}{\overline{M}_n}$

For natural polymers, PDI = 1

$\therefore \quad \overline{M}_w = \overline{M}_n$

27. Isoprene is $CH_2{=}C(CH_3)-CH{=}CH_2$ (2-methyl-1, 3-butadiene).

28. Neoprene (synthetic rubber) resembles with natural rubber.

$$\text{+}CH_2-CH{=}C(Cl)-CH_2\text{+}_n$$

neoprene

$$\text{+}CH_2-CH{=}C(CH_3)-CH_2\text{+}_n$$

natural rubber

29. Thiokol is a synthetic polysulphide rubber which is obtained by the condensation polymerisation of ethylene dichloride and sodium polysulphide. It is resistant to oils and abrasion.

30. Heating of rubber with sulphur or sulphur compounds at 373 K to 415 K in the presence of ZnO is called vulcanisation.

31. Vulcanised rubber is highly elastic, so intermolecular forces present in it, are weakest.

32. Additon of 3-10% sulphur to rubber, makes it hard.

33. Buna-N and buna-S both are synthetic rubber and copolymers. The difference lies in their compostiion.

Buna-N constituents are buta-1, 3-diene and acrylonitrile.

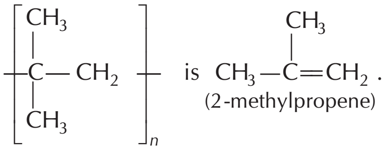
Buna-S constituents are buta-1, 3-diene and styrene.

34. Low density polythene is a branched chain polymer.

36. High density polythene is obtained, when ethene undergoes *Ziegler-Natta* polymerisation. In this process, *Ziegler-Natta* catalyst, a mixture of titanium tetrachloride ($TiCl_4$) and trimethyl aluminium [$(CH_3)_3Al$] is used to catalyse the polymerisation.

37. The commercial name of polyacrylonitrile is orlon (acrilan).

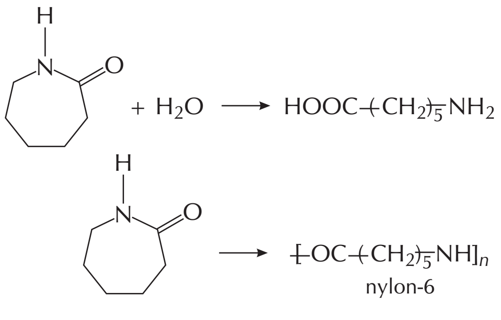
38. Monomer of



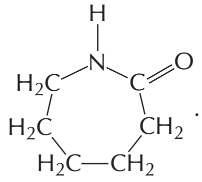
$$\left[\underset{CH_3}{\overset{CH_3}{C}}-CH_2\right]_n \text{ is } CH_3-\overset{CH_3}{C}{=}CH_2 .$$

(2-methylpropene)

40. Caprolactum is widely used for preparing nylon-6, for this it is first hydrolysed with water to form amino acid.

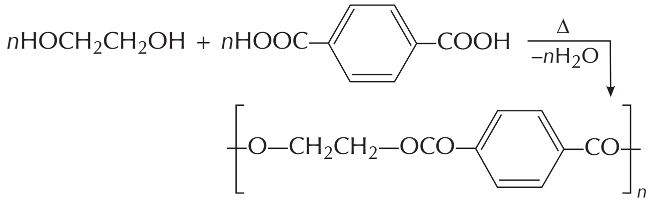


So, it is clear that nylon-6 (polymer) can be formed by the using of the caprolactum



monomer unit

41. Esterification of terephthalic acid with ethylene glycol produces terylene.



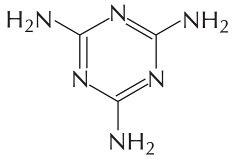
terylene or dacron

42. In addition homopolymers such as teflon, empirical formula resembles with monomer.

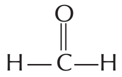
43. Orlon is a polymer of vinyl cyanide or acrylonitrile ($CH_2{=}CHCN$).

44. Break—NH—CH_2 bond and add H_2O to get the structure of monomers.

(a) 2, 4, 6-triamino-1, 3, 5-triazine or melamine

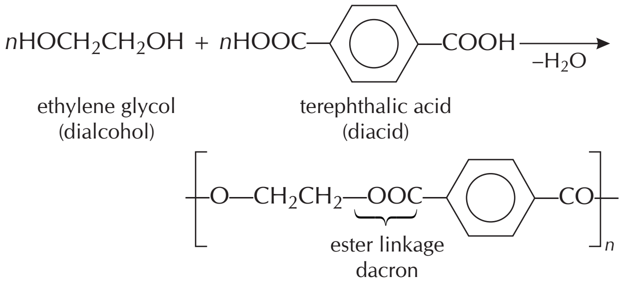


(b) Formaldehyde or methanal (HCHO)



45. Polystyrene contains only linear chains.

46. When a diacid is condensed with dialcohol, the polymer obtained contains ester linkage.



47. SBR (styrene-butadiene) is a synthetic rubber.

48. Cellulose is a biodegradable polymer.

Round II

1. Cellulose acetate has been used in the manufacture of non-inflammable photographic films.

2. Polystyrene and orlon, being vinyl derivative, are chain growth polymers while dacron is a step growth polymer.

3. For the synthesis of nylon-4, lactam with four carbon atoms is required.

4. Buna-S is an elastomer, thus has weakest intermolecular forces. Nylon-66, is a fibre, thus has strong intermolecular forces like H-bonding. Polythene is a thermoplastic polymers, thus the intermolecular forces present in polythene are in between elastomer and fibres. Thus, the order of intermolecular forces of these polymers is

Buna-S < Polythene < Nylon-66

5. Electron releasing groups such as CH_3, —OCH_3 activate the monomer towards cationic polymerisation as these groups provide stability to the carbocation formed. Thus, the correct order is

$$CH_2{=}CHC_6H_5(OCH_3) > CH_2{=}CH-C_6H_5(CH_3) > NO_2C_6H_5-CH{=}CH_2$$

6. Vinyl derivatives containing electron releasing group readily undergo head to tail addition polymerisation.

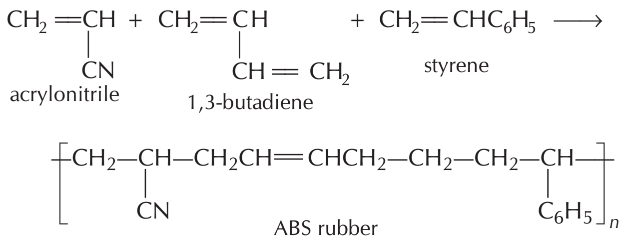
7. Electron withdrawing groups make the monomer more reactive towards anionic polymerisation.

8. All options are correct.

9. PCTFE (poly monochloro tetrafluoro ethylene), $\lbrack ClFC-CF_2 \rbrack_n$ is not a polyacrylate.

10. SARAN, a polymer of vinyl chloride ($CH_2{=}CHCl$). and vinylidene chloride, is used for making synthetic hair wigs.

11. ABS is acrylonitrile-butadiene-styrene rubber which is obtained by copolymerisation of acrylonitrile, 1, 3-butadiene and styrene.



$$\underset{\text{acrylonitrile}}{CH_2{=}\underset{|}{CH}\!-\!CN} + \underset{\text{1,3-butadiene}}{CH_2{=}CH-CH{=}CH_2} + \underset{\text{styrene}}{CH_2{=}CHC_6H_5} \longrightarrow \underset{\text{ABS rubber}}{\lbrack CH_2-\underset{CN}{CH}-CH_2CH{=}CHCH_2-CH_2-CH_2-\underset{C_6H_5}{CH} \rbrack_n}$$

12. PCTFE and PTFE both have same carbon backbone.

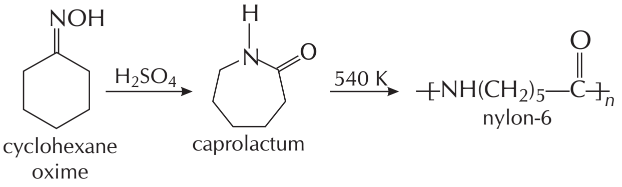
$$+ClFC-CF_2+_n$$

PCTFE (polymonochloro tetrafluoroethylene)

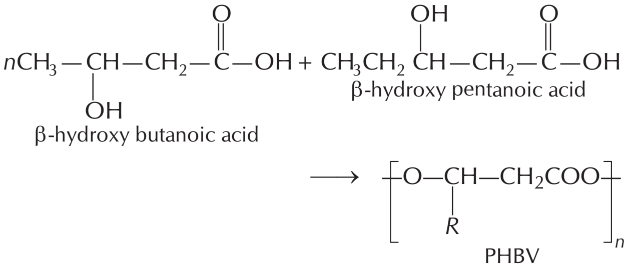
$$+F_2C-CF_2+_n$$

PTFE (polytetrafluoroethylene)

13. Caprolactum is the monomer of nylon-6.



14. Monomers 3-hydroxy butanoic acid and 3-hydroxypentanoic acid react each other and form biodegradable PHBV. Glycine and amino caproic acid also react to form biodegradable polymers nylon-2-nylon-6.

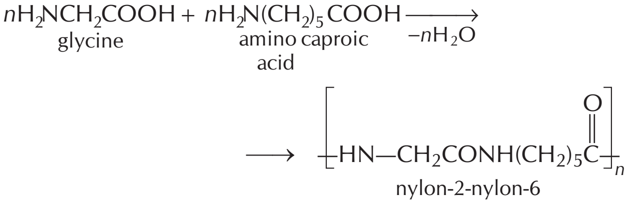


$$nCH_3-\underset{OH}{CH}-CH_2-\overset{O}{\overset{\|}{C}}-OH+CH_3CH_2\overset{OH}{CH}-CH_2-\overset{O}{\overset{\|}{C}}-OH$$

β-hydroxy butanoic acid β-hydroxy pentanoic acid

$$\longrightarrow \left[O-\underset{R}{CH}-CH_2COO\right]_n$$

PHBV



$$nH_2NCH_2COOH+nH_2N(CH_2)_5COOH\xrightarrow[-nH_2O]{}$$

glycine amino caproic acid

$$\longrightarrow \left[HN-CH_2CONH(CH_2)_5\overset{O}{\overset{\|}{C}}\right]_n$$

nylon-2-nylon-6

15. Nylon and polyesters have strong intermolecular forces (*i.e.*, hydrogen bonding).

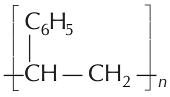
16. Vulcanisation makes the rubber more elastic and more stiff.

17. Nylon-66 is a condensation polymer.*i.e.,* obtained by condensation polymerisation.

PVC is obtained by free radical polymerisation whereas HDP (high density polythene) is a result of *Zieglar-Natta* polymerisation.

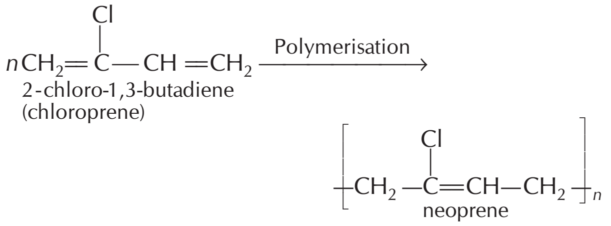
18. Glyptal is a polymer of glycol and phthalic acid Buna-S is obtained by copolymerisation of 1, 3-butadiene and styrene.

Novolac is a linear polyester of phenol formaldehyde resin Dacron is a polyester of glycol and terephthalic acid Buna-N is a copolymer of 1, 3-butadiene and acryclonitrile.



19. Polystyrene $\left[\underset{}{\overset{C_6H_5}{\overset{|}{CH}}}-CH_2\right]_n$ teflon $+CF_2-CF_2+_n$ and acrilan polymers have vinylic monomer, units.

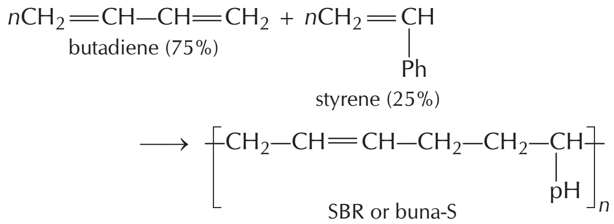
20. Buna-S and neoprene polymers need atleast one diene monomer for their preparation.



$$nCH_2=\overset{Cl}{\overset{|}{C}}-CH=CH_2\xrightarrow{\text{Polymerisation}}\left[CH_2-\overset{Cl}{\overset{|}{C}}=CH-CH_2\right]_n$$

2-chloro-1,3-butadiene (chloroprene)

neoprene



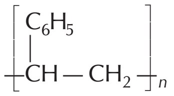
$$nCH_2=CH-CH=CH_2+nCH_2=\underset{Ph}{\underset{|}{CH}}$$

butadiene (75%) styrene (25%)

$$\longrightarrow\left[CH_2-CH=CH-CH_2-CH_2-\underset{pH}{\underset{|}{CH}}\right]_n$$

SBR or buna-S

21. The polymer which become infusible on moulding *i.e.*, can't be used further and are heavily branched (cross-linked) are called thermosetting ploymers.



22. Teflon $+CF_2-CF_2+_n$ polystyrene $\left[\overset{C_6H_5}{\overset{|}{CH}}-CH_2\right]_n$ and polythene $+CF_2-CF_2+_n$ are thermoplastic polymers.

23. Carbon tetrachloride and carbon tetrabromide act as chain transfer reagent in vinyl polymerisation.

24. Olefinic monomers being unsaturated undergo addition polymerisation. Polymerisation of vinylchloride is initiated by peroxides/ persulphates.

25. Rayon is a semisynthetic polymer which is obtained from cellulose through acetylation process. It is taken as a better choice than cotton fabric.

26. Polyvinyl alcohol cannot be prepared by polymerisation of vinyl alcohol since it readily tautomerises to acetaldehyde.

27. Network polymers are thermosetting. They have the high molecular mass.

28. Statement I is the correct explanation of Statement II.

29. $HOOC(CH_2)_2COOH$ form condensation polymers.

30. Condensation polymers one formed from monomers adipic acid and hexamethylene diamine.

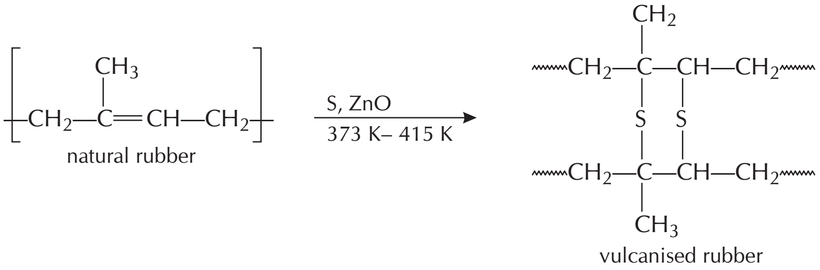
$$nNH_2(CH_2)_6NH_2+n(CH_2)_4(COOH)_2\longrightarrow +NH(CH_2)_6NHCO(CH_2)_4CO+_n+nH_2O$$

nylon-66

31. Buna-S is copolymer.

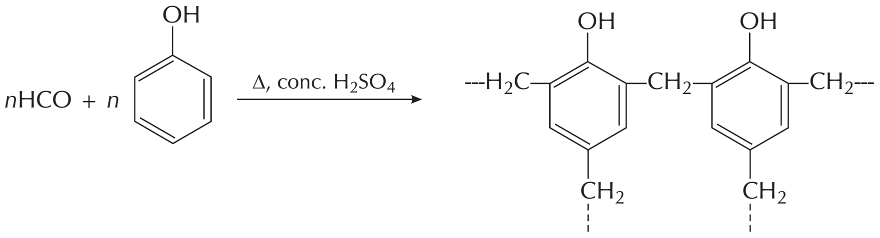
32. Vulcanisation is responsible for tensile strength, elasticity and resistance to abrasion of rubber.

33. During vulcanisation process, sulphur cross-links are introduced at the reactive sites of double bonds,



34. Bakelite is a thermosetting plastic formed by reaction of phenol with HCHO in the presence of conc. H_2SO_4.

It is thus cross-linked polymer, condensation taking place at *o*-and *p*-positions.



35. In nylon-66 hydrogen bonds are formed between  $-\overset{\overset{\large O}{\|}}{C}-NH$ group of successive chains.

36. Buna-N actually abbreviated from where Bu represents 1, 3- butadiene, Na represents Na, sodium and N represents nitrile (acrylonitrile).

Thus, buna-N is co-polymer of 1, 3-butadiene and acrylonitrile usually polymerise in the presence of sodium.

37. Teflon is $\left[\!-CF_2-CF_2-\!\right]_n$

38. Nylon threads are made up of polyamide.

39. Condensation is the process of aggregation of more than one molecule without losing any atom or group (sometimes smaller group or atoms H_2O, R—OH etc., are released).

$$\underset{\text{(monomer)}}{n\,CH_2{=}CH_2} \longrightarrow \underset{\text{polymer}}{-CH_2-(CH_2-CH_2)-CH_2-}$$

14 Biomolecules

JEE Main MILESTONE

- Carbohydrates
- α-Amino Acids
- Proteins
- Enzymes
- Vitamins
- Nucleic Acids

14.1 Carbohydrates

These are naturally occurring organic substances. These are present in both plants and animals. Initially these are produced in plants by a process known as photosynthesis. In this process, sunlight is absorbed by a green pigment called chlorophyll (present in the green plants). The photochemical energy thus obtained is used to convert carbon dioxide and water into carbohydrates and oxygen.

$$xCO_2 + yH_2O \xrightarrow[\text{Chlorophyll}]{\text{Sunlight}} C_x(H_2O)_y + xO_2$$

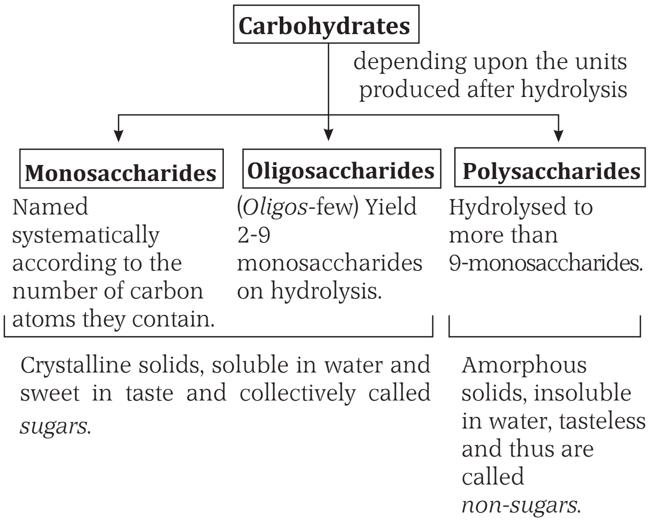
Animals do not synthesise carbohydrates.

Previously it was believed that carbohydrates are the substances with general formula $C_x(H_2O)_y$ *i.e.,* hydrates of carbon. However, a number of compounds have been discovered which are carbohydrates by chemical behaviour, but do not possess the formula $C_x(H_2O)_y$, *e.g.,* rhamnose ($C_6H_{12}O_5$) and deoxyribose ($C_5H_{10}O_4$). Similarly, all compounds possessing to the formula $C_x(H_2O)_y$ are not necessarily carbohydrates, *e.g.,* HCHO, CH_3COOH etc. Hence, this definition has been changed now. According to modern definition *optically active polyhydroxy aldehydes or polyhydroxy ketones or compounds which can be hydrolysed to one of these are called carbohydrates.*

Biomolecules are complex life less substances which forms the basis of life i.e., they not only build up living creatures but are also responsible for their growth and maintenance. The size and complexity gives almost unlimited potential for diversity of molecules, but it also makes organic molecules much more fragile and easy to destroy than the smaller and simpler inorganic molecules.

Classification of Carbohydrates

Carbohydrates are also known as **saccharides** and classified according to their behaviour towards hydrolysis.



Carbohydrates are also classified as either **reducing sugars** or **non-reducing sugars.** The sugars that reduce the Tollen's reagent and Fehling's solution are called **reducing sugars.** Reducing sugars include all the monosaccharides, both aldoses as well as ketoses with a $—CH_2OH$ next to the carbonyl group. The disaccharides may be reducing or non-reducing depending upon the position of linkages between two monosaccharide units. If the glycosidic linkage involves the carbonyl functions of both the monosaccharides units, the resulting disaccharide would be **non-reducing** (as sucrose). If one of the carbonyl functions in the anyone of the monosaccharide units is free, the resulting disaccharide would be reducing sugar (as maltose, lactose, cellobioase.). All polysaccharides are non-reducing sugars.

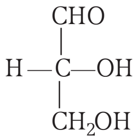
Sample Problem 1 *Carbohydrates are classified on the basis of their behaviour on hydrolysis and also as reducing or non-reducing sugar. Sucrose is a* **[NCERT Exemplar]**

(a) *monosaccharide* (b) *disaccharide*
(c) *reducing sugar* (d) *non-reducing sugar*

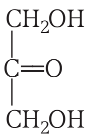
Interpret (*b,d*) Sucrose is the most common disaccharide. It consists of a D-glucose subunit and a D-fructose subunit linked by a glycosidic bond between C-1 of glucose (in the α-position) and C-2 of fructose (in the β-position). Sucrose is a non-reducing sugar because it does not have a hemiacetal or hemiketal group, so it is not in equilibrium with the readily oxidisable open chain aldehyde or ketone form in aqueous solution.

Monosaccharides : General Features

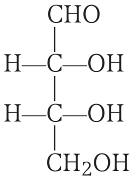
These are the simplest carbohydrates which cannot be hydrolysed to smaller molecules. All these are polyhydroxy compounds containing either an aldehydic (—CHO) group and are called **aldoses** (the aldehydic group being monovalent is present at the end of the chain) or a ketonic ($>C{=}O$) group and are called **ketoses** (the ketonic group is present next to terminal carbon atom). The simplest monosaccharides are **trioses** such as glyceraldehyde (aldose), dihydroxyacetone (ketose) and aldotetros such as erythrose and threose.



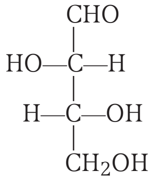
D(+)-glyceraldehyde
(An aldotriose)



dihydroxyacetone
(A ketotriose)



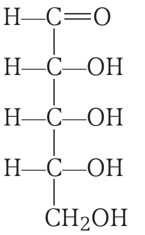
D(–) erythrose



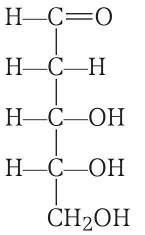
D(–) threose

Any natural sugar degrade to D-(+) glyceraldehydes. But some synthetic carbohydrate degrade to L-(–) glyceraldehyde. Ketotriose does not considered as a monosaccharide because it is optically inactive.

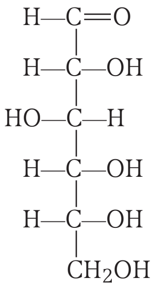
However, the naturally occurring monosaccharides are pentoses (5 C atoms) and hexoses (6 C atoms) out of these, the most common are ribose, 2-deoxyribose, glucose (aldoses) and fructose (ketose).



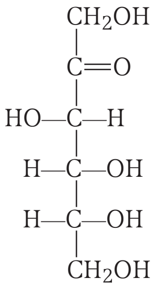
D(–)-ribose



D(–) 2-deoxyribose

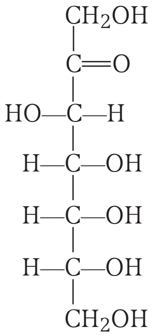


D(+)-glucose



D(–)-fructose

Sedoheptulose, a ketoheptose sugar (7 carbon atoms) has the same structure as fructose with an extra carbon.

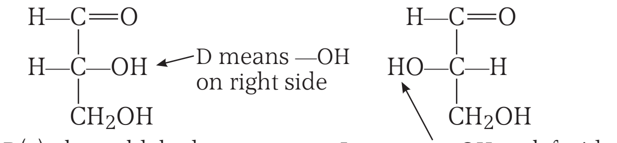


D-sedoheptulose

Similarly, L-glycero-D-manno-heptose (aldoheptose) is a constituent of polysaccharides in Gram-negative bacteria.

Configuration of Carbohydrates

D or L letter before the name of any carbohydrate indicate the relative configuration of a particular stereo-isomer. Glyceraldehyde, a simplest saccharide exists in two enantiomeric forms.



D(+)-glyceraldehyde

L-means —OH on left side.

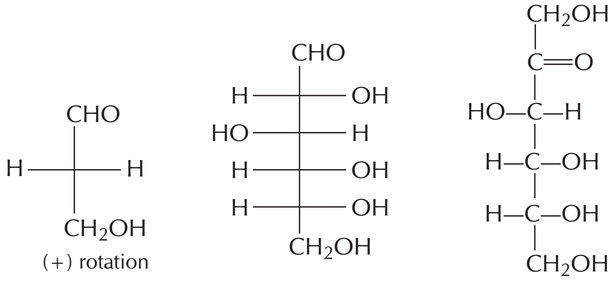
These two forms serve as a reference point for designating and drawing all other monosaccharides. The monosaccharides having the same configuration as of D-glyceraldehyde at the asymmetric carbon which is adjacent to —CH_2OH group but the most distant from carbonyl group (aldehyde or ketone group) are designated as D-form and those having the same configuration as of L-glyceraldehyde are designated as L-forms. The natural glucose and fructose are D-forms.

The maximum number of optical isomers of a carbohydrate is equal to 2^n.

where, n = number of chiral carbons.

Caution Point *The (+) and (–) signs only indicates the direction of rotation of plane polarized light by a specific enantiomer and it does not give any information about the arrangement of —OH group on the asymmetric carbon atom which is adjacent to —CH_2OH group.*

Sample **Problem 2** *Optical rotations of some compounds along with their structures are given below. Which of them have D configuration.* **[NCERT Exemplar]**

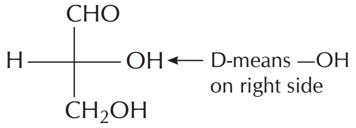


(I) (II) (III)

(*a*) I, II, III (*b*) II, III

(*c*) I, II (*d*) III

Interpret (*a*) The monosaccharides having the same configuration as of D-glyceraldehyde at the asymmetric carbon which is adjacent to —CH_2OH group but the most distant from carbonyl group are designated as D-configuration.

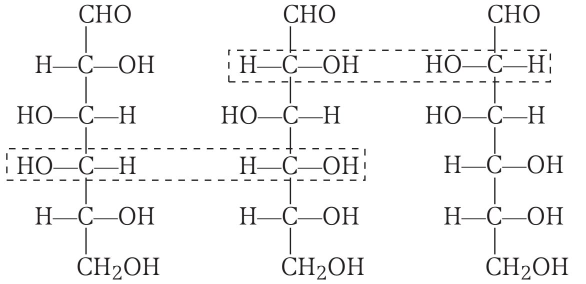


D-(+)-glyceraldehyde

Therefore, all the given species have D-configuration.

Epimers

A more selective term, **epimer** is used to designate diastereomers that differ in configuration at only one chiral centre. Thus, glucose is epimeric with D (+)-mannose and D(+)-galactose as shown below :



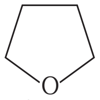
D(+)-galactose D(+)-glucose D(+)-mannose

Similarly, ribose and arabinose are epimers at C-2 and arabinose and lyxose are epimers at C-3.

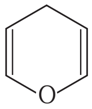
Caution Point *Arabinose and xylose are not epimers, since their configuration differ at both C-2 and C-3.*

Ring Structure of Monosaccharides

The ring form of monosaccharides is favoured in aqueous solution. Structures of pentoses and hexoses are cyclic involving five or six membered rings containing an oxygen atom. The five membered ring containing an oxygen atom, because of its similarity with **furan** is called the **furanose form** and the six membered ring containing an oxygen atom because of its similarity with **pyran** is called the **pyranose form**.



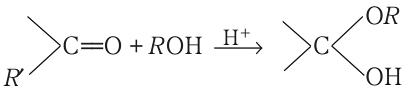
furan



pyran

During ring formation, reaction between an aldehyde and an alcohol forms a **hemiacetal.** A **hemiketal** is an analogous product formed by reaction of a ketone with an alcohol.

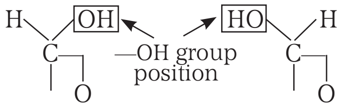
Formation of a hemiacetal or a hemiketal



(where, $R' = \mathrm{H}$ or R)
If aldehyde (*i.e.*, $R' = \mathrm{H}$) ⟶ hemiacetal,
If ketone (*i.e.*, $R' = R$) ⟶ hemiketal

As a result of ring formation

(i) Carbon number 1–(C_1) becomes asymmetric (chiral) and hence, monosaccharides exist in two stereoisomeric forms, α and β-form. In the α-form, the —OH at C_1 is towards right while in the β-form, the —OH at C_1 is towards left.



α-position β-position

A pair of stereoisomers which differ in configuration only around C_1 carbon are called **anomers** and the C_1 is called the **anomeric carbon** (or glycosidic carbon).

Glucose ($C_6H_{12}O_6$)

Glucose is a monosaccharide, aldohexose and reducing sugar. It is found in ripe grapes (hence named **grape-sugar**), honey and most sweet fruits. It is also a normal constituent of blood and occurs in the urine of diabetics. The blood normally contains 65 to 110 mg of glucose per 100 mL (hence named blood sugar). In the combined state, it occurs in glucosides, dissacharides and polyssacharides.

Methods of Preparation

(i) **From sucrose** Cane sugar (sucrose) on acid hydrolysis in the presence of alcohol, gives a mixture of glucose and fructose.

$$\underset{\text{sucrose}}{C_{12}H_{22}O_{11}} + H_2O \xrightarrow{H^+} \underset{\text{glucose}}{C_6H_{12}O_6} + \underset{\text{fructose}}{C_6H_{12}O_6}$$

Glucose being less soluble in alcohol than fructose separates out by crystallising on cooling (fractional crystallisation).

(ii) **From starch** Glucose is obtained on a large scale by the hydrolysis of starch with dilute H_2SO_4 or dilute HCl under pressure.

$$\underset{\text{starch}}{(C_6H_{10}O_5)_n} + nH_2O \xrightarrow[393\text{ K, 2-3 atm}]{H^+} \underset{\text{glucose}}{nC_6H_{12}O_6}$$

After neutralisation with $CaCO_3$ and filteration, filterate is decolourised by boiling with animal charcoal and then concentrated under reduced pressure and crystallised.

(iii) **From lactose or maltose**

$$\underset{\text{lactose}}{C_{12}H_{22}O_{11}} + H_2O \xrightarrow{H^+} \underset{\text{glucose}}{C_6H_{12}O_6} + \underset{\text{galactose}}{C_6H_{12}O_6}$$

$$\underset{\text{maltose}}{C_{12}H_{22}O_{11}} + H_2O \xrightarrow{H^+} \underset{\text{glucose}}{2C_6H_{12}O_6}$$

Physical Properties of Glucose

(i) Glucose is a white crystalline solid (m.p. 146°C). It also occurs in the form of monohydrate, $C_6H_{12}O_6 \cdot H_2O$ (mp 86°C).

(ii) Glucose is readily soluble in water, sparingly soluble in alcohol and insoluble in ether.

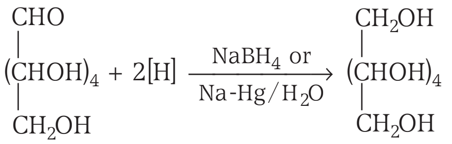
(iii) It is optically active and dextrorotatory (hence named dextrose). It shows mutarotation (The change in specific rotation of an optically active compound in solution with time, to an equilibrium value is called mutarotation)

(iv) It has a very sweet taste but is about three fourth as sweet as sucrose (cane-sugar).

Chemical Properties of Glucose

(i) **Reduction**

(a) On reduction with $NaBH_4$ or Na-Hg, glucose yields sorbitol.



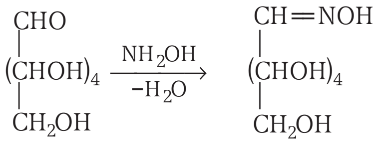
$$\begin{array}{l} CHO \\ | \\ (CHOH)_4 \\ | \\ CH_2OH \end{array} + 2[H] \xrightarrow[\text{Na-Hg}/H_2O]{NaBH_4\text{ or}} \begin{array}{l} CH_2OH \\ | \\ (CHOH)_4 \\ | \\ CH_2OH \end{array}$$

sorbitol

(b) On reduction with HI and red P, it gives a mixture of *n*-hexane and 2-iodohexane.

$$\underset{\text{Glucose}}{C_6H_{12}O_6} \xrightarrow[\Delta]{\text{Red P/HI}} \underset{n\text{-hexane}}{CH_3CH_2CH_2CH_2CH_2CH_3}$$
$$+ \underset{\text{2-iodohexane}}{CH_3CHICH_2CH_2CH_2CH_3}$$

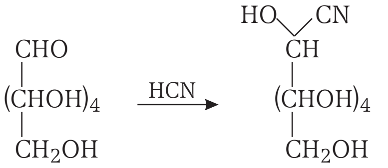
(ii) **Reaction with hydroxylamine** Glucose forms glucose oxime with hydroxylamine.



$$\begin{array}{l} CHO \\ | \\ (CHOH)_4 \\ | \\ CH_2OH \end{array} \xrightarrow[-H_2O]{NH_2OH} \begin{array}{l} CH{=}NOH \\ | \\ (CHOH)_4 \\ | \\ CH_2OH \end{array}$$

glucose oxime

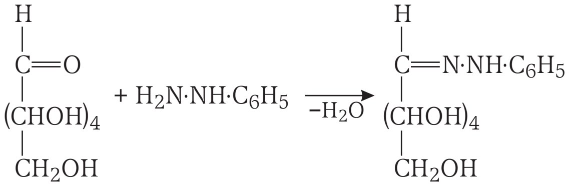
(iii) **Reaction with hydrogen cyanide** An addition product, glucose cyanohydrin is formed.



$$CHO(CHOH)_4CH_2OH \xrightarrow{HCN} CH(OH)(CN)(CHOH)_4CH_2OH$$

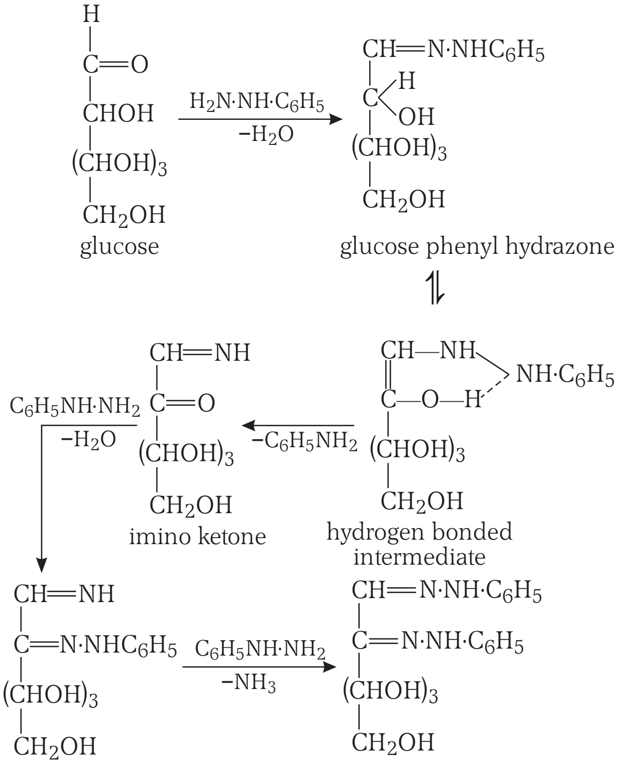
glucose cyanohydrin

(iv) **Reaction with phenyl hydrazine** When treated with equimolar quantities of phenyl hydrazine, glucose yields a phenyl hydrazone.



$$\underset{\text{glucose}}{HC{=}O(CHOH)_4CH_2OH} + H_2N{\cdot}NH{\cdot}C_6H_5 \xrightarrow[-H_2O]{} \underset{\text{glucose phenyl hydrazone}}{HC{=}N{\cdot}NH{\cdot}C_6H_5(CHOH)_4CH_2OH}$$

- However, when glucose is warmed with excess of phenyl hydrazine, crystalline product, glucosazone is formed.



$$\underset{\text{glucose}}{HC{=}O\,CHOH(CHOH)_3CH_2OH} \xrightarrow[-H_2O]{H_2N{\cdot}NH{\cdot}C_6H_5} \underset{\text{glucose phenyl hydrazone}}{CH{=}N{\cdot}NHC_6H_5\,CH(OH)(CHOH)_3CH_2OH}$$

$$\rightleftharpoons \underset{\text{hydrogen bonded intermediate}}{CH{-}NH\cdots NH{\cdot}C_6H_5 \,\|\, C{-}O{-}H\,(CHOH)_3CH_2OH} \xrightarrow{-C_6H_5NH_2} \underset{\text{imino ketone}}{CH{=}NH\,C{=}O(CHOH)_3CH_2OH}$$

$$\xrightarrow[-H_2O]{C_6H_5NH{\cdot}NH_2} CH{=}NH\,C{=}N{\cdot}NHC_6H_5(CHOH)_3CH_2OH \xrightarrow[-NH_3]{C_6H_5NH{\cdot}NH_2} CH{=}N{\cdot}NH{\cdot}C_6H_5\,C{=}N{\cdot}NH{\cdot}C_6H_5(CHOH)_3CH_2OH$$

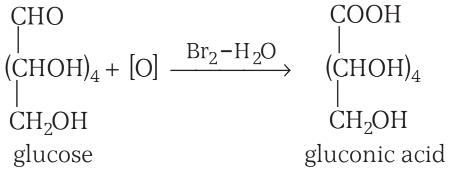
glycosazone
(yellow crystalline solid)

Osazone formation is given by only α-hydroxy aldehyde and α-hydroxy ketones. (Glucose, fructose and mannose form the same osazone, *i.e.,* glucosazone).

Glucosazone is a yellow crystalline solid, sparingly soluble in water and has sharp melting point. Due to these properties, it is used to identify glucose.

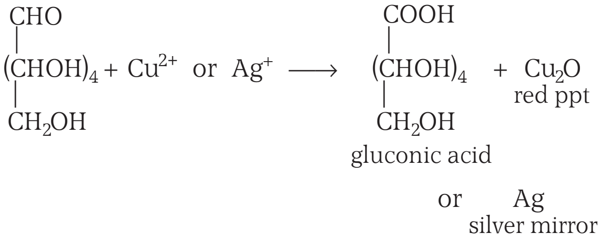
(v) **Oxidation**

(a) With bromine water, glucose gives gluconic acid.



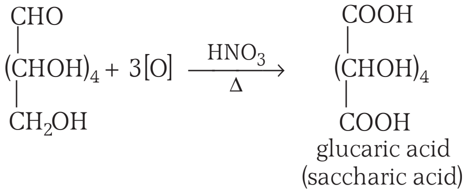
$$\underset{\text{glucose}}{CHO(CHOH)_4CH_2OH} + [O] \xrightarrow{Br_2-H_2O} \underset{\text{gluconic acid}}{COOH(CHOH)_4CH_2OH}$$

(b) Glucose on oxidation with Fehling's solution and Tollen's reagent gives coloured precipetate and gluconic acid.



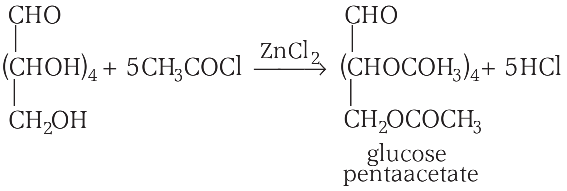
$$CHO(CHOH)_4CH_2OH + Cu^{2+} \text{ or } Ag^+ \longrightarrow \underset{\text{gluconic acid}}{COOH(CHOH)_4CH_2OH} + \underset{\text{red ppt}}{Cu_2O} \text{ or } \underset{\text{silver mirror}}{Ag}$$

(c) On oxidation with strong acids like nitric acid, glucose gives glucaric (saccharic) acid.



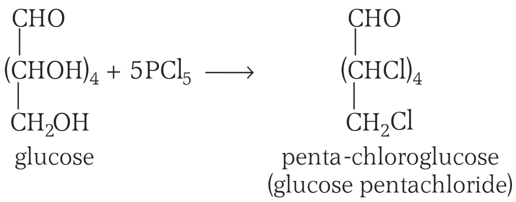
$$CHO(CHOH)_4CH_2OH + 3[O] \xrightarrow[\Delta]{HNO_3} \underset{\text{glucaric acid (saccharic acid)}}{COOH(CHOH)_4COOH}$$

(vi) **Reaction with acetyl chloride** Glucose reacts with acetyl chloride to form glucose penta-acetate.



$$CHO(CHOH)_4CH_2OH + 5CH_3COCl \xrightarrow{ZnCl_2} \underset{\text{glucose pentaacetate}}{CHO(CHOCOH_3)_4CH_2OCOCH_3} + 5HCl$$

(vii) **Reaction with PCl_5** Glucose reacts with PCl_5 to form penta-chloro glucose.

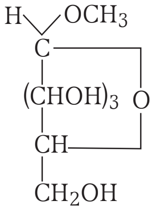


$$\underset{\text{glucose}}{CHO(CHOH)_4CH_2OH} + 5PCl_5 \longrightarrow \underset{\text{penta-chloroglucose (glucose pentachloride)}}{CHO(CHCl)_4CH_2Cl}$$

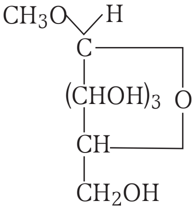
$+ 5POCl_3 + 5HCl$

(viii) **Reaction with methanol** D(+)-glucose when treated with methanol in presence of dry HCl gas, reacts with its one mole only and yields monomethyl ether which is actually a mixture of α- and β- forms indicating that one of the —OH group is different from others.

$$C_6H_{11}O_5 - \boxed{OH + H}\, OCH_3 \xrightarrow{\text{dry HCl}} \underset{\substack{\alpha\text{- and }\beta\text{-methyl} \\ \text{glucoside}}}{C_6H_{11}O_5OCH_3} + H_2O$$

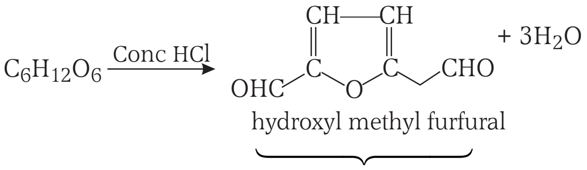


α-methyl-glucoside



β-methyl-glucoside

(ix) **Reaction with conc. HCl** On treatment with conc. HCl, glucose forms hydroxymethyl furfural which further produces laevulic acid.



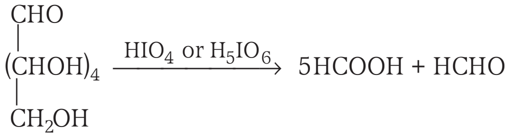
hydroxyl methyl furfural

$CH_3COCH_2CH_2COOH + H_2O$
laevulic acid

(x) **Reaction with metallic hydroxides** Glucose reacts with metallic hydroxides like $Ca(OH)_2$, $Ba(OH)_2$, $Sr(OH)_2$ etc. to form metallic glucosates, which are soluble in water.

$$C_6H_{11}O_5 - \boxed{OH + H}\, O—Ca—OH \longrightarrow \underset{\text{calcium glucosate}}{C_6H_{11}O_5—O—Ca—OH} + H_2O$$

(xi) **Reaction with periodic acid** Periodic acid splits glucose into formic acid and formaldehyde.



$$\begin{matrix} CHO \\ | \\ (CHOH)_4 \\ | \\ CH_2OH \end{matrix} \xrightarrow{HIO_4 \text{ or } H_5IO_6} 5HCOOH + HCHO$$

(xii) **Fermentation** Glucose when fermented by zymase, yields ethanol.

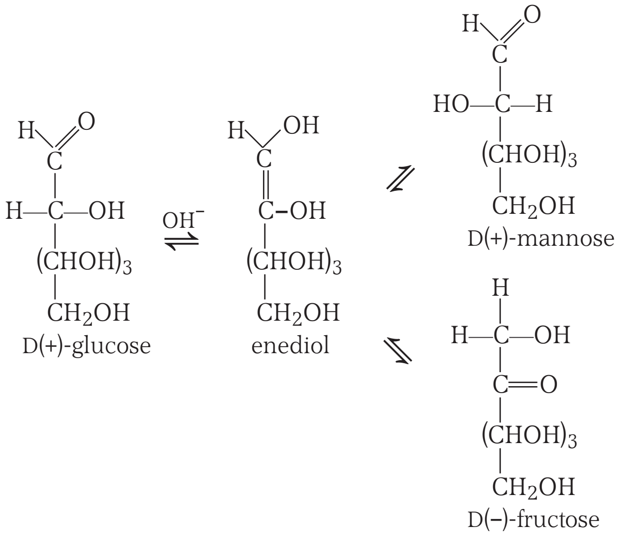
$$\underset{\text{glucose}}{C_6H_{12}O_6} \xrightarrow{\text{Zymase}} 2C_2H_5OH + 2CO_2$$

(xiii) **Dehydration** On strong heating or on treating with warm conc. H_2SO_4, glucose is dehydrated to give a black mass (sugar carbon).

$$C_6H_{12}O_6 \xrightarrow{\text{Conc. } H_2SO_4} \underset{\text{black carbon}}{6C} + 6H_2O$$

(xiv) **Reaction with alkalies** When warmed with conc. alkali, glucose first turns yellow, then brown and finally gives a resinous mass.

A dilute solution of glucose when warmed with dilute alkali, is converted into an optically inactive solution of D(+)-glucose, D(+)-mannose and D(–)- fructose. This is known as **Lobry-de-Bruyn-van Ekenstein rearrangement**,



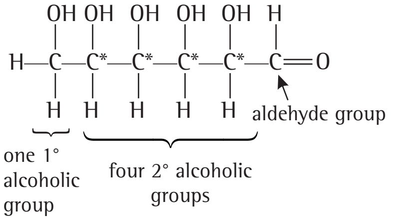
Hot Spot 1

STRUCTURE of Glucose

Structure of glucose is an important topic for JEE main examination. Generally questions are seen from this topic. The level of question is from easy to average.

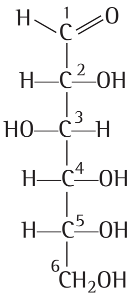
- By the usual analytical methods, the molecular formula of glucose is found to be $C_6H_{12}O_6$.
- Formation of 2-iodohexane and *n*-hexane [Reaction (i)b] indicates that six carbon atoms in glucose are present in a straight chain.
- Formation of glucose penta acetate (Reaction-vi) indicates the presence of 5—OH groups. Since it exists as a stable compound, five —OH groups should be attached to different carbon atoms.
- Formation of glucose oxime and glucose cyanohydrin (reaction (iii) and (iv)) respectively confirms the presence of carbonyl group in glucose.
- Formation of gluconic acid in presence of mild oxidising agent like Br_2—H_2O (Reaction (ii)-a) indicates that glucose contains an aldehydic group. Since aldehydic group is monovalent, it must be present on the end of the chain.

On the basis of point discussed above, it was suggested that glucose has an **open chain structure.** The open chain structure, for the first time, was proposed by **Baeyer.** Glucose contains one —CHO group, one 1° alcoholic group and four 2° alcoholic groups as



(C* = asymmetric centres)

There are four dissimilar chiral carbon atoms in the molecule, but a definite configuration to these asymmetric centres has not been assigned. The configuration of D-glucose was proved by **Emil Fischer.**

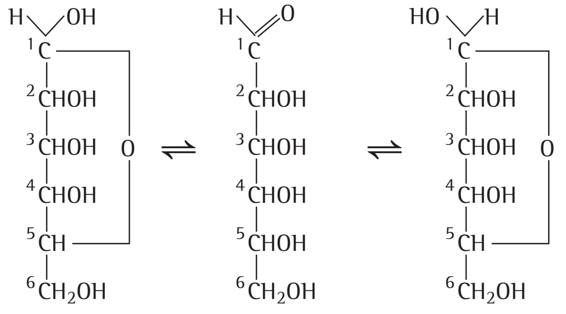


D(+)-glucose

Evidence against open chain structure However, there are some evidences which do not support the open chain structure of glucose. These are

1. Even though an aldedhyde gorup is present, the glucose does not react with $NaHSO_3$, NH_3, 2,4-DNP and Grignard reagent.
2. Glucose does not respond to Schiff's reagent test.
3. Glucose penta-acetate does not react with hydroxyl-amine. This indicates the absence of free —CHO group in glucose.
4. Glucose exists in two stereoisomeric forms *i.e.,* α and β anomers. α-glucose (mp 146°C) with specific rotation +111° is obtained by crystallising glucose from alcohol or acetic acid solution whereas β-glucose (mp 150°C) with specific rotation 19.2° is obtained by crystallising glucose form pyridine solution.
5. An aqueous solution of glucose shows mutarotation, *i.e.,* if either of the two forms is dissolved in water and allowed to stand, the specific rotation of the solution changes gradually until a final value of +52.5° is reached. It means that the specific rotation gradually decreases from +111° to +52.5° in case of α-glucose and increases from +19.2° to +52.5° in case of β-glucose. This phenomena is known as **mutarotation.**

Cyclic Structure of Glucose This behaviour could not be explained by the open chain structure for glucose. It was proposed that one of the —OH groups may add to the —CHO group to form a cyclic hemiacetal structure. According to **Fischer** in this process, glucose forms a stable cyclic hemiacetal between —CHO group and the —OH group of the fifth carbon atom in pyranose structure.

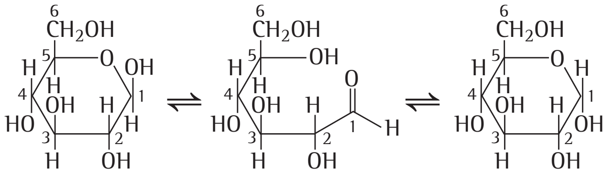


α-D(+)-glucose $[\alpha]_D$ = 111° (36%)

open-chain $[\alpha]_D$ = 52.5° (0.02%)

β-D(+)-glucose $[\alpha]_D$ = 19.2° (64%)

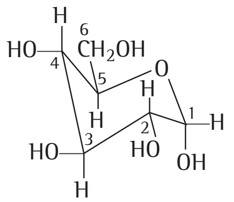
Fischer projections are not the best way to show the structure of a glucose. The cyclic structure of glucose is more correctly represented by **Haworth projection formula.**



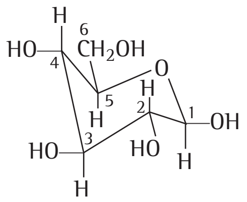
β-D(+)-glucose (64%) Δ(+)-glucose (open chain) (0.02%) α-D(+)-glucose (36%)

The two cyclic hemiacetal forms of glucose differ only in the configurtion of the hydroxyl group at C-1 called anomeric carbon. Such isomers, *i.e.*, α-form and β-form are called anomers.

Glucose is sometimes illustrated as a **chair form** because it is a more accurate representation of bond-angles of the molecule (**Reeves**, 1950).



α-anomer



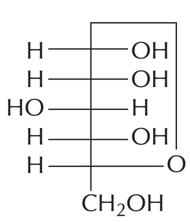
β-anomer (stable)

In β-anomer, the glycosidic hydroxyl group is equatorial and as a general rule, the conformation with greatest number of large groups in equatorial orientation is the most stable form. Thus, β-anomer predominates in the equilibrium mixture. The **boat form** of glucose is unstable.

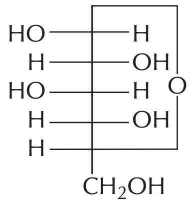
Sample **Problem 3**

Three cyclic structures of monosaccharides are given below which of these are anomers?

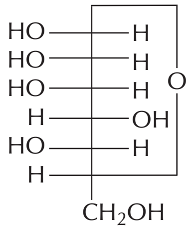
[NCERT Exemplar**]**



(I)



(II)



(III)

(*a*) *I and II* (*b*) *II and III*

(*c*) *I and III* (*d*) *III is anomer of I and II*

Interpret (*a*) Cyclic hemiacetal forms of monosaccharide which differ only in the configuration of the hydroxyl group at C-1 are anomers.

Sample **Problem 4**

Which of the following reactions of glucose can be explained only by its cyclic structure?

[NCERT Exemplar**]**

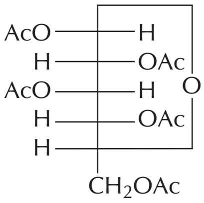
(*a*) *Glucose forms pentaacetate*

(*b*) *Glucose reacts with hydroxylamine to form an oxime*

(*c*) *Pentaacetate of glucose does not react with hydroxylamine*

(*d*) *Glucose is oxidised by nitric acid to gluconic acid*

Interpret (*c*)



Glucose pentaacetate does not have a free —OH group at C-1 and so can't be converted to the open chain form to give —CHO group and hence does not form oxime.

Sample **Problem 5**

Glucose when treated with CH_3OH *in presence of dry* HCl *gas, gives* α- *and* β-*methyl glucosides because it contains*

(*a*) *an aldehydic group* (*b*) —CH_2OH *group*

(*c*) *a ring structure* (*d*) *five* —OH *groups*

Interpret (*c*) Mixture of α- and β-form indicates that one —OH group is different from other which may combine with —CHO group to form intramolecular hemiacetal.

So, this reaction is an evidence for the cyclic structure of glucose in solutions.

Sample **Problem 6**

The optical rotation of the α *form of a pyranose is* +150.7°; *that of* β-*form is* +52.8°. *In solution, an equilibrium mixture of the anomers has an optical rotation of* +80.2°. *The percentage of the* α-*form at equilibrium is*

(*a*) 28% (*b*) 32% (*c*) 68% (*d*) 72%

Interpret (*a*) Let '*a*' and '*b*' be the mole fractions of α and β anomers in equilibrium mixture. Thus,

$$a + b = 1 \quad \text{or} \quad b = (1 - a)$$

$$150.7a + 52.8b = 80.2$$

$$150.7a + 52.8(1 - a) = 80.2$$

$$150.7a + 52.8 - 52.8a = 80.2$$

$$97.9a = 27.4$$

$$a = 0.279 \approx 0.28 = 28\%$$

Hence, $\%$ of α-form = 28%

Fructose

The only important ketohexose is D(–)-fructose (also known as laevulose). In the free state, it is present along with honey and most sweet fruits (berries, melons etc.,), hence named as **fruit sugar.** In the combined state, fructose is present in sucrose and insulin. It is the sweetest monosaccharide.

Methods of Preparation of Fructose

(i) **By hydrolysis of cane sugar with dilute acids.**

$$\underset{\text{cane sugar}}{C_{12}H_{22}O_{11}} + H_2O \xrightarrow{H^+,\Delta} \underset{\text{D(+)-glucose}}{C_6H_{12}O_6} + \underset{\text{D(–)-fructose}}{C_6H_{12}O_6}$$

The solution having equal molecules of D-glucose and D-fructose is termed **invert sugar** and the process is known as inversion.

(ii) **By calcium fructosate**

$$C_6H_{11}O_5\text{—O—Ca—OH} + CO_2 \longrightarrow \underset{\text{fructose}}{C_6H_{12}O_6} + CaCO_3$$

(iii) **From insulin**

$$(C_6H_{10}O_5)_n + nH_2O \xrightarrow{HCl} nC_6H_{12}O_6$$

(Insulin is a polysaccharide which occurs in dahlia tubers and Jerusalem artichokes).

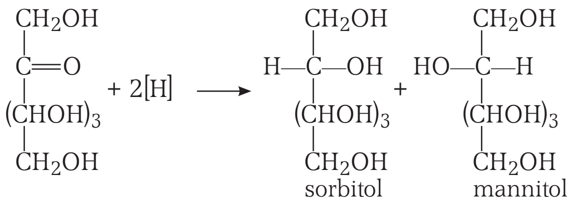
Physical Properties

Fructose is colourless crystalline compound (mp 102°). It is soluble in water and insoluble in benzene and ether. It is less soluble in water than glucose. Like glucose, it also shows mutarotation.

Chemical Properties

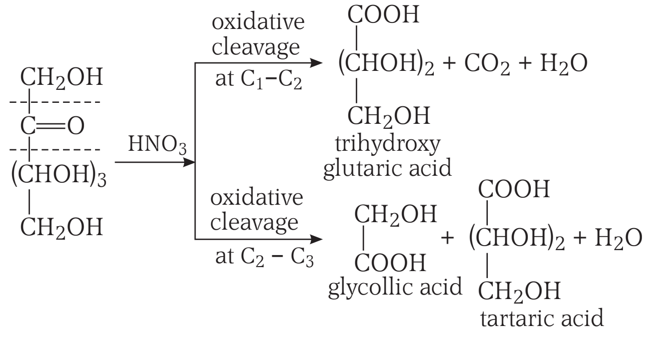
The chemical reactions of fructose are almost similar to those of glucose. The only different behaviour are oxidation and reduction.

(i) **Reduction** On reduction with $NaBH_4$ or $Na\text{–}Hg/H_2O$, fructose forms a mixture of sorbitol and mannitol.



Caution Point *The reduction of glucose with* $NaBH_4$ *forms D-sorbitol while that of fructose forms a mixture of D-sorbitol and D-mannitol* (*they differ in configuration*).

(ii) **Oxidation** Fructose is not oxidised by mild oxidising agent like Br_2 water. However, when oxidised with nitric acid, fructose is converted into a mixture of trihydroxy glutaric, glycollic and tartaric acids.



Since a mixture of acids each containing fewer carbon atoms than fructose is obtained, the carbonyl group in fructose must be a ketonic group.

(iii) **Reducing nature** Unlike ketones, fructose can reduce Fehling's solution and Tollen's reagent. This is probably due to formation of an equilibrium mixture of glucose, mannose and fructose in alkaline solution.

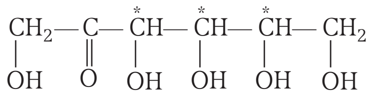
(iv) **Action of conc. HCl**

$$C_6H_{12}O_6 \xrightarrow{HCl} \underset{\text{Laevulinic acid}}{H_3C\cdot CO\cdot CH_2\cdot CH_2\cdot COOH} + \underset{\text{formic acid}}{HCOOH} + H_2O$$

Structure of Fructose

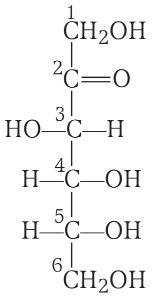
(a) Open Chain Structure of Fructose

The open chain structure of fructose may be represented as below



$$\underset{OH}{CH_2}\text{—}\underset{\|\atop O}{C}\text{—}\underset{OH}{\overset{*}{CH}}\text{—}\underset{OH}{\overset{*}{CH}}\text{—}\underset{OH}{\overset{*}{CH}}\text{—}\underset{OH}{CH_2}$$

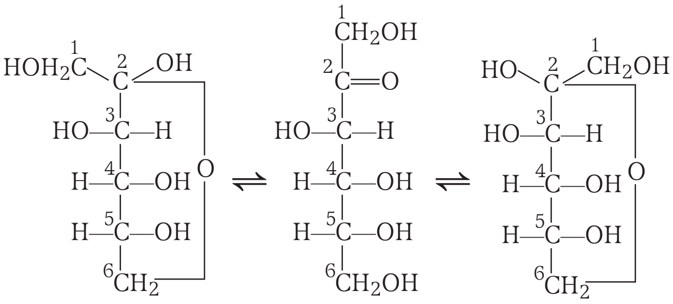
The structure contains three asymmetric carbon atoms and eight optically active forms but only six are known. The configuration of D(–)-fructose is,



D(–)-fructose

(b) Cyclic Structure of Fructose

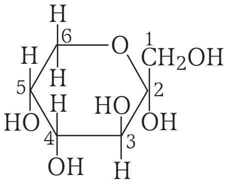
Fructose also has a cyclic structure in aqueous solution, *i.e.*, intramolecular hemiketal. It also exhibit mutarotation.



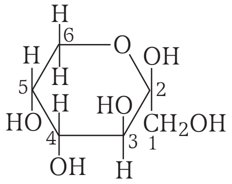
α-D(–)-fructose $[\alpha]_D = -21°$ α-D(–)-fructose $[\alpha]_D = -92°$ β-D(–)-fructose $[\alpha]_D = -133°$

(c) The Haworth Projection Formulae

For the cyclic structure of D(–)-fructose is represented as

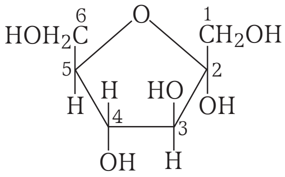


α-D(–)-fructopyranose

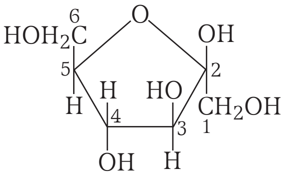


β-D(–)-fructopyranose

However, in the combined state (such as in sucrose) fructose exists in the furanose form.



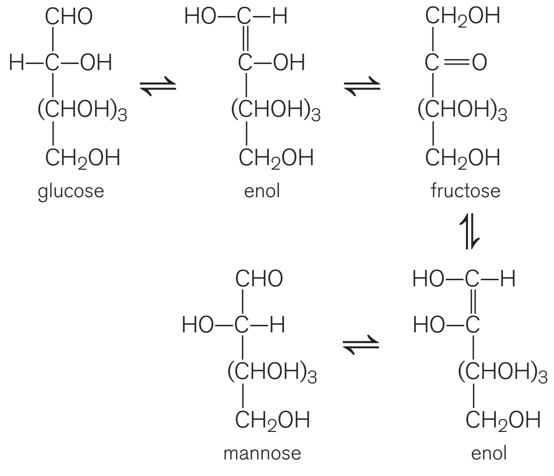
α-D(–) fructofuranose



β-D(–) fructofuranose

In solution, fructose exists as an equilibrium mixture of 70% fructopyranose and about 22% fructofuranose as well as small amounts of the three other forms, including the acylic structure [*i.e.,* D(+)-glucose, D(+)-mannose and D(–)-fructose]

Caution Point *Although fructose contains ketonic group, yet it also reduces Tollen's reagent and Fehling's solution. Dilute solution of alkali present in these reagents converts fructose into an equilibrium mixture of glucose, fructose and mannose. Hence, fructose has reducing property.*



Oligosaccharides : General Features

Molecules of these carbohydrates are made up of a small number of monosaccharide units joined together by glycosidic bonds  $\left(-\overset{|}{\underset{|}{C}}-O-\overset{|}{\underset{|}{C}}-\right)$. Glycosidic bonds are *established during the condensation of monosaccharides. The process is called dehydration synthesis.*

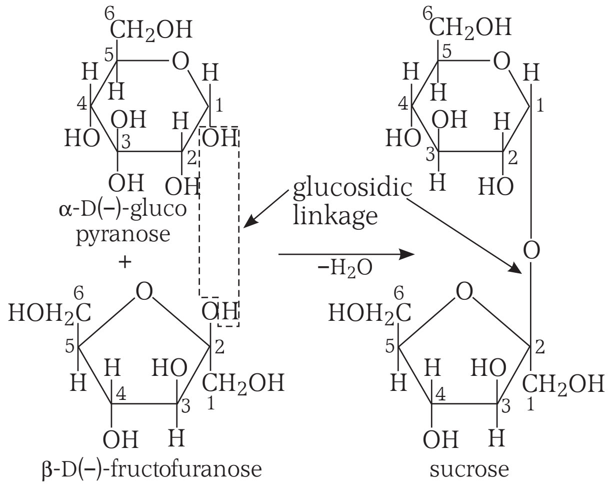
Depending upon the number of monosaccharide molecules condensed to form oligosaccharides, the latter are known as **disaccharides** (*e.g.,* sucrose), **trisaccharides** (*e.g.,* raffinose), **tetrasaccharides** (*e.g.,* stachyrose) etc.

Larger oligosaccharides having branched or unbranched chains often attached to cell membranes.

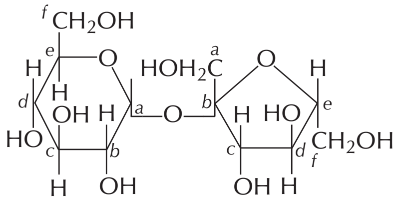
Sucrose ($C_{12}H_{22}O_{11}$)

It is commercial sugar which is also called **cane sugar** because most of it is obtained from sugarcane (16–20%). It also present in sugarbeet (10–15%), pineapple (10–12%), apricot banana, mango and honey.

Preparation It is formed by condensation of one molecule each of glucose and fructose.



Sample Problem 7 *The structure of a disaccharide formed by glucose and fructose is given below. Identify anomeric carbon atoms in monosaccharide units.*



[NCERT Exemplar]

(*a*) *'a' carbon of glucose and 'a' carbon of fructose*
(*b*) *'a' carbon of glucose and 'e' carbon of fructose*
(*c*) *'a' carbon of glucose and 'b' carbon of fructose*
(*d*) *'f' carbon of glucose and 'f' carbon of fructose*

Interpret (*c*) The two cyclic forms of a carbohydrate differ in configuration only of the carbon atom involved in ring formation (hemiacetal carbon). This carbon is called anomeric carbon. Therefore, '*a*' carbon of glucose and '*b*' carbon of fructose is anomeric.

Properties

(i) It is a colourless, odourless, crystalline substance having m.p. 180°C. It is very soluble in water but insoluble in alcohol and ether. It is dextro-rotatory with a specific rotation +66.5°.

(ii) On hydrolysis with dilute acids or invertase or sucrase, it gives an equimolar mixture of D(+)-glucose and D(–)-fructose.

$$\underset{\substack{(+)\text{-sucrose}\\ [a]_D = +66.5^\circ}}{C_{12}H_{22}O_{11}} + H_2O \xrightarrow[\text{enzyme}]{\text{Acid or}} \underset{\substack{D(+)\text{-glucose}\\ [a]_D = +52.7^\circ}}{C_6H_{12}O_6} + \underset{\substack{D(-)\text{-fructose}\\ [a]_D = -92.4^\circ}}{C_6H_{12}O_6}$$

Since, D(–)-fructose has a greater specific rotation than D(+)-glucose, the resulting mixture is laevorotatory. Because of this, the hydrolysis of cane-sugar is known as **the inversion of cane-sugar** and the mixture is known as **invert sugar.** Due to the presence of fructose, invert sugar is sweeter than sucrose. Invert sugar is used to coat chocolate.

Swetening power of common sugars

Fructose > Invert sugar > Sucrose > Glucose > Maltose > Lactose

(iii) On heating (200°C), sucrose melts and on cooling forms a glassy yellow solid known as **barley sugar.** When heated above its melting point, it loses water and gives a brown substance known as **caramel.** On further heating sucrose gets charred to almost pure carbon (sugar charcoal).

(iv) Sucrose on acetylation gives sucrose octaacetate. This shows the presence of eight —OH groups in sucrose.

(v) Sucrose does not form oxime or osazone. This shows the absence of $>C{=}O$ group.

(vi) Sucrose does not reduces Tollen's reagent and Fehling's solution. This shows the absence of —CHO group in sucrose.

(vii) **Fermentation** In the presence of yeast, it yields ethanol and carbon dioxide.

$$C_{12}H_{22}O_{11} + H_2O \xrightarrow{\text{Invertase}} \underset{\text{glucose}}{C_6H_{12}O_6} + \underset{\text{fructose}}{C_6H_{12}O_6}$$

$$\underset{\text{glucose}}{C_6H_{12}O_6} \xrightarrow{\text{Zymase}} \underset{\text{ethanol}}{2C_2H_5OH} + CO_2$$

(viii) On reaction with conc. nitric acid sucrose oxidises to oxalic acid.

$$C_{12}H_{22}O_{11} + 8[O] \xrightarrow{\text{Conc. }HNO_3} \underset{\text{oxalic acid}}{6[COOH]_2} + 5H_2O$$

(ix) With conc. H_2SO_4, sucrose loses water to give sugar charcoal (charring of sugar).

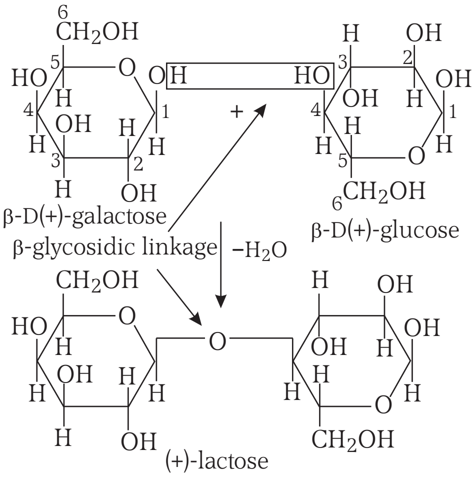
$$C_{12}H_{22}O_{11} + H_2SO_4 \longrightarrow 12C + 11H_2O$$

$$C + 2H_2SO_4 \longrightarrow 2SO_2 + CO_2 + 2H_2O$$

A small of sulphurdioxide is also observed due to reduction of the acid.

Lactose ($C_{12}H_{22}O_{11}$)

It occurs in the milk of all animals (milk-sugar). It is a white crystalline solid (with m.p. 203°C), soluble in water and is dextrorotatory. It is hydrolysed by dilute acid or enzyme lactose, to an equimolar mixture of D(+)-glucose and D(+)-galactose. Lactose is a reducing sugar, forms an oxime and osazone and undergoes mutarotation. It gets hydrolysed by emulsin also, an enzyme which specifically hydrolyses β-1,4-glycosidic linkage.



(+)-lactose

Maltose ($C_{12}H_{22}O_{11}$)

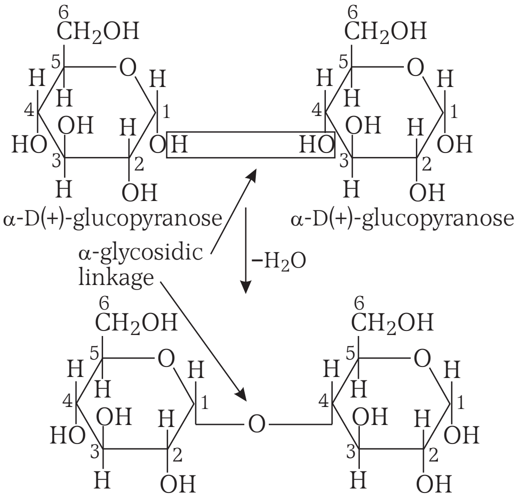
It is obtained by partial hydrolysis of starch by diastase enzyme present in malt, *i.e.,* sprouted barley seeds (hence named **maltose** or **malt sugar**).

$$2(C_6H_{10}O_5)_n + nH_2O \xrightarrow{\text{Diastase}} \underset{\text{maltose}}{nC_{12}H_{22}O_{11}}$$

Properties

(i) Maltose is a white crystalline solid (with m.p. 160°–165°C), soluble in water and dextrorotatory.

(ii) When maltose is hydrolysed with dilute acid or by enzyme maltase, it yields two molecules of D(+)-glucose. Hence, maltose is a condensation product of two α-D-glucose units which are linked by an acetal linkage called α-1,4 glycosidic linkage.



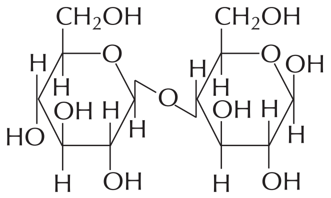
(iii) Maltose is a reducing sugar. It reduces Fehling's solution Tollen's reagent, it forms an oxime and an osazone and undergoes mutarotation. This indicates that at least one aldehyde group is free in it. (Free aldehyde group can be produced at C-1 of second glucose in solution which shows reducing property).

Cellobiose ($C_{12}H_{22}O_{11}$)

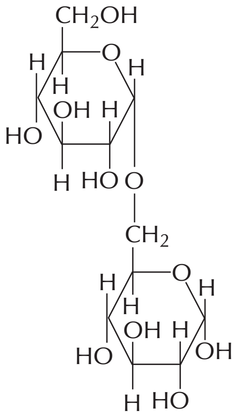
It is obtained by the hydrolysis of cellulose and also contains two D-glucose subunits. These two units are linked together by a β-1,4-glycosidic linkage. Therefore, the only difference in the structures of maltose and cellobiose is the configuration of glucosidic linkage. Like maltose, cellobiose is reducing sugar and undergoes mutarotation.

Sample **Problem 8** *Three structures are given below in which two glucose units are linked. Which of these linkages between glucose units are between* C-1 *and* C-4 *and which linkages are between* C-1 *and* C-6? **[NCERT Exemplar]**

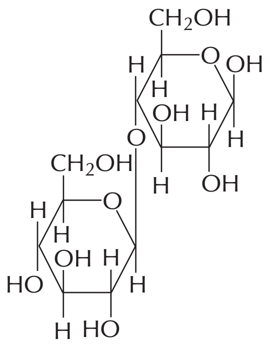
(*A*)



(*B*)



(*C*)



(*a*) *(A) is between* C-1 *and* C-4, *(B) and (C) are between* C-1 *and* C-6

(*b*) *(A) and (B) are between* C-1 *and* C-4. (C) *is between* C-1 *and* C-6

(*c*) *(A) and (C) are between* C-1 *and* C-4, *(B) is between* C-1 *and* C-6

(*d*) *(A) and (C) are between* C-1 *and* C-6, *(B) is between* C-1 *and* C-4

Interpret (*c*) **Structure '*A*'** (structure of maltose) two α-D glucose units are held together by glycosidic linkage between C-1 of one glucose and C–4 of another glucose.

In structure '*B*', glycosidic linkage is in between C-1 of one monosaccharide and C-6 of another monosacccharide.

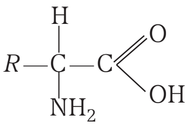
In structure' *C*' , the two monosaccharide units are joined together by glycosidic linkage between C-1 of one unit and C-4 of another unit.

Check Point 1

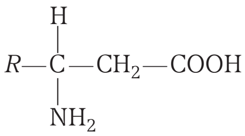
1. Why do glucose, mannose and fructose form identical osazone?
2. Why is D-glucose used for sweetening cold drinks but not hot ones?
3. Why is sucrose called invert sugar?
4. Aldoses give positive test with Tollen's reagent or Fehling's solution but fail to respond Schiff's and bisulphite tests. Explain.
5. Ketones do not reduce Tollen's reagent or Fehling solution but fructose, however has ketonic group, reduces them. Explain.
6. Which monosaccharides from identical osazone on treatment with an excess of phenyl hydrazine and why?

14.2 α-Amino Acids

Bifunctional organic compounds containing carboxylic and amino group either at the same carbon atom or at the nearby carbon atoms are called amino acids. These are the monomers of proteins and properties of a protein mainly depend on the consitituent amino acids. Amino acids can be classified as α, β, γ, δ and so on depending upon the location of the amino group on the carbon chain containing the carboxyl functional group. Some examples are

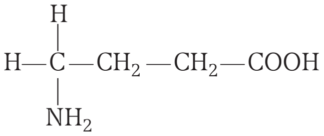


α-amino acid



$R-\underset{NH_2}{\overset{H}{C}}-CH_2-COOH$

β-amino acid



$H-\underset{NH_2}{\overset{H}{C}}-CH_2-CH_2-COOH$

γ-amino acid

Amino acids are also classified as acidic, basic or neutral depending upon the relative number of amino and carboxyl groups in their molecule. Equal number of amino and carboxyl groups makes it neutral; more number of amino groups than carboxyl groups makes it basic and more carboxyl groups than amino groups makes it acidic.

Usually amino acids have primary amino group but proline is a secondary amine.

Natural proteins can be broken down into about 20 different α-amino acids (19α-amino acids and 1α-imino acid). These molecules differ in the nature of the *R*-group attached to the alpha carbon. The *R*–group can be

(i) An aliphatic side chain
(ii) A hydroxyl group containing side chain
(iii) A sulphur atom containing side chain
(iv) A side chain containing acidic (carboxylic) group or their amides
(v) A side chain containing basic groups
(vi) A side chain containing aromatic ring

Sample Problem 9 *Amino acids are classified as acidic, basic or neutral depending upon the relative number of amino and carboxyl groups in their molecule. Which of the following are acidic?*

(*a*) $(CH_3)_2CH-\underset{NH_2}{CH}-COOH$

(*b*) $HOOC-CH_2-CH_2-\underset{NH_2}{CH}-COOH$

(*c*) $H_2N-CH_2-CH_2-CH_2-COOH$

(*d*) $HOOC-CH_2-\underset{NH_2}{CH}-COOH$

Interpret (*b,d*) are acidic amino acids because both of them have more number of —COOH groups than that of —NH_2 group.

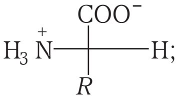
Sample Problem 10 *Lysine,*  $H_2N(CH_2)_4-\underset{NH_2}{CH}-COOH$ *is* **[NCERT Exemplar]**

(*a*) *α-amino acid*
(*b*) *basic amino acid*
(*c*) *amino acid synthesised in body*
(*d*) *β-amino acid*

Interpret (*a,b*) Lysine is α-amino acid because —NH_2 group is attached with α-carbon atom. It is an example of basic amino acid as it has more —NH_2 groups than that of —COOH group.

Stereochemistry of the α-Amino Acids

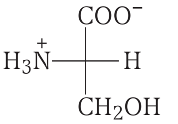
With exception of glycine, all common naturally occurring α-amino acids have an asymmetric α-carbon atom. The chiral amio acids are found within naturally occurring proteins in only one enantiomeric form, which has the following configuration.



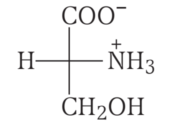
; This configuration is S in all cases except for cysteine.

D and L Configuration for α-amino Acids

If refers to the configuration of the α-carbon regardless of the number of asymmetric carbons in the molecule. A D-amino acid has amino group on right and hydrogen on left when —COOH group is up and side chain is down in a Fischer projection of the α-carbon and a L-amino acid has amino group on left. Naturally occurring amino acids have L-configuration.



L-serine or (S) serine



D-serine or (R) serine

Table 14.1 **Structure of Protein Synthesising Amino Acids**

Group I Side Chains with Aliphatic Carbon Chains				
 Glycine (Gly)	 Alanine (Ala)	 Valine (Val)	 Leucine (Leu)	 Isoleucine (Ile)

Group II-Side Chains With –OH Groups		Group III-Side Chains With S Atoms	
 Serine (Ser)	 Threonine (Thr)	 Cysteine (Cys)	 Methionine (Met)

Group IV-Side Chains With Acid Groups or their Amides			
 Aspartate (Asp)	 Asparagine (Asn)	 Glutamate (Glu)	 Glutamine (Gln)

Group V-Side Chains Contain Basic Groups			
 Arginine (Arg)	 Lysine (Lys)	 Hydroxylysine (Hyl)	 Histidine (His)

Group VI-Side Chains Contain Aromatic Rings		
 Phenylalanine (Phe)	 Tyrosine (Tyr)	 Tryptophan (Trp)

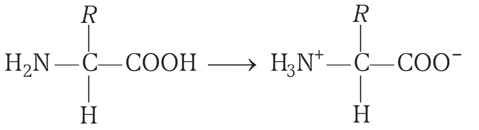
Group VII-Imino Acids	
 Proline (Pro)	 4-hydroxyproline (Hyp)

Essential and Non-Essential Amino Acids

Human body can synthesise 10 out of 20 amino acids found in proteins, these are called **non-essential** or **dispensable amino acids** while the remaining ten, which the human body cannot synthesise, are called **essential** or **indispensable amino acids**. These essential amino acids are required for the growth of the body and their deficiency causes disease like kwashiorkor. The essential amino acids are – Arginine, Valine, Methionine, Leucine, Threonine, Phenylalanine, Histidine, Isolucine, Lysine and Tryptophan.

Zwitter Ion Structure

- Amino acids contain the —COOH group, which is acidic and the —NH_2 group which is basic. In the solid state, an amino acid ordinarily exists as a **Zwitter ion** or as **a bipolar ion,** formed by the transfer of a proton from a —COOH group to an —NH_2 group.



$$H_2N-\underset{\underset{H}{|}}{\overset{\overset{R}{|}}{C}}-COOH \longrightarrow H_3N^+-\underset{\underset{H}{|}}{\overset{\overset{R}{|}}{C}}-COO^-$$

amino acid Zwitter ion form

- Modern researches have proved that the acidic properties of amino acids are due to —NH_3^+ group (which can donate a proton) and basic properties are due to the $-\overset{\overset{O}{\|}}{C}-O^-$ group (which can accept a proton) in a Zwitter ion or 'inner salt'.
- A Zwitter ion behaves like a polar molecule. Within the molecule, there is a (+)ve charge at the nitrogen atom of the amino group and a (–)ve charge at the oxygen atom of the carboxyl group. Overall, the Zwitter ion has no net charge.

Hot Spot 2

ISOELECTRIC Point

Isoelectric point of α-amino acids is also an important topic for JEE Main examination. Generally level of questions based on this topic are from easy to average.

In aqueous solution, Zwitter ions are stable only over a certain pH range. At high H^+ ion concentration (low pH), the $-COO^-$ group picks up a proton and forms a cation (due to the presence of NH_3^+ group) with a (+)ve charge. At low H^+ ion concentration (high pH), the NH_3^+ group loses a proton and forms an anion (due to the presence of $-COO^-$ group) with a (–)ve charge.

$$\underset{\text{cation}}{{}^+NH_3-CH_3COOH} \xleftarrow[\text{Less pH}]{H^+} \underset{\text{Zwitter ion}}{{}^+NH_3-CH_2-COO^-}$$

$$\xrightarrow[\text{More pH}]{} \underset{\text{anion}}{NH_2-CH_2-COO^-}$$

Caution Point *The amino acid can never exist as an uncharged compound at any* pH. *In fairly acidic medium, it exists as cation while in fairly basic medium it exists as an anion. At physiological* pH (≈ 7.3), *an amino acid exists as a dipolar ion called* ***Zwitter ion or inner salt.***

The point (pH range) at which the amino acid molecule has equal positive and negative charges is called the **isoelectric point.** At this point, the amino acids do not migrate in an electric field.

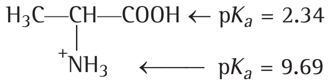
All aminoacids do not have the same isoelectric point. Neutral amino acids have isoelectric point from pH 5.5 to 6.3 (*e.g.,* glycine = 6.1). Acidic amino acids have isoelectric point around 3 (*e.g.,* aspartic acid = 3) and basic amino acids have isoelectric points from pH 7.6 to 10.8 (*e.g.,* Lysine = 9.7)

Amino acids usually shows their lowest solubility in a solution at the isoelectric point, since here, there is a highest concentration of dipolar ion. This property has been used in the separation of different amino acids obtained from the hydrolysis of proteins.

The acidity and basicity constants of amino acids are very low as compared to carboxylic acids and aliphatic amines. The reason being that in α-amino acids, —NH_3^+ and —COO^- groups which acts as acid and base respectively.

α-amino acids have protonated —NH_3^+ group which exerts a strong electron withdrawing inductive effect (–*I* effect) and therefore, increases acid strength. That's why the carboxylic acid groups of the amino acids are so much more acidic (pK_a = 2) than a carboxylic acid such as acetic acid (pK_a = 4.76).

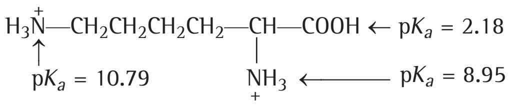
If an amino acid has amino group and one carboxyl group such as alanine, it has two pK_a values. The isoelectric point of this amino acid has the average value of the both pK_a values.



$$H_3C-\underset{\underset{{}^+NH_3\ \longleftarrow\ pK_a = 9.69}{|}}{CH}-COOH \leftarrow pK_a = 2.34$$

$$\text{The isoelectric point, pI} = \frac{2.34 + 9.69}{2} = 6.02$$

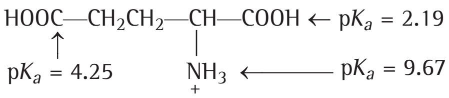
The pI of an amino acid that has an ionisable side chain is the average of the pK_a values of the similarly ionizing group. For example, Lysine :



$$\underset{\uparrow \atop pK_a = 10.79}{\overset{+}{H_3N}}-CH_2CH_2CH_2CH_2-\underset{\underset{+}{NH_3}\ \longleftarrow\ pK_a = 8.95}{\underset{|}{CH}}-COOH \leftarrow pK_a = 2.18$$

$$pI = \frac{8.95 + 10.79}{2} = 9.87$$

Glutamic acid :



$$\underset{\uparrow \atop pK_a = 4.25}{HOOC}-CH_2CH_2-\underset{\underset{+}{NH_3}\ \longleftarrow\ pK_a = 9.67}{\underset{|}{CH}}-COOH \leftarrow pK_a = 2.19$$

$$pI = \frac{2.19 + 4.25}{2} = 3.22$$

Sample Problem 11 *The isoelectric point or* pI *of an amino acid or a protein is*

(a) *the* pH *at which the amino acid or protein has no net charge*

(b) *zero at* pH 7.0

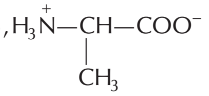
(c) *the* pH *at which the amino or protein is neither hydrophobic nor hydrophilic*

(d) *The measure of the hydropathy of an amino acid or protein.*

Interpret (*a*) At isoelectric point, an amino acid exist only as Zwitter ion giving net charge equal to zero.

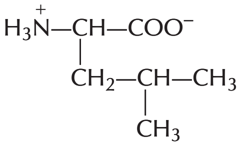
Sample Problem 12 *In which of the following case, the forms of amino acid and* pH *is not correctly matched?*

(*a*) *Alanine* : pH = 3,



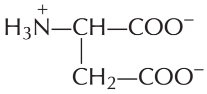
$$\overset{+}{H_3N}-\underset{\underset{CH_3}{|}}{CH}-COO^-$$

(*b*) *Leucine* : pH = 10,



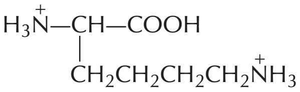
$$\overset{+}{H_3N}-\underset{\underset{CH_2-\underset{\underset{CH_3}{|}}{CH}-CH_3}{|}}{CH}-COO^-$$

(*c*) *Aspartic acid* : pH = 9,



$$\overset{+}{H_3N}-\underset{\underset{CH_2-COO^-}{|}}{CH}-COO^-$$

(*d*) *Lysine* : pH = 3,



$$\overset{+}{H_3N}-\underset{\underset{CH_2CH_2CH_2CH_2\overset{+}{N}H_3}{|}}{CH}-COOH$$

Interpret (*a*) Isoelectric point for neutral amino acids ranges from pH 5.5 to 6.3. Acidic amino acids have isoelectric point around 3 while basic amino acids have ranges from pH 7.6 to 10.8. At isoelectric point amino acid exist as Zwitter ion. At low pH it exists as cation and at high pH it is exists as anion. Hence, alanine (pH = 3) will exists as cation.

Sample Problem 13 *Give the* pOH *range for isoelectric point of the amphoteric ion of an amino acid*

(*a*) 5.5 *to* 6.3
(*b*) 2.5 *to* 5.0
(*c*) 7.7 *to* 8.5
(*d*) 9.0 *to* 10.7

Interpret (*c*) The pH at which a particular amino acid does not migrate under the influence of an electric field is called isoelectric point of that amino acid. The pH range for the isoelectric point is from 5.5 to 6.3 or the pOH range for the isoelectric point is from 7.7 to 8.5.

Check Point 2

1. The amino acids in water acts as an ampholyte. Explain.
2. In an electric field, the amino acids migrates towards cathode when pH is below the isoelectric point while it migrates towards anode when pH is higher than isoelectric point. Explain.
3. How does the proline differ from the other α-amino acids in structure?
4. Give reason, "amino acids have relatively higher melting point as compared to corresponding halo acids".
5. The monoamino monocarboxylic acids have two pK values. Explain.
6. Amino acids behave like salts rather than simple amines or carboxylic acids. Explain. **[NCERT Exemplar]**

14.3 Proteins

The term protein is derived from the Greek word 'proteios' meaning of the 'first rank' because the proteins are ranked first amongst the natural polymer essential for the growth and maintenance of life. These are, infact the polymers of amino acids (specifically α-amino acids) and make up to 15% by mass of our body.

The chief sources of proteins are pulses, cheese, milk, egg, peanut, fish, meat etc. The protein content of these sources are

Soyabean (pulse)	= 54%
Meat	= 22%
Egg	= 14%
Wheat	= 12%
Milk	= 4%

Table 14.2 **Examples of Some Proteins and Their Biological Functions**

S.N.	Class of proteins	Example	Function
1.	Structural proteins	Collagen	Connective tissue
2.	Enzumes	DNA polymerase	Replicate and repair DNA
3.	Transport protein	Haemoglobin	Transportation of respiratory gases (O_2 and CO_2)
4.	Contractile protein	Active myosin	Responsible for contraction of muscles
5.	Protective proteins	Antibodies	Complex with foreign proteins
6.	Hormones	Insulin	Regulate glucose metabolism
7.	Toxins	Snake venom	Incapcitate prey

Proteins are important components of most foods. In the digestive system, proteins are broken down into small molecules called **α-amino acids.** These molecules are then reassembled in cells to form other proteins required by the body.

- A pure protein is tasteless, odourless and colourless. Chromoproteins are coloured. Most of proteins are hydrophilic. They do not have sharp melting point.
- All proteins on partial hydrolysis give peptide of varying molecular masses, which on complete hydrolysis gives α-amino acids.

$$\text{Proteins} \xrightarrow{\text{Hydrolysis}} \text{Peptides} \xrightarrow{\text{Hydrolysis}} \alpha\text{-amino-acids}$$

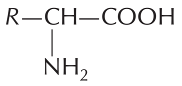
- All the proteins are laevorotatory due to the presence of asymmetric carbon in α-amino acids.

Sample Problem 14 *Amino acids can be classified as α-, β-, γ-, δ-, and so on depending upon the relative position of amino group with respect to carboxyl group. Which type of amino acids form polypeptide chain in proteins?*

[NCERT Exemplar]

(a) *α-amino acids* (b) *β-amino acids*
(c) *γ-amino acids* (d) *δ-amino acids*

Interpret (a) Because on complete hydrolysis, proteins give α-amino acids.

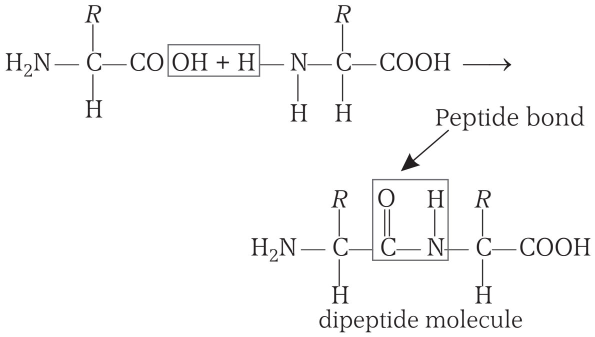


$$R-\underset{\underset{NH_2}{|}}{CH}-COOH$$

Peptide Bond and Protein Structure

Amino acids may be joined together by an amide linkage called **peptide linkage** (—CO—NH—). A water molecule is always eliminated in forming a peptide linkage.

The parts of amino acids in a peptide (after liberation of water molecules) are called **amino acid residues.**



$$H_2N-\underset{\underset{H}{|}}{\overset{\overset{R}{|}}{C}}-CO\boxed{OH + H}-\underset{\underset{H}{|}}{N}-\underset{\underset{H}{|}}{\overset{\overset{R}{|}}{C}}-COOH \longrightarrow$$

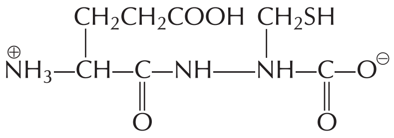
Peptide bond

$$H_2N-\underset{\underset{H}{|}}{\overset{\overset{R}{|}}{C}}-\boxed{\overset{\overset{O}{\|}}{C}-\overset{\overset{H}{|}}{N}}-\underset{\underset{H}{|}}{\overset{\overset{R}{|}}{C}}-COOH$$

dipeptide molecule

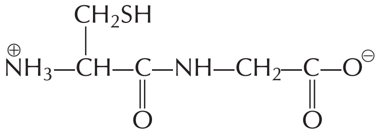
- Peptide are amides formed by the condensation of amino group of one α-amino acid with the carboxyl group of another molecule through peptide linkage, with the elimination of a molecule of water.
- The molecule derived from two amino acids containing a single peptide linkage is called a **dipeptide,** that derived from three amino acids is termed as a **tripeptide.** The peptides having 2-10 amino acid residues are called **oligopeptides** while those with greater than 10 amino acid residues are called **polypeptides**.

Sample Problem 15 *A tripeptide (X) on partial hydrolysis gave two dipeptides Cys-Gly and Gly-Cys i.e.,*



$$\overset{\oplus}{N}H_3-\overset{\overset{CH_2CH_2COOH}{|}}{CH}-\underset{\underset{O}{\|}}{C}-NH-\overset{\overset{CH_2SH}{|}}{NH}-\underset{\underset{O}{\|}}{C}-O^{\ominus}$$

and

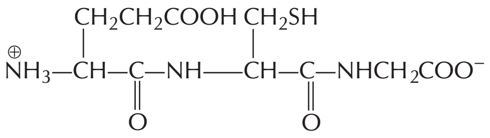


$$\overset{\oplus}{N}H_3-\overset{\overset{CH_2SH}{|}}{CH}-\underset{\underset{O}{\|}}{C}-NH-CH_2-\underset{\underset{O}{\|}}{C}-O^{\ominus}$$

Identify tripeptide.

(a) *Gly-Cys-Gly* (b) *Gly-Gly-Cys*
(c) *Cys-Gly-Glu* (d) *Glu-Cys-Gly*

Interpret (d) Since the tripeptide on hydrolysis give two dipeptides, Glu-Cys and Cys-Gly, hence cystein must be in between glutamic acid and glycine.



$$\overset{\oplus}{N}H_3-\overset{\overset{CH_2CH_2COOH}{|}}{CH}-\underset{\underset{O}{\|}}{C}-NH-\overset{\overset{CH_2SH}{|}}{CH}-\underset{\underset{O}{\|}}{C}-NHCH_2COO^-$$

Glu-Cys-Gly

- **Polypeptide** with molecular weight greater than 10,000 u is termed as a **protein**. Proteins generally have more than 70 amino acid residues, but a polypeptide with fewer α-amino acids may also be called a **protein** if it has a well defined conformation characteristic of a protein such as insulin (contains 51 amino-acids).

- Polypeptides are amphoteric in nature because of the presene of terminal ammonium and carboxylate ions as well as the ionised side chains of amino acid residues. Therefore, like α-amino acids, they neutrlise both acids as well as bases and possess isoelectric point. At isoelectric points, polypeptides have least solubility and hence can be separated.

Composition of Proteins

An approximate composition of proteins is as follows :

Carbon = 50 – 53%
Oxygen = 23 – 25%
Nitrogen = 16 – 17%
Hydrogen = 6 – 7%
Sulphur = 1%

Other elements such as phosphorus in nucleoproteins, iron in haemoglobin and iodine in thyroid are also present.

Classification of Proteins

Proteins can be classfied on the basis of their chemical composition and functions or on the basis of their physical properties.

(I) **Based on the molecular structure and the function they perform,** proteins can be further classified as

(i) **Fibrous proteins** These are long and thread like molecules and tend to lie side by side to form fibres. They are held together by intermolecular H-bonding and hence insoluble in water *e.g.,* keratin (in hair, skin, nails, horn and wool), fibroin (in silk) and myosin (in muscle).

(ii) **Globular proteins** Molecules of globular proteins are folded with spheroidal shapes. The folding takes place in such a way that the lipophilic parts are turned inward and hydrophilic parts tend to move towards the surface, Hydrogen bonding is chiefly intramolecular. Hence, they are soluble in water, acids, bases and salts *e.g.,* albumin (in eggs), haemoglobin (in blood), all enzymes and most hormones (insulin).

(II) **On the basis of their physical properties,** proteins can be classified as

(a) **Simple proteins** They give only amino acids on hydrolysis, *e.g.,* albumin, globulins.

(b) **Conjugated proteins** These contain a non-protein part (prosthetic group). The prosthetic group in a protein controls its biological functions. The common prosthetic group in the proteins are tabulated below

Table 14.3 **Examples of Some Conjugated Proteins**

S.N.	Name of protein	Prosthetic group
1.	Glyco-protein	Sugars (carbohydrates)
2.	Nucleo-protein	Nucleic acid
3.	Lipo-protein	Lipid
4.	Phospho-proteins	Phosphoric acid
5.	Chromo-protein	Pigments having metals Cu, Fe (haemoglobin)

(c) **Derived proteins** These are obtained by the hydrolysis of higher proteins with acids, alkalies or enzymes. *e.g.*, peptones, proteases and denatured proteins.

Structure of Proteins

The structure of protein is studied under different levels as primary structure, secondary structure, tertiary structure and quaternary structure.

(a) Primary Structure

The number and sequence of amino acids in the polypeptide chain constitute the primary structure. It shows how the atoms in protein molecule are joined to one another through covalent bonds to form chains. **Fredrick Sanger,** for the first time determined the amino acid sequence of a protein (*i.e.,* insulin) and for this work he was awarded by the Nobel Prize (in 1958). The nature and the sequence of the amino acids determines the three dimensional structure and properties of proteins.

Determination of sequence of amino acids in a peptide chain It can be determined either by analyzing the products of partial hydrolysis or by end group analysis.

(i) **Partial hydrolysis** In partial hydrolysis method, dilute acids or enzymes are used to break the polypeptide chain into small fragments. By knowing the structures of these small fragments, the sequence of amino acids in a polypeptide chain is determine. For example, partial hydrolysis of a tetra peptide containing Ala, Gly, Phe and Val yields a tripeptide Gly–Phe–Val and a dipeptide Ala–Gly.

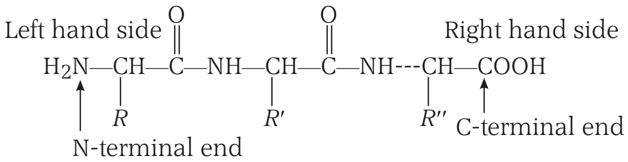
$$\text{Tetrapeptide} \xrightarrow{\text{Hydrolysis}} \text{Gly–Phe–Val} + \text{Ala–Gly}$$

Since, dipeptide shows that Ala is linked to Gly, the amino acids in the tetrapeptide are linked in the following sequence.

$$\text{Ala}\underset{1.}{\mid}\text{Gly}\underset{2.}{\mid}\text{Phe—Val}$$

Cleavage at 1. gives tripeptide and at 2. gives dipeptide.

(ii) **Terminal residue analysis or End group analysis** Peptide structures are written in such a way that the amino group is at the left and carboxy group is at the right. Hence, the amino end is called the N-terminal and carboxy end is called C-terminal. Amino groups of all amino acids except N-terminal amino acid and carboxy group of all amino acids except C-terminal amino acid are involved in amide bond formation. In other words, amino group is free at the N-terminal end and carboxy group is free at the C-terminal end.



$$H_2N-\underset{R}{\underset{|}{CH}}-\overset{O}{\overset{\|}{C}}-NH-\underset{R'}{\underset{|}{CH}}-\overset{O}{\overset{\|}{C}}-NH\text{---}\underset{R''}{\underset{|}{CH}}-COOH$$

The primary structure of proteins dissolved in water is not disrupted by heating above 80°C. The difference in chemical and biological properties of various proteins and peptides arise due to the difference in their primary structure. *e.g.,* in haemoglobin (blood protein) which carries oxygen, there are 574 amino acid units in a definite sequence but the replacement of only one α-amino acid results in defective haemoglobin. This is the cause of a disease, called **sickle cell anaemia.** In the patients suffering from this disease, the defective haemoglobin precepitates causing the cells to sickle shaped and sometimes even makes them burst leading ultimately to death. Normal haemoglobin has–Val–His–Len–Thr–Pro–Glu–Lys. On the other hand, sickle cell haemoglobin structure.

Val–his–Len–Thr–Pro–Val–Glu–Lys structure.

(b) Secondary Structure

Most of the long polypeptide chain are folded or coiled to produce specific three-dimensional structures. These are called **secondary structure** and give idea about shape of the conformation of the protein molecule. Depending upon the size of *R* groups, three major types of secondary structure (α-helix, β-conformation, β-pleated sheet and triple-helix) have been identified.

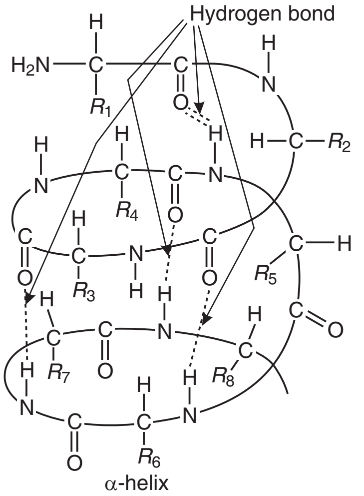


Fig. 14.1 α-helix structure of proteins

- Imagine, you can coil a polypeptide chain around an invisible rod. This results in a structure called a **helix.** The most common form of coiling is the right handed **α-helix.** In α-helix, the size of *R* groups is quite large and H-bonds are formed between the $>$C=O of one amino acid and the ($>$N—H) of the fourth amino acid residue in the chain. Only right handed α- helix exists in nature, since it is more stable than left handed helix. In this form, there are 3.6 amino acid residues per complete turn. The rise along the central axis is 1.5 Å per residue.
- The structure is stabilized by intramolecular hydrogen bonds between an amide hydrogen ($>$N—H group) and the carbonyl oxygen ($>$C=O group) of the fourth amino acid residue away in the peptide chain.

$$>C{=}O\text{---}H{-}N<$$

- Although the hydrogen bond is fairly weak, their large number stabilizes the structure. The imino acid, **proline** along with amino acids **glycine, serine** do not fit into the normal α-helix. They disrupt the α-helical structure and cause **sharp bends** in the direction of the chain. They are called **helix-breakers.** α-helix is found in both fibrous and globular proteins. Fibrous proteins such as α-keratin in hair, nail, wool, skin, beaks, claws and myosin in muscle have α-helix structure. Globular proteins also contain segments of α-helix, because of the α-helical structure, human hair fibres are stretchable and elastic to some extent. When hair is stretched, the H-bonds are broken but when the stretching force is removed, the H-bonds are reformed.

Sample **Problem 16** *Proteins are found to have two different types of secondary structures viz α-helix and β-pleated sheet structure. α-helix structure of protein is stabilised by*

[NCERT **Exemplar]**

(*a*) *peptide bonds*
(*b*) *van der Waals' forces*
(*c*) *hydrogen bonds*
(*d*) *dipole-dipole interaction*

Interpret (*c*) In α-helix, hydrogen bonds are present between —NH group of one amino acid residue to the $>$C=O group of another amino acid residue.

- **β-conformation** (β-pleated sheet) results from hydrogen bonding between two peptide chains. In this conformation, the polypeptide chains lie side by side in a *zig-zag* manner with alternate —*R* groups on the same side situated at fixed distances apart. The chains may be parallel or antiparallel. In a parallel chain β-pleated sheet, the N-atoms point in the same direction, while in the antiparallel chain β-pleated sheet, alternate chains are oriented in the same direction. The antiparallel structure permits maximum hydrogen bonding. The β-conformation is found in fibrous proteins.

- Keratin protein (present in hair) has parallel β-pleated sheet structure while the silk protein, fibroin has anti-parallel β-pleated sheet structure.

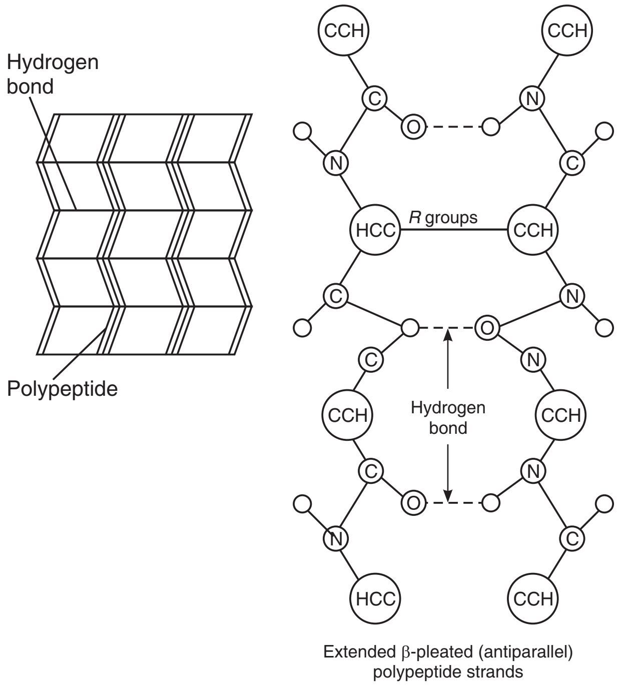

Fig. 14.2 β-pleated structure

- Three loosely coiled helical polypeptide chains can wind around each other to form a stiff cable. This rod like structure is called a **triple helix.** It is very strong and relatively rigid. The triple helix is found mainly in collagen, the major structural protein of skin, bones, teeth, tendons and cartilage. It can be seen that the triple helix structure is more extended and stabilised by hydrogen bonds between the chains, while in the α-helix, it is between the amino acid residues in the same chain.

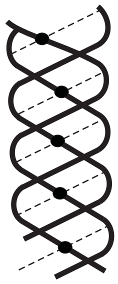

Fig. 14.3 Triple helix

- A protein may have the different secondary structures throughout its length. Some parts may have α-helix structure, while other may have β-pleated sheet structure. Some parts of the chain may even have no secondary strcutrue at all. These structureless parts are called **random coils** and the arrangement is called **random coil arrangement.** This type of structure is flexible, changing and statistically random. Synthetic polylysine exists as a random coil.

(c) **Tertiary structure** The tertiary structure of a protein is its three dimensional shape that arises from further foldings of its polypeptide chains, foldings superimposed on the coils of the α -helixes. This folding brings together **active amino acids,** which are otherwise scattered along the chain, and may form a distinctive **cavity** or **cleft** in which the substrate is bound. At normal pH and temperature, each protein will take up a tertiary structure that is energetically most stable. In proteins consisting of a single polypeptide chain, the tertiary structure determines the overall shape of the molecule. So, proteins are called **fibrous proteins** when they form thin, long threads and **globular proteins,** if very compact.

- The tertiary structure is specific to a given amino acid sequence and is called the native shape of the protein. Thus, primary structure of a protein dictates its tertiary structure.

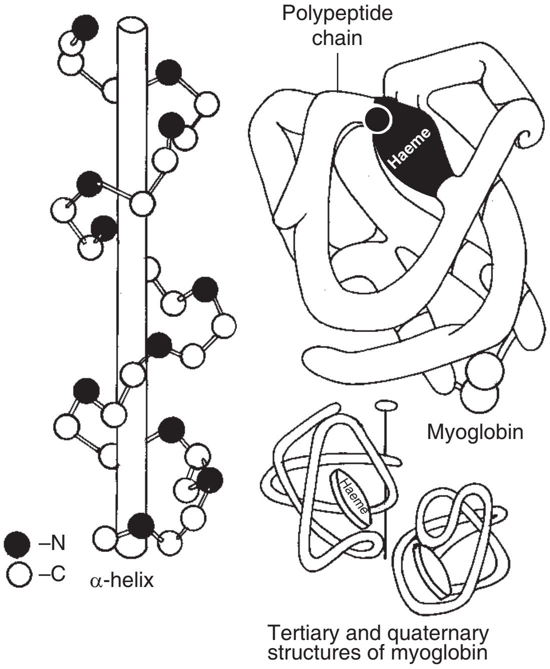

Fig. 14.4 Structure of proteins

(d) Quaternary Structure

It is shown by proteins containing more than one polypeptide chain. Two or more polypeptide chains may associate to give rise to the quaternary structure. These are held together by non-covalent forces such as hydrogen bonds, electrostatic interactions and van der Waals' interactions.

If the protein consists of identical units it is said to have a **homogeneous quaternary structure**, *e.g.,* the isozymes H_4 and M_4 of **lactic dehydrogenase** (LDH) and the enzyme phosphorylase. If the units are dissimilar, the protein is said to have a **heterogeneous quaternary structure,** *e.g.,* haemoglobin which consists of two α chains and two β chains.

Denaturation of Proteins

A protein that is in a biologically inactive form is said to be in a denatured state. The conformational change that produces this state is called **denaturation of proteins.** Denatured proteins usually forms large aggregates that are precipitated from solution. This process is called **coagulation. During denaturation no peptide bonds are broken,** *i.e.,* chemical composition or primary structure remains unaffected.

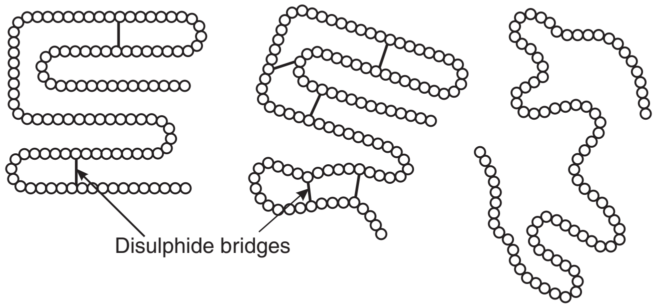

Fig. 14.5 Denaturation of proteins

The relatively weak, non-covalent interactions are disrupted in the denaturation of a protein.

The following can bring about the denaturation of proteins

(a) **Heat** When you fry or boil an egg, you bring about a denaturation of egg proteins. The reason why bacteria are destroyed at high temperatures that exist in an autoclave is that their proteins are denatured.

(b) **Exposure to organic solvents** Organic solvents such as ethanol and rubbing alcohol can denature proteins. Alcohol is rubbed on the skin, before an injection to kill surface bacteria by denaturing bacteria proteins, thus preventing infection.

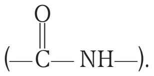
(c) **Exposure to acid and bases** Strong acids and bases can denature proteins by disrupting salt bridges and hydrogen bonds. Prolonged treatment with strong acids will bring about hydrolysis of peptide bonds of a protein.

(d) **Exposure to salts of heavy metal ions** Cation of metals such as Hg^{2+}, Ag^{+} and Pb^{2+} interfere with the disulphide bonds and salt bridges that stabilize the protein structure and bring about denaturation. Hence, mercury and lead are poisonous to the human system as they denature proteins in the body. (The first aid treatment for a person who has ingested a heavy metal is to give a large dose of egg whites or milk, both of which are rich in proteins. The proteins in them form complexes with the heavy metals in the stomach, temporarily preventing absorption of the metals into the blood. The patient should later be given an emetic to get rid of the poison.)

Test for Proteins

With the help of following tests, presence of proteins can be checked.

(i) **Biuret test** Protein is gently warmed with 10% solution of NaOH and then a drop of dil. $CuSO_4$ solution is added. Formation of reddish-violet colour indicates the presence of peptide linkage



$(-\overset{\overset{O}{\|}}{C}-NH-)$.

This test is also given by the compound biuret, obtained by urea on heating.

(ii) **Xanthoprotic test** Certain proteins give yellow colour with conc. HNO_3. This yellow colour is same which is formed on skin when skin comes on contact with conc. HNO_3.

(iii) **Millon's test** When Millon's reagent (a solution of mercurous and mercuric nitrates in nitric acid containing some nitrous acid) is added to a protein solution, a white precipitate is obtained. On heating it turns to red precipitate or colour.

(iv) **Ninhydrin test** When a protein is boiled with a dilute solution of ninhydrin, a violet colour is obtained.

This test is given by all proteins.

(v) **Nitroprusside test** When sodium nitroprusside is added to proteins containing —SH group, a violet colour is obtained.

Sample **Problem 17** *Proteins when heated with conc.* HNO_3 *give a yellow colour. This is*

(a) *Hoppe's test*
(b) *acid-base test*
(c) *Biuret's test*
(d) *Xanthoprotic test*

Interpret (*d*) Protein + conc. $HNO_3 \xrightarrow{\Delta}$ yellow colour

This test is called Xanthoprotic test. It is given by those proteins which consists of α-amino acid containing benzene ring, *e.g.,* tyrosine.

Check Point 3

1. Why do polypeptide have amphoteric nature? **[NCERT Exemplar]**
2. Coagulation of egg white on boiling is an example of denaturation of proteins. Explain it in terms of structural changes. **[NCERT Exemplar]**
3. Explain the terms primary and secondary structure of proteins. What is the difference between α-helix and β-pleated sheet structure of proteins? **[NCERT Exemplar]**
4. Why are bacteria destroyed at high temperature?
5. Why is alcohol rubbed on the skin, before an injection?

14.4 Enzymes

Kuhne (1878) coined the term enzyme. **Buchner** (1897, 1903) isolated enzmes (including zymase from yeast for the first time). **Sunner** found that enzymes are protinaceous. He crystallised the first enzyme, urease from jack bean.

An enzyme is a specialised protein produced within an organism which is capable of catalysing a specific chemical reaction. Since the enzymes act as catalyst, they are sometimes referred to as **biocatalysts.** A catalyst alters the rate of a chemical reaction, usually without undergoing any change itself. In this respect an enzyme differs from a normal catalyst. The enzyme may participate in a reaction by combining with the substrate. Ultimately, however, it is set free.

Some examples of enzymes along with the reaction, they catalyse are as follows

Table 14.4 **Enzymes**

S.N.	Enzymes	Reaction catalyse
1.	Amylase	Starch to *n* glucose
2.	Maltase	Maltose to (2) glucose
3.	Lactase	Lactose to glucose + galactose
4.	Invertase	Sucrose to glucose + fructose
5.	Pepsin	Proteins to amino acids
6.	Trypsin	Polypeptides to α-amino acids
7.	Urease	Urea to ammonia + CO_2
8.	Nuclease	DNA, RNA to nucleotides
9.	Carbonic anhydrase	H_2CO_3 to $H_2O + CO_2$
10.	DNA polymerase	Deoxyribonucleotide triphosphate to DNA
11.	RNA polymerase	Ribonucleotide triphosphate to RNA

Nomenclature and Classification of Enzymes

Enzymes are generally named by adding **-ase** to the root indicating the substrate on which the enzyme acts. This system was provided by **Duclau x** (1883). Thus, **fumarase** catalyses the conversion of fumaric acid to malic acid.

- The **International Union of Biochemistry report of 1962** (revised in 1964) contains a scheme for the classification of enzymes. *Enzymes have been divided into following six groups, viz.*

(a) Oxidoreductases

They include a large number of enzymes (221 are listed). They bring about the main energy yielding reactions of living tissue. Oxidoreductases include **oxidases** and **dehydrogenases.** They act by transferring electrons and hydrogen ions.

(b) Transferases

They are concerned with the transfer of a group of atoms from one molecule to another. Oxidoreductases and transferases together represent over half the enzymes known.

(c) Hydrolases

Complex molecules undergo cleavage, and the elements of H_2O are added across the bond cleaved by the action of hydrolases.

(d) Lyases

They may work in two ways. A group of atoms may be removed from the substrate leaving double bonds, or groups may be added to double bonds without hydrolysis, oxidation or reduction. The enzymes act on the following bonds : C—C, C—O, C—N, C—S and C—*X*.

(e) Isomerases

They catalyse reactions which bring about intramolecular rearrangement of atoms in substrates.

(f) Ligases (Synthetases)

They catalyse reactions in which the pyrophosphate bond of ATP is broken down and linkage takes place between two molecules. These enzymes form the following bonds : C—O, C—S, C—N and C—C.

Table 14.5 **Types of Reactions Shown by Enzymes**

S.N.	Enzymes	Reactions
1.	Oxidoreductases	Oxidation-reduction reactions
2.	Transferases	Group transfer reactions
3.	Hydrolases	Hydrolytic reactions (addition of H_2O)
4.	Lyases	Addition or loss of groups to double bonds
5.	Isomerases	Isomeration reactions
6.	Ligases	Synthesis by condensation of two groups requiring ATP

- In another system of classification, the name of the enzyme is derived from its substrate *e.g.,* carbohydrases, proteases, dehydrogenases, oxidases, decarboxylases, hydrases, isomerases, transferases, amidases and esterases.

Mechanism of Enzyme Action

There is a very close structural relationship between the molecular surface of an enzyme and its substrates. Enzyme are protein molecules with definite surface geometry. The functional groups of the enzyme are exactly complementary to those of the substrate. Only particular types of substrate molecules will fit with a given enzyme molecule for example, substrates A and B will fit into the enzyme E but not substrate C, this is referred to as a **lock-and-key** mechanism. Thus, reactions involving A and B will be speeded up but not reactions involving C.

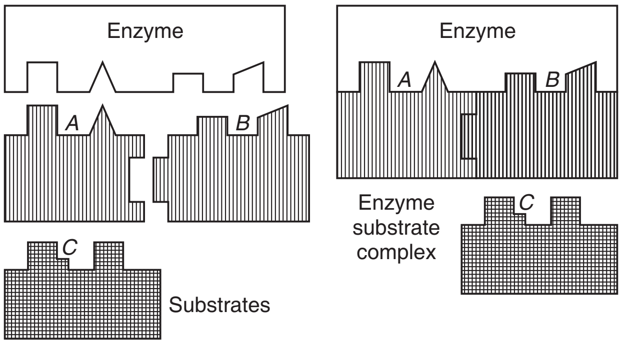


Fig. 14.6 Diagram illustrating how only particular substrates react with an enzyme

The **enzyme** enters into a chemical combination with the **substrate** to form an **enzyme-substrate complex** (Michaelis-Menton hypothesis).

$$E + S \longrightarrow ES$$

The enzyme-substrate complex then breaks down to give the products of reaction. The enzyme is released and can be used over and over again.

$$ES \longrightarrow E + \text{products}$$

Features of Enzymes

(a) Specificity

Enzymes show striking specificity. They catalyse specific reactions of specific substrates. Some enzymes are so specific that they catalyse only one type of substrate molecule. The specificity may extend to only one isomer of a substrate. *e.g.,* The enzyme chymotrypsin catalyses the hydrolysis of acetyl-L-phenyl- alanine methyl ester, but is inert to the D isomer.

(b) Required in Small Amount

Only one enzyme can catalyse a large number of substrate molecules. In other words, enzymes are required in very small amounts.

(c) Activation Energy

Enzymes alter the speed of a chemical reaction. In increasing the speed, they lower the energy of activation of a reaction, thus enabling it to occur at ordinary physiological temperatures. When reactions proceed from one direction to another they have to overcome an energy barrier called the **activation energy.**

Normally only a small part of the total number of molecules in a compound contain enough energy to react. Application of heat enables a larger proportion of molecules to overcome the activation energy barrier. However, living systems are relatively isothermal, *i.e.*, they do not have large temperature differences. They, therefore, employ enzymes to activate the molecules of the reacting compounds. When the enzyme combines with the substrate to form the enzyme-substrate complex, the energy level of the substrate is raised, and it reacts faster. Enzymes increase the speed of a chemical reaction thousands of times by bringing about mutual contact of reacting compound. The coming together of these compounds is no longer a matter of chance, but becomes a certainty.

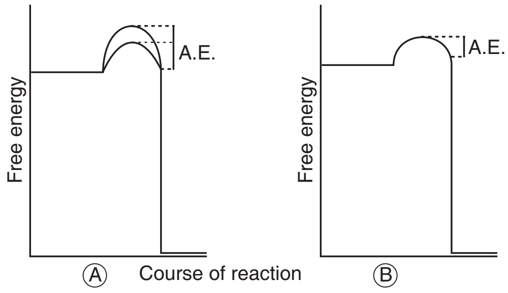

Fig. 14.7 Change in activation energy (A.E.) (A) Reaction without enzyme, (B) Reaction with enzyme.

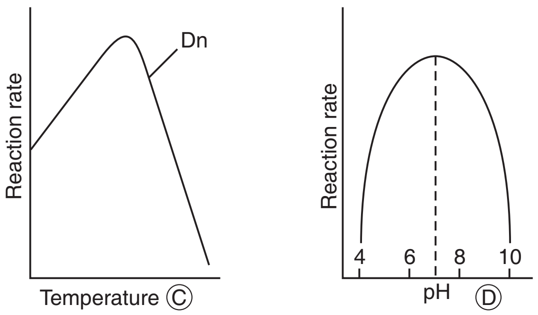

Fig. 14.8 (C) Effect of temperature on the rate of enzymatic reaction. Dn represents the point where thermal denaturation of the enzyme beings (44–45°C). (D) Effect of pH on the rate of enzyme reaction. The dashed line indicates optimum pH.

Enzymes, as we call them biological catalyst work in the same manner as a catalyst does, *i.e.,* by lowering the energy of activation of chemical reaction.

Factors Affecting Enzyme Activity

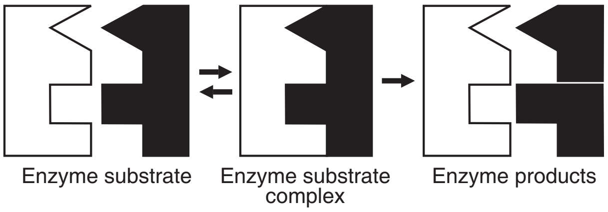
(a) **Effect of temperature** Enzyme action is greatly affected by temperature. If the temperature is increased by 10°C, the rate of most chemical reactions is doubled. However, at 40–60°C, there is loss of enzyme activity because denaturation of proteins occurs at this temperature.

(b) **pH** At optimum pH, the activity of enzyme is maximum. For most **enzymes,** the effective pH range is 4–9. Below and beyond these limits, denaturation of enzymes takes place. The optimum pH for pepsin is 2.0 and for trypsin is 8.0.

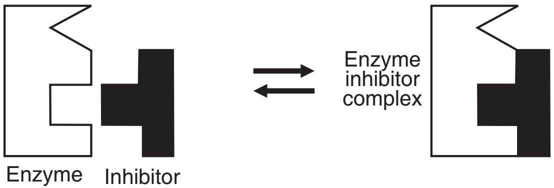
(c) **Ions** Enzyme activity is affected by H^+ ion concentration and other ionic concentrations. Some enzymes require a loosely bound cation such as Mg^{2+}.

(d) **Concentration** Enzyme concentration affect the rate of a reaction. If the substrate concentration is increased, the rate of enzyme reaction also rises. Beyond a certain point, however, the enzyme becomes saturated with substrate molecules. Further increase in reaction velocity occurs only if the enzyme concentration is increased. For example, during starvation the supply of the substrate (glucose) decreases and glycolysis is depressed. Conversely increase in glucose concentration accelerates the rate of reaction upto the point when enzyme is saturated with glucose.

(e) **Inhibitiors** Certain compounds (*e.g.,* drugs, poisons) combine with an enzyme but do not serve as substrates. They thus block catalysis by the enzyme and function as **inhibitors.** The inhibitors usually closely resemble the substrate in structure. The enzyme and the inhibitor form an enzyme-inhibitor complex which is inactive.



(a) Enzyme action



(b) Inhibition

Fig. 14.9 Mechanism of enzyme action inhibition.

- Inhibition may be **competitive** or **non-competitive.** In competitive inhibition both inhibitor and substrate molecules compete for binding with the enzyme. If the inhibitor is in sufficiently high concentration, it displaces the substrate molecules. For example, sulphanilamide is a competitive inhibitor for a bacterial enzyme that incorporates *p*-amino benzoic acid into folic acid. Competitive inhibition can be reversed by increasing the concentration of the substrate. In **non-competitive inhibition**, the inhibitors (poisons) react with the various functional groups of the enzyme. They inhibit the *normal reactions catalysed by the enzyme and result in death. Non-competitive inhibition cannot be reversed by increasing the concentration of the substrate*.

Check Point 4

1. Some enzymes are named after the reaction, where they are used what name is given to class of enzymes which catalyse the oxidation of one substrate with simultaneous reduction of another substrate. **[NCERT** Exemplar]
2. Enzymes are called biological catalyst, why? Also tell, how do enzymes differ from usual catalysts?
3. At high temperature enzymes loss their activity, explain why?

14.5 Vitamins

These are essential dietary factors required by an organism in minute quantities. Vitamins are not utilized in cell building or as energy source but they act as catalysts (coenzymes) in biological processes. In general, the fresh natural foods contain all necessary vitamins in appropriate amount, but human beings (and sometimes other animals) take food which is prepared by some processes result in loss or deficiency of some vitamins in food. Remember vitamins are not synthesised in the body and hence should be supplied in diet. Their deficiency causes specific diseases (avitaminosis).

Classification of Vitamins

These are classified into two groups

(a) **Fat soluble vitamins** These are vitamin A, D, E and K.

(b) **Water soluble vitamins** These are vitamin B and vitamin C. Water soluble vitamins must be supplied regularly in diet because they are excreted in urine and cannot be stored in our body (except B_{12}).

Caution Point *Excess of vitamins specially fat soluble vitamins is also harmful and vitamin pills should not be taken without the advice of doctor. Fat soluble vitamins are stored in liver and adipose tissues (fat storing tissues).*

- Vitamins catalyze biological reactions in very low concentration, therefore the daily requirement of any vitamin for any individual is extremely small.
- The sources and diseases caused by the deficiency of different vitamins are tabulated below

Table 14.6 **Vitamins : Sources and Deficiency Diseases**

Name of vitamin	Sources	Deficiency disease
Vitamin A (Retinol or Axerophthol, $C_{20}H_{30}O$)	Fish liver oil	Xerophthalamia (hardening of cornea)
Vitamin B_1 (Thiamine or Aneurin, $C_{12}H_{18}N_4SOCl_2$)	Green vegetables, milk	Beri-Beri (disease of nervous system)
Vitamin B_2 (Riboflavin or Lactoflavin, $C_{17}H_{20}N_4O_6$)	Vegetables, milk, liver, egg white, kidney	Dark red tongue dermatitis, cheilosis
Vitamin B_3 (Pantothenic acid, $C_9H_{17}O_5N$)	All food, more in yeast, liver, kidneys tomatoes	Dermatities in cocks, retarded body and mental growth
Vitamin B_5 (Nicotinic acid or Niacin, (C_5H_4N—COOH)	Fresh meat, liver, fish, cereals, milk, pulses	Pellagra, dermatities
Vitamin B_6 (Pyridoxine or adermin, $C_8H_{11}O_3N$)	Grams, molasses, egg yolk meat	Savere dermatitis, convulsions
Vitamin H (Biotin, $C_{10}H_{16}N_2O_3S$)	Yeast, liver, kidney milk	Dermatitis, loss of hair and paralysis
Vitamin B_{12} (Cyanocobalamine, $C_{63}H_{88}O_4$ $N_{14}PCo$)	Liver of ox, sheep, pig, fish etc.	Pernicious anaemia
Vitamin C (Ascorbic acid, $C_6H_8O_6$)	Citrus fruits, green vegetables	Scurvy
Vitamin K (K_1 and K_2) (Phylloquinone, $C_{13}H_{46}O_2$)	Cereals, leafy vegetables	Hemorrhagic conditions, increased blood clotting time
Vitamin D (Ergocalciferol, $C_{28}H_{44}O$)	Synthesized in skin cells in the presence of sunlight, liver, egg yolk, meat and milk	Rickets with osteomalacia, soft and fragile teeth
Vitamin E (Tocopherol, $C_{29}H_{50}O_2$)	Wheat germ oil, cotton seed oil, soyabean oil	Sterility (impotency), muscular weakness.
Coenzyme Q_{10}	Chloroplast (green plants), mitochondria (of animals)	Low order of immunity of body against many diseases.

Caution Point *Provitamins are the biologically inactive compounds which have almost similar structure as vitamins and can be converted into active vitamins.*

Sample **Problem 18** *Which one of the following vitamin is responsible for the coagulation of blood?* **[NCERT]**

(a) *Vitamin A* (b) *Vitamin C*
(c) *Vitamin K* (d) *Vitamin E*

Interpret (c) Vitamin K is responsible for the coagulation of blood.

Check Point 5

1. Why does vitamin B not store in human body?
2. Why must vitamin C be supplied regularly in diet?

[NCERT Exemplar]

14.6 Nucleic Acids

Nucleic acids are present in all living organisms, whether plants, animals or virus. They are generally associated with proteins (in eukaryotes) to form **nucleoproteins.** Nucleic acids are responsible in the biosynthesis of proteins and for the transmission of heredity characters. The genetic information coded in nucleic acids helps to know the structure of all proteins including enzymes and all metabolic activities of living organisms.

Classification of Nucleic Acids

There are two types of nucleic acids, **deoxyribose nucleic acid** (DNA) and **ribose nucleic acid** (RNA). DNA is found predominantly in the nucleus, while RNA is predominant in the cytoplasm. DNA is the genetic material of most organisms, including many viruses. Some viruses, however, have RNA as their genetic material.

- Some important discoveries about nucleic acids are

  1869 - **Meischer** isolated nucleic acids, which he called **nuclein.**

  1899 - **Altmann** used the term **nucleic acid** to replace nuclein.

  1912 - **Feulgen** discovered a staining reaction (now called the Feulgen reaction), specific for DNA.

  1944 - **Avery, MacLeod** and **McCarty** presented first evidence that DNA is the genetic material.

  1953 - **Watson** and **Crick** presented the now famous double helix model of DNA.

Deoxyribose Nucleic Acid (DNA)

It is present in the cells of all plants, animals, prokaryotes and in a number of viruses. In prokaryotes (*e.g., Escherichia coil* , a bacterium), the genetic material consists of a single giant molecule of DNA without any associated proteins. DNA is present mainly in the chromosomes. It has also been reported in cytoplasmic organcells like mitochondria and chloroplasts. The DNA of most plants and animals and many viruses (polyoma virus, small-pox virus, bacteriophages T_2, T_4 and T_6) is double stranded. In bacteria and in higher plants and animals both DNA and RNA are present. Viruses usually contain either DNA or RNA.

Structure of DNA

The widely accepted molecular model of DNA is the **double helix structure,** proposed by **Watson** and **Crick** (1953). The DNA molecule consists of two helically twisted strands connected together by **steps.** Each strand consists of alternating molecules of deoxyribose (a pentose sugar) and phosphate groups. Each step is made up of a double ring purine base and a single ring pyrimidine base. The purine and pyrimidine bases are connected to deoxyribose sugar molecules. The two strands are interwined in a clockwise direction, *i.e.,* in a right hand helix, and run in opposite directions. The strand completes a turn each 34Å. Each nucleotide occupies 3.4Å. Thus, there are 10 nucleotides per turn. Each successive nucleotide turns 36 degrees in the horizontal plane. The width of the DNA molecule is 20Å. The twisting of the strands results in the formation of **deep** and **shallow** spiral grooves.

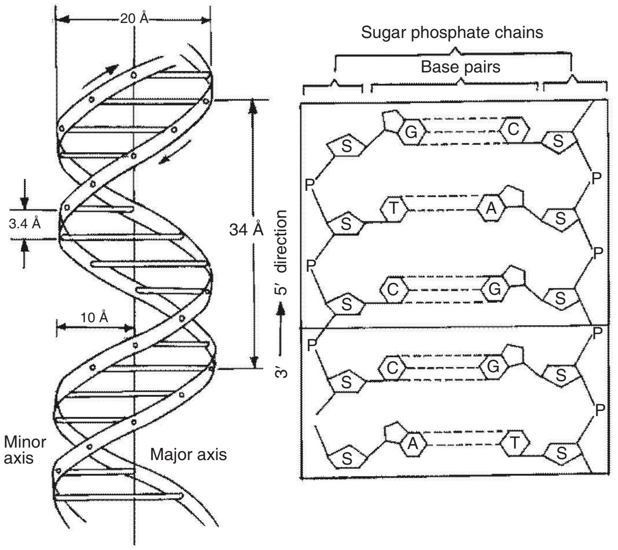


Fig. 14.10 Double helix structure of DNA

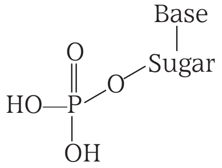
Chemical Composition of DNA

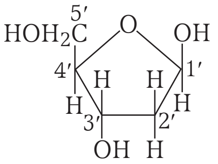
The DNA molecule is a polymer consisting of several thousand pairs of nucleotide monomers. Each nucleotide consists of the pentose sugar, deoxyribose, a phosphate group and nitrogenous base which may be either a purine or pyrimidine. Deoxyribose and a nitrogenous base together form a **nucleoside.** A nucleoside and a phosphate together form a **nucleotide.**

Nucleoside = deoxyribose + nitrogenous base
Nucleotide = deoxyribose + nitrogenous base + phosphate
= nucleoside + phosphate

Thus, nucleotide may be represented, as,

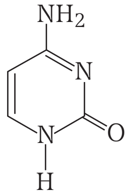


(i) **Deoxyribose** is a pentose sugar with five carbon atoms. Four of the five carbon atoms plus a single atom of oxygen form a five-membered ring. The fifth carbon atom is outside the ring and forms a part of a —CH_2 group. The four atoms of the ring are numbered 1′, 2′, 3′ and 4'. The carbon atom of —CH_2 is numbered 5′. There are three —OH groups in position 1′, 3′ and 5′. Hydrogen atoms are attached to carbon atoms 1′, 2′, 3′ and 4′.
All the sugars in one strand are directed to one end *i.e.,* the strand has polarity. The sugars of the two strands are directed in opposite direction (antiparallel strands).

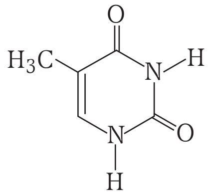


2-deoxyribose sugar

(ii) **Nitrogenous bases** are of two types, *viz,* pyrimidines and purines. The pyrimidines are single ring compounds, with nitrogen in position 1 and 3 of a 6-membered benzene ring. The two most common pyrimidines of DNA are **cytosine** (C) and **thymine** (T). The purines are double ring compounds. A purine molecule consists of a 5-membered imidazole ring joined to a pyrimidine ring at positions 4 and 5. The two most common purines of DNA are **adenine** (A) and **guanine** (G). The structure of these bases are follows :

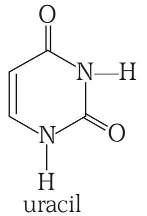


cytosine (*C*)

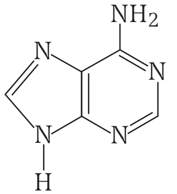


thymine (*T*)

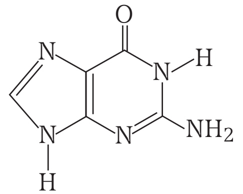
Pyrimidines



uracil
(a pyrimidine base present in RNA)



adenine (*A*)



guanine (*G*)

purines

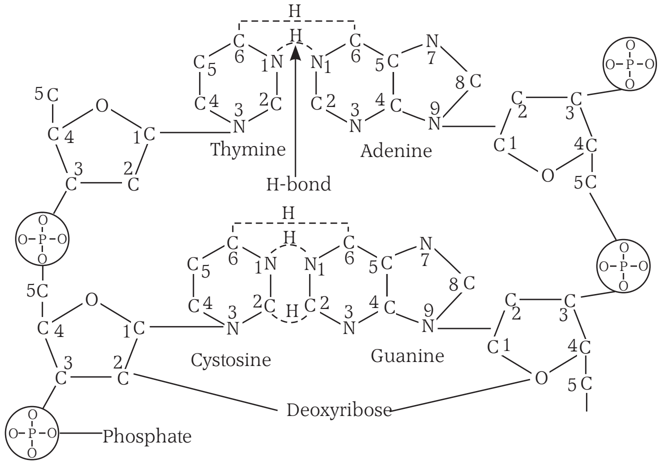
Sample **Problem 19** *Which of the following are purine bases?* **[NCERT** Exemplar**]**

(a) *Guanine* (b) *Adenine*
(c) *Thymine* (d) *Uracil*

Interpret (*a,b*) Purines are double ring compounds. Guanine and adenine are purines.

- **Base pairing** Each **'step'** on the DNA ladder is made up of a purine and a pyrimidine pair, *i.e.,* of a double ring and a single ring.
- Two purines would occupy too much space, while two pyrimidines would occupy too little. Because of the purine-pyrimidine pairing, the total number of purines in a double-stranded DNA molecule is equal to the total number of pyrimidines. Thus, A/T = 1 and G/C = 1 or A + G = C + T (Chargaff's rule).

(iii) **Phosphate** In the DNA strand, the phosphate groups alternate with deoxyribose. Each phosphate group is joined to carbon atom 3 of one deoxyribose and to carbon atom 5 of another. Thus, each strand has a 3 end and a 5 end. The two strands are oriented in opposite direction. The 3 end of one strand corresponds to the 5 end of the other. Consequently the oxygen atoms of deoxyribose point in opposite directions.



Caution Point *A unit formed by the attachment of a base to* 1 *position of sugar is called* ***nucleoside.*** *When nucleoside is linked with phosphoric acid at* 5 *position of sugar moiety, a* ***nucleotide*** *is formed. Nucleotides are joined together by* ***phosphodiester linkage*** *between* 5 *and* 3 *carbon atoms of the pentose sugar.*

Sample **Problem 20** *What products would be formed when a nucleotide from DNA containing thymine is hydrolysed?* **[NCERT]**

(a) *A deoxyribose molecule*
(b) *Phosphoric acid*
(c) *Thymine, a pyrimidine base*
(d) *All of the above*

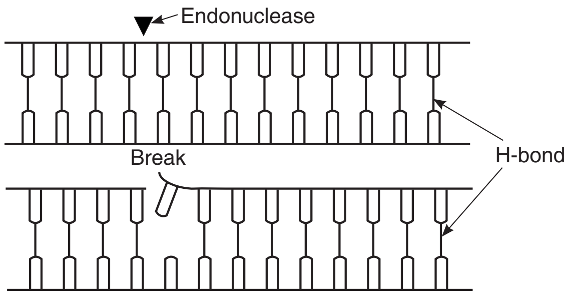
Interpret (*d*) When a nucleotide from DNA is hydrolysed, it will give a deoxyribose sugar molecules, phosphoric acid and a pyrimidine base (thymine in this case) or a purine base.

Replication of DNA

The formation of new DNA from older one is called replication.

Its outlines are as

1. Replication is a **semi-conservative process** in which each of the two double helices formed from the parent double strand have one old and one new strand. Repair replication is non-conservative.
2. DNA replication requires a DNA template, a primer, deoxyribonucleoside triphosphates (dATP, dGTP, dTTP and dCTP), Mg^{2+}, DNA unwinding protein, super helix relaxing protein, a modified RNA polymerase to synthesize the RNA primer, the products of DNAA, DNAB, DNAC-D, DNAE and DNAG genes and polynucleotide ligase, a joining enzyme.
3. Replication starts at a specific point called the origin.
4. According to one model replication starts with a 'nick' or incision made by an **incision enzyme** (endonuclease).



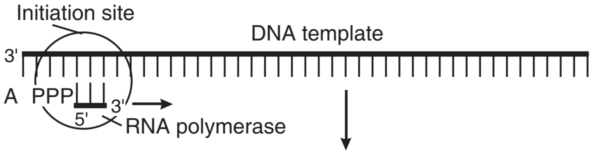
Enzyme (endonuclease) action starts with incision

Fig. 14.11 Replication of DNA

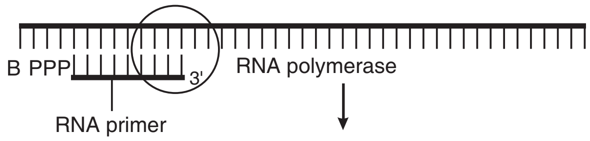
5. The two strands of the DNA double helix unwind with the help of a DNA unwinding protein (also called the DNA binding protein) which binds to single DNA strands.
6. The unwinding of the strands imposes strain which is relieved by the action of a super helix relaxing protein or swiveling protein.
7. Initiation of DNA synthesis requires an RNA primer. The primer is synthesized by the DNA template close to the origin of replication. The synthesis is catalysed by a special form of RNA polymerase.
8. Deoxyribose nucleotides are now added to the 3' end of the RNA primer and the main DNA strand is synthesized on the DNA template. This strands is complementary to the DNA strand and is synthesized

by DNA polymerase III. The roles of polymerases in DNA replication are

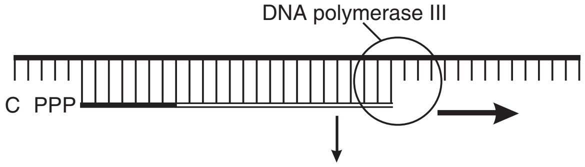
(i) Complementary RNA primer initiated on the DNA template at the initiation point by a form of RNA polymerase'.



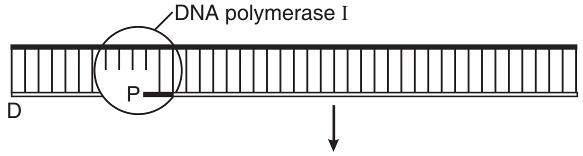
(ii) RNA primer grows in $5' \rightarrow 3'$ direction. RNA polymerase ultimately dissociates from the DNA template.



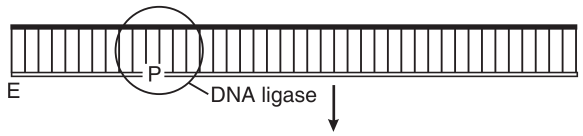
(iii) DNA nucleotides added at the 3' end of the RNA primer and a complementary DNA strand synthesized by DNA polymerase III.



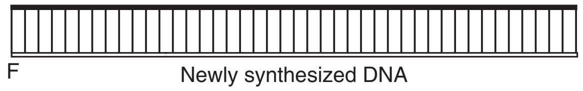
(iv) RNA primer degraded and simultaneously replaced by a DNA polymerase I.



(v) RNA primer completely degraded and DNA segment further extended. The segment is now joined to the main DNA strand by ligase.



(vi) The DNA template strand (black) with the newly synthesized DNA strand (white).



9. The enzyme DNA polymerase I now degrades the RNA primer and simultaneously catalyses the synthesis of a short DNA segment to replace the primer. This segment is then joined to the main DNA strand by a DNA ligase.
10. Replication takes place discontinuously and short pieces called Okazaki fragments are synthesized. One strand may synthesize a continuous strand and the other Okazaki fragments, or both strands may synthesize Okazaki fragments. Both new strands are synthesized in the $5' \rightarrow 3'$ direction. Thus, one strand is synthesized forwards (leading strand) and the other backwards (lagging strand).
11. The Okazaki pieces are joined by polynucleotide ligase, a joining enzyme, to form continuous strand.
12. Replication may be in one direction (unidirectional) from the point of origin or in both directions (bidirectional).

Ribose Nucleic Acid (RNA)

It is the genetic material of mainly viruses. It can be single stranded or double stranded.

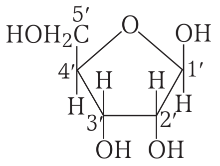
Chemical Composition of RNA

RNA, like DNA is also a polymer of nucleotide which in turn obtained from nucleoside, chemical which when combines with phosphate. Here the point of difference is that the sugar present in nucleoside is ribose sugar instead of deoxyribose sugar.

Nucleoside = ribose + nitrogenous base

Nucleotide = ribose + nitrogenous base + phosphate

(i) **Ribose** The pentose sugar of RNA has an identical structure with deoxyribose sugar except that there is an —OH group instead of H on carbon atom 2′.



ribose sugar

(ii) **Nitrogenous base** here also are of two types : pyrimidines and purines. Purine bases are same as that in DNA but pyrimidine bases are cytosine (C) and uracil (U). (In RNA uracil replaces thymine).

(iii) **Phosphate** same as DNA.

Caution Point *There are viruses, called retroviruses, in which information flows from RNA to DNA. The virus that causes AIDS is a retrovirus.*

Types of RNA

$$\text{RNA}\begin{cases} m\text{-RNA} \xrightarrow{\text{Formed}} \text{During cleavage} \\ r\text{-RNA} \xrightarrow{\text{Formed}} \text{At the end of cleavage} \\ t\text{-RNA} \xrightarrow{\text{Formed}} \text{During gastrulation} \end{cases}$$

(i) ***m*-RNA** makes **3–5%** of total cellular RNA. The name messenger RNA was proposed by Jacob and Monad (1961). Some points related to structure and functioning of *m*-RNA are as follows

(a) Structurely the *m*-RNA contains a cap at its 5' end. The cap controls the rate of protein synthesis.

(b) The cap is followed by non coding region 1 which is usually 10–100 nitrogenous bases long and is rich in adenine and uracil bases.

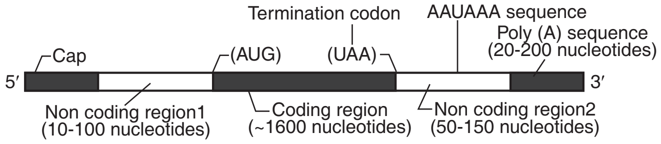


Fig. 14.12 Structure of *m*-RNA

(c) The *m*-RNA of prokaryotes is considered as metabolically unstable as it does not stays so longer in their body, it normally destroyed while concerning metabolic process is going on. The *m*-RNA of eukaryotes on the other hand is considered as metabolically stable as it normally waits for the completion of process concerned.

(d) The *m*-RNA comes out with proteins into the cytoplasm and normally swim as spherical balls along with the same untill these are required. These RNA + protein spherical balls are called informosomes.

(ii) *r*-RNA makes 80% of total cellular RNA. This RNA is the basic constituent of ribosomes. It is developed from r-DNA in the case of prokaryotes while in the case of eukaryotes, it is developed from the nucleolar organizer region of chromosome. Some points related to rRNA are as follows

(a) The *r*-RNA may be seen in the form of a compact rod or a coil or in the form of extended regions. The structure actually depends upon various factors like ionic strength, temperature and pH etc.

(b) The *r*-RNA is found to be stable for atleast 2 generations.

(c) The various *r*-RNAs present in different units of ribosome are as follows :

Prokaryotes (70S)

$30\text{S} \longrightarrow 16\text{S}\, r\text{-RNA};\ 50\text{S} \longrightarrow 23\text{S and } 5\text{S}\, r\text{-RNA}$

Eukaryotes (80S)

$40\text{S} \longrightarrow 18\text{S}\, r\text{-RNA};\ 60\text{S} \longrightarrow 28\text{-}29\text{S}, 5.85\text{S}, 5\text{S}\, r\text{-RNA}$

Chloroplast and Mitochondria (55S)

$30\text{S} \longrightarrow 12\text{-}13\text{S}\, r\text{-RNA};\ \mathbf{40S} \longrightarrow 16\text{-}17\text{S}\, r\text{-RNA} + 5\text{S}$

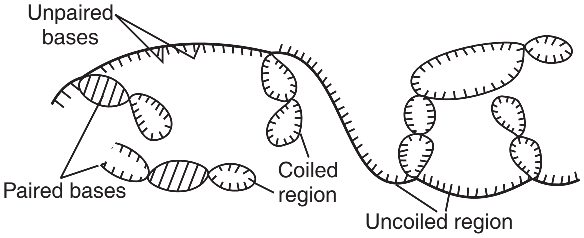

Fig. 14.13 Structure of *r*-RNA

(iii) *t*-RNA makes 10–20% of total cellular RNA with sedimentation coefficient of 3.8S. This RNA contains 73–93 nucleotides with in the structure given below.

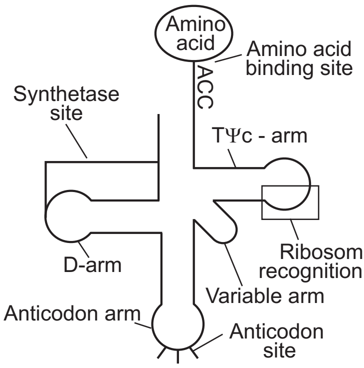

Fig. 14.14 Structure of *t*-RNA

The above structure is called Clover Leaf Model and was fully worked out by Holley *et al*. of yeast alanine *t*-RNA.

- The function of *t*-RNAs is to align the required amino acids according to the nucleotide sequence of *m*-RNA.

  The *t*-RNA can be of **monomeric** (arising from one gene) or **multimeric** (arising from many genes) type.

Differences between DNA and RNA

1. DNA is the usual genetic material while RNA is the genetic material of some viruses.
2. DNA is usually double stranded (single stranded in some viruses like $\phi \times 174$), while RNA is usually single stranded (some viruses like reovirus contain double stranded RNA).
3. DNA have deoxy ribose sugar as the pentose sugar while RNA have ribose sugar.
4. The nitrogenous bases of DNA are adenine, guanine, cytosine and thymine while RNA has uracil in the place of thymine.
5. Base pairing is seen throughout the molecule in DNA while it is region specific or absent in the case of RNA.
6. DNA is only of one type while RNA is of three types namely messenger RNA (*m*-RNA), ribosomal RNA (*r*-RNA) and transfer RNA (*t*-RNA).
7. Most of the DNA is found in nucleus and some of it is also found in cytoplasm while RNA is found in cytoplasm only.
8. DNA on replication forms DNA and on transcription forms RNA while usually the RNA does not replicate or transcribe.
9. Genetic messages are usually encoded in DNA while RNA translates the encoded messages from DNA and thus helps in protein formation.
10. There are few uncommon bases found in DNA while these bases are more found in RNA.

The Genetic Code

Nucleic acids control heredity on molecular level. The double helix of DNA is reponsible for the hereditary information of the organisms. The information is stored as the sequence of bases along the polynucleotide chain. DNA preserve the hereditary informations and use it.

It does these things through two properties

(i) DNA molecules can duplicate themselves (replication)

(ii) DNA molecules can control the synthesis of proteins in an exact and specific way. Synthesis of a polypeptide chain is controlled by a particular **gene.** The gene, which is almost always a segment of a DNA strand, transcribes an *m*-RNA which thus acts as an intermediate in conveying information from the sequence of amino acids in the polynucleotide chain. Each amino acid is specified by a sequence of three bases known as **codon** of *m*-RNA. Each *t*-RNA molecules has a sequence of three bases known as **anticodon,** which reads a codon of *m*-RNA. *t*-RNA molecules thus serve as adaptors in protein synthesis by reading of *m*-RNA codons in a sequence.

The relationship between the sequence of bases in DNA/RNA and the sequence of amino acids in a polypeptide chain is called the **genetic code.** The code indicates which codons specify which amino acids.

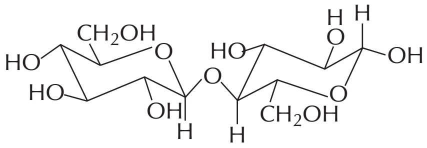
Check Point 6

1. What is the difference between ribose and deoxyribose sugar?
2. The two strands of DNA are easily separated during replication. Why?
3. When RNA is hydrolysed, there is no relationship among the quantities of different bases obtained. What does this fact suggest about the structures of RNA? **[NCERT]**
4. Which moieties of nucleosides are involved in the formation of phosphodiester linkages present in dinucleotides? Which acid is involved in the formation of this linkage? **[NCERT Exemplar]**

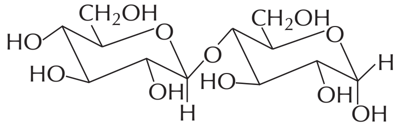
WORKED OUT Examples

Example 1 *Which of the following disaccharides is a non-reducing sugar?*

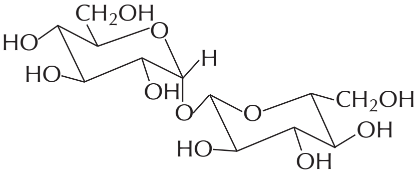
(*a*)



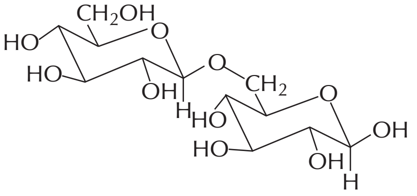
(*b*)



(*c*)



(*d*)



Solution (*c*) Because it does not contain free aldehyde or ketone group or in other words it has a stable acetal structure which cannot be opened into a free carbonyl group.

Example 2 *D-fructose is used for sweetening cold drinks but not hot ones because*

(*a*) *it is not a true carbohydrate*
(*b*) *on heating it converts into pyranose form*
(*c*) *on heating it converts into furanose form*
(*d*) *on heating it gets decomposed of D-fructose*

Solution (*c*) The sweeter form of D-fructose is fructopyranose. The high temperature causes a shift in the pyranose $\rightleftharpoons$ furanose equilibrium towards the less sweet furanose.

Example 3 *Given,* $[\alpha]_D = +52.7°$ *for D-glucose and* $[\alpha]_D = -92.40$ *for D-fructose. The specific rotation of invert sugar is*

(*a*) $-39.7°$ (*b*) -145.1 (*c*) $-19.9°$ (*d*) $-72.55°$

Solution (*c*) The specific rotation of invert sugar is one half of the sum of those of individual monosaccharides.

$$\therefore \text{ Specific rotation of invert sugar} = \frac{1}{2}\,[+52.7° + (-92.4°)]$$
$$= -19.9°.$$

Example 4 $A \xrightarrow{\text{HOH/H}^+}$ *glucose* + *fructose*

$B \xrightarrow{\text{HOH/H}^+}$ *glucose* + *glucose*

$C \xrightarrow{\text{HOH/H}^+}$ *glucose* + *galactose*

the disaccharides A, B and C respectively are

(*a*) *lactose, sucrose, maltose*
(*b*) *sucrose, maltose, lactose*
(*c*) *sucrose, lactose, maltose*
(*d*) *maltose, sucrose, lactose*

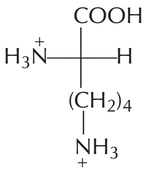
Solution (*b*) $\underset{\text{(invert sugar)}}{\text{Sucrose}} \xrightarrow{\text{HOH/H}^+} \text{glucose} + \text{fructose}$

$\text{Maltose} \xrightarrow{\text{HOH/H}^+} 2\ \text{glucose}$

$\text{Lactose} \xrightarrow{\text{HOH/H}^+} \text{glucose} + \text{galactose}$

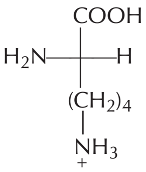
Example 5 *Which of the following is the major solute species in a solution of lysine at pH* = 10.5 *(pI* = 9.6*)* ?

(*a*)



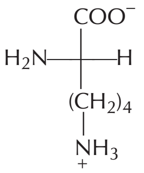
$$\begin{array}{c}\mathrm{COOH}\\ \mathrm{H_3\overset{+}{N}}\text{—}\!\!\!|\!\!\!\text{—}\mathrm{H}\\ \mathrm{(CH_2)_4}\\ |\\ \mathrm{\underset{+}{N}H_3}\end{array}$$

(*b*)



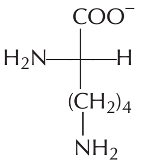
$$\begin{array}{c}\mathrm{COOH}\\ \mathrm{H_2N}\text{—}\!\!\!|\!\!\!\text{—}\mathrm{H}\\ \mathrm{(CH_2)_4}\\ |\\ \mathrm{\underset{+}{N}H_3}\end{array}$$

(*c*)



$$\begin{array}{c}\mathrm{COO^-}\\ \mathrm{H_2N}\text{—}\!\!\!|\!\!\!\text{—}\mathrm{H}\\ \mathrm{(CH_2)_4}\\ |\\ \mathrm{\underset{+}{N}H_3}\end{array}$$

(*d*)



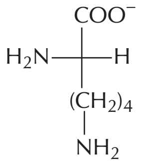
$$\begin{array}{c}\mathrm{COO^-}\\ \mathrm{H_2N}\text{—}\!\!\!|\!\!\!\text{—}\mathrm{H}\\ \mathrm{(CH_2)_4}\\ |\\ \mathrm{NH_2}\end{array}$$

Solution (*d*) $\because$ Here, pH = 10.5 and pI = 9.6

$$\text{pH} > \text{pI}$$

∴ Anionic form dominates

i.e.,



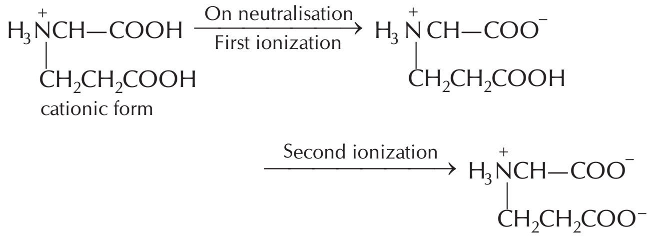
$$H_2N-\overset{COO^-}{\underset{(CH_2)_4-NH_2}{C}}-H$$

is present in solution.

Example 6 *Glutamic acid,* $H_2NCH(CH_2CH_2COOH)\cdot COOH$ *has* $pK_{a_1}, (\alpha - COOH) = 2.2, pK_{a_2}(\alpha - \overset{+}{N}H_3) = 9.8$ *and* pK_{a_3} *(R group* $COOH) = 4.3$. *The isoelectric point of glutamic acid is*

(a) 3.2
(b) 6
(c) 7.05
(d) 8.3

Solution (*a*)



$$\underset{\text{cationic form}}{H_3\overset{+}{N}\underset{CH_2CH_2COOH}{CH}-COOH} \xrightarrow[\text{First ionization}]{\text{On neutralisation}} H_3\overset{+}{N}\underset{CH_2CH_2COOH}{CH}-COO^- \xrightarrow{\text{Second ionization}} H_3\overset{+}{N}\underset{CH_2CH_2COO^-}{CH}-COO^-$$

So, $$pI = \frac{pK_{a_1} + pK_{a_3}}{2} = \frac{2.2 + 4.3}{2} = 3.25$$

Example 7 *For which of the following amino acid, van-Styke estimation method is not applicable?*

(a) *Alanine*
(b) *Aspartic acid*
(c) *Senine*
(d) *Proline*

Solution (*d*) Proline has a 2° amino group. Hence, it is not estimated by this method.

Example 8 *A hexapeptide has the composition Ala, Gly, Phe, Val. Both the N-terminal and C-terminal units are Val. Cleavage of the hexapeptide by chemotrypsin gives two different tripeptides, both having Val as the N-terminal group. Among the products of random hydrolysis is a Ala-Val dipeptide fragment. What is the primary structure of the hexapeptide?*

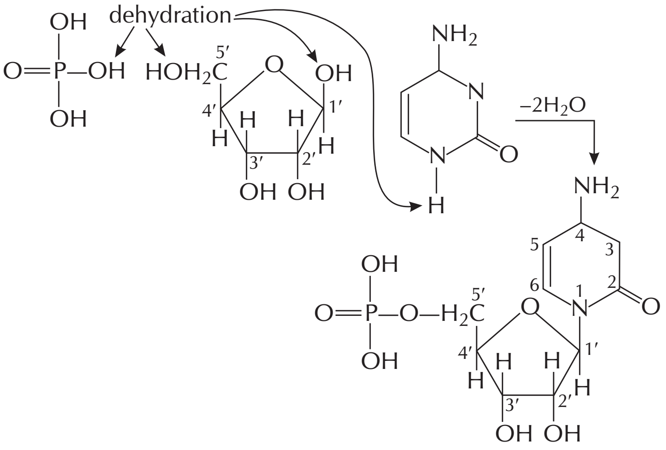
(a) Val-Gly-Phe-Val-Ala-Val
(b) Val-Ala-Phe-Val-Gly-Val
(c) Val-Gly-Ala-Val-Phe-Val
(d) Val-Phe-Val-Ala-Gly-Val

Solution (*a*) Val-Gly-Phe-Val-Ala-Val Random hydrolysis gives Ala-val dipeptide fragment which indicates the connected presence of Ala and Val.

Example 9 *In both DNA and RNA, heterocyclic base and phosphate ester linkages are at*

(a) C_1' *and* C_5' *respectively of the sugar molecule*
(b) C_5' *and* C_1' *respectively of the sugar molecule*
(c) C_2' *and* C_5' *respectively of the sugar molecule*
(d) C_5' *and* C_2' *respectively of the sugar molecule*

Solution (*b*) Synthesis of RNA/DNA from phosphoric acid ribose and cylosine is given below. Thus, ester linkages are at C_5' and C_1' of sugar molecule.



Example 10 *An electric current is passed through an aqueous solution of a mixture of alanine (isoelectric point* 6.0), *glutamic acid* (3.2) *and arginine* (10.7) *buffered at* pH 6. *What is the fate of the three acids?*

(a) *Glutamic acid migrates to anode at* pH 6. *Arginine present as a cation and migrates to the cathode. Alanine in a dipolar ion remains uniformly distributed in solution*
(b) *Glutamic acid migrates to cathode and others remain uniformly distributed in solution*
(c) *All these remain uniformly distributed in solution*
(d) *All three move to cathode*

Solution (*d*) At pH = 6, glutamic acid exists as a dianionic species and migrates to anode while arginine exists as cationic species and moves to cathode. Alanine does not migrate to any electrode at its isoelectric point.

Start Practice for JEE Main

Round I (Topically Divided Problems)

Carbohydrates

1. Glycogen is a branched chain polymer of α-D-glucose units in which chain is formed by $C_1—C_4$ glycosidic linkage whereas branching occurs by the formation of $C_1—C_6$ glycosidic linkage. Structure of glycogen is similar to **[NCERT Exemplar]**

(a) amylose (b) amylopectin
(c) cellulose (d) glycogen

2. Which of the following polymer is stored in the liver of animals? **[NCERT Exemplar]**

(a) Amylose (b) Cellulose
(c) Amylopectin (d) Glycogen

3. Which is not a hexose?

(a) Glucose (b) Ribose
(c) Fructose (d) Galactose

4. What is not true for carbohydrates?

(a) General formula is $C_nH_{2n}O_n$
(b) Glucose is the most common monomer of carbohydrates
(c) Fructose is the sweetest of all sugars
(d) Do not conjugate with lipids

5. Identify the product '*C*' in the following series of reactions

$$\text{Glucose} \xrightarrow{\text{HCN}} A \xrightarrow{H_2O} B \xrightarrow{\text{HI}} C$$

(a) heptanoic acid (b) hexanoic acid
(c) α-methyl caproic acid (d) None of these

6. Milk changes after digestion into

(a) glucose (b) lactose
(c) fructose (d) glucogen

7. A solution of D-glucose in water rotates the plane of polarised light

(a) to the left (b) to the right
(c) to either side (d) None of these

8. Which of the following reagent is used to identify fructose?

(a) Neutral $FeCl_3$ (b) $CHCl_3$/alc. KOH
(c) Ammoniacal $AgNO_3$ (d) Iodine

9. Which of the following pairs give positive Tollen's test?

(a) Glucose, sucrose
(b) Glucose, fructose
(c) Hexanal, acetophenone
(d) Fructose, sucrose

10. The two forms of D-glucopyranose obtained from the solution of D-glucose are called

(a) isomer (b) anomer
(c) epimer (d) enantiomer

11. Consider the following reagents

I. Br_2 water II. Tollen's reagent
III. Fehling's solution

Which can be used to make distinction between an aldose and a ketose?

(a) I, II and III (b) II and III
(c) I only (d) II only

12. Although D-galactose rotates plane-polarised light, its oxidation product, galactaric acid, due to HNO_3, does not. It is due to

(a) galactaric acid is racemic mixture of D- and L-isomer
(b) galactaric acid is a *meso* compound
(c) Both are correct
(d) None of the above is correct

13. If α-D-glucopyranose is reacted with acetic anhydride at 373 K, the major product is the β-isomer of the pentaacetate. It is attributed to

(a) isomerisation of α-D into β-D-glucose at 373 K
(b) opening of glucopyranose ring
(c) Both the statements are correct
(d) None of the statement is correct

14. Sucrose (cane sugar) is a disaccharide. One molecule of sucrose on hydrolysis gives …… . **[NCERT Exemplar]**
(a) 2 molecules of glucose
(b) 2 molecules of glucose + 1 molecule of fructose
(c) 1 molecule of glucose + 1 molecule of fructose
(d) 2 molecules of fructose

15. Which of the following statements is not true about glucose?
(a) It is an aldohexose
(b) On heating with HI it forms *n*-hexane
(c) It is present in furanose form
(d) It does not give 2,4-DNP test

16. An organic compound consumes 4 moles of periodic acid to form following compounds, per mole of the starting compounds HCHO, 3HCOOH and CHOCOOH. The organic compound is
(a) glucose (b) fructose
(c) gluconic acid (d) sorbitol

17. An optically active compound *A*, gave an $[\alpha]_D^{25} = 30°$, while a mixture of *A* and its enantiomer *B*, gave $[\alpha]_D^{25} = +15°$. The ratio of *A* to *B* in the mixture is
(a) 1 to 3 (b) 3 to 1
(c) 1 to 2 (d) 2 to 1

Amino Acids

18. Which of the following is involved in the formation of heme?
(a) Lysine (b) Glysine
(c) Tryosin (d) Arginine

19. Which one of the following is involved in the formation of nicotinamide and indole-3-acetic acid?
(a) Lysine (b) Tryptophan
(c) Tyrosine (d) Glutamic acid

20. At intermediate pH values of about 6.0, an amino acid behaves as a dipolar ion or Zwitter ion. On decreasing and increasing the pH values, the amino acid becomes
(a) basic and acidic respectively
(b) acidic and basic respectively
(c) remains in the state of a neutral molecule
(d) loses its optical activity with the exception of glycine

21. Which of the following is not an essential amino acid for man?
(a) Tyrosine (b) Leucine
(c) Lysine (d) Valine

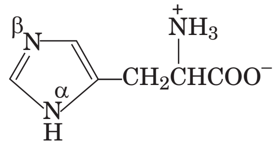
22. Which of the following has an imino ($>$NH) group instead of amino group (—NH_2) ?
(a) Proline (b) Isoleucine
(c) Tryptophan (d) Serine

23. Which of the following is not an α-amino acid?
(a) Cysteine (b) Proline
(c) Trypsin (d) Serine

24. In an amino acid, the carboxyl group ionises at $pK_{a_1} = 2.34$ and ammonium ion at $pK_{a_2} = 9.6$. The isoelectric point of the amino acid is at pH
(a) 5.97 (b) 2.34
(c) 9.60 (d) 6.97

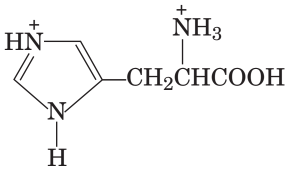
25. Which of the following statement(s) is/are true?
(i) All amino acids contain one chiral centre
(ii) Some amino acids contain one, while some contain more chiral centre or even no chiral centre
(iii) All amino acids found in protein have L-configuration
(iv) All amino acids found in proteins have 1° amino group
(a) (ii), (iii) and (iv)
(b) (ii) and (iii)
(c) (i), (iii) and (iv)
(d) (i) and (iv)

26. Which of the nitrogen of histidine is first protonated?



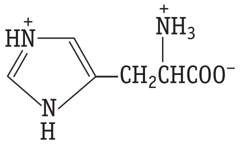
(a) α (b) β
(c) Both (a) and (b) (d) None of these

27. Histidine, a heterocyclic amino acid has following structure at pH < 1.82

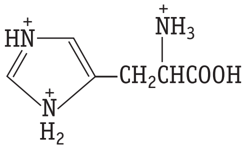


At pH > 1.82, it should have which structure?

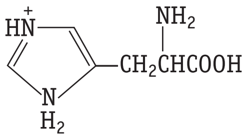
(a)



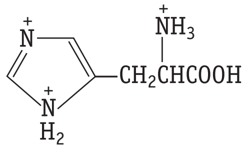
(b)



(c)



(d)



28. Which amino acid have more than one stereogenic centre?
(a) Aspartic acid (b) Lysine
(c) Arginine (d) Histidine

29. When $H_2N-\overset{COOH}{\underset{R}{C}}-H$ is acylated using Ac_2O
- (a) its configuration is retained
- (b) its configuration is inverted
- (c) it becomes unstable
- (d) no reaction takes place

30. In an electric field, if an amino acid migrate towards cathode, the pH of the solution is said to be
- (a) less than pI
- (b) more than pI
- (c) equal to pI
- (d) 7

Proteins

31. Which one is a fibrous protein?
- (a) Globulin
- (b) Collagen
- (c) Hordein
- (d) Glutin

32. Casein contained in milk as a
- (a) carbohydrate
- (b) lipid
- (c) protein
- (d) important molecule

33. Which one is not a protein?
- (a) Actin
- (b) Collagen
- (c) Albumin
- (d) Haematin

34. Aleurone grains are
- (a) starch
- (b) glycogen
- (c) lipid
- (d) protein

35. Initiation of polypeptide chain is through
- (a) lysine
- (b) glycine
- (c) leucine
- (d) methionine

36. Which of the following is not a function of proteins?
- (a) Nail formation
- (b) Skin formation
- (c) Muscle formation
- (d) Providing energy for metabolism

37. Which one of the following is not a protein?
- (a) Wool
- (b) Nail
- (c) Hair
- (d) DNA

38. A tripeptide is composed equally of L-valine, L-tyrosine and L-alanine (one molecule of each). How many isomeric tripeptide of this kind may exist?
- (a) 3
- (b) 4
- (c) 6
- (d) 8

39. Primary structure of protein is based upon the
- (a) hydrogen bonding
- (b) van der Waals' forces
- (c) ionic bonding
- (d) covalent bonding

40. Each polypeptide in a protein has aminoacids linked with each other in a specific sequence. This sequence of amino acids is said to be …… . **[NCERT Exemplar]**
- (a) primary structure of proteins
- (b) secondary structure of proteins
- (c) tertiary structure of proteins
- (d) quaternary structure of proteins

41. Denaturation of proteins leads to loss of its biological activity by
- (a) formation of amino acids
- (b) loss of primary structure
- (c) loss of both primary and secondary structure
- (d) loss of both secondary and tertiary structure

Enzymes

42. The enzyme which facilitates internal rearrangement in 3-phosphoglyceric acid to form 2-phosphoglyceric acid is
- (a) aldolase
- (b) triose phosphate isomerase
- (c) phosphoglycero mutase
- (d) pyruvate kinase

43. The enzymes which have control site in addition to active site are called
- (a) holozymes
- (b) coenzymes
- (c) apoenzymes
- (d) allosteric enzymes

44. Enzymes, in the living systems
- (a) provide energy
- (b) provide immunity
- (c) transport oxygen
- (d) catalyse biochemical processes

45. Which enzyme is present in saliva?
- (a) Urease
- (c) Maltase
- (c) Lactase
- (d) Amylase

46. Which of the following is present in animals like cow, buffaloes etc., to digest compound like paper cloth etc?
- (a) Urease
- (b) Cellulase
- (c) Silicones
- (d) Sucrase

47. The enzyme pepsin hydrolysis
- (a) proteins to amino acids
- (b) fats to fatty acids
- (c) glucose to ethyl alcohol
- (d) polysaccharides to monosaccharides

Vitamins

48. Which of the following B group vitamins can be stored in our body? **[NCERT Exemplar]**
- (a) Vitamin B_1
- (b) Vitamin B_2
- (c) Vitamin B_6
- (d) Vitamin B_{12}

49. Which of the following biomolecules contains non-transition metal ion?
(a) Vitamin B_{12} (b) Chlorophyll
(c) Haemoglobin (d) Insulin

50. Which of the following compounds is known as the antisterility factor?
(a) α-tocopherol (b) Retinol
(c) Calciferol (d) Pyridoxine

51. Vitamin B_6 is known as
(a) pyridoxin (b) thiamine
(c) tocopherol (d) riboflavin

52. The best source of vitamin A is
(a) wheat (b) beans
(c) carrots (d) oranges

53. The deficiency of vitamin B_1 causes
(a) beri-bei (b) dermatitis
(c) scurvy (d) rickets

54. The metal present in vitamin B_{12} is
(a) iron (b) manganese
(c) cobalt (d) mercury

Nucleic Acids

55. Maximum amount of RNA is found in
(a) nucleolus (b) chloroplast
(c) ribosomes (d) cytoplasm

56. When adenine is attached to ribose sugar, it is called adenosine. To make a nucleotide from it, it would require
(a) oxygenation
(b) addition of a base
(c) addition of phosphate
(d) hydrogenation

57. DNA template sequence of CTGATAGC is transcribed over *m*-RNA as
(a) GUCTUTCG (b) GACUAUCG
(c) GAUTATUG (d) UACTATCU

58. Which is capable of self replication?
(a) Enzymes (b) DNA polymerase
(c) DNA ligase (d) DNA

59. Genetic code determines
(a) sequence of amino acids in a peptide chain
(b) sequence of variable amino acids in a protein chain
(c) structure of human cells
(d) morphology of traits

60. Double stranded DNA virus with 20000 base pairs has nucleotides
(a) 20000 (b) 10000
(c) 666 (d) 40000

61. A DNA nucleotide chain has AGCTTCGA sequence. The nucleotide sequence of other chain would be
(a) TCGAAGCT (b) GCTAAGCT
(c) TAGCATAT (d) GATCCTAG

62. Ligase is an enzyme required for
(a) renaturation of DNA (b) proof-reading
(c) joining DNA bits (d) breaking of DNA

63. Nucleotide pairs present in one turn of DNA helix are
(a) 4 (b) 10
(c) 8 (d) 9

64. DNA and RNA contain four bases each. Which of the following bases is not present in RNA?
[NCERT Exemplar]
(a) Adenine (b) Thymine
(c) Uracil (d) Cytosine

65. Antibiotic inhibiting translation in eukaryotes is
(a) tetracyclin (b) penicillin
(c) puromycin (d) chloromycetin

66. Which one is not a constituent of nucleic acid?
(a) Uracil (b) Guanidine
(c) Phosphoric acid (d) Ribose sugar

67. In biological systems, the RNA molecules direct the synthesis of specific proteins which are characteristics of each kinds of organisms. This process is known as
(a) transcription (b) mutation
(c) replication (d) translation

68. Charagaff's rule states that in an organism
(a) amount of adenine (A) is equal to that of thymine (T) and amount of guanine (G) is equal to that of cytocine (C)
(b) amont of adenine (A) is equal to that of guanine (G) and the amount of thymine (T) is equal to that of guanine (G)
(c) amount of adenine (A) is equal to that of cytocine (C) and the amount of thymine (T) is equal to that of guanine (G)
(d) amount of all bases are equal

69. In DNA, the complementary bases are,
(a) adenine and thymine; guanine and cytocine
(b) uracil and adenine; cytocine and guanine
(c) adenine and guanine; thymine and cytocine
(d) adenine and thymine; guanine and uracil

70. The hydrogen bonding for the bases pairs of DNA are between
(a) amide carbonyl and —NH_2 only
(b) amide N—H and cyclic amine nitrogen only
(c) alcohols and carbonyls only
(d) Both (a) and (b)

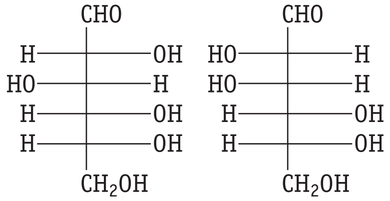
Round II (Mixed Bag)

Only One Correct Option

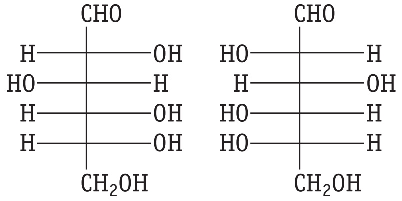
1. A compound gives negative test with ninhydrin and positive test with Benedict's solution. The compound is
(a) a protein (b) an amino acid
(c) a lipid (d) a monosaccharide

2. Which of the following pairs represents anomers? **[NCERT Exemplar]**

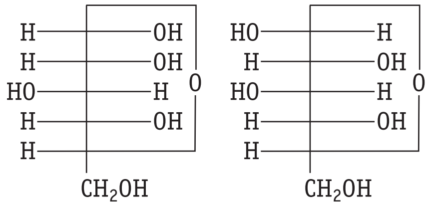
(a)



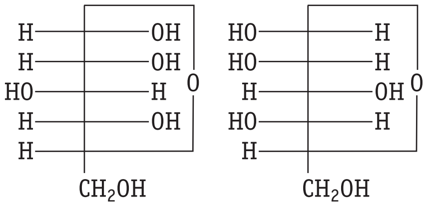
(b)



(c)



(d)

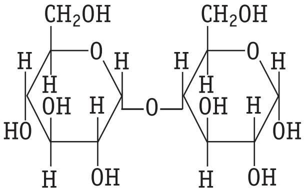


3. The charring of sugar when it is treated with conc. H_2SO_4 is due to
(a) oxidation
(b) reduction
(c) dehydration
(d) hydrolysis

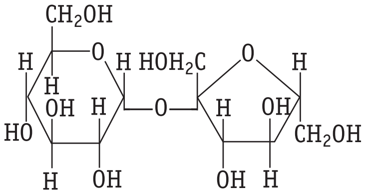
4. Pick out the one which does not belong to the family of enzyme
(a) pepsin (b) cellulose
(c) ptyalin (d) lipase

5. In disaccharides, if the reducing groups of monosaccharides *i.e.*, aldehydic or ketonic groups are bonded, these are non-reducing sugars. Which of the following disaccharide is a non-reducing sugar? **[NCERT Exemplar]**

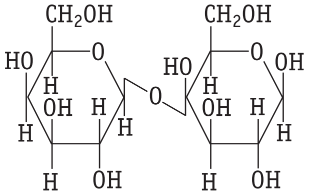
(a)



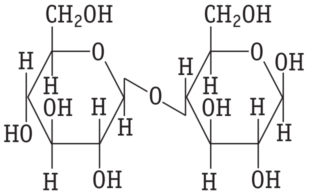
(b)



(c)



(d)



6. Complete hydrolysis of cellulose gives
(a) D-fructose
(b) D-ribose
(c) D-glucose
(d) L-glucose

7. The reason for double helical structure of DNA is operation of
(a) van der Waals' forces
(b) dipole-dipole interaction
(c) hydrogen bonding
(d) electrostatic attractions

8. The prosthetic group of haemoglobin is
(a) porphin (b) globulin
(c) haem (b) gelatin

9. Isoelectric point is a
- (a) specific temperature
- (b) suitable concentration of amino acid
- (c) hydrogen ion concentration that does not allow migration of amino acid under electric field
- (d) melting point of an amino acid under the influence of electric field

10. The number of disulphide linkages present in insulin are
- (a) 1
- (b) 2
- (c) 3
- (d) 4

11. From the following statements

I. Albumin is a simple protein.
II. Amino acid alanine contains an acidic side chain.
III. Insulin is a hormone.
IV. Muscles contain the protein keratin.

Choose the wrong statements.
- (a) I, II
- (b) III, IV
- (c) I, III
- (d) II, IV

12. The correct statement in respect of protein haemoglobin is that it
- (a) acts as an oxygen carrier in the blood
- (b) forms antibodies and offers resistance to diseases
- (c) functions as a catalyst for biological reactions
- (d) maintains blood sugar level

13. Identify the correct statement regarding enzymes.
- (a) Enzymes are specific biological catalysts that can normally function at very high temperatures ($T \sim 1000$ K)
- (b) Enzymes are normally heterogeneous catalysts that are very specific in their action
- (c) Enzymes are specific biological catalysts that cannot be poisoned
- (d) Enzymes are specific biological catalysts that possess well defined active sites

14. The highest calorific value is found in
- (a) proteins
- (b) fats
- (c) vitamins
- (d) carbohydrates

15. Which of the following acids is a vitamin? **[NCERT** Exemplar**]**
- (a) Aspartic acid
- (b) Adipic acid
- (c) Ascorbic acid
- (d) Saccharic acid

16. Dinucleotide is obtained by joining two nucleotides together by phosphodiester linkage. Between which carbon atoms of pentose sugars of nucleotides are these linkages present? **[NCERT** Exemplar**]**
- (a) 5′ and 3′
- (b) 5′ and 5′
- (c) 1′ and 5′
- (d) 3′ and 3′

17. An example of a protein which acts as a hormone is
- (a) casein
- (b) oxytocin
- (c) trypsin
- (d) keratin

18. Insulin production and its action in human body are responsible for the level of diabetes. This compound belongs to which of the following categories?
- (a) A co-enzyme
- (b) A hormone
- (c) An enzyme
- (d) An antibiotic

19. When glucose reacts with bromine water the main product is
- (a) acetic acid
- (b) saccharic acid
- (c) glyceraldehyde
- (d) gluconic acid

20. Nucleic acids are polymers of **[NCERT** Exemplar**]**
- (a) nucleosides
- (b) sugars
- (c) bases
- (d) nucleotides

21. Night-blindness may be caused by the deficiency of vitamin
- (a) A
- (b) B
- (c) D
- (d) C

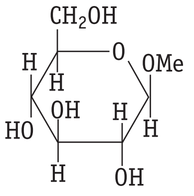
22. The number of amino acids in insulin is
- (a) 21
- (b) 574
- (c) 51
- (d) 5733

23. Amylopectin is a polymer of
- (a) α-D glucose
- (b) α-D fructose
- (c) lactose
- (d) amylose

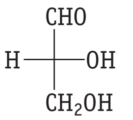
More than One Correct Option

24. Which of the following carbohydrates are D-isomers?

(a)

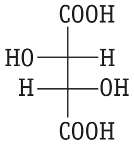


(b)



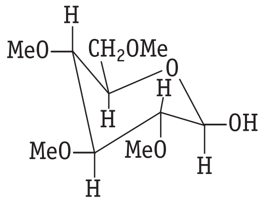
$$\begin{array}{c} CHO \\ H-\!\!\!-\!\!\!\!\!\!\mid\!\!\!\!\!\!-\!\!\!-OH \\ CH_2OH \end{array}$$

(c)



$$\begin{array}{c} COOH \\ HO-\!\!\!\!\!\mid\!\!\!\!\!-H \\ H-\!\!\!\!\!\mid\!\!\!\!\!-OH \\ COOH \end{array}$$

(d)



25. Which of the following monosaccharides are present as five membered cyclic structure (furanose structure)? **[NCERT** Exemplar**]**
- (a) Ribose
- (b) Glucose
- (c) Fructose
- (d) Galactose

26. The product of the reaction

D-glyceraldehyde $\xrightarrow[\text{HCl}]{\text{Me}_2\text{CO}} \xrightarrow{\text{H}_2\text{C}{=}\text{CHMgCl}} \xrightarrow{\text{O}_3}$

is/are?

(a) 
(b) 
(c) 
(d) 
27. Which of the following carbohydrates are branched polymer of glucose? **[NCERT Exemplar]**

(a) Amylose (b) Amylopectin

(c) Cellulose (d) Glycogen

28. A mixture of two amino acids having pI 9.60 and 5.40 can be separated

(a) by adjusting the pH of the solution a 9.60

(b) by adjusting the pH of the solution at 5.40

(c) by adjusting the pH of the solution at 7.0

(d) by adjusting the pH of the solution at 14.0

29. Proteins can be classified into two types on the basis of their molecular shape *i.e.*, fibrous proteins and globular proteins. Examples of globular proteins are **[NCERT Exemplar]**

(a) Insulin (b) Keratin

(c) Albumin (d) Myosin

30. In fibrous proteins, polypeptide chains are held together by .... **[NCERT Exemplar]**

(a) van der Waals' forces

(b) disulphide linkage

(c) electrostatic forces of attractions

(d) hydrogen bonds

31. Which of the following terms are correct about enzyme? **[NCERT Exemplar]**

(a) Proteins (b) Dinucleotides

(c) Nucleic acids (d) Biocatalysts

Assertion and Reason

Directions (Q. Nos. 32 to 36) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*), (*d*) *given below :*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.

(c) Statement I is true; Statement II is false.

(d) Statement I is false; Statement II is true.

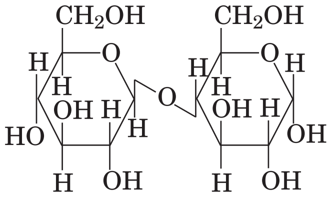
32. **Statement I** D(+)-glucose is dextrorotatary in nature.

Statement II 'D' represents its dextrorotatory nature. **[NCERT Exemplar]**

33. **Statement I** Vitamin D can be stored in our body.

Statement II Vitamin D is fat soluble vitamin. **[NCERT Exemplar]**

34. **Statement I** β-glucodisic linkage is present in maltose.



Statement II Maltose is composed of two glucose units in which C-1 of one glucose unit is linked to C-4 of another glucose unit. **[NCERT Exemplar]**

35. **Statement I** In presence of enzyme, substrate molecule can be attacked by the reagent effectively.

Statement II Active sites of enzymes hold the substrate molecule in a suitable position. **[NCERT Exemplar]**

36. **Statement I** All naturally occurring α-aminoacids except glycine are optically active.

Statement II Most naturally occurring amino acids have L-configuration. **[NCERT Exemplar]**

Comprehension Based Questions

Directions (Q. Nos. 37 to 39) Monosaccharides have —CHO (or $\gt C{=}O$) and —OH groups, so they undergo usual oxidation and reduction. Further, monosaccharides form osazone when treated with excess of phenylhydrazine (3 equivalents). In osazone formation, only the first two carbon atoms are involved. Thus, monosaccharides having identical configuration on rest of C atoms except first two will form same osazone, as in the case with glucose and fructose, *A*, *B* and *C* are three hexoses and form osazone *D*. Compounds *A* to *D* behave as below

(i) $D \xrightarrow{\text{HCl}} \xrightarrow[\text{CH}_3\text{COOH}]{\text{Zn}}$ D-fructose

(ii) $A \xrightarrow{\text{Ni, H}_2} \xrightarrow{\text{HNO}_3} \xrightarrow[\text{H}_3\text{O}^+]{\text{Na–Hg}} B + C$

(iii) $B \xrightarrow{HNO_3}$ optically active glyceric acid

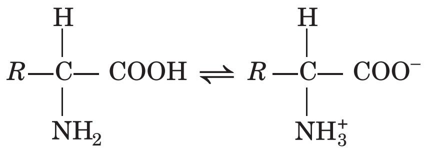
(iv) $C \xrightarrow{HNO_3}$ optically active glyceric acid

37. Compound A should be
(a) D-glucose (b) D-fructose
(c) L-glucose (d) L-fructose

38. Compound B should be
(a) D-glucose (b) D-mannose
(c) L-glucose (d) L-mannose

39. Compound C should be
(a) D-mannose (b) D-glucose
(c) L-glucose (d) L-mannose

Directions (Q. Nos. 40 to 42) Amino acids contain an —NH_2 as well as a —COOH group. In many non-polar solvents, they exist in their neutral form, but in aqueous solution, they exist as dipolar ions (Zwitter ions).

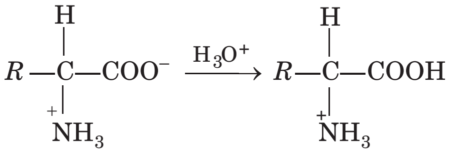


$$R-\underset{NH_2}{\overset{H}{C}}-COOH \rightleftharpoons R-\underset{NH_3^+}{\overset{H}{C}}-COO^-$$

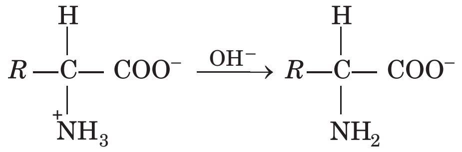
neutral Zwitter ion

This explains their several characteristics properties, like composition on heating, solubility in water, large dipole moment.

If the pH is lowered significantly, say to pH 1 or 2, then carboxylate ion will be protonated, likewise at a very high pH, the free amino group is exposed by deprotonation of ammonium ion.



$$R-\underset{\overset{+}{N}H_3}{\overset{H}{C}}-COO^- \xrightarrow{H_3O^+} R-\underset{\overset{+}{N}H_3}{\overset{H}{C}}-COOH$$

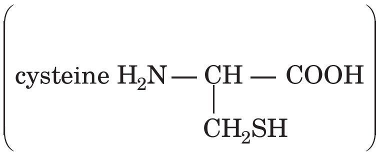


$$R-\underset{\overset{+}{N}H_3}{\overset{H}{C}}-COO^- \xrightarrow{OH^-} R-\underset{NH_2}{\overset{H}{C}}-COO^-$$

There is a pH corresponding to each amino acid where it remains neutral and neither moves towards cathode nor anode when the electric field is applied. This pH of the solution is referred to as isoelectric point. For example, the isoelectric point of alanine is 6.01, that of isoleucine is 6.02 and so on.

Hence, the ionic form of the amino or carboxylic group is the effect of pH on the functional group in the side chain of amino acid. The side chain of many amino acids contain a functional group that can also be protonated or deprotonated.

40. For the thiol group of cysteine at pH 8.2, of pK_a is 8.3, the concentration ratio of RS^- *vs* RSH (cysteine $H_2N-CH(CH_2SH)-COOH$) is



$$\left(\text{cysteine } H_2N-\underset{CH_2SH}{CH}-COOH\right) \text{ is}$$

(a) 0.8 (b) 0.6
(c) 0.9 (d) 0.2

41. In cysteine at $pK_a = 8.3, pH = 8.2$. If total amounts of RSH and RS^- is equal to 100%, then the side-chain of cysteine will exist in the protonated thio form to the extent of
(a) 26% (b) 36%
(c) 46% (d) 56%

42. If pK_a of carboxyl (2.34) and ammonia (9.69) groups, for alanine, the pH would be
(a) 12.03 (b) 7.35
(c) 6.02 (d) 11.33

Previous Years' Questions

43. Which of the following compounds can be detected by Molisch's test? **[AIEEE 2012]**
(a) Nitro compounds
(b) Sugars
(c) Amines
(d) Primary alcohols

44. The change in the optical rotation of freshly prepared solution of glucose is known as **[AIEEE 2011]**
(a) tautomerism
(b) racemization
(c) specific roation
(d) mutarotation

45. The presence or absence of hydroxy group on which carbon atom of sugar differentiates RNA and DNA **[AIEEE 2011]**
(a) 1st (b) 2nd
(c) 3rd (d) 4th

46. Biuret test is not given by **[AIEEE 2010]**
(a) carbohydrates
(b) polypeptides
(c) urea
(d) proteins

47. The two functional groups present in a typical carbohydrate are [AIEEE 2009]

(a) —OH and —COOH

(b) —CHO and —COOH

(c) $>C{=}O$ and —OH

(d) —OH and —CHO

48. The secondary structure of a protein refers to [AIEEE 2007]

(a) α-helical structure

(b) hydrophobic interactions

(c) sequence of α-amino acids

(d) fixed configuration of polypeptide back bone

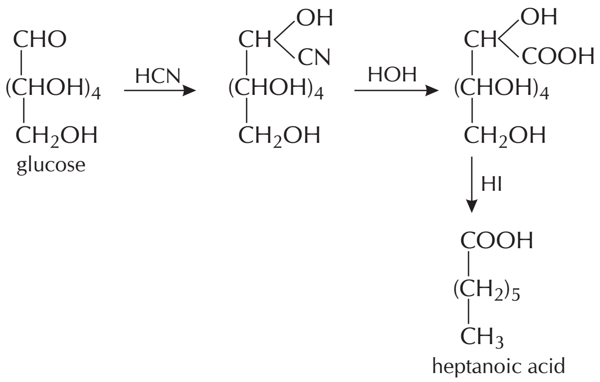
the Guidance

Round I

5.



6. Milk contains lactose which on hydrolysis gives glucose and galactose.

7. Natural glucose is dextrorotatory and thus glucose is also known as dextrose.

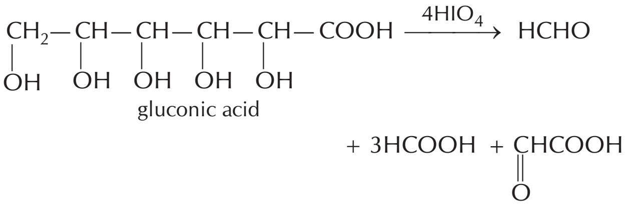
8. Fructose is oxidised by ammoniacal $AgNO_3$.

9. Aldehydes and α-hydroxy ketones give positive Tollen's test. Glucose is a polyhydroxy aldehyde and fructose is an α-hydroxy ketone.

10. α-D(+)-glucopyranose and β-D(+)-glucopyranose are anomers (a pair of stereoisomers which differ in configuration only around first carbon atom).

15. Glucose is present in pyranose form.

16.



$$\underset{OH}{\underset{|}{CH_2}}-\underset{OH}{\underset{|}{CH}}-\underset{OH}{\underset{|}{CH}}-\underset{OH}{\underset{|}{CH}}-\underset{OH}{\underset{|}{CH}}-COOH \xrightarrow{4HIO_4} HCHO + 3HCOOH + \underset{\underset{O}{\|}}{C}HCOOH$$

gluconic acid

17. $\frac{15}{30} \times 100 = 50$

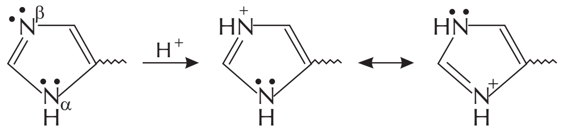
Thus, the mixture is 50% optically pure. Hence, the amount of

$$A = 50 + 25 = 75$$
$$B = 0 + 25 = 25 \therefore A : B = 3 : 1$$

18. The heme ring system is synthesized from glycine and succinyl —CoA.

25. pH (at isoelectric point) $= \frac{2.34 + 9.6}{2} = 5.97$

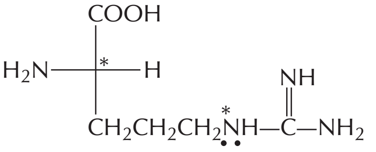
26. Protonation of β-N leads to imidazolium ion, which is stabilized by two equivalent resonating structures.



equivalent resonating structure

27. On increasing the pH by adding an alkali; H^+ will be lost from —COOH.

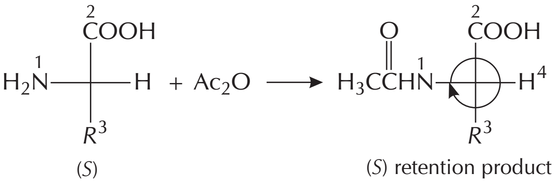
28.



$$H_2N-\underset{CH_2CH_2CH_2\overset{*}{N}H-\overset{\overset{NH}{\parallel}}{C}-NH_2}{\overset{COOH}{\overset{|}{\underset{|}{\overset{*}{C}}}}}-H$$

arginine

29.



30. Cations move towards cathode and when pH < pI, thus cationic form dominates.

35. The first codon of *m*-RNA will be always AUG. This codon specifies the amino-acid methionine. So, the first amino-acid in a polypeptide chain will be always methionine.

38. Val. Uyr. Ala Tyr. ala. val
Val. Ala. Tyr Ala. Tyr. Val
Tyr. Val. Ala Ala. Val. Tyr

42. The internal rearrangement of 3-phosphoglyceric acid into 2-phosphoglyceric acid takes place in the presence of enzyme phosphoglycero mutase.

65. The antibiotic puromycin inhibits protein synthesis by causing nascent polypeptide chains to be released before their synthesis is completed.

Round II

1. Protein gives blue-violet colour with ninhydrin while carbohydrate give negative test with ninhydrin. Carbohydrates give brown red ppt. with Benedict's solution. Hence, compound is a monosaccharide.

2. Cyclic hemiacetal forms of monosaccharides which differ only in the configuration of the hydroxyl group at C-1 are anomers.

3. Charring of sugar when it is treated with conc. H_2SO_4 is due to dehydration. All water molecule is removed from the sugar.

$$C_{12}H_{22}O_{11} + \text{Conc. } H_2SO_4 \longrightarrow 12C + 11H_2O$$

4. Pepsin, ptyalin and lipase are enzyme while cellulose is not the enzyme. It is a polysaccharide.

5. Sucrose is a non-reducing sugar because reducing groups of glucose and fructose are involved in glycosidic linkage formation.

6. Cellulose is a polysaccharide, composed of D-glucose units which are joined by β-glucosidic linkages. On complete hydrolysis cellulose produces D-glucose.

$$\underset{\text{cellulose}}{(C_6H_{10}O_5)_n} + nH_2O \xrightarrow{H^+} \underset{\text{D-glucose}}{nC_6H_{12}O_6}$$

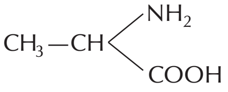
7. The two polynucleotide chains or strands of DNA are joined by hydrogen bonding between the nitrogenous base molecules of their nucleotide monomers.

8. The prosthetic group of haemoglobin is haem (Fe^{2+}).

9. Isoelectric point is a pH at which Zwitter ions do not migrate towards any of the electrode. Amino acids are also Zwitter ions hence, they do not migrate under electric field at isoelectric point.

10. Insulin is composed of two peptide chains referred as the chain *A* and *B*. *A* chain of 21 residues and *B* chain of 30 residues are crosslinked by two disulphide bridges.

11. Amino acid, alanine contains side chain of methyl group, *i.e.*,



$$CH_3-CH\begin{matrix} NH_2 \\ COOH \end{matrix}$$

Muscles contain myoglobin protein.

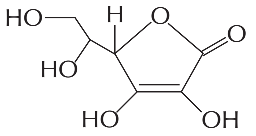
12. Haemoglobin act as an oxygen carrier in the blood because four Fe^{2+} ions of haemoglobin can bind with 4 molecules of O_2 and form oxyhaemoglobin.

$$Hb + O_2 \longrightarrow \text{Oxyhaemoglobin}$$

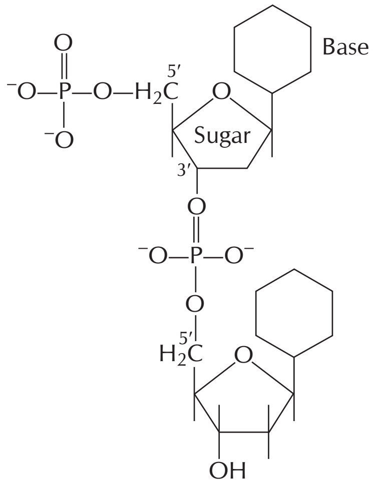
13. Enzymes have well defined active sites and their action are specific in nature. They are called biological catalysts and work at optimum temperature between 25 to 40°C.

14. 1 g fat provide 37 kJ of energy on oxidation while 1 g carbohydrate on oxidation gives 17 kJ of energy. Hence, fat has highest calorific value.

15. Ascorbic acid is vitamin C. Its structure is



16. Nucleotides are joined together by phosphodiester linkage between 5′ and 3′ carbon atoms of pentose sugar.



17. Oxytocin hormone plays an important role in child birth and milk ejection. It is secreted by posterior pitutary gland.

18. Insulin is proteinaceous hormone. It is secreted by pancreas and controls the metabolism of glucose and maintains glucose level in the blood.

19. When glucose reacts with Br_2 water, gluconic acid is obtained as main product.

20. Nucleic acids are polymers of nucleotides. They play an important role in all living cells.

21. Night blindness is caused by the deficiency of vitamin A or retinol.

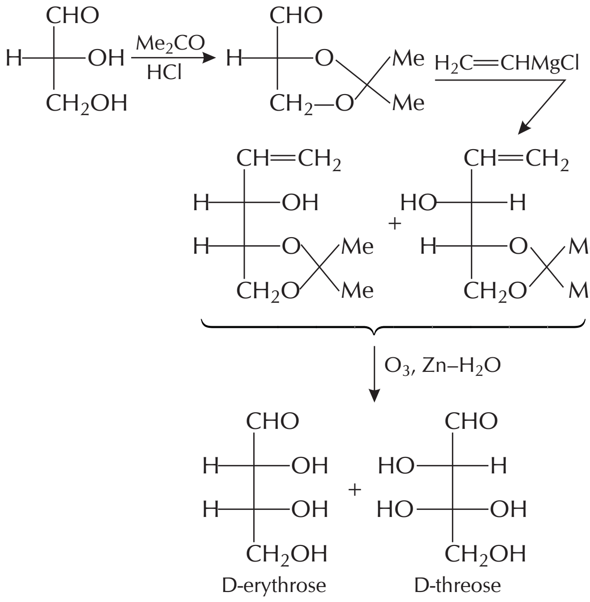
22. Insulin is an important peptide hormone. Its structure was determined by Sangar. It has two polypeptide chains with 21 and 30 amino acids. Hence, total amino acids are 51.

23. Amylopectin is a polymer of α-D-glucose. It consists of branched chains of α-D-glucose involving about 1000 or more units per molecule.

24. The compound whose numerically largest numbered (as per IUPAC convention) asymmetric carbon has configuration similar to D-glyceraldehyde has D-configuration.

25. Ribose and fructose have furanose structure.

26.



27. Amylopectin is insoluble in water, it is branched chain polymer of α-D glucose units in which chain is formed by C-1 and C-4 glycosidic linkage whereas branching occurs by C-1 and C-6 glycosidic linkage.

Structure of glycogen is similar to amylopectin and it also highly branched.

28. Every amino acid exists exclusively as dipolar ion when the pH of the solution is equal to its isoelectric point (pI), hence at this pH it does not migrate to either electrode, while at other pH, an amino acid migrates either to cathode or to anode depending upon its pH. Thus, at pH 9.60, amino acid with pI 5.40 will exist as an anion and migrate to anode while that with pI 9.60 will not migrate to any electrode. Similarly, at pH 5.40, amino acid with pI 9.60 will exist as cation and migrate to either electrode.

29. Albumins and insulin are common examples of globular proteins. In this structure, chains of polypeptides coil around to give a sperical shape.

30. In fibrous proteins, polypeptide chains are held together by hydrogen and disulphide bonds.

31. Almost all enzymes are globular proteins. These are biocatalysts because they speed up the reactions in biosystems.

32. D and L are the relative configurations given to carbohydrates in order to distinguish between the two different stereoisomers. If the —OH group attached to the bottom most asymmetric carbon (the carbon that second from the bottom) is on the right, then the compound is a D-sugar and its mirror image is L-sugar.

⊕ sign indicates that compound is dextrorotatory.

33. Vitamin D is a fat soluble vitamin so it can be stored in our body.

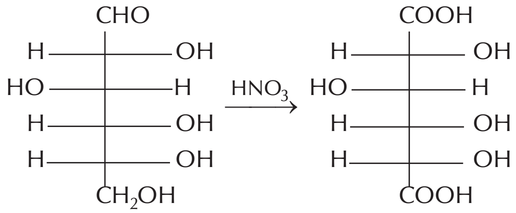
34. In maltose, α-1, 4′-glycosidic linkage is present because the oxygen atom involved in the glycosidic linkage is in the α-position.

35. Statement II is the correct explanation of statement I.

36. All naturally occurring α-amino acids except glycine are optically active because α-carbon atom is asymmetric.

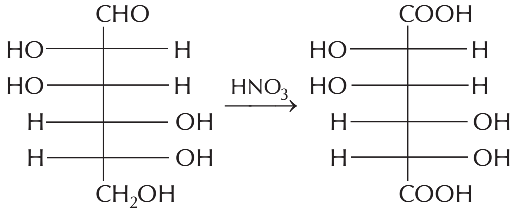
37. The (ii) series of reactions points out for the presence of a ketonic group in *A*, hence *A* must be D-fructose.

38. *B* on oxidation gives an optically active glyceric acid thus *B* should have following structure



D-glucose   optically active

39. C on oxidation gives an optically inactive glyceric acid, which is indicative of following structure for C.



D-mannose   optically active

40. For the equilibrium, $RSH \rightleftharpoons RS^- + H^+$

Henderson-Hasselbalch equation,

$$\text{pH} = \text{p}K_a + \log\frac{[\text{salt}]}{[\text{acid}]}$$

$$\therefore \quad 8.2 = 8.3 + \log\frac{[RS^-]}{[RSH]}$$

$$\text{or} \quad \frac{[RS^-]}{[RSH]} = 0.8$$

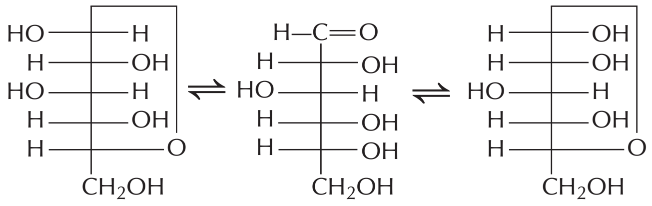
41. From the above calculations, $\dfrac{[RSH]}{[RS^-]} = \dfrac{1}{0.8} = 1.25$

$$\frac{[RSH]}{[RS^-] + [RSH]} \times 100 = 56\%$$

42. $\text{pH} = \dfrac{2.34 + 9.69}{2} = 6.015$

43. Molisch's test is for carbohydrates (*e.g.,* sugar). Add two drops of alcoholic solution of α-naphthol to the carbohydrate solution under study. Add conc. H_2SO_4 slowly by the side of the test tube. A violet ring is formed at the junction of two liquids if carbohydrate is present.

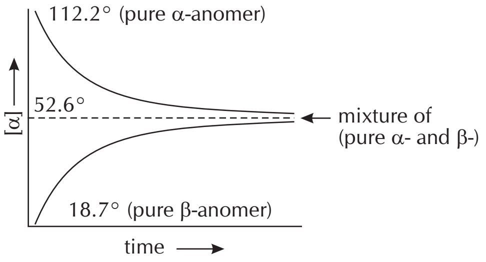
44. A spontaneous change in the specific rotation of a solution of an optically active compound is called mutarotation. Hemiacetal forms of α and β-D-glucose are stable in solid stable but in aqueous solution, there is opening of the cyclic structure which gives solution of constant specific rotation.



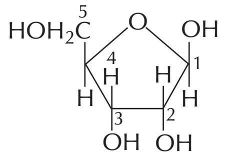
β-
Specific roatation
[α] = + 18.7°

D-glucose
+52.6°

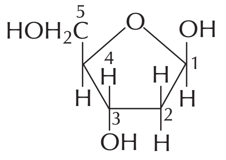
α-
+112.2°



45. Oxytocin is a hormone.

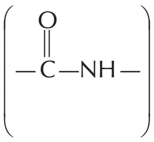


β-D-ribose used in
RNA
(at 2 carbon atom, —OH
group is present)



β-D-deoxyribose used in
DNA
(at 2 carbon atom, —OH
group is missing)

46. Biuret test is characteristically given by the compound having



$\left(-\overset{\overset{\displaystyle O}{\|}}{C}-NH-\right)$ functional group.

47. Carbohydrate are optically active polyhydroxy aldehyde or polyhydroxy ketones.

$>$C=O, —OH are functional groups of typical ketose.

—CHO, —OH functional groups of typical aldose.

48. Secondary structure involves α-helical and β-pleated sheet like structure.

15 Chemistry in Everyday Life

JEE Main MILESTONE

- Chemicals in Medicines
- Chemicals in Food
- Cleansing Agents

15.1 Chemicals in Medicines

Usually there are three systems for curing diseases. These are Unani system, Ayurvedic system and Allopathic system. In all of these three systems, the substances used to cure diseases, are chemical compounds. These compounds may be of natural or synthetic origin and are called **medicines** or **drugs.** Therefore, "the chemical substances either of natural or synthetic origin, used for treating diseases and reducing suffering from pain are called **medicines** or **drugs."** The average molecular mass of drug is ~ 100 u to 500 u.

Caution Point *All medicines are drug but all drugs are not medicines.*

Chemistry plays a vital role in every aspect of our life. Many substances which are used in daily life, are chemical compounds, e.g., soaps, detergents, household bleach, toothpaste etc., all are made up of chemicals.

The branch of science which deals with the treatment of diseases using suitable chemical compounds is called **chemotherapy.** On this basis, the various drugs used for curing diseases are also known as **chemotherapeutic agents**.

While designing a drug the following factors must be considered

(i) The target of drug
(ii) Drug metabolism
(iii) Physiological function of the drug target
(iv) Mechanism of drug action

Actually, when the biological response of a drug is therapeutic and useful, it is termed as **medicine** and used for diagnosis, prevention and treatment of diseases. If medicines are taken in higher doses than the recommended, these are potential poisons.

The factors on the basis of which medicines (drugs) can be classified are structure of drug, drug target, drug action and pharmacological effect of drug. Out of these, the classification based on pharmacological effect of drug is useful for doctors because it provides them the whole range of drugs available for the treatment of a particular type of problem.

Drug-Target Interaction

Macromolecules of biological origin such as proteins, carbohydrates, lipids, enzymes and nucleic acids are called drug targets because drug interact with these macromolecules.

(a) Enzymes as Drug Targets

Enzymes have active sites that bind the substrate for effective and quick chemical reaction. The functional groups present at the active site of enzyme interact with functional groups of substrate *via* ionic bonding, hydrogen bonding, van der Waals' interactions or dipole-dipole interaction. Some drugs interfere with this interaction by blocking the binding site of enzyme and prevent the binding of actual substrate with enzyme. This inhibits the catalytic activity of the enzyme so, these are called **enzyme inhibitors.** Drugs which block the active site of an enzyme are of two types Competitive inhibitors and non-competitive inhibitors.

Competitive inhibitors are those drugs which compete with substrate for the attachment on active sites of enzymes.

Non-competitive inhibitor are those drugs which changes the active site of enzyme after binding at **allosteric site.** Sites different from active site of the enzyme where a molecule (drug molecule) can bind and affect the active site are called allosteric site.

Caution Point *If the formation between an enzyme and an inhibitor is a strong bond, then the enzyme is blocked permanently. The body then synthesises the new enzyme.*

(b) Receptors as Drug Targets

Receptor proteins are embedded in the cell membrane. The active site of the receptor opens on the outside region of the cell membrane. **Chemical messengers** communicate the messages between two neurons and between neurons to muscles. Receptor receives chemical messenger at its binding site (or active site). Shape of the receptor site changes which results in the transfer of message into the cell.

- Receptor regains shape after removal of chemical messenger.

Antagonistic drugs are those that bind to the receptor site and inhibit its natural function. **Agonistic drugs** are those that mimic the natural messenger by switching on the receptor.

Sample **Problem 1** *Which one of the following is not a drug target?* **[NCERT Exemplar]**

(a) *Vitamins* (b) *Proteins*
(c) *Carbohydrates* (d) *Nucleic acids*

Interpret (a) Nucleic acids, proteins, carbohydrates, lipids and enzymes are drug targets because drugs interact with these macromolecules, but vitamins are not drug targets.

Therapeutic Action of Different Classes of Drugs

Antipyretics

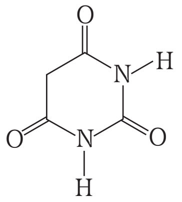
The chemical substances which are used to bring down body temperature during high fever are called antipyretics. *e.g.*, paracetamol, aspirin, phenacetin (4-ethoxy acetanilide), analgin, novalgin etc. Out of these, paracetamol is the most popular antipyretics.

Caution Point *Paracetamol, aspirin, novalgin and phenacetin act as antipyretics as well as analgesics.*

Tranquillizers

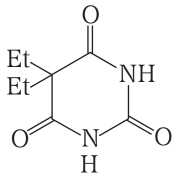
The chemical compounds which are used for the treatment of stress, mild and severe mental diseases are known as tranquillizers. They induce the sense of fitness and relieve stress and fatigue. Therefore, these drugs are also known as **psychotherapeutic drugs.** They form an essential part of sleeping pills.

Tranquillizers act on central nervous system and are habit forming in nature. They make the patient passive and help to control their emotional distress or depression. Moreover, they simply help the individuals to work with full capacities that they already have. Derivatives of barbituric acid, *i.e.*, barbiturates such as amytal, veronal, nembutal, seconal and luminal are the examples of hypnotic tranquillizers (sleep producing) whereas equanil, valium, serotonin, chlorodiazepoxide, meprobamate are examples of non-hypnotic tranquillizers. An alkaloid resperine, extracted from the plant "*Rauwolfia serpentina*" is also a tranquillizer which lowers the blood pressure and slows down the pulse rate.

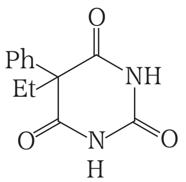


barbituric acid

;

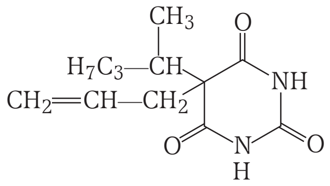


veronal (barbital)

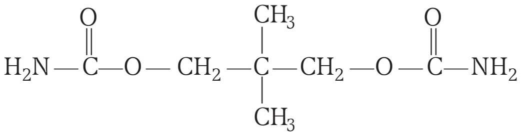


luminal

;

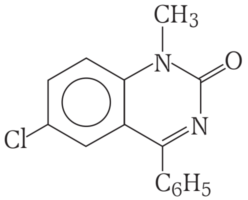


seconal

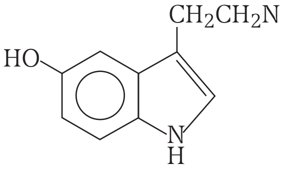


$H_2N-\overset{\overset{O}{\|}}{C}-O-CH_2-\underset{\underset{CH_3}{|}}{\overset{\overset{CH_3}{|}}{C}}-CH_2-O-\overset{\overset{O}{\|}}{C}-NH_2$

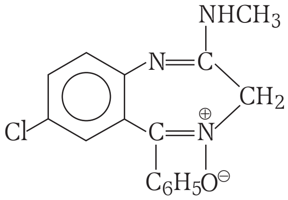
equanil



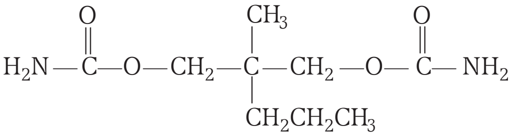
valium



serotonin



chlorodiazepoxide



$H_2N-\overset{\overset{O}{\|}}{C}-O-CH_2-\underset{\underset{CH_2CH_2CH_3}{|}}{\overset{\overset{CH_3}{|}}{C}}-CH_2-O-\overset{\overset{O}{\|}}{C}-NH_2$

meprobamate

Caution Point *Tranquillizers and analgesics are neurologically active drugs.*

Tranquillizers may be of the following types

(a) **Sedatives** These act as depressant and suppress the activities of central nervous system. These are given to mentally agitated and violent patients. Sedatives give a feeling of calmness, relaxation or drowsiness in the body, *e.g*., valium, barbiturates, diazepam etc.

(b) **Antidepressants** These drugs are given to persons with shattered confidence. These drugs act on central nervous system and produce a feeling of well being and confidence in the person of depressed mood. That's why these are also termed as mood booster drugs. *e.g*., Iproniazid, phenelzine, equanil, vitalin, benzedrine, tofranil, methedrine, cocaine etc.

(c) **Hypnotics** These are used to reduce mental tension and anxiety, *e.g*., chloretone, luminal, seconal etc.

(d) **Psychedic drugs** They produce hallucination, disturb vision and hearing and cause false feeling of happiness. An example of powerful psychedlic drug is LSD (lysergic acid diethylamide). Other example of such drugs is mescaline.

Sample **Problem 7** *Which of the following statements are correct about barbiturates?* **[NCERT Exemplar]**

(a) *Hypnotics or sleep producing agents*

(b) *These are tranquillizers*

(c) *Non-narcotic analgesics*

(d) *Pain reducing without disturbing the nervous system*

Interpret (*a, b*) Barbiturates constitute an important class of tranquillizers. These are hypnotic *i.e.,* sleep producing agents.

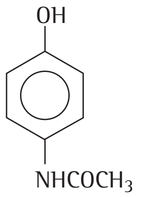
Hot Spot 1

ANALGESICS

Analgesics specially non-narcotic analgesics is the most important topic of this chapter. Generally questions are asked on paracetamol and aspirin from this topic.

The medicines which are used to reduce pain are known as analgesics. In simple words, we can say, analgesic is the medical name for pain killers. These can be further of two types :

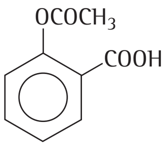
(a) **Non-narcotic** (or non-addictive) **analgesics** The non-habit forming chemicals which are used to reduce mild to moderate pain such as headache, toothache, muscle and joint pain etc., are called non-narcotic analgesics. Because of their non-habit forming nature, they are also termed as non-addictive. These drugs do not produce sleep and unconsciousness. Some examples of non-narcotic analgesics are naproxen, diclofenac sodium or potassium, ibuprofen, paracetamol, ketoprofen, mefenamic acid etc.



paracetamol
(4-acetamidophenol)

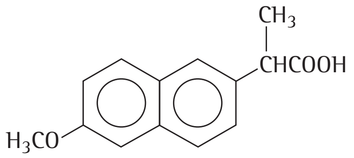
Some non-narcotic analgesics have anti-inflammatory properties, *i. e.*, they inhibit the synthesis of prostaglandins which leads to inflammation in a tissue and causes pain. Due to which these are known as non-steroidal anti-inflammatory drugs (NSAIDS).

Examples of such drugs (medicines) with their structure are given below :

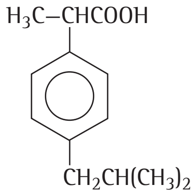


acetyl salicylic acid
or 2-acetoxy benzoic acid
(aspirin)

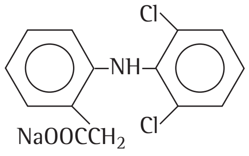
;



naproxen



ibuprofen



dichlorofenac sodium

Aspirin is the most common analgesic alongwith antipyretic (temperature lowering), anti-inflammatory and anti-blood clotting properties (due to its anti-blood clotting action, it is widely used to prevent heart attack). Moreover aspirin is also used to check pregnancy related problems, viral inflammation in AIDS patients and cancer.

Aspirin is supposed to be toxic to the liver. In some cases, it causes bleeding from the wall of stomach and gastric irritation. Infact, in empty stomach aspirin gets hydrolysed into salicylic acid which is responsible for these problems. Therefore, it is advised that aspirin should not be taken into empty stomach. However, calcium and sodium salts of aspirin are more soluble and less harmful.

Sample **Problem 4** *The* pH *value of gastric juice in human stomach is about* 1.8 *and in the small intestine it is about* 7.8. *The* pK_a *value of aspirin is* 3.5. *Aspirin will be*

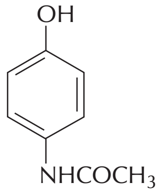
(*a*) *completely ionised in the small intestine and in the stomach*
(*b*) *ionised in the small intestine and almost unionised in the stomach*
(*c*) *unionised in the small intestine and in the stomach*
(*d*) *ionised in the stomach and almost unionised in the small intestine*

Interpret (*b*) Aspirin is a moderate acid (pK_a = 3.5), hence is almost unionised in stomach due to strong acidic medium of it (because of HCl). It is due to common ion effect. While in small intestine, the medium is alkaline, hence aspirin will be sufficiently ionised in small intestine.

Sample **Problem 5** *The functional groups present in paracetamol are*

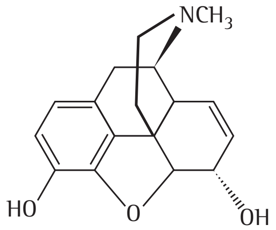
(*a*) —OH, —$NHCONH_3$ (*b*) —OH, —COOH
(*c*) —OH, —COO*R* (*d*) —NH_2, —OH

Interpret (*a*) The structure of paracetamol is

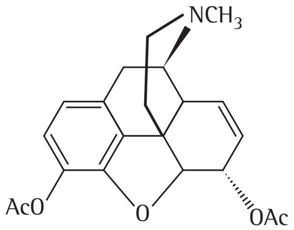


Thus, it have —OH and —$NHCOCH_3$ groups.

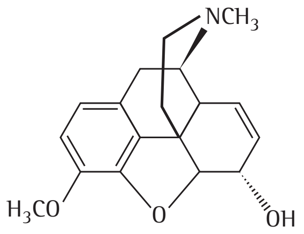
(b) **Narcotic** (or addictive) **analgesics** The pain relieving drugs which produce sleep and unconsciousness are called narcotic analgescis. Unlike non-naroctic analgesics, these are habit forming. These are more effective than non-narcotic drugs. These are mostly opium derivatives and used only in severe pain, ***e.g.,*** morphine, codeine, meperidine, heroin (or morphine diacetate obtained by acetylation of morphine) etc.



morphine



heroin

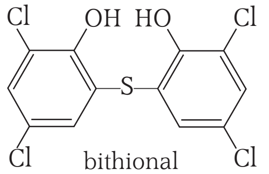


codeine

These drugs when used in small dose, relieve pain and produce sleep but their large dose, causes laziness, convulsions and ultimately death.

Antiseptics and Disinfectants

The chemicals which either prevent the growth of microorganisms or kill them but are not harmful to the living tissues, are known as antiseptics. Being harmless to living tissues, antiseptics can be safely applied on wounds, ulcers, cuts and diseased skin surfaces. These drugs also reduce odours caused by bacterial decomposition on the body or in the mouth. These are, therefore, mixed with body deodorants, face powders and breath purifiers, *e. g.*, bithional, an antiseptic, is mixed to medicated soaps to impart antiseptic properties.



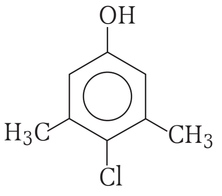
bithional

The chemical substances which also kill the microorganisms but are not safe to apply over living tissues, are called **disinfectants.** Disinfectants play an important role in water treatment and in public health sanitation. They are actually used for inanimate objects such as floors, toilets, instruments etc.

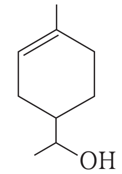
Many times, the same substance can act as an antiseptic as well as disinfectant on the basis of its concentration, *e. g.*, 0.2% solution of phenol is an antiseptic whereas its 1% solution acts as disinfectant. Similarly, low concentration of SO_2 is used to sterilize squash for preservation but its high concentration is used as disinfectant for living rooms.

Other examples of antiseptics and disinfectants are as follows

(i) Dettol is one of the most commonly used antiseptics. It is a mixture of chloroxylenol and α-terpineol. It is chloroxylenol which is responsible for its antiseptic and disinfectant properties.



chloroxylenol



α-terpineol

(ii) 0.2 to 0.4 ppm (parts per million) concentration of chlorine is used for making water fit for drinking.

(iii) Savlon in non-aqueous solution is used as an antiseptic.

(iv) Amyl metacresol (5-methyl-2-pentylphenol) is an antiseptic which is used as a mouthwash or gargles in infections of the mouth and throat.

(v) Iodine and iodoform both are powerful antiseptics. Iodine is employed as tincture, *i.e.*, a solution of 2–3% iodine in alcohol and water while iodoform is used as powder for wounds.

(vi) A dilute aqueous solution of boric acid is used as a weak antiseptic for eyes. Boric acid is also used as antiseptic in baby talcum powders.

(vii) Hydrogen peroxide, salol (phenyl salicylate) and mercurochrom are also used as antiseptics.

(viii) A soapy solution of cresol, called lysol, is used as disinfectant.

(ix) Some organic dyes such as gention violet, methylene blue have antiseptic property and are used for dressing wounds and for treating various skin diseases.

Antimicrobials

The chemicals which are used to cure infections caused by microbes (microorganisms) either by killing or destroying them, are known as antimicrobials. Microbes are extremely small organisms that can be seen through microscope only, *e.g.*, bacteria, viruses etc. The microbes which produce diseases/infections are known as **pathogens**.

Human body possesses an efficient natural defence mechanism for fighting against potential pathogenic microbes. Certain body secretions such as nasal secretion, saliva, lactic acid (in sweat) and hydrochloric acid (in stomach), kill the pathogens and also inhibit their growth.

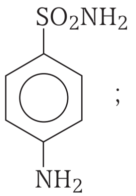
However, when the natural defence mechanism is not working properly or fails, the pathogens attack on the living tissues and lead to infection or disease. There are three possible ways by which these microbial diseases can be controlled.

These are

1. By using bacteriostatic drug which inhibits or arrests the growth of microbes.
2. By using bactericidal drug which kills the microbes.
3. By increasing immunity and resistance to infection of the body.

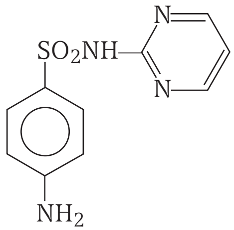
Most of the microbial diseases are cured by using antibiotics and sulpha drugs. The examples of antibiotics are tetracycline, penicillin, chloramphenicol and the examples of sulpha drugs are sulphanilamide (*p*-amino benzene sulphonamide) and its derivative such as sulphadiazine, sulphadimidine, sulphadimethoxine, sulphadoxine, sulphasomidine, sulphaguanidine etc.

In fact sulpha drugs are a group of drugs which are derivatives of sulphanilamide and have great antimicrobial capacity, thus these are used widely against diseases such as dyptheria, dysentry, tuberculosis etc., caused by cocci, a type of bacteria. In structure, these drugs are analgoues of *p*-amino benzoic acid as shown below.

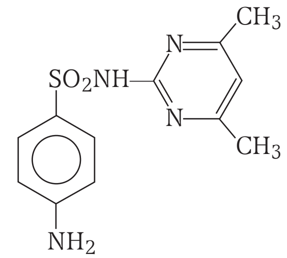


sulphanilamide
(p-amino benzene
sulphonamide)

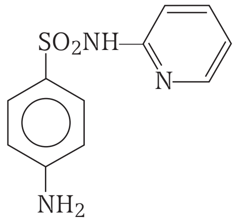
;



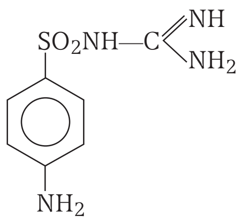
sulphadiazine



sulphadimidine



sulphapyridine



sulphaguanidine

Sulphonamides in combination with trimethoprim are used for the treatment of urinary tract infection.

Mode of Action of Sulpha Drugs

Sulpha drugs inhibit the growth of those bacteria which need *p*-amino benzoic acid for the synthesis of folic acid. Sulphanilamide acts as an inhibitor for those enzymatic steps which are involved in the synthesis of folic acid by the bacteria.

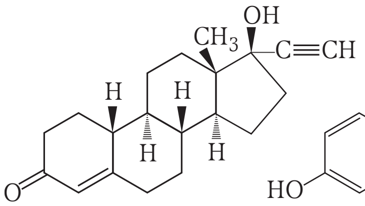
This results in the death of bacteria because synthesis of folic acid is essential for bacteria. Humans do not synthesize their own folic acid, they get it from dietry sources, so they are unaffected by sulpha drugs.

Antifertility Drugs

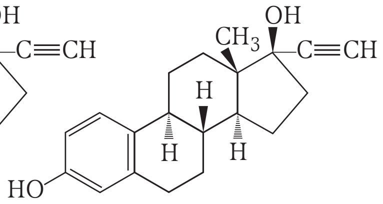
The chemicals which are used to check pregnancy in woman are known as antifertility drugs. These are also known as **birth control pills** or **oral contraceptives**. The basic aim of these drugs is to prevent conception or fertilization.

Chemically, antifertility drugs belong to the class of natural products, known as steroids. Steroids are the active ingredients of antifertility drugs. These check the pregnancy by controlling female menstrual cycle and ovulation.

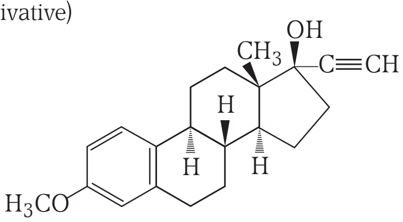
These, essentially, contain a mixture of synthetic estrogen and progesterone derivatives which are more potent than the natural hormones. The common progesterone, used are ethynodial, norethindrone, noresthistereone, lynestrenol etc., and estrogens used are ethynylestradiol, mestranol etc., *e.g.,* a brand name enovid *E* contains a mixture of norethindrone (a progesterone derivative) and mestranol (a synthetic estrogen).



norethindrone
(a progesterone
derivative)

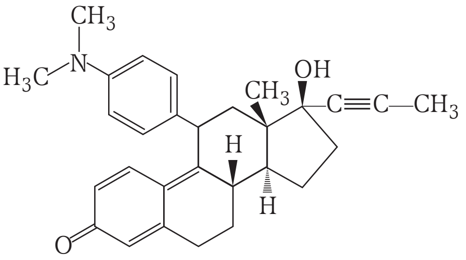


ethynylestradiol
(an estrogen)



mestranol
(ethynylstradiol monomethyl ether)
(an estrogen)

Ormeloxifene (centchroman, saheli) is also an effective antifertility drug. Mifepristone is a synthetic steroid that checks the effect of progesterone and is used as a "morning after pill".



mifepristone (a synthetic steroid)

Adverse Effects These contraceptives may cause disruption of normal menstrual cycle (prolonged or excessive bleeding) and increase in weight. In some cases, prolonged infertility has been reported after the use of these contraceptives.

Antibiotics

The chemicals which are obtained from microorganisms such as bacteria, fungi, moulds etc., and used to inhibit the growth or even kill the microorganisms are called antibiotics. However, this definition has been modified with the development of synthetic methods. An antibiotic now refers to a chemical which in low concentration inhibits the growth or kills microorganisms by intervening in their metabolic processes.

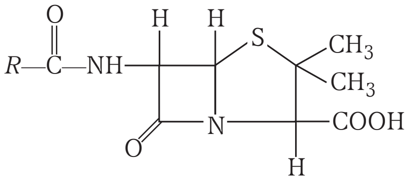
Since, antibiotics are the products of microbial growth, this therapy has been likened to "setting one thief against another".

Antibiotics can be either bactericidal or bacteriostatic. **Bactericidal drugs** (*bacteri* = microorganisms, *cidal* = kill)

kill the microorganisms. Penicillin, aminoglycosides, ofloxacin etc., are the examples of bactericidal antibiotics. **Bacteriostatic drugs** (*bacteri* = microorganisms, *satic* = inhibit) inhibit or arrest the growth of microorganisms. Commonly used bacteriostatic antibiotics are tetracycline, erthyromycin etc.

The full range of microorganisms affected by an antibiotic is called its **spectrum**. An antibiotic may be narrow spectrum or broad spectrum. A **broad spectrum antibiotic** is effective against a large number of harmful organisms whereas **narrow spectrum antibiotics** affect only certain classes of microorganisms. Ofloxacin, aminoglycosides, tetracycline, chloramphenicol etc., are the examples of broad spectrum antibiotics while penicillin is an example of narrow spectrum antibiotics.

First discovered antibiotic is penicillin which is discovered by A. Fleming in 1929. He obtained it from *penicillium notatum*. General formula of penicillin is $C_9H_{11}O_4SN_2R$. With the substitution of different *R* groups, about six natural penicillins have been isolated so far. The general structure of penicillin and its derivatives are given below :



General structure of penicillin

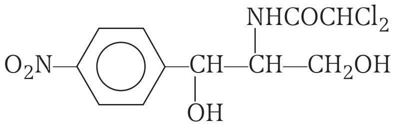
Table 15.1 **Different Penicillines**

S.N.	*R* group	Name
1.	*R* = 	Penicillin G or benzyl penicillin
2.	$R = CH_3CH_2CH{=}CH{-}CH_2$	Penicillin F
3.	$R = CH_3{-}(CH_2)_6{-}$	Penicillin K
4.	*R* = 	Ampicillin*
5.	*R* = 	Amoxycillin*

*Ampicillin and amoxycillin are semi-synthetic modifications of penicillin.

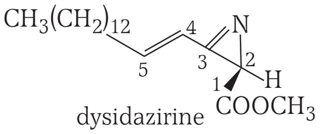
Penicillin is a narrow spectrum antibiotic and used for curing sore throat, gonorrhoea, rheumatic fever etc. Some persons have allergy to it hence, it is essential to test the sensitivity (allergy) of the patient by giving a test dose.

Chloramphenicol, tetracycline and chloromycetin all are broad spectrum antibiotics and used for the treatment of typhoid, acute fever, pneumonia, dysentery, whooping cough and certain urinary infections. Chloramphenicol is readily absorbed from the gastro-intestinal tract and hence, it can be given orally.



chloramphenicol

Streptomycin which is also an antibiotic is highly effective for curing tuberculosis. It is also used for the treatment of meningitis and pneumonia. Dysidazirine, an antibiotic, is supposed to be toxic towards certain strains of cancer cells.



dysidazirine

Sample Problem 10 *Chloramphenicol is a*

(a) *broad spectrum bacteriostatic antibiotic*
(b) *broad spectrum bactericidal antibiotic*
(c) *narrow spectrum bacteriostatic antibiotic*
(d) *narrow spectrum bactericidal antibiotic*

Interpret (a) Chloramphenicol have static (inhibitory) effect on microbes. It is effective against a number of diseases such as fever, typhoid, dysentery, certain form of urinary infections, meningitis and pneumonia. So, it is a broad spectrum bacteriostatic antibiotic.

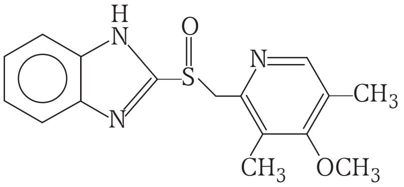
Antacids

Wall of stomach secrets acids to make the stomach acidic and for the digestion of food. When the acid is secreted in excess, it leads to indigestion, heart burn or gastric ulcers. The chemicals which are used to neutralise the excess acid present in the gastric juice and to raise the pH of stomach up to an appropriate level are called antacids.

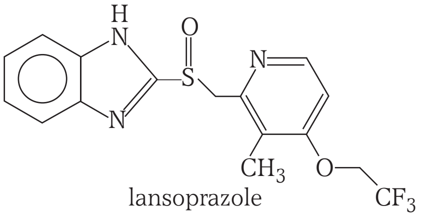
Since acids are neutralised by bases, weak bases such as sodium bicarbonate ($NaHCO_3$), magnesium hydroxide [$Mg(OH)_2$], magnesium carbonate ($MgCO_3$), magnesium trisilicate, aluminium hydroxide etc., are used as antacids.

Generally, antacids in liquid form are more effective than that in the form of tablets because these have great surface area available for interaction and neutralisation of acid.

Calcium salts can also be used as antacids but they are not so effective. Recently omeprazole and lansoprazole have been synthesised to give quick relief from acid gastritis.

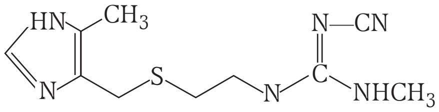


omeprazole

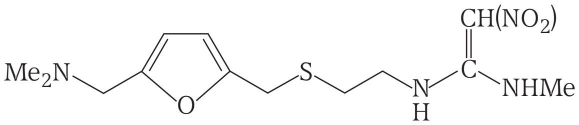


lansoprazole

Histamine also stimulates the secretion of pepsin and hydrochloric acid. To prevent hyperacidity, produced by histamine, cimetidine (tegamet) and ranitidine (zantac) are used as antacid.



cimetidine



ranitidine

Cimetidine and ranitidine both prevent the interaction of histamine with the receptors of stomach wall, which results in the release of lesser amount of acid.

Caution Point *Milk acts as a weak antacid and thus, possesses a protective action against acidity.*

Sample **Problem 13** *Which one of the following statement is incorrect?*

(a) *Cimetidine and ranitidine are better antacids than* $NaHCO_3$, $Mg(OH)_2$ *and* $Al(OH)_3$.

(b) *Cimetidine and ranitidine neutralize the excess acid produced in the stomach.*

(c) *Cimetidine and ranitidine both prevent the interaction of histamine with the receptors of stomach wall.*

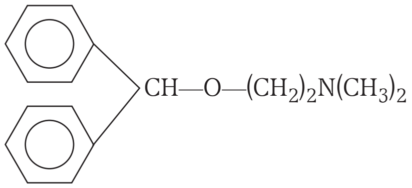
(d) *Cimetidine and ranitidine are also known as tegamet and zantac respectively.*

Interpret (*b*) Cimetidine and ranitidine both prevent the interaction of histamine with the receptors of the stomach wall as histamine stimulates the secretion of acid.

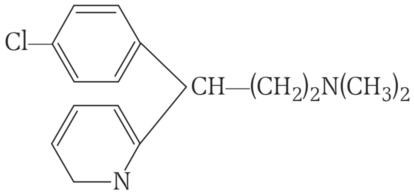
Antihistamines

These are infact anti-allergic drugs. Since, allergy is caused due to secretion of histamine (by mast cells) in the body, these drugs combat the effect of histamines. In other words, "the chemicals which diminish or abolish the effect of histamine and hence, prevent the allergic reactions such as hay fever, mild asthma, nasal discharge etc., are known as antihistamins. These drugs are also useful for conjunctivitis (*i.e.*, inflammation of conjunctiva of eye) and rhinitis (*i.e.*, inflammation of nasal mucosa).

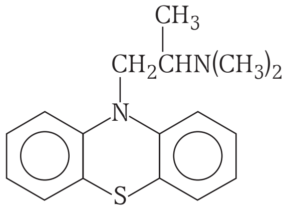
The common examples of antihistamines are diphenylhydramine (common name benadryl), pheniramine maleate (avil), chlorpheniramine maleate (zeet), promethzine etc.



diphenylhydramine (benadryl)



chlorpheniramine



promethazine

Anaesthetics

The chemicals which produce general or local insensibility to pains and other sensations are called anaesthetics. Here, the word 'local' means 'in a limited area'. Some anaesthetics act after inhaling its vapours, *e.g.*, diethyl ether, nitrous oxide, cylopropane etc., while others are administered orally or injected into the body, *e.g.*, morphine and pathedine.

Cocaine, novocine (procaine), xylocaines and ethyl chloride are some examples of local anaesthetics. These are used for tooth extraction or small surgical operations.

Check Point 1

1. What is the difference between a medicine and a drug?
2. What is the mode of action of antimicrobial drugs? **[NCERT Exemplar]**
3. Why is it advised that aspirin should not be taken into empty stomach?
4. Antacids in their liquid form are more effective as compared that in their tablet form. Explain, why?
5. Why are certain drugs called enzyme inhibitors? **[NCERT Exemplar]**
6. Which analgesics are called opiates? **[NCERT Exemplar]**

15.2 Chemicals in Food

All those chemicals which are added to food for its preservation and enhancing its appeal are called food additives. These include antioxidants, artificial sweeteners, preservatives, edible colours, flour improvers etc. With the exception of preservatives, antioxidants and artificial sweetener, the remaining classes mentioned above have no nutritive value.

Preservatives

During the storage and distribution of food, several undesirable changes occur in flavour, colour, texture and appetitic appeal. To avoid these changes some chemicals are added to food. These chemicals are known as preservatives. In other words, the chemicals which are used to protect food from microbes actions, *i.e.*, which arrest the process of fermentation, acidification and any other decomposition of food are known as food preservatives. Some important examples of food preservatives are given below

(i) **Carboxylates** such as sodium benzoate (C_6H_5COONa) are commonly used to preserve food. Sodium benzoate is used as preservative in soft drinks and acidic foods. It is metabolised by conversion to hippuric acid ($C_6H_5CONHCH_2COOH$) which is ultimately excereted with urine. Sodium and calcium propionates are used as preservatives in breads and cakes.

(ii) **Vitamin E** is naturally occurring food preservative found in vegetable oil.

(iii) The jams and squashes-pickles are preserved by adding sodium metabisulphite ($Na_2S_2O_5$) or potassium metabisulphite, $K_2S_2O_5$. The sulphurous acid present in it inhibit the growth of microbes.

$$Na_2S_2O_5 \longrightarrow Na_2SO_3 + SO_2$$
$$SO_2 + H_2O \longrightarrow H_2SO_3$$

(iv) In cheese, baked food, pickles and meat, sorbic acid and its salts are used as preservative.

(v) Epoxides and ethyl formates are used for the preservation of species, nuts and dried fruits.

(vi) Table salt, sugar and vegetable oils are also used as preservatives.

Sample Problem 14 *Hippuric acid is a metabolic products of*

(a) *sodium propionate* (b) *vitamin E*
(c) *sodium benzoate* (d) *sodium salt of sorbic acid*

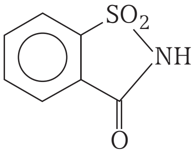
Interpret (c) Sodium benzoate is metabolised to hippuric acid in body, which is excreted with urine.

Artificial Sweetening Agents

The chemicals which are not sugars (carbohydrates) but give sweetening effect to the food and ehnance its odour and flavour are called **artificial sweetening agents**. Usual sweeteners such as sucrose and fructose add calorific intake in addition to sweetness while artificial sweeteners give sweetening effect without producing any calories. This is because these chemicals do not undergo the biochemical reactions in the body *i.e.,* they pass through the human body unmetabolised. Therefore, these chemicals are also called low calorie sweeteners or calorie-free sweeteners.

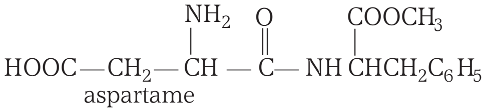
Important artificial sweeteners are

(a) **Saccharin** It is the first discovered artificial sweetener. It is very popular sweetening agent. It is about 300 times sweeter than cane sugar. It is non-biodegradable compound but has no calorific value. In market, it is available in the form of its sodium or calcium salt as these are water soluble. Saccharin has proved to be a life saver for countless diabetics and is of great value to people who need to control intake of calories.



saccharin

(b) **Aspartame** It is an another artificial sweetener. It is methyl ester of the dipeptide obtained from phenylalanine and aspartic acid. Its structure is

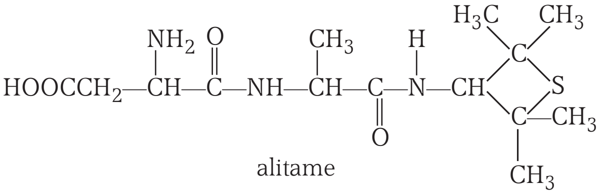


$$HOOC—CH_2—\overset{\overset{NH_2}{|}}{CH}—\overset{\overset{O}{||}}{C}—NH\,\overset{\overset{COOCH_3}{|}}{CH}CH_2C_6H_5$$

aspartame

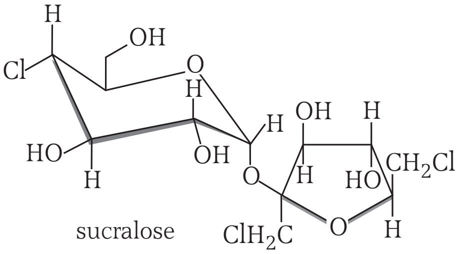
It is also known as "Nutra sweet". It is about 180 times sweeter than cane sugar. The only limitation for it is that at baking or higher temperatures, it gets decomposed, so its use is limited only in cold foods and soft drinks.

(c) **Alitame** It is more stable than aspartame at high temperature. It is about 2000 times sweeeter than sucrose.



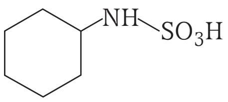
alitame

(d) **Sucralose** It is a trichloro derivative of sucrose. It is about 650 times sweeter than cane sugar. It is a zero calorie sugar.



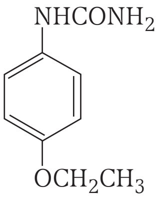
sucralose

(e) **Cyclamate** It is also an artificial sweetener. Chemically, it is N-cyclohexylsulphamate. It is only twenty times sweeter than cane sugar.



cyclamate

(f) **Dulcin** (a urea sweetener) It is only twenty five times sweeter than cane sugar. It has the following structure

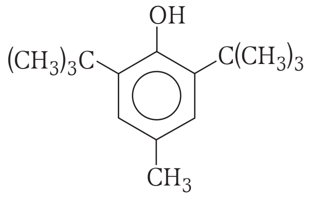


dulcin

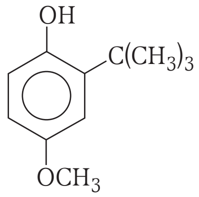
Other examples of this category are nitro anilines, dihydrochalcones (DHC) etc.

Antioxidants

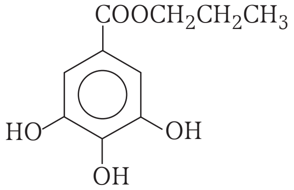
Unsaturated oils and fats containing food materials, when stored, undergo deterioration because of the oxidation by atmospheric oxygen. To avoid their oxidation and to prevent their spoilage, certain chemicals which are able to prevent their oxidation are added. These chemicals are known as **antioxidants**. Therefore, the chemicals which retard the action of oxygen on the food material and thereby help in its preservation, are called **antioxidants**. BHA (butylated *p*-hydroxyanisole), BHT (butylated *p*-hydroxy toluene), esters of gallic acid and lecithin are some examples of antioxidants.



BHT
(butylated hydroxy toluene)



BHA
(butylated hydroxy anisole)



propyl gallate
(an ester of gallic acid)

Some antioxidants are already present in food materials. *e.g.*,

Table 15.2 **Sources of Some Antioxidant**

Antioxidants	Food materials containing antioxidants
Vitamin C (ascorbic acid)	Fruits and vegetables
Vitamin E (tocopherols)	Vegetable oils
Carotenoids	Fruits and vegetables
Polyphenolic antioxidants	Tea, coffee, soyabean, red wine, chocolate etc.

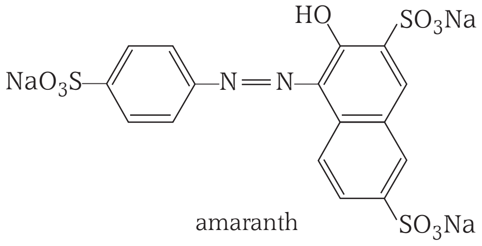
Sulphur dioxide and sulphite are useful antioxidants for wine and beers, sugar syrups, peeled fruits.

Edible Colours

The chemicals which are used for imparting colour to the food and to increase the eye appeal are called **edible colours**. These are essentially dyes which may be either of natural or synthetic origin. Azo dyes are used as synthetic edible colours. However, these are harmful for young children and asthma patients. The most important synthetic dye is tetrazine but its use is banned now.

The common natural colour are chlorophyll (green colouring matter extracted from leaves), saffron (prepared from flowers), caramel (obtained by heating sugar), turmeric (obtained from dried and ground root of ginger) etc.

The other synthetic colours used in food products are amaranth (a red brown powder with saline taste), indigo carmine (blue), ponceau (fast green), erythrosin etc.



amaranth

Check Point 2

1. Sugar is the main source of energy as it produces energy on metabolic decomposition. But these days low calorie drinks are more popular, why?
2. Name two α-amino acids which form a dipeptide which is 100 times more sweet than cane sugar?
3. $Na_2S_2O_5$ is used as a preservative for jams and squashes-pickles. Explain, why?
4. 'Nutra sweet' is about 180 times sweeter than cane sugar but its use is limited only to soft drinks. Explain why?
5. Pickles have a long shelf life and do not get spoiled for mouths. Why?

15.3 Cleansing Agents

These are also known as surfactants or surface active agents. In fact, those chemicals which concentrate at the surface of the solution or interfaces or surface films, reduce surface tension of the solution and help in removing dirt and dust by emulsifying grease are known as **surfactants**. Soaps and detergents belong to this class.

Soaps

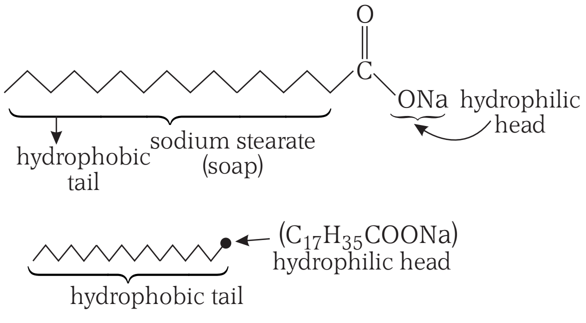
The mineral salts of higher fatty acids such as oleic acid ($C_{17}H_{33}COOH$), stearic acid ($C_{17}H_{35}COOH$) and palmitic acid ($C_{15}H_{31}COOH$) etc., are called **soaps**. Out of these, only sodium and potassium salts of fatty acids being water soluble, are widely used for cleaning purposes and are commonly known as **common soaps**. Other soaps, being water insoluble are less useful. Sodium soaps are hard whereas potassium soaps are soft to skin. Therefore, sodium soaps are used for washing purposes and potassium soaps are as liquid soaps, shaving creams and toilet soaps.

Composition of Soaps

Chemically, soaps contain two parts

(i) **Non-polar hydrocarbon part** which is fat soluble and also called hydrophobic or lipohilic (*lipo* = fat; *philic* = loving) part.

(ii) **Polar carboxylate part** which is water soluble and also called hydrophilic or lipophobic (*lipo* = fat; *phobic* = hating) part.



A soap molecule

Cleansing Action of Soap

On applying soap to a dirty wet cloth, the hydrocarbon part (non-polar part) of soap dissolves in grease or dust while the polar carboxylate part is directed towards water. Thus, an emulsion is formed between grease particles and water molecules, which appears in the form of foam. On washing the cloth with excessive water, these dirt or dust or grease particles are washed away from the surface of cloth along with soap and the cloth becomes clean.

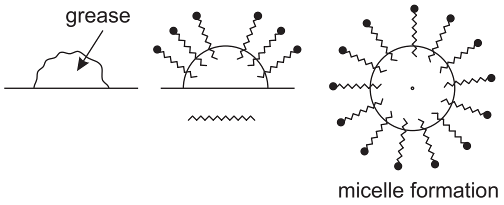


Fig. 15.1 Cleansing action of soap

Advantages and limitations of soaps Soaps are 100% biodegradable, *i.e.,* these are completely degraded by the microorganisms. Therefore, these do not cause water pollution.

Soaps cannot be used in hard water because calcium and magnesium ions present in hard water form curdy white precipitate with soap. Soaps also cannot be used in acidic solution. This is because insoluble fatty acids are precipitated by acids which adhere to the fabrics and prevent dyeing process.

$$2\,\underset{\text{soap}}{RCOONa} + \underbrace{Ca^{2+} \text{ or } Mg^{2+}}_{\text{from hard water}} \longrightarrow \underset{\text{white curdy ppt}}{(RCOO)_2Ca \text{ or } Mg}$$

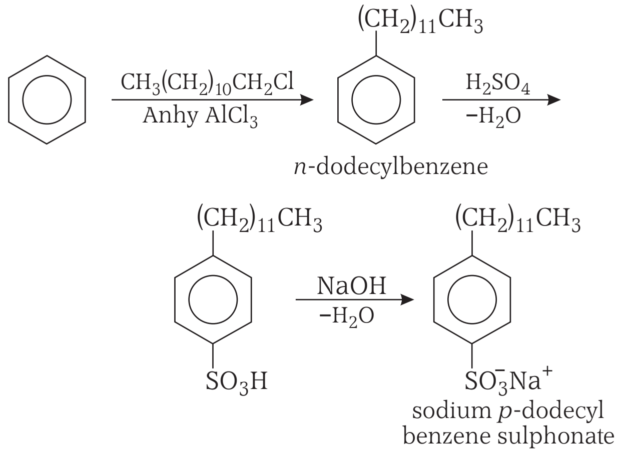
Detergents

The structure of detergents is similar to that of soaps. These are also used for cleansing purpose, although these do not contain usual soaps like sodium salts of fatty acids. Hence, these are also known as "**soapless soap**". These are better cleansing agents than soaps. This is because these do not form insoluble precipitates with calcium and magnesium salts of hard water. There are also effective in acidic solution to form alkyl hydrogen sulphate which is soluble.

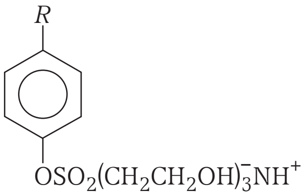
Chemically, detergents are sodium or potassium salts of long chain alkyl or aryl sulphonates or sulphates. Thus, detergents are of two types :

(a) Sodium Alkyl Benzene Sulphonates

These are obtained from derivatives of benzene sulphonic acid. The common example of such detergents is sodium *p*-dodecyl benzene sulphonate which is prepared from benzene by treating it with dodecyl chloride in the presence of anhydrous $AlCl_3$, followed by sulphonation and base catalysed hydrolysis.



Sulphonates with triethanol ammonium ion in place of sodium serve as highly soluble material for liquid detergents.



Unbranched or less branched alkyl group containing sulphonates are soft and highly branched alkyl group containing sulphonates are hard detergents.

(b) Sodium Alkyl Sulphate

Oils and fats on hydrogenolysis give alcohols with 10-15 carbon atoms. These alcohols on esterification with sodium salts of sulphuric acid give sodium alkyl sulphates. Examples of such detergents are sodium dodecyl sulphate, sodium lauryl sulphate, sodium cetyl sulphate.

$$\underset{\text{alkyl alcohol}}{RCH_2OH} + HOSO_3H \xrightarrow[-H_2O]{\text{Sulphonation}} \underset{\text{alkyl hydrogen sulphate}}{RCH_2OSO_3H}$$

$$\xrightarrow[-H_2O]{NaOH} \underset{\text{sodium alkyl sulphate}}{RCH_2OSO_3^-Na^+}$$

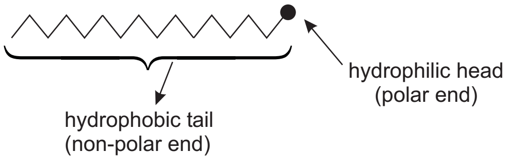
where, $R = CH_3(CH_2)_{10}^-$ or $C_{15}H_{31}^-$

Composition of Detergents

Detergents have structure similar to soaps. These contain

(i) a long non-polar hydrocarbon chain with 12 or more carbon atoms which is hydrophobic or lipophilic in nature.

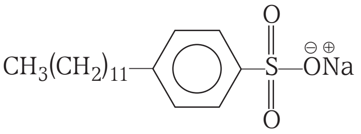
(ii) a polar ionic part which is hydrophilic or lipophobic in nature.



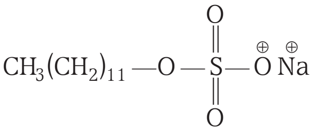
Structure of detergents

The hydrophilic surface active group may be anionic, cationic or netural. On the basis of nature of surface active group, detergents may be classified into three categories.

(i) **Anionic detergents** contain anionic hydrophilic group such as alkyl hydrogen sulphates and alkyl benzene sulphonates.



sodium *p*-*n*-dodecyl benzenesulphonate (SDS)

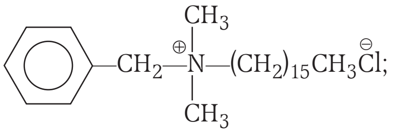


$$CH_3(CH_2)_{11}—O—\underset{\underset{O}{\|}}{\overset{\overset{O}{\|}}{S}}—\overset{\oplus}{O}\overset{\oplus}{Na}$$

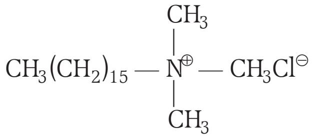
sodium lauryl sulphate

In anionic detergents, the anionic part of the molecule is involved in the cleansing action. These are used for household work and used in toothpastes also.

(ii) **Cationic detergents** are also called **invert detergents**. In these, the polar head of the detergent is positively charged. These are infact, quaternary ammonium salts (chlorides, bromides, acetates) containing one or more long chain alkyl groups, *e.g.,*



benzylcetyldimethyl ammonium chloride

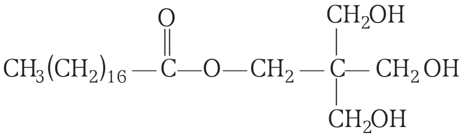


$$CH_3(CH_2)_{15}-\overset{\displaystyle CH_3}{\underset{\displaystyle CH_3}{N^{\oplus}}}-CH_3Cl^{\ominus}$$

cetyl trimethyl ammonium chloride

These detergents are widely used as fabric softeners and germicides. Cetyl trimethyl ammnonium bromide is a popular cationic detergent and is used in hair conditioners.

(iii) **Neutral detergents** contain non-ionic but polar groups capable of forming H-bonding with water. These are monoesters of polyhydric alcohols or polyethers derived from ethylene oxides *e.g.,*



$$CH_3(CH_2)_{16}-\overset{\displaystyle O}{\overset{\|}{C}}-O-CH_2-\overset{\displaystyle CH_2OH}{\underset{\displaystyle CH_2OH}{C}}-CH_2OH$$

non-ionic detergent

These detergents are also called non-ionic detergents and used as liquid dish washing detergent.

Applications and Limitations of Detergents

Detergents do not produce hydroxyl ions on hydrolysis, so these can be used safely for woollen garments.

Straight chain alkyl groups containing detergents are biodegradable whereas branched chain alkyl groups containing detergents are non-biodegradable. Hydrocarbon side chains stops the bacteria from attacking and breaking the chains. This results in the slow degradation of detergent molecule These detergents persist in water even after sewage treatment and cause foaming in river water.

Sample **Problem 17** *Dish washing soaps are synthetic detergents. Chemically these are* **[NCERT Exemplar]**

(a) *cationic detergent* (b) *anionic detergent*
(c) *neutral detergent* (d) *Any of these*

Interpret (c) Dish washing soaps are non-ionic detergents. These remove oil and grease by micelle formation.

Check Point 3

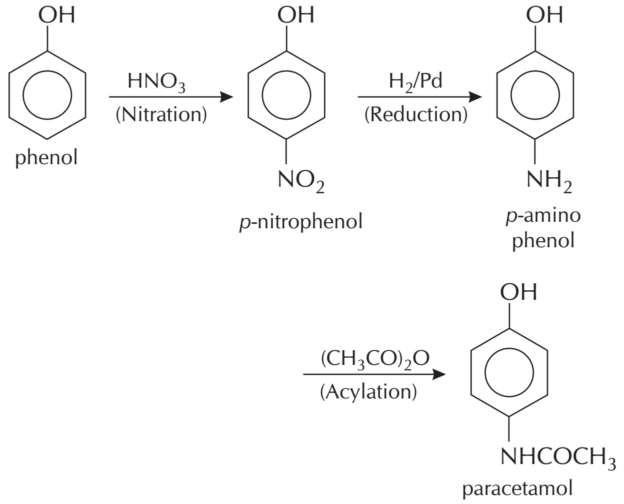
1. Why, sometimes foaming is seen in river water near the place where sewage water is poured after treatment? **[NCERT Exemplar]**
2. Why is the term surfactant used for cleansing agents?
3. Acidic water is not suitable for washing clothes with soap. Explain why?
4. Washing of woolen garments with detergent is safe but with soap is not. Explain.
5. How does the branching of hydrocarbon chain of synthetic detergents after their biodegradability? **[NCERT Exemplar]**

WORKED OUT Examples

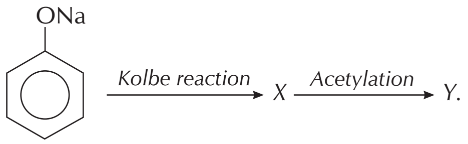
Example 1 *Which of the following sets of reactants is used for the preparation of paracetamol from phenol?*

(*a*) HNO_3, H_2/Pd, $(CH_3CO)_2O$
(*b*) H_2SO_4, H_2/Pd, $(CH_3CO)_2O$
(*c*) $C_6H_5N_2Cl$, $SnCl_2/HCl$, $(CH_3CO)_2O$
(*d*) Br_2/H_2O, Zn/HCl, $(CH_3CO)_2O$

Solution (*a*)

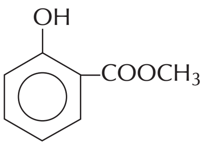


Example 2

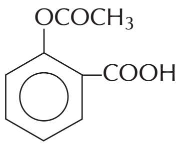


Product 'Y' is

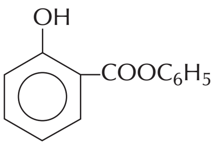
(a)



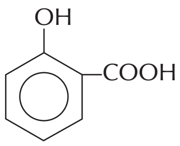
(*b*)



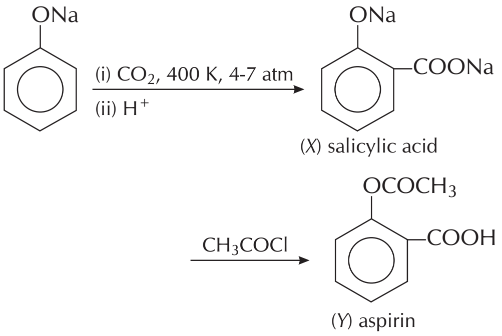
(*c*)



(*d*)



Solution (*b*)



Product '*Y*' is aspirin.

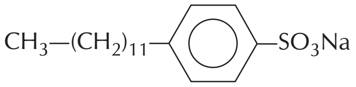
Example 3 *Which type of drugs come under anti-microbial drugs?*

(*a*) *Antiseptics, antibiotics, disinfectants*
(*b*) *Tranquilizers, analgesics, antiseptics*
(*c*) *Tranquilizers, antiseptics, antifertility*
(*d*) *Antiseptics, antacids, antihistamines*

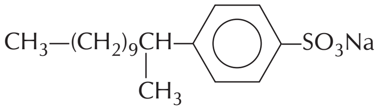
Solution (*a*) Bacteria, virus, fungi and other pathogens are microorganisms. These may cause diseases in human beings and animals. An antimicrobial drug prevents the development or inhibit the pathogenic action of microorganisms such as bacteria (antibacterial drug), virus (antiviral drugs) fungi (antifungal drugs) or other parasite (antiparasite drugs selectively). Antibiotics, antiseptics and disinfectants are antimicrobial drugs.

Example 4 *Which of the following is a example of non-biodegradable detergent?*

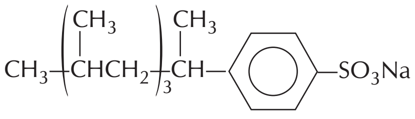
(*a*)



(*b*)



(*c*)



(*d*) $CH_3(CH_2)_{10}CH_2OSO_3Na$

Solution (*c*) Biodegradable detergents have less branching in their structure whereas non-biodegradable detergents have more branching in their structure. Bacteria cannot degrade this highly branched hydrocarbon chain easily. Hence, detergents given in option (c) is an example of non-biodegradable detergent.

Example 5 *Which of the following is known as invert detergent?*

(*a*) *Pentaerythritol monostearate*
(*b*) *Sodium stearyl sulphate*
(*c*) *Trimethyl cetyl ammonium bromide*
(*d*) *Ethoxylated non phenol*

Solution (*c*) Cationic detergents are also known as invert detergents. Cetyl trimethyl ammonium bromide is an example of invert detergent.

Example 6 *Detergents are prepared by the action of* H_2SO_4 *followed by neutralisation by starting with*

(*a*) *cholesterol* (*b*) *cyclohexanol*
(*c*) *lauryl alcohol* (*d*) *p-nitrophenol*

Solution (*c*)

$$\underset{\text{lauryl alcohol}}{CH_3(CH_2)_{10}CH_2OH} \xrightarrow{H_2SO_4} \underset{\text{lauryl hydrogen sulphate}}{CH_3(CH_2)_{10}CH_2OSO_3H}$$

$$\xrightarrow{NaOH\,(aq)} \underset{\substack{\text{sodium lauryl sulphate}\\ \text{(anionic detergent)}}}{CH_3(CH_2)_{10}CH_2OSO_3Na}$$

Example 7 *Low level of noradrenaline is the cause of depression. What type of drugs are needed to cure this problem?* **[NCERT]**

(*a*) *Sedatives*
(*b*) *Antidepressants*
(*c*) *Hypnotics*
(*d*) *Psychedic*

Solution (*b*) Antidepressants such as iproniazid and phenylzine are needed because noradrenaline is a neuro transmitter and it plays an important role in mood changes. Its low level causes depression.

Example 8 *Which forces are involved in holding the drugs to the active site of enzymes?*

(I) Ionic bonding (II) Hydrogen bonding (III) van der Waals' interaction (IV) dipole-dipole interaction. **[NCERT]**

(*a*) *I and II*
(*b*) *I and III*
(*c*) *II and IV*
(*d*) *I, II, III and IV*

Solution (*d*) Ionic bonding, H-bonding, van der Waals' interactions, dipole-dipole interaction etc., are involved in holding the drugs to the active site of enzyme.

Start Practice for JEE Main

Round I (Topically Divided Problems)

Chemicals in Medicines

1. Which of the following statements is not correct? **[NCERT Exemplar]**
- (a) Some antiseptics can be added to soaps
- (b) Dilute solutions of some disinfectants can be used as antiseptic
- (c) Disinfectants are antimicrobial drugs
- (d) Antiseptic medicines can be ingested

2. Which is the correct statement about birth control pills? **[NCERT Exemplar]**
- (a) Contain estrogen only
- (b) Contain progesterone only
- (c) Contain a mixture of estrogen and progesterone derivatives
- (d) Progesterone enhances ovulation

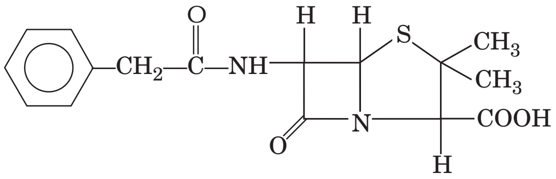
3. Which statement about aspirin is not true? **[NCERT Exemplar]**
- (a) Aspirin belongs to narcotic analgesics
- (b) It is effective in relieving pain
- (c) It has antiblood clotting action
- (d) It is a neurologically active drug

4. The most useful classification of drugs for medicinal chemists is **[NCERT Exemplar]**
- (a) on the basis of chemical structure
- (b) on the basis of drug action
- (c) on the basis of molecular targets
- (d) on the basis of pharmacological effect

5. Which of the following statements is not true?
- (a) Some disinfectants can be used as antiseptics at low concentration
- (b) Sulphadiazine is a synthetic antibacterial
- (c) Ampicillin is natural antibiotic
- (d) Aspirin is analgesic and antipyretic both

6. Equanil is
(a) artificial sweetener (b) tranquillizer
(c) antihistamine (d) antifertility drug

7. The structure given below is known as



(a) penicillin-F (b) penicillin-G
(c) penicillin-K (d) ampicillin

8. Which of the following statement is not true about the drug barbital?
(a) It causes addiction (b) It is a non-hypnotic drug
(c) It is a tranquillizer (d) It is used in sleeping pills

9. Select the incorrect statement.
- (a) Equanil is used to control depression and hypertension
- (b) Mifepristone is a synthetic steroid used as "morning after pill"
- (c) 0.2 per cent solution of phenol is an antiseptic while its 1.0 per cent solution is a disinfectant
- (d) A drug which kills the organism in the body is called bacteriostatic

10. Which set has different class of compounds?
- (a) Tranquillizers : equanil, heroin, valium
- (b) Antiseptics : bithional, dettol, boric acid
- (c) Analgesics : naproxen, morphine, aspirin
- (d) Bactericidal : Penicillin, aminoglycosides, ofloxacin

11. Salol can be used as
(a) antiseptic (b) antipyretic
(c) analgesic (d) disinfectant

12. Which of these is a hypnotic?
(a) Metaldehyde (b) Acetaldehyde
(c) Paraldehyde (d) None of these

13. Which of the following is used as an antiseptic?
(a) Phenol (b) Benzaldehyde
(c) Benzalamine (d) Malic anhydride

14. One of the most known antiseptic, dettol is a mixture of terpineol and

(a) bithional
(b) chloroxylenol
(c) *o*-cresol
(d) serotonin

15. Sulpha drugs are the derivatives of

(a) benzenesulphonic acid
(b) sulphanilic acid
(c) sulphanilamide
(d) *p*-aminobenzoic acid

16. Heroin is acetyl derivative of

(a) caffeine
(b) cocaine
(c) nicotine
(d) morphine

17. Acetoxybenzoic acid is

(a) antiseptic
(b) aspirin
(c) antibiotic
(d) mordant dye

18. Medicine which is an antibiotic is

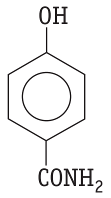
(a) ampicillin
(b) aspirin
(c) compose
(d) All of these

19. A drug that is antipyretic as well as analgesic is

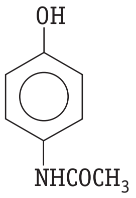
(a) chloropromazine hydrochloride
(b) *para*-acetamidophenol
(c) chloroquin
(d) penicillin

20. The correct structure of the drug paracetamol is

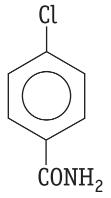
(a)



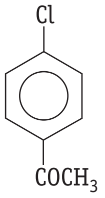
(b)



(c)



(d)



21. Which of the following can possibly be used as analgesics without causing addiction and any modification?

(a) Morphine
(b) N-acetylparaaminophenol
(c) Diazepam
(d) Tetrahydrocatecol

22. A substance which can act both as an antiseptic and disinfectant is

(a) aspirin
(b) chloroxylenol
(c) bithional
(d) phenol

23. The drug, which is not a tranquillizer, is

(a) ibuprofen
(b) veronal
(c) luminal
(d) seconal

24. Anti-allergy drugs are

(a) antimicrobials
(b) antihistamines
(c) antivirals
(d) antifungals

25. Oral contraceptive drugs contain

(a) mestranol
(b) Norethindrone
(c) Both (a) and (b)
(d) None of these

26. The drug used for the prevention of heart attacks is

(a) aspirin
(b) valium
(c) chloramphenicol
(d) cephalsoprin

27. Which of the following is not an analgesic?

(a) Ibuprofen
(b) Dichlofenac sodium
(c) Naproxen
(d) Ofloxacin

28. An antibiotic effective in treatment of pneumonia, bronchitis etc., is

(a) penicillin
(b) patalin
(c) chloromycetin
(d) tetracycline

29. Which of the following is used as a local anaesthetic agent?

(a) Diazepam
(b) Procaine
(c) Mescaline
(d) Seconal

30. An ester used as medicine is

(a) ethyl acetate
(b) methyl acetate
(c) methyl salicylate
(d) ethyl benzoate

31. Drug which helps to reduce anxiety and brings about calmness is

(a) tranquillizer
(b) diuretic
(c) analgesic
(d) antihistamine

32. Which of the following is not used as an antacid?

(a) Magnesium hydroxide
(b) Sodium carbonate
(c) Sodium bicarbonate
(d) Aluminium phosphate

33. Which of the following drugs is an analgesic ?

(a) Sulphaguanidine
(b) Paludrin
(c) Analgin
(d) Iodex

34. Luminal, a barbiturate drug, is used as a/an

(a) antihistamine
(b) sedative
(c) antiseptic
(d) antimalarial

Chemicals in Food

35. The preservative which is used to preserve breads and cakes is

(a) sodium benzoate
(b) sodium metabisulphite
(c) sodiumpropionate
(d) sodium sorbate

36. Which of the following is not a artificial sweetener?
(a) Sucralose (b) Alitame (c) Saccharin (d) Sucrose

37. Trade name of aspartame is
(a) alitame (b) saccharin
(c) sucralose (d) nutra sweet

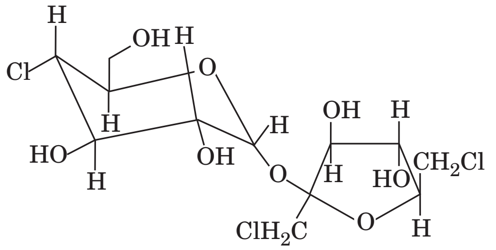
38. Hippuric acid has the formula
(a) $CH_3CONHCH_2COOH$ (b) $C_6H_5CONHCH_2COOH$
(c) $C_6H_5NHCOOH$ (d) $NH_2CONHCOOH$

39. Choose the correct statement.
(a) Saccharin is 650 times sweeter than sugar
(b) Aspartame is 550 times sweeter than sugar
(c) Sucralose is 160 times sweeter than sugar
(d) Alitame is 2000 times sweeter than sugar

40. Which of the following is an aritificial edible colour?
(a) Saffron (b) Carotene (c) Tetrazine (d) Melamine

41. Which of the following is used as an antioxidant in food?
(a) BTX (b) BHT
(c) BHC (d) All the three

42. The following structure represents



(a) sucrose (b) sucralose
(c) aspartame (d) alitame

43. Which of the following is used as food preservative?
(a) Sodium benzoate (b) Potassium chloride
(c) Sodium bicarbonate (d) Both (b) and (c)

Cleansing Agents

44. Which of the following is a *germicide* also?
(a) Cationic detergent (b) Anionic detergent
(c) Non-ionic detergent (d) None of these

45. Structurally biodegradable detergents should contain
(a) highly branched alkyl chain
(b) normal alkyl chain or less branched alkyl chain
(c) cyclopentyl side chain
(d) benzyl side chain

46. Soaps are classified as
(a) esters
(b) ethers
(c) carbohydrates
(d) sodium salts of fatty acids

47. The group commonly present in synthetic detergents is
(a) HCOONa (b) RONa
(c) RCOONa (d) $RC_6H_4SO_3Na$

48. The detergent which is used as a *germicide* is
(a) sodium lauryl sulphate
(b) cetyltrimethyl ammonium chloride
(c) lauryl alcohol ethoxylate
(d) sodium-2-dodecylbenzenesulphonate

49. Which of the following is an anionic detergent?
(a) $CH_3(CH_2)_{16}CH_2OSO_3Na$
(b) $CH_3(CH_2)_{16}\overset{+}{N}(CH_3)_3Cl^-$
(c) $CH_3(CH_2)_{16}COO(CH_2CH_2O)_nCH_2CH_2OH$
(d) $C_6H_5SO_3Na$

50. Compound which is added to soap to impart antiseptic properties is **[NCERT** Exemplar**]**
(a) sodium lauryl sulphate
(b) sodium dodecyl benzene sulphonate
(c) resin
(d) bithional

51. Polyethyleneglycols are used in the preparation of which type of detergents? **[NCERT** Exemplar**]**
(a) Cationic detergents (b) Anionic detergents
(c) Non-ionic detergents (d) Soaps

52. Which of the following is an example of liquid dishwashing detergent?
(a) $CH_3(CH_2)_{10}—CH_2OSO_3^-Na^+$

(b) 
(c) 
(d) 
$$\left[\begin{array}{c} CH_3 \\ | \\ CH_3(CH_2)_{15}—N—CH_3 \\ | \\ CH_3 \end{array}\right]^+ Br^-$$

53. Which category of the synthetic detergents is used in toothpaste? **[NCERT** Exemplar**]**
(a) Anionic detergents (b) Cationic detergents
(c) Non-ionic detergents (d) All of these

54. Hair shampoos belong to which class of synthetic detergents? **[NCERT** Exemplar**]**
(a) Anionic detergents
(b) Cationic detergents
(c) Non-ionic detergents
(d) All of the above

55. Match structures given in Column I with the type of detergents given in Column II.

	Column I		Column II
A.	$CH_3(CH_2)_{16}COO(CH_2CH_2O)_nCH_2CH_2OH$	1.	Cationic detergent
B.	$C_{17}H_{35}COO^-Na^+$	2.	Anionic detergent
C.	$CH_3—(CH_2)_{10}CH_2SO_3^-Na^+$	3.	Non-ionic detergent
D.	 $\left[CH_3(CH_2)_{15}—\overset{CH_3}{\underset{CH_3}{N}}—CH_3\right]^+ Br^-$	4.	Soap

[NCERT Exemplar]

Codes

	A	B	C	D
(a)	2,	1,	3,	4
(b)	3,	4,	2,	1
(c)	4,	3,	1,	2
(d)	2,	3,	4,	1

56. Match the detergents given in Column I with their uses given in Column II. [NCERT Exemplar]

	Column I		Column II
A.	 $\left[CH_3(CH_2)_{15}—\overset{CH_3}{\underset{CH_3}{N}}—CH_3\right]^+ Br^-$	1.	Dish washing powder
B.		2.	Laundry soap
C.	$C_{17}H_{35}CO\overset{-}{O}\overset{+}{Na} + Na_2CO_3 + \text{Rosin}$	3.	Hair conditioners
D.	$CH_3(CH_2)_{16}COO(CH_2CH_2O)_nCH_2CH_2OH$	4.	Toothpaste

Codes

	A	B	C	D		A	B	C	D
(a)	3,	2,	1,	4	(b)	4,	1,	2,	3
(c)	3,	4,	2,	1	(d)	2,	4,	4,	1

Round II (Mixed Bag)

Single Correct Option

1. Which of the following statements is correct? [NCERT Exemplar]

(a) Some tranquillizers function by inhibiting the enzymes which catalyse the degradation of noradrenaline

(b) Tranquillizers are non-narcotic drugs

(c) Transquillizers are chemical compounds that do not affect the message transfer from nerve to receptor

(d) Tranquillizers are chemical compounds that can relieve pain and fever

2. Salvarsan is arsenic containing drug which was first used for the treatment of [NCERT Exemplar]

(a) syphilis (b) typhoid

(c) meningitis (d) dysentry

3. A narrow spectrum antibiotic is active against [NCERT Exemplar]

(a) gram positive or gram negative bacteria

(b) gram negative bacteria only

(c) single organism or one disease

(d) both gram positive and gram negative bacteria

4. The compound that causes general antidepressant action on the central nervous system belongs to the class of [NCERT Exemplar]

(a) analgesics (b) tranquillizers

(c) narcotic analgesics (d) antihistamines

5. Glycerol is added to soap. It functions …… . [NCERT Exemplar]

(a) as a filler

(b) to increase leathering

(c) to prevent rapid drying

(d) to make soap granules

6. An antibiotic contains nitro group attached to aromatic nucleus in its structure. It is

(a) pencillin (b) streptomycin

(c) tetracyclin (d) chloramphenicol

7. Which of the following is not a surfactant?

(a) $CH_3—(CH_2)_{15}—N^+(CH_3)_3Br^-$

(b) $CH_3—(CH_2)_{14}—CH_2NH_2$

(c) $CH_3—(CH_2)_{16}—CH_2OSO_2^-Na^+$

(d) $OHC—(CH_2)_{14}—CH_2—COO^-Na^+$

8. In the following sets of compounds, the one which contains only medicinal compounds is

(a) alizarin, phenacetin, morphine

(b) aspirin, gention violet, phenolphthalein

(c) boric acid, chloramphenicol, aspirin

(d) 9-oxodecanoic acid, boric acid, morphine

9. 
The final product '*Y*' is medicine. Which of the following is incorrect regarding '*Y*'?

(a) It has analgesic as well as antipyretic properties
(b) It helps to prevent heart attack
(c) It has anti-blood clotting action
(d) It suppresses the gastric anomalies

10. Aspartame is one of the good artificial sweeteners whose use is limited to cold foods and soft drinks because

(a) it has very low boiling point
(b) it gets dissociated at cooking temperature
(c) it is sweetener at low temperature only
(d) it is insoluble at higher temperatures

11. For the preparation of a detergent '*A*' (given below) from benzene, the following steps are involved

I. $\xrightarrow[\text{HF, Friedel-Crafts}]{RCH=CH_2}$

II. $\xrightarrow{H_2SO_4/SO_3}$

III. 
(*A*)

These steps should be in sequence

(a) I, II, III (b) II, I, III (c) II, III, I (d) I, III, II

12. Aspartame is a non-nutritive sweetener. Assuming that both, amide and ester bonds are hydrolysed in the stomach, the amino acids obtained is

(a) 
(b) 
$H_2N—\underset{\underset{\displaystyle COOH}{|}}{C}HCH_2COOH$

(c) Both (a) and (b) (d) None of these

13. Which detergent can cause maximum pollution?

(a) $CH_3CH(C_4H_9) — CH_2CH_2CH(C_4H_9)(CH_2)_3CH(C_4H_9)CH_2CH_2SO_3Na$
(b) $CH_3(CH_2)_{10}CH_2OSO_3Na$
(c) $CH_3CH(C_3H_7)—(CH_2)_6CH(C_4H_9)CH_2SO_3Na$
(d) $[CH_3(CH_2)_{15}N(CH_3)_3]^+Br^-$

14. Which of the following chemicals can be added for sweetening of food items at cooking temperature and does not provide calories? **[NCERT** Exemplar**]**

(a) Sucrose (b) Glucose (c) Aspartame (d) Sucralose

15. Which of the following will not enhance nutritional value of food? **[NCERT** Exemplar**]**

(a) Minerals (b) Artificial sweeteners
(c) Vitamins (d) Aminoacids

More than One Correct Option

16. Which of the following statements are incorrect about receptor proteins? **[NCERT** Exemplar**]**

(a) Majority of receptor proteins are embedded in the cell membranes
(b) The active site of receptor proteins opens on the inside region of the cell
(c) Chemical messengers are received at the binding sites of receptor proteins
(d) Shape of receptor doesn't change during attachment of messenger

17. Which of the following are not used as food preservatives? **[NCERT** Exemplar**]**

(a) Table salt
(b) Sodium hydrogencarbonate
(c) Cane sugar
(d) Benzoic acid

18. Compounds with antiseptic properties are **[NCERT** Exemplar**]**

(a) $CHCl_3$
(b) CHI_3
(c) Boric acid
(d) 0.3 ppm aqueous solution of Cl_2

19. Which of the following statements are incorrect about penicillin? **[NCERT** Exemplar**]**

(a) An antibacterial drug
(b) Ampicillin is its synthetic modification
(c) It has bacteriostatic effect
(d) It is a broad spectrum antibiotic

20. Amongst the following antihistamines, which are antacids? **[NCERT** Exemplar**]**

(a) Ranitidine
(b) Brompheniramine
(c) Terfenadine
(d) Cimetidine

Assertion and Reason

Directions (Q. Nos. 21 to 25) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*), (*d*) *given below :*

(a) Statement I is true; Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true; Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

21. **Statement I** Non-competitive inhibitor inhibits the catalyic activity of enzyme by binding with its active site.

Statement II Non-competitive inhibitor changes the shape of the active site in such a way that substrate can't recognise it. [**NCERT** Exemplar]

22. **Statement I** Penicillin (G) is an antibiotic.

Statement II Penicillin (G) is effective against gram positive as well as gram negative bacteria.

[**NCERT** Exemplar]

23. **Statement I** Receptors are crucial to body's communication process.

Statement II Receptors are proteins.

[**NCERT** Exemplar]

24. **Statement I** Chemical messenger gives message to the cell without entering the cell.

Statement II Chemical messenger is received at the binding site of receptor proteins. [**NCERT** Exemplar]

25. **Statement I** All chemicals added to food items are called food additives.

Statement II All these chemicals increase the nutritive value of the food. [**NCERT** Exemplar]

Comprehension Based Questions

Directions (Q. Nos. 26 and 27) Body possesses an efficient natural defence mechanism, which works against pathogenic microorganisms (disease causing microorganisms). Many body secretions inhibit the growth of microorganisms. For example, Lysozyme in tears, nasal secretion and saliva lactic acid in sebacious secretions and HCl in stomach. When a break in defence mechanism takes place, pathogens reach the tissues and causes infections. Pathogens multiply in the host, produce toxins, which affects the cell metabolism. Microbial diseases can be controlled by the following three ways :

A. By increasing immunity and resistance to infection of the body.
B. By using a drug which inhibits the growth of the microorganisms (bacteriostatic)
C. By using a drug which kills the microorganisms in the body (bactericidal)

Antibiotics, antiseptics and disinfectants are antimicrobial drugs.

26. Which one is an antibiotic?
(a) Chloramphenicol (b) Aspirin
(c) Veronal (d) Seldane

27. Which one of the following is not bacteriostatic antibiotic?
(a) Erythromycin
(b) Tetracycline
(c) Chloramphenicol
(d) Ofloxacin

Directions (Q. Nos. 28 to 30) Soaps and synthetic detergents are used as cleansing agents. These days, detergents are much in vogue and get preference over soaps because they work even in hard water. Detergents molecules with highly branched hydrocarbon tail is a source of pollution because hydrocarbon side chain stops the bacteria from attacking and breaking the chains resulting in slow degradation of detergent molecule and leads its accumulation in water bodies. Hence, detergents with straight chain of hydrocarbons are preferred over side chain (branched chain) because latter are non-biodegradable and cause pollution.

28. A synthetic detergent is a
(a) cleansing agent (b) catalyst
(c) drug (d) soap

29. Select the incorrect statement regarding detergents.
(a) These have a non-polar organic part and a polar group
(b) These are surface active reagent
(c) These are sodium salt of fatty acids
(d) These are not easily biodegradable

30. Detergents obtained from LAB are biodegradable. LAB stands for
(a) laboratory tested raw material
(b) low anionic balance
(c) linear alkyl benzene
(d) None of the above

Previous Years' Questions

31. Aspirin is known as [AIEEE 2012]

(a) acetyl salicylic acid (b) phenyl salicylate
(c) acetyl salicylate (d) methyl salicylic acid

32. The drug used to bring down fever are known as [AIEEE 2005]

(a) analgesic (b) antibiotic
(c) antipyretic (d) tranquillizer

33. The compound  is used as [AIEEE 2002]

(a) antiseptic
(b) antibiotic
(c) analgesic
(d) pesticide

Answers

Round I

the Guidance

Round I

1. Antiseptics are applied to the living tissues such as wounds, cuts, diseased skin surfaces. These are not ingested like antibiotics.

4. Carbohydrates, lipids, proteins and nucleic acids are target molecules or drug targets. Drugs possessing some common structural features have same action on targets. That's why the classification based on molecular targets is the most useful classification for medicinal chemists.

8. Barbital or varonal is a sleep producing drug, *i.e.*, hypnotic tranquillizer. It is used in sleeping pills and causes addiction.

9. Bacteriostatic drugs inhibit the growth of microorganism while bactericidal drugs kill the microorganisms.

10. Heroin is not a tranquillizer, it is a narcotic analgesic.

13. 0.2% solution of phenol is used as an antiseptic.

15. Sulpha drugs are the derivatives of sulphanilamide.

22. 0.2% solution of phenol is an antiseptic while its one per cent solution is disinfectant.

25. Oral contraceptive drugs contain mestranol (an estrogen) and norethindrone (a progesterone derivative).

26. Due to anti-blood clotting action of aspirin, it is used to prevent heart attack.

27. Ofloxacin is used as antibiotic.

36. Sucrose is a natural sweetener whereas sucralose, alitame and saccharin are artificial sweeteners.

39. Saccharin is 110 times sweeter than sugar, aspartame is 180 times sweeter than sugar. Sucralose is 650 times sweeter than sugar.

42. Sucrolose is trichloro derivative of sucrose. Its appearance and taste are like sugar.

44. Cationic detergents are quaternary ammonium salts, containing long chain alkyl groups and possesing *germicidal* properties.

50. Bithional is added to soap to impart antiseptic properties.

51. Polyethylene glycol are used to prepare non-ionic detergents. These do not contain any ion in their constitution.

52. Non-ionic detergents are used as liquid dishwashing detergents.

53. Toothpaste—anionic detergents

54. Hair shampoos — cationic detergents

Round II

1. Various types of tranquillizers function by different mechanism. For example, noradrenaline is one of the neurotransmitters. If the level of noradernaline is low, then the signal-sending activity becomes low and the person suffers from depression. In such situation, person requires antidepressant drugs. These drugs inhibit the enzymes which catalyse the degradation of noradrenaline. Due to this the level of neurotransmitter becomes normal, it can activate its receptor for longer periods of time, thus counteracting the effect of depression.

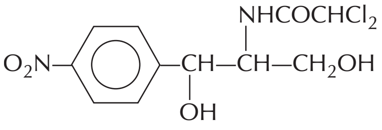
2. Salvarsan contains —As═As— linkage. It is used for the treatment of syphilis. Although it is toxic to human beings, but its effect on the bacteria, spirochete, which causes syphilis is much greater than on human beings.

3. Narrow spectrum antibiotics are effective mainly against gram-positive or gram-negative bacteria. If antibiotics are effective against a single organisms or disease, they are known as **limited spectrum antibiotics.**

4. Tranquillizers causes general antidepressant action on the cental nervous system. They affect the message transfer mechanism from nerve to receptor.

5. Glycerol is added to soap (toilet soap and shaving creams) to prevent rapid drying.

6. Among the given antibiotics, only chloramphenicol contains a nitro group attached to aromatic ring.

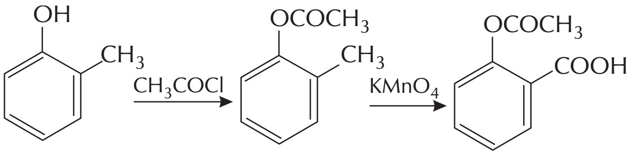


chloramphenicol

7. Every surfactant contains two parts *viz* a hydrophobic part and a hydrophilic part. The compound $CH_3(CH_2)_{14}CH_2NH_2$ contains only hydrophobic part but no hydrophilic part, hence it is not a surfactant.

8. Boric acid is a mild antiseptic, chloramphenicol is an broad spectrum antibiotic and aspirin is an analgesic as well as antipyretic.

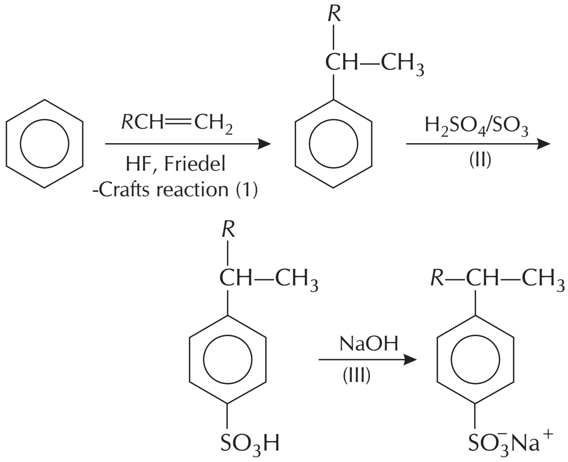
9.



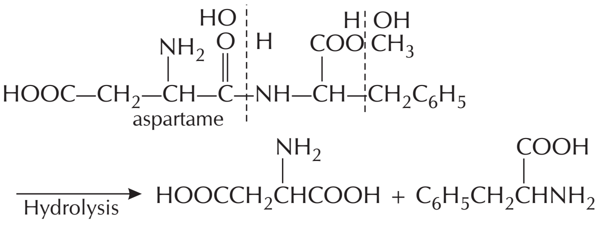
o-acetyl salicylic acid (aspirin)

10. Aspartame gets dissociated at cooking temperature.

11.



12.



$$\mathrm{HOOC{-}CH_2{-}\overset{NH_2}{CH}{-}\overset{\overset{HO}{O}}{\overset{\|}{C}}{-}\overset{H}{NH}{-}\overset{\overset{H}{COO}}{CH}{-}\overset{\overset{OH}{CH_3}}{CH_2C_6H_5}}$$

aspartame

$$\xrightarrow[\text{Hydrolysis}]{} \mathrm{HOOCCH_2\overset{NH_2}{CH}COOH + C_6H_5CH_2\overset{COOH}{CH}NH_2}$$

13. Greater the branching, greater is the non-biodegradability of a detergent. A non-biodegradable detergent cause maximum pollution.

14. Sucrose and glucose provide energy. Aspartame is used in cold foods and soft drinks because it is unstable at cooking temperature. Sucralose is stable at cooking temperature and it does not provide calories.

15. Minerals, vitamins and amino acids have nutritive value but artificial sweeteners are only sweetening agent.

16. (*b*) The active site of receptor proteins opens on the outside region of the cell membrane.

(*d*) To accommodate a messenger, shape of the receptor site changes.

17. (*b*) Sodium hydrogen carbonate is not used as a preservative.

(*d*) Sodium benzoate is used as preservative (not benzoic acid).

18. CHI_3, iodoform is used as an antiseptic for wounds. Boric acid in dilute aqueous solution is weak antiseptic for eyes. 0.3 ppm aqueous solution of Cl_2 is disinfectant.

19. Penicillin is bactericidal (has killing effect) and it is a narrow spectrum antibiotic.

20. Ranitidine and cimetidine are used as antacids.

21. Non-competitive inhibitor inhibits the catalytic activity of enzyme by binding with its allosteric site, this results in changing the shape of the active site in such a way that substrate can't recognize it.

22. Penicillin-G is an antibiotic. It has bactericidal effect and it is narrow spectrum antibiotic (effective against gram-positive or Gram-negative bacteria.

23. Receptors are proteins that are crucial to body's communication process.

24. Statement II is the correct explanation of statement I.

25. All chemicals added to food items are called food additives. Only nutritional supplements such as vitamins, minerals and amino acids increase the nutritive value of the food whereas others are added either to increase the shelf life of stored food or for cosmetic purposes.

26. Chloramphenicol — antibiotic, aspirin — analgesics as well as antipyretics, veronal — tranquillizer and seldane — antihistamines.

27. Erythromycin, tetracycline and chloramphenicol are bacteriostatic type antibiotic whereas ofloxacin is bactericidal type antibiotic.

28. A synthetic detergent is a cleansing agent which has all the properties of soap but do not contain any soap.

29. Sodium salt of fatty acids are known as soaps.

30. LAB stands for linear alkyl benzene.

31. Acetyl salicylic acid is the chemical name of aspirin.

32. Antipyretics are used to bring down the body temperature in fever.

33.  is aspirin. It is an acetylated product of salicylic acid as an analgesics.

16 Principles Related to Practical Chemistry

JEE Main MILESTONE

- Qualitative Analysis of Organic Compounds
- Preparation of Some Inorganic and Organic Compounds
- Salt Analysis or Qualitative Inorganic Analysis
- Chemical Principles Involved in Some Experiments

16.1 Qualitative Analysis of Organic Compounds

Two major steps involved in the characterisation of an organic compound are (1) Element detection (For it see chapter 12 purification and characterisation of organic compounds) (2) Detection of functional group.

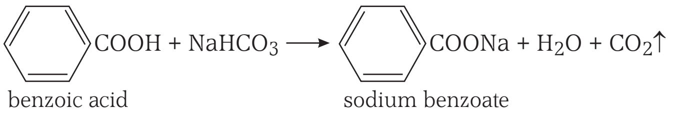
Detection of Functional Groups in Organic Compounds

Element detection shows the presence or absence of different elements. On the basis of element present, the test of corresponding functional group is performed. Tests for different functional groups are given below.

Tests for Carboxylic (—COOH) Group

(i) **Litmus paper test** Dip blue litmus paper in the aqueous solution or suspension of the compound. It turns red.

(ii) **Sodium bicarbonate test** In a test tube, take a little quantity of the compound and then, add a saturated solution of sodium bicarbonate. Formation of brisk effervescence shows the presence of —COOH group.



Experimental (practical) Chemistry involves the study of concerned material under specific experimental conditions. It can be divided into two branches : synthetic chemistry and analytical chemistry.

(iii) **Ester formation** Heat a small quantity of organic compound with ethyl alcohol and a little conc H_2SO_4 · Cool the solution and pour in a tube containing water. A fruity smell, due to formation of an ester, indicates the presence of carbxylic group.

$$R\text{—COOH} + C_2H_5OH \xrightarrow{\text{Conc } H_2SO_4} \underset{\substack{\text{ester} \\ \text{(fruity smell)}}}{RCOOC_2H_5} + H_2O$$

Sample Problem 1 *A compound liberated* CO_2 *with* $NaHCO_3$ · *Thus, it contains*

(*a*) —CHO *group*
(*b*) —OH *phenolic group*
(*c*) —NH_2 *group*
(*d*) —COOH *group*

Interpret (*d*) *Carboxylic acid decomposes* $NaHCO_3$ *giving* CO_2.

$$R\text{—COOH} + NaHCO_3 \longrightarrow RCOONa + CO_2 + H_2O$$

Tests for Alcoholic (—OH) Group

(i) **Sodium test** In a test tube, take some organic compound and add a thin slice of sodium metal to it. A brisk effervescence due to the formation of hydrogen gas takes place.

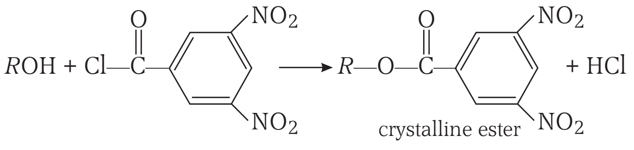
$$2ROH + 2Na \longrightarrow 2RONa + H_2 \uparrow$$

(ii) **Ester test**

(a) Heat the given compound with acetic acid in the presence of sulphuric acid. A fragrant fruity smell indicates the formation of ester.

$$ROH + CH_3COOH \xrightarrow{\text{conc. } H_2SO_4} CH_3COOR + H_2O$$

(b) Alcohols give crystalline esters with 3,5-dinitrobenzoyl chloride. These esters have sharp melting points and can be used for testing a given alcohol.



(iii) **Ceric ammonium nitrate test** To small amount of organic compound or its aqueous solution, add a few drops of ceric ammonium nitrate. A red colour indicates the presence of alcoholic hydroxy group.

$$2ROH + (NH_4)_2Ce(NO_3)_6 \longrightarrow \underset{\text{red colour}}{Ce(NO_3)_4 \cdot (ROH)_2} + 2NH_4NO_3$$

This test is useful when the compound contains less than 10 C-atoms.

(iv) **Lucas test** This test is used to distinguish between primary, secondary and tertiary alcohols. In this test, treat 2 mL of organic compound with about 8 mL of Lucas reagent (for preparing Lucas reagent dissolve 32 g of anhy $ZnCl_2$ in 20 mL of conc HCl) and shake.

(a) Immediate formation of turbidity indicates the presence of **tertiary alcohol.**

(b) Formation of turbidity after 4-5 min shows the presence of **secondary alcohols.**

(c) If solution remains clear, then **primary alcohol** is present.

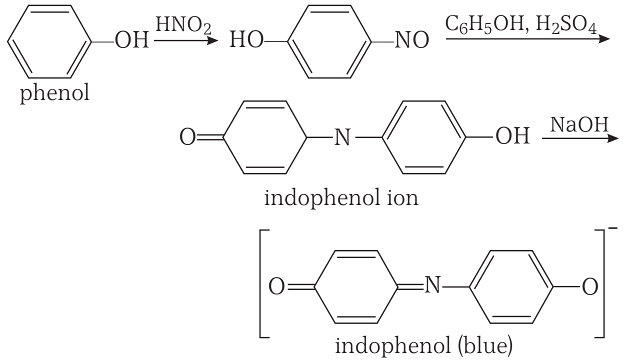
Tests for Phenolic (Ph—OH) Group

(i) **Ferric chloride test** To aqueous or alcoholic solution of compound, add few drops of ferric chloride ($FeCl_3$). Formation of green, blue or violet colour shows the presence of phenol.

$$6C_6H_5OH + FeCl_3 \longrightarrow 3H^+ + \underset{\text{violet}}{[Fe(OC_6H_5)_6]^{3-}} + 3HCl$$

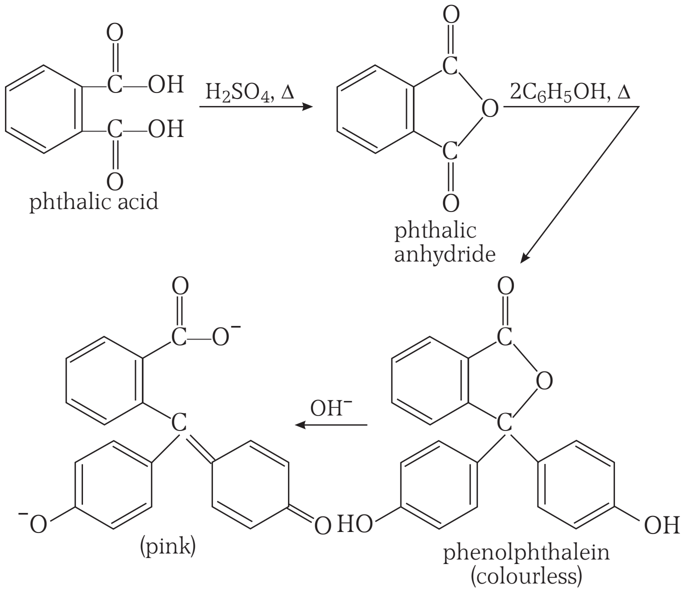
This test is also given by enols.

(ii) **Liebermann's nitroso reaction** Fuse a little amount of compound with a crystal of $NaNO_2$ in a test tube. Cool the mixture and add 1 mL conc H_2SO_4. A deep green to blue solution is formed which turns red when poured in a large excess of water. The red aqueous solution becomes again deep green or blue if made alkaline with NaOH. It shows the presence of phenol.



Caution Point *Nitrophenol do not respond to* $FeCl_3$ *test as well as Liebermann's nitroso reaction.*

(iii) **Phthalein test** Phenol on heating with phthalic acid in the presence of conc. H_2SO_4 gives colourless compound called phenolpthalein, which changes to pink coloured compound in alkaline medium.



Phenolphthalein is used as an indicator in acid-base titrations. It is colourless in acidic medium and pink in basic medium.

Tests for Aldehyde (—CHO) Group

(i) **Tollen's reagent test** Take a little quantity of the compound in a test tube and add 2 mL of freshly prepared reagent. Shake, warm and allow the contents to stand for 2-3 minutes. Formation of silver mirror or a grey ppt indicates the presence of an aldehydic group.

$$2Ag(NH_3)_2OH + R\cdot CHO \longrightarrow \underset{\text{silver mirror or grey ppt}}{2Ag\downarrow} + RCOONH_4 + 3NH_3 + H_2O$$

(ii) **Fehling's solution test** Take a mixture of equal amounts of Fehling's solution *A* and *B*, and a few drops of organic compound and boil the contents. Formation of a red ppt shows the presence of an aldehyde.

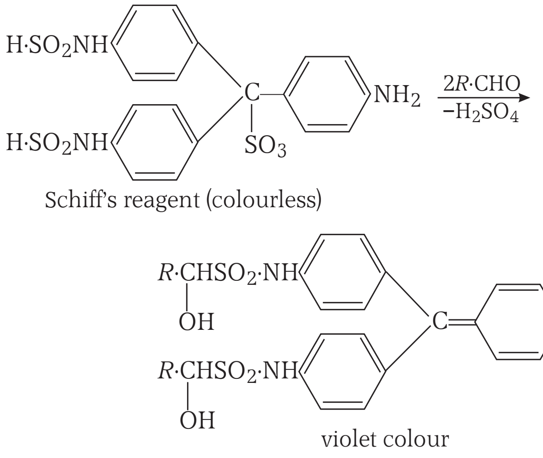
$$2CuO + R\cdot CHO \longrightarrow \underset{\text{red ppt.}}{Cu_2O\downarrow} + RCOOH$$

Caution Points

(*i*) *Both the above tests are also given by reducing sugars.*

(*ii*) *Benzaldehyde does not reduce Fehling's solution (a distinction from other aldehydes). Benzaldehyde is confirmed by malachite green test.*

(iii) **Schiff's reagent test** Add 5-6 drops of organic compound to 2 mL of the reagent. Shake vigorously. After some time formation of a deep red or violet colour indicates the presence of an aldehydic group.



Schiff's reagent (colourless)

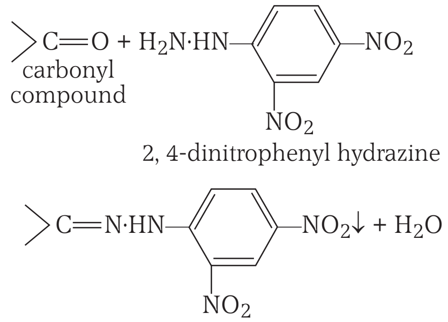
violet colour

(iv) **Benedict's solution test** Boil the compound with 2-3 mL of Benedict's solution for few minutes. Appearance of a red-yellow ppt confirms the presence of aliphatic aldehydes.

Caution Point *This test is usually given by only aliphatic aldehydes, thus used to differentiate between aliphatic and aromatic aldehydes.*

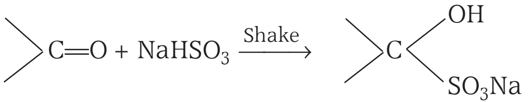
Tests for Ketone $\left(\begin{matrix}R\\R\end{matrix}\!\!>C{=}O\right)$ Group

(i) **2,4-dinitro phenyl hydrazine test** In a dry test tube add few drops of the organic compound (if liquid) or its alcoholic solution (if solid) to about 2 mL of the reagent and one drop of conc H_2SO_4. Shake vigorously, heat (if necessary) and allow to stand for about 5 minutes. A yellow or orange ppt separates out in case of a compound containing carbonyl group due to the formation of respective hydrazones.



yellow or orange red coloured crystalline derivative of 2 : 4 dinitrophenyl hydrazine of carbonyl compound

(ii) **Sodium bisulphite test** Add a very small quantity of organic compound to 1 mL of saturated solution of sodium bisulphite and shake vigorously. Formation of white ppt shows the presence of carbonyl group.



$$>C{=}O + NaHSO_3 \xrightarrow{\text{Shake}} >C\begin{matrix}OH\\SO_3Na\end{matrix}$$

Sodium bisulphite derivative of carbonyl compound (white crystalline ppt)

(iii) **Sodium nitroprusside test** Add 0.1 g of solid or 0.2 cc of liquid compound to 2 cc of sodium nitroprusside, $Na_2[Fe(CN)_5NO]$ solution and then, make it alkaline with 2-3 drops of sodium hydroxide. A red or purple colour indicates the presence of ketone (benzophenone does not give this test).

Caution Point *The first two tests are given by aldehydes also. Therefore, to differentiate between aldehydes and ketones it should be known that ketone do not give any test with Tollen's reagent, Schiff's solution, Fehling's solution and Benedict's solution.*

Sample **Problem 2** *Which of the following tests can be used to distinguish between acetone and α-hydroxy acetone?*

(a) *Tollen's test*

(b) *Iodoform test*

(c) *Both (a) and (b)*

(d) *None of the above*

Interpret (*a*) Acetone does not give Tollen's test but α-hydroxy acetone forms silver mirror with Tollen's reagent.

$$CH_3COCH_2OH + \underset{\text{Tollen's reagent}}{Ag_2O} \xrightarrow{\Delta} CH_3COCHO + \underset{\text{silver mirror}}{2Ag\downarrow} + H_2O$$

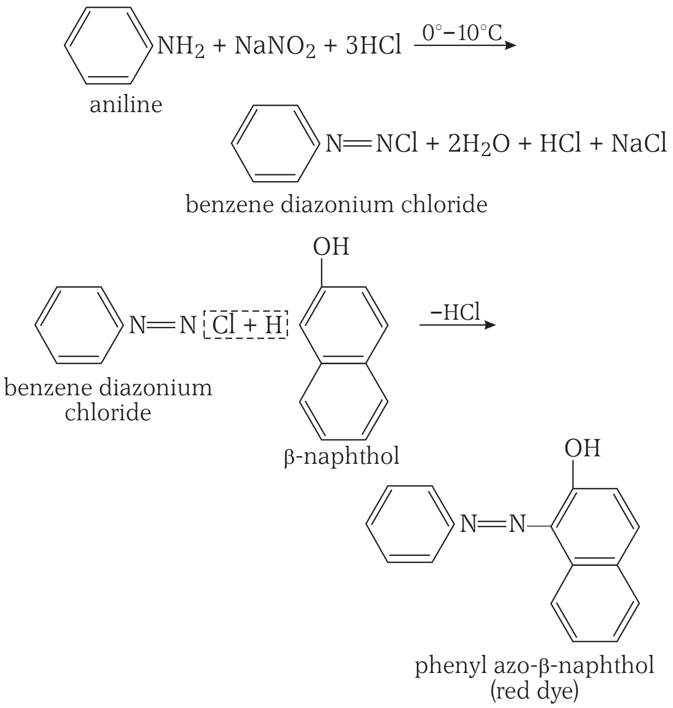
Iodoform test is given by both hence can't used for distinction.

Tests for Primary Amine (—NH_2) Group

(i) **Carbylamine test** Boil a little quantity of the compound with 2 drops of chloroform and 2 mL of alcoholic caustic potash. An intolerable offensive odour of carbylamine indicates the presence of primary amine.

$$\underset{\text{primary amine}}{R—NH_2} + CHCl_3 + 3KOH \longrightarrow \underset{\text{carbylamine}}{R\cdot NC\uparrow} + 3KCl + 3H_2O$$

(ii) **Dye test** Dissolve about 0.2 g of the compound in dil HCl and cool. Now, add 10% aq $NaNO_2$ solution. Pour all this content into a beaker containing alkaline β-naphthol solution. Formation of a red or orange dye indicates the presence of aromatic primary amino group.



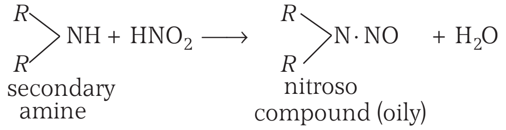
Tests to Distinguish between Primary, Secondary and Tertiary Amines

(i) **Nitrous acid test** Prepare a solution of nitrous acid by adding ice cold dil HCl to a solution of 1% aq $NaNO_2$. Add gradually this solution to 0.2 g of the organic compound in 10 mL dil HCl.

(a) Formation of brisk effervescence shows the presence of **aliphatic primary amine.**

$$R—NH_2 + HNO_2 \longrightarrow ROH + H_2O + N_2\uparrow$$

(b) Formation of an oily dark coloured liquid indicates the presence of **secondary amine.**



(c) No reaction indicates the presence of **aliphatic tertiary amine** while production of green or brown colour indicates the presence of **aromatic tertiary amines.**

(ii) **Hinsberg's test** To about 0.2 g of the compound, add 1 mL of 5% NaOH and 3 mL pyridine. Shake well and add few drops of benzene sulphonyl chloride (Hinsberg's reagent) with continuous shaking.

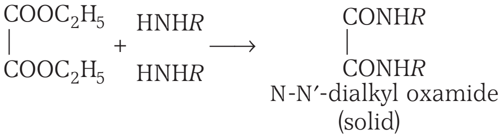
(a) Formation of yellow colour indicates the presence of **primary amine.**

(b) Formation of orange colour shows the presence of **secondary amine.**

(c) Formation of a red or purple colour shows the presence of **tertiary amines.**

(iii) **Hofmann's method** Take same organic compound in a test tube and add diethyl oxalate solution to it, shake well.

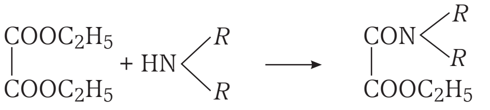
(a) Formation of solid product (N, N′-dialkyl oxamide) indicates the presence of 1° amine.



$$\begin{array}{l}COOC_2H_5\\ |\\ COOC_2H_5\end{array} + \begin{array}{l}HNHR\\ \\ HNHR\end{array} \longrightarrow \begin{array}{l}CONHR\\ |\\ CONHR\end{array}$$

N-N′-dialkyl oxamide (solid)

(b) Formation of liquid product (oxamic ester) indicates the presence of 2° amine.



$$\begin{array}{l}COOC_2H_5\\ |\\ COOC_2H_5\end{array} + HN\begin{array}{l}R\\ R\end{array} \longrightarrow \begin{array}{l}CON\begin{array}{l}R\\ R\end{array}\\ |\\ COOC_2H_5\end{array}$$

oxamic ester (liquid)

(c) 3° amine does not react with diethyl oxalate.

Check Point 1

1. Give simple chemical tests to distinguish between
   (a) Phenol and benzoic acid **[NCERT]**
   (b) Propanal and propanone
2. Describe a method for the identification of primary, secondary and tertiary amines. **[NCERT]**
3. Phenol on heating with phthalic acid in the presence of conc. H_2SO_4 forms a colourless compound '*A*', which turns to pink on making it alkaline. What is the name of this test and what is the name of the compound *A*?
4. Why is the reactivity of all the three classes of alcohols with conc. HCl and $ZnCl_2$ (Lucas reagent) different?

16.2 Preparation of Some Inorganic and Organic Compounds

Preparation of Inorganic Compounds

(i) **Mohr's salt or Ferrous ammonium sulphate,** $[FeSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O]$

It is a double salt. When solutions of ferrous sulphate and ammonium sulphate are mixed together, evaporated and cooled, light green crystals of Mohr's salt are obtained.

$$(NH_4)_2SO_4 + FeSO_4 + 6H_2O \longrightarrow \underset{\text{Mohr's salt}}{FeSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O}$$

During the preparation of ferrous sulphate solution in boiling water, dilute H_2SO_4 in small amount is also added to boiling water to prevent the hydrolysis of ferrous sulphate *i.e.*, to prevent conversion of ferrous sulphate into ferrous hydroxide.

(ii) **Potash Alum,** $KAl(SO_4)_2 \cdot 12H_2O$ It is also a double salt.

Potash alum is prepared by dissolving K_2SO_4 and $Al_2(SO_4)_3$ in equimolar ratio in small amount of water containing some drops of conc. H_2SO_4. On cooling potash alum separates as colourless crystals.

$$K_2SO_4 + Al_2(SO_4)_3 + 24H_2O \longrightarrow K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$$

Sample Problem 3 *Alum is found to contain hydrated monovalent cation* $[M(H_2O)]^+$, *trivalent cation* $[M'(H_2O)_6]^{3+}$ *and* SO_4^{2-} *in the ratio of*

(a) 1:1:1
(b) 1:2:3
(c) 1:3:2
(d) 1:1:2

Interpret (*d*) General formula for potash alum is $KAl(SO_4)_2 \cdot 12H_2O$ (1 : 1 : 2)

$$K^+ = \text{monovalent cation}$$
$$Al^{3+} = \text{trivalent cation}$$

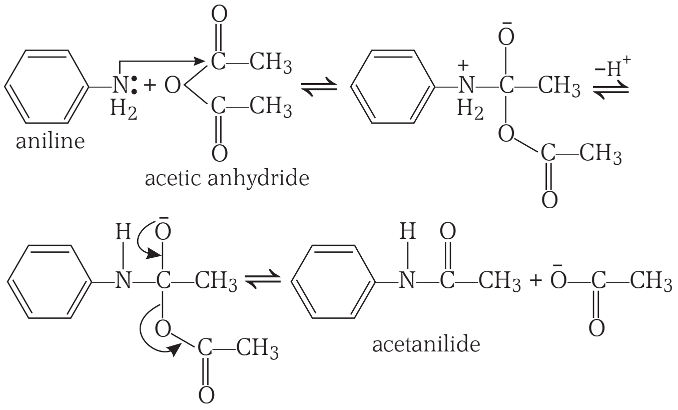
Preparation of Organic Compounds

Acetanilide, 
It is prepared by direct acetylation of aniline by using the mixture of equal volumes of acetic anhydride and acetic acid.

Amines containing —NH_2 or $>NH$ groups respectively can be directly acetylated. Their reactive hydrogen atoms get replaced by acetyl group (—$COCH_3$) to give acetyl derivatives of the type $RNH \cdot COCH_3$ and $R_2N \cdot COCH_3$ respectively which may be regarded as mono and di-alkyl substituted acetamide.

$$R—NH_2 + (CH_3CO)_2O \longrightarrow RNH \cdot COCH_3 + CH_3COOH$$

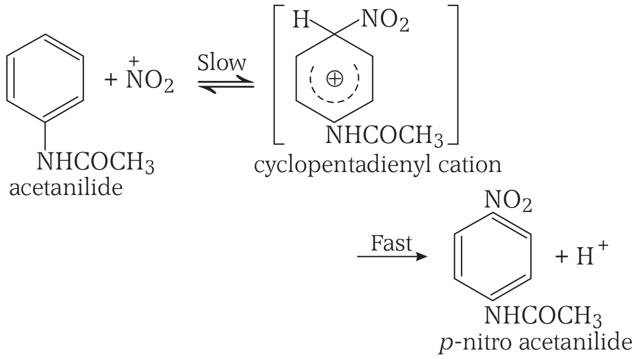
The mechanism of this reaction is as follows



Small amount of zinc is added to the reaction mixture to prevent the oxidation of aniline and to reduce the coloured impurities present in aniline during the reaction.

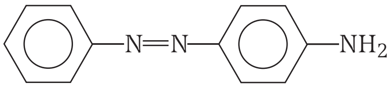
p-Nitro acetanilide, 
It is prepared by the nitration of acetanilide. Acetanilide is dissolved in glacial acetic acid. Concentrated H_2SO_4 is added to it with vigorous stirring. Temperature of reaction mixture should be maintained below 10°C. Now add fuming HNO_3 drop by drop with regular stirring. It gives *p*-nitro acetanilide along with a little amount of *o*-isomer. In this process fuming HNO_3 in the presence of conc H_2SO_4, gives nitronium ion (NO_2^+) which attack on acetanilide to form *p*-nitro acetanilide through the cyclopentadienyl cation (intermediate) formation.

$$HNO_3 + H_2SO_4 \longrightarrow \underset{\text{nitronium ion}}{NO_2^+} + H_2O + HSO_4^-$$



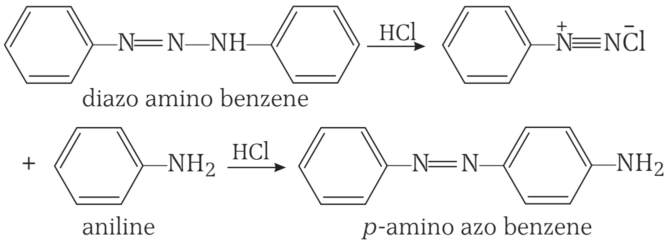
$$H^+ + HSO_4^- \longrightarrow H_2SO_4$$

Aniline yellow or *p*-amino azobenzene,

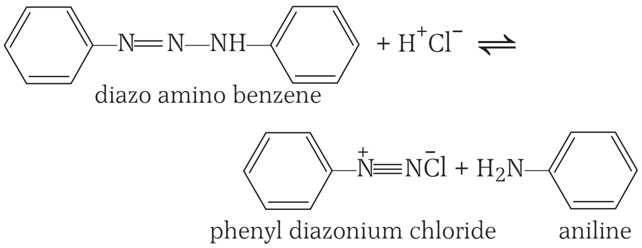


It is prepared from diazo amino benzene.

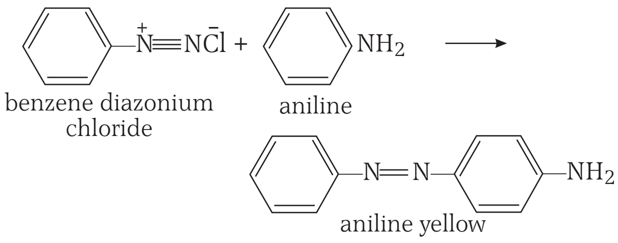
When diazo amino benzene is heated with aniline and a little amount of aniline hydrochloride at about 40°C, for a short time, it gives *p*-amino azo benzene or aniline yellow in good yield.



The mechanism of the reaction is based on the equilibrium involving the diazo amino compound, phenyl diazonium chloride and aniline.



The reaction takes place between the two latter compounds under weakly acidic conditions.

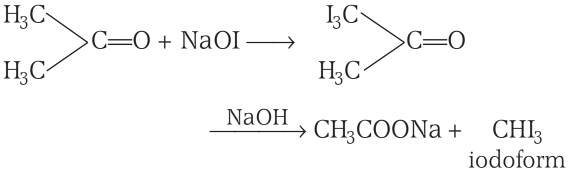


Iodoform, CHI_3

It is prepared from acetone.

Acetone when treated with potassium iodide and sodium hypochlorite (NaOCl), gives iodoform.

$$NaOCl + KI \longrightarrow NaOI + KCl$$



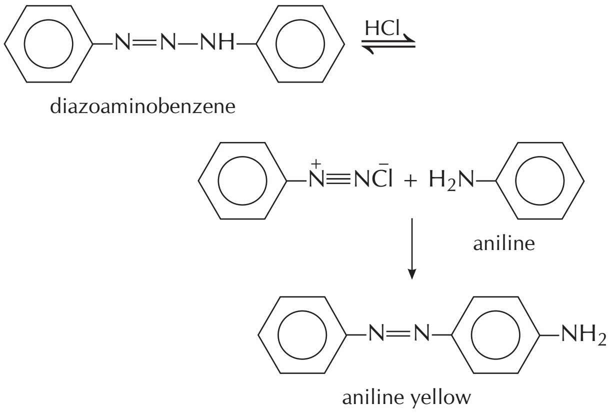
$$(H_3C)_2C{=}O + NaOI \longrightarrow (I_3C)(H_3C)C{=}O \xrightarrow{NaOH} CH_3COONa + \underset{\text{iodoform}}{CHI_3}$$

Caution Point *The compounds containing* $CH_3-\overset{O}{\overset{\|}{C}}-$ *and* $CH_3-\underset{OH}{\underset{|}{CH}}-$ *groups give iodoform test.*

Sample Problem 4 *When aniline hydrochloride reacts with diazoamino benzene at 40°C, it gives*

(*a*) *aniline yellow*
(*b*) *hydrazo compound*
(*c*) *azobenzene*
(*d*) *no reaction takes place*

Interpret (a)



Check Point 2

1. Why is dilute H_2SO_4 added in boiling water during the preparation of ferrous sulphate solution?
2. In the preparation of acetanilide, zinc is added to reaction mixture. Explain.
3. Identify the functional groups present in *p*-nitroacetanilide.
4. Mention the name of the reactants for the synthesis of *p*-amino azobenzene. Write chemical reaction involved in its synthesis also.

Hot Spot

TITRIMETRIC Exercises

Titrimetric exercises is one of the important topic of this chapter. Generally questions are seen from this topic. The level of question vary from moderate to difficult.

Titration

A titration is an experiment where the volume of reactant solution (titrant) needed to react exactly with some amount of another reactant is measured. This volume is called equivalence point. A titration is performed by slowly adding a standard solution from a burette to a solution under examination until the reaction between the two is observed to be complete. The volume or mass of the reagent needed to complete the titration is determined from the difference between the initial and final readings.

It is sometimes necessary to add an excess of the standard titrant and then determine the excess amount by **back titration** with a second titrant. (The solution taken in the burette during titration is known as titrant and the other solution being titrated is called the titrate).

Standard Solutions

A volumetric method employs one or more standard solutions which are reagents of exactly known concentrations. A standard solution used for acid-base titration is usually a solution of strong acids or bases *e.g.*, HCl, H_2SO_4, NaOH, KOH and $Ba(OH)_2$. Bases, however, are not as good as acid for permanent standards because they absorb CO_2 whenever they come in contact with air. Therefore, the accuracy of a volumetric method is limited by the accuracy with which the concentration of the standard solution is known.

The ideal standard solution (of known concentration) must have the following characteristics

(i) It should be sufficiently stable so that it is necessary to determine its concentration only once.

(ii) It must react rapidly with the analyte.

If concentration of a substance can be known simply by dissolving its known amount in a given volume of solution, then the substance is called **primary standard and the solution formed as primary standard solutions.** *e.g.,* Oxalic acid, potassium dichromate. In most cases, concentration can be determined by standardisation against primary standard solution. Such solutions are called **secondary standard solutions.** *e.g.*, Ferrous sulphate, mineral acids (H_2SO_4, HNO_3), Their solutions are prepared by dissolving a known amount or volume but they have to be standardised using primary standard. Thus, all these are secondary standards.

Equivalence Point and End Point

The equivalence point in a titration is a theoretical point reached when the amount of added titrant is chemically equivalent to the amount of analyte (titrate) in the sample. It cannot be determined experimentally. We can only estimate its position by observing some physical change associated with the condition so equivalence. This is called end point of titration. For example, equivalent point is reached when 1 mole of HCl is neutralized by 1 mole of NaOH. But we cannot detect this equivalent point. If one drop of suitable indicator such as phenolphthalein is added in HCl (analyte), then additional drop of NaOH (from burette) will give light pink colour. This is the **end point.** Therefore, end point is the point of completion of the reaction indicated by suitable indicator. It has additional drop of titrating reagent but, we use

$$N_1V_1 = N_2V_2$$

$$NaOH + HCl \longrightarrow NaCl + H_2O$$

$$1 \text{ equivalent of NaOH} \equiv 1 \text{ equivalent of HCl}$$

$$\equiv 1 \text{ mol of HCl}$$

$$2NaOH + H_2SO_4 \longrightarrow Na_2SO_4 + 2H_2O$$

$$1 \text{ equivalent of NaOH} \equiv 1 \text{ equivalent of } H_2SO_4$$

$$\equiv 0.5 \text{ mol of } H_2SO_4$$

Caution Point *The volume of titrant at the end point is larger than that at the equivalence point.*

Acid-Base Indicators

Acid-base indicators are special types of substances which possess one colour in acid solution and different colour in alkaline medium. For acid-base titration, a weak acid or weak base is used as an indicator. Since, the concentration of acid or base is controlled by pH, the colour of an indicator solution is pH dependent. The Henderson-Hasselbalch equation shows that when pH $= pK_a$, the acid and base concentrations are equald. Thus, the colour will be a mixture of both the acid and base forms. Since, there is at least 20 times higher acid concentration than base, the acidic form and colour predominate at pH $< pK_a - 1.0$ Likewise, the basic form and colour predominate at pH $> pK_a + 1.0$.

Table 16.1 **pH Transition Ranges and Colours of Some Common Indicators**

	Indicator	pH range	Colour in acid solution	Colour in alkaline solution
1.	Thymol blue	1.2 – 2.8	Red	Yellow
2.	Bromophenol blue	3.1 – 4.6	Yellow	Purple
3.	Methyl orange	3.1 – 4.5	Red	Yellow
4.	Methyl red	4.2 – 6.3	Red	Yellow
5.	Bromothymol blue	6.0 – 7.5	Orange	Blue
6.	Phenol red	6.4 – 8.2	Yellow	Red
7.	Thymol blue (base)	8.1 – 9.6	Yellow	Blue
8.	Phenolphthalein	8.0 – 9.8	Colourless	Pink
9.	Thymophthalein	9.3 –10.5	Colourless	Blue
10.	Alizarin yellow R	10.1 – 12.1	Yellow	Lilac

Acid-base Titration

(Neutralization Method of Analysis)

The neutralization method of analysis commonly called "acid-base titration" is a very common method of determining amount of acids, bases or salts of weak acids or bases in an unknown sample. An acid-base titration involves a neutralisation reaction in which an acid is reacted with an equivalent amount of a base. The reaction is characterised by a rapid change in pH near the equivalence point, which is detected by the colour change of indicator that occur at the end point. The analysis that can be done by neutralisation method may be grouped in two general classes.

(i) Determination of acid or base or their anhydride in a sample by titrating with a standard solution of base or acid.

(ii) Determination of salts of weak acids or bases by titrating with a standard solution of a strong base or acid.

The titration of a very weak base with strong acid and a titration of a very weak acid with strong base can not be performed because a sharp end point cannot be observed for them. Usually when acid is too weak to be titrated with a standard base, a salt of acid can be titrated with standard acid solution. For example, carbonic acid cannot be titrated by sodium hydroxide quantitatively, but sodium carbonate can be titrated by hydrochloric acid or sulphuric acid.

$$CO_3^{2-} + 2H^+ \longrightarrow H_2O + CO_2$$

Table 16.2 **Indicators in Acid-base Titrations**

S.N.	Acid-base titrations	Indicators
1.	Strong acid *vs* strong base	Bromothymol blue, phenolphthalein methyl orange, thymophthalein
2.	Strong acid *vs* weak base	Methyl orange, methyl red, bromocresol green
3.	Weak acid *vs* strong base	Phenolphthalein, thymophthalein
4.	Weak acid *vs* weak base	Phenol red

Titration Curve

By constructing a titration curve, we can easily explain how the end point of a titration can be detected. A titration curve is constructed by plotting the pH of the solution as a function of the volume of titrant added. The titrant is always a strong acid or a strong base.

Redox Titrations Reducing agents such as Fe, Fe^{2+}, H_2O_2, $CaOCl_2$, MnO_2 can be determined by suitable oxidising agents such as as $KMnO_4$, $K_2Cr_2O_7$ in acidic or basic or neutral medium. These are called redox titrations. *e.g.*, Fe^{2+} is oxidised to Fe^{3+} by MnO_4^- which in turn is reduced to Mn^{2+} in acidic medium.

$$5Fe^{2+} + MnO_4^- + 8H^+ \longrightarrow Mn^{2+} + 5Fe^{3+} + 4H_2O$$

In all cases, $N_1V_1 = N_2V_2$

but $M_1V_1 \neq M_2V_2$

$$\text{Equivalent weight} = \frac{\text{molecular weight}}{\text{total change in ON}}$$

$$= \frac{\text{molecular weight}}{\text{number of electrons gained or lost}}$$

Some Important Examples of Titrations

(i) Na_2CO_3 *vs* HCl Titration

The titration of Na_2CO_3 *vs* HCl is a neutralisation titration (acidimetry and alkalimetry) which involve the neutralisation of an acid with a base. *e.g.,* sodium carbonate is attacked by dil HCl in the following way

$$Na_2CO_3 + 2HCl \longrightarrow 2NaCl + H_2O + CO_2\uparrow$$

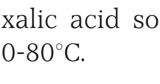
Methyl orange is used as an indicator for end pont detection. In this titration, sodium carbonate is estimated by titrating it with a standard solution of HCl.

(ii) Oxalic Acid *vs* $KMnO_4$ Titration

This is an example of redox titration in which a reducing agent (as oxalic acid) is estimated by titrating it with a standard solution of oxidising agent (as $KMnO_4$). Such reactions are accompanied by the change in valency of ions. In these titrations oxidation and reduction takes place simultaneously *i.e.*, while one substance is being oxidised, the other one is being reduced.

$$\underset{\substack{\text{oxidising}\\\text{agent}}}{2KMnO_4} + 3H_2SO_4 \longrightarrow K_2SO_4 + 2MnSO_4 + 3H_2O + 5[O];$$

$$\left(E_{KMnO_4} = \frac{M}{5}\right)$$



$$\underset{\text{reducing agent}}{5\begin{array}{c}COOH\\|\\COOH\end{array}} + 5[O] \longrightarrow 5H_2O + 10CO_2\uparrow; \quad \left(E_{H_2C_2O_4} = \frac{M}{2}\right)$$

$KMnO_4$ acts as self indicator for end point detection.

This titration is carried out in the presence of HCl or H_2SO_4 but not in the presence of conc. HNO_3 because it is a strong oxidising agent and hence interfere with oxidising action of $KMnO_4$. In $KMnO_4$ *vs* oxalic acid titration, the oxalic acid solution is heated with dilute H_2SO_4 up to 70-80°C.

Mohr's Salt, $FeSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$ *vs* $KMnO_4$ Titration

This titration is also an example of redox titration and work on the same principle as oxalic acid *vs* $KMnO_4$ titration. In this titration, the active constituent of ferrous ammonium sulphate (Mohr's salt) is ferrous sulphate, which is oxidised to ferric sulphate by acidified potassium permanganate as follows.

$$2KMnO_4 + 3H_2SO_4 \longrightarrow K_2SO_4 + 2MnSO_4 + 3H_2O + 5[O]; \quad \left(E_{KMnO_4} = \frac{M}{5}\right)$$

$$\frac{[2FeSO_4 + H_2SO_4 + [O] \longrightarrow Fe_2(SO_4)_3 + H_2O] \times 5}{2KMnO_4 + 8H_2SO_4 + 10FeSO_4 \longrightarrow K_2SO_4 + 2MnSO_4 + 5Fe_2(SO_4)_3 + 8H_2O} \quad \left(E_{FeSO_4} = \frac{M}{1}\right)$$

$KMnO_4$ acts as self indicator for end point detection.

This titration is carried out at room temperature because Mohr's salt is oxidised by air on heating.

Sulphuric acid should be present in excess otherwise a brown precipitate due to the formation of MnO_2 will be formed.

Table 16.3 **Redox Titrations** (Excluding Iodometric/Iodimetric Titrations)

Estimation of	By Titrating with	Reactions	Relation between O.A and R.A
Fe^{2+}	MnO_4^-	$Fe^{2+} \longrightarrow Fe^{3+} + e^-$ $MnO_4^- + 8H^+ + 5e^- \longrightarrow Mn^{2+} + 4H_2O$	$5Fe^{2+} \equiv MnO_4^-$ eq.wt. $Fe^{2+} = \frac{M}{1}$; eq.wt $MnO_4^- = \frac{M}{5}$
Fe^{2+}	$Cr_2O_7^{2-}$	$Fe^{2} \longrightarrow Fe^{3+} + e^-$ $Cr_2O_7^{2-} + 14H^+ + 6e^- \longrightarrow 2Cr^{3+} + 7H_2O$	$6Fe^{2+} \equiv Cr_2O_7^{2-}$ eq.wt. $Cr_2O_7^{2-} = M/6$
$C_2O_4^{2-}$	MnO_4^-	$C_2O_4^{2-} \longrightarrow 2CO_2 + 2e^-$ $MnO_4^- + 8H^+ + 5e^- \longrightarrow Mn^{2+} + 4H_2O$	$5C_2O_4^{2-} \equiv 2MnO_4^-$ eq.wt. $C_2O_4^{2-} = M/2$; eq.wt. $MnO_4^- = \frac{M}{5}$
H_2O_2	MnO_4^-	$H_2O_2 \longrightarrow 2H^+ + O_2 + 2e^-$	$5H_2O_2 = 2MnO_4^-$ eq.wt $H_2O_2 = M/2$; eq.w.t $MnO_4^- = \frac{M}{5}$
As_2O_3	MnO_4^-	$As_2O_3 + 5H_2O \longrightarrow 2AsO_4^{3-} + 10H^+ + 4e^-$	eq.wt of $As_2O_3 = M/4$
AsO_3^{3-}	BrO_3^-	$AsO_3^{3-} + H_2O \longrightarrow AsO_4^{3-} + 2H^+ + 2e^-$ $BrO_3^- + 6H^+ + 6e^- \longrightarrow Br^- + 3H_2O$	eq.wt. $AsO_3^{3-} = M/2$ eq.wt. of $BrO_3^- = M/6$

Sample **Problem 5** Oxalic acid ($H_2C_2O_4$) is present in many plants and vegetables. If 24.0 *mL of* 0.01 *M* $KMnO_4$ *solution is needed to titrate* 1.00 *g of* $H_2C_2O_4$ *to the equivalence-point, what is the per cent by mass of* $H_2C_2O_4$ *in the sample?*

(*a*) 0.54%
(*b*) 5.4%
(*c*) 54%
(*d*) 0.054%

Interpret (*b*) 24 mL of 0.01 M $KMnO_4 = 0.24 \times 10^{-3}$ mol $KMnO_4$

$$2MnO_4^- + 5C_2O_4^{2-} + 16H^+ \longrightarrow 10CO_2 + 2Mn^{2+} + 8H_2O$$

$$\therefore \quad C_2O_4^{2-} \text{ (pure) reacted } = \frac{5}{2} \times 0.24 \times 10^{-3} \text{ mol}$$
$$= 0.60 \times 10^{-3} \text{ mol}$$

Thus, oxalic acid (pure) $= 0.60 \times 10^{-3} \times 90$ g $= 0.054$ g in 1.0 g impure oxalic acid

% purity = 5.4%

Sample **Problem 6** *A mixture of* HCl *and* H_3PO_4 *is titrated with* 0.1 *M* NaOH. *The first end point (methyl red) occurs at* 35.00 *mL and the second end-point (bromothymol blue) occurs at a total of* 50.00 *mL* (15.00 *mL after the first end point). Calculate the millimoles of* HCl *and* H_3PO_4 *present in the solution respectively.*

(*a*) 2.0 *and* 1.5
(*b*) 1.5 *and* 2.0
(*c*) 20 *and* 15
(*d*) 15 *and* 20

Interpret (*a*) $HCl \rightleftharpoons H^+ + Cl^-$ end point indicated by methyl red.

$H_3PO_4 \rightleftharpoons H^+ + H_2PO_4^-$ end pont indicated by methyl red.

$H_2PO_4^- \rightleftharpoons H^+ + HPO_4^{2-}$ end point indicated by bromothymol blue.

Let HCl $= x$ milimol

$H_3PO_4 = y$ millimol

then $x + y = 35 \times 0.1 = 3.5$ millimol (first step ionization)

$y = 15 \times 0.1 = 1.5$ millimol (second step ionization)

$\therefore$ HCl $= 3.5 - 1.5 = 2.00$ millimol

and $H_3PO_4 = 1.5$ millimol

Check Point 3

1. What is the difference between equivalence point and end point?
2. Urea sample is 60% pure. Calculate volume of 1 NHCl required to absorb NH_3 from 1.0 g of urea sample on decomposition with NaOH.
3. What is the molarity of a MnO_4^- solution, if 32.00 mL of the solution is required to titrate 40.00 mL of 0.400 N Fe^{2+}?

$$MnO_4^- + 5Fe^{2+} + 8H^+ \longrightarrow Mn^{2+} + 5Fe^{3+} + 4H_2O$$

4. Why does colour of $KMnO_4$ disappear when oxalic acid is added to its solution in acidic medium? **[NCERT** Exemplar**]**

16.3 Salt Analysis or Qualitative Inorganic Analysis

Qualitative analysis of given inorganic mixture is done in the following steps

1. **Dry tests** Dry tests involve following tests
   - (a) Physical observation
   - (b) Effect of heating
   - (c) Smell of compound
   - (d) Solubility of salts
   - (e) Flame tests
   - (f) Charcoal cavity test
   - (g) Cobalt nitrate test
   - (h) Borax bead test
   - (i) Microcosmic salt bead test
   - (j) Sodium carbonate bead test
2. **Wet tests** Dry tests tells us about the presence of possible radicals in the mixture but these are confirmed by wet tests.

Dry Test

These are preformed in the following manner

(a) **Physical Observation of Salt or Mixture**

In physical examination, colour, smell and density of a given mixture are observed.

S.N.	Observation	Inference
A.	**Colour of the substance**	
(i)	Blue, its aqueous solution is also blue.	Cupric salt
(ii)	Green, its aqueous solution is also green.	Salts of nickel
(iii)	Dark green, its aq. solution is also dark green but becomes light on dilution.	Salts of chromium
(iv)	Violet-pink, its aq. solution is pink.	Salts of cobalt
(v)	Light pink, its aqueous solution is colourless.	Salts of manganese
(vi)	Reddish brown	Fe_2O_3
(vii)	Red	$HgO, HgI_2, Pb_3O_4, Cu_2O$
(viii)	Orange red	Sb_2S_3
(ix)	Black	CuO, NiO, SnO, FeS, CuS, HgS, PbS, CoS, FeO, $Co_3O_4, Ni_2O_3, Cu_2S, CuBr_2$, NiS etc.
(x)	Yellow	As_2S_3, CdS, Bi_2O_3, As_2S_5, PbI_2, AgI, chromates etc.
(xi)	Yellow-green, aqueous solution is light green or almost colourless.	Salts of Fe^{2+}
(xii)	Yellow-brown, aqueous solution is yellow	Salts of Fe^{3+}
(xiii)	Colourless	Transition metals absent except some salts of Mn^{2+}
(xiv)	Purple	Some Cr^{3+} salts and permanganates.

S.N.	Observation	Inference
B.	**Odour of the substance**	
(i)	Vinegar like smell	Acetates
(ii)	Rotten egg like smell	Sulphides
(iii)	Ammoniacal smell	Ammonia salts mainly $(NH_4)_2CO_3$ Some ammonium salts and sulphides do not give smell.
C.	**Density**	
	Mixture or salt is light	Salts of Zn, Bi, Al, Ba, Sr, Ca and Mg.
	Mixture of salts is heavy	Salts of Hg and Pb.

(b) Effect of Heating

Take the given substance in a clear, dry test tube and heat it first gently and then strongly. Observe the changes takes place upon heating.

S.N.	Observation	Inference
(i)	Substance melts	Salts of alkali metals, chlorides of Hg, Ag and Pb and salts having water of crystallisation.
(ii)	Substance cracks	$Pb(NO_3)_2$, $Ba(NO_3)_2$, NaCl and KI
(iii)	Substance swells	Alums, salts of phosphate and borate.
(iv)	Substance sublimes on heating and the colour of sublimate is	
	White	$HgCl_2$, As_2O_3, Hg_2Cl_2, $AlCl_3$, Sb_2O_3, halides of NH_3
	Yellow	As_2S_3 and HgI_2
	Black	Sulphides of Hg, Sb, As
	Blue, yellow or violet vapours	Iodides
	Grey (having garlic odour)	As
(v)	Colour of residue obtained after heating (Residue mainly contains metallic oxides	
	White and non-fusible	Oxides of Ca, Ba, Sr, Mg, Zn and Al.
	Red-brown	Fe_2O_3
	Yellow-brown when hot, on cooling it is brown	SnO_2
	Black and infusible	NiO, MnO_2 and CuO
	Dark orange red in heating state and sublimes	HgO
	White, infusible, becomes yellow on heating	ZnO
	Initially it is blue or green but becomes white on heating	$CuSO_4 \cdot 5H_2O$
(vi)	Observations of gases evolved	
A.	Colourless, odourless gas	
	O_2, which supports combustion.	Nitrates of Na and K
	CO_2, which turns lime water milky.	Carbonates and oxalates.
B.	Colourless, odorous gas	
	H_2S, smell of rotten eggs	Sulphides.
	HCl, Pungent smell and forms white fumes with NH_3	Hydrated chloride salts
	NH_3, turns red litmus to blue	Ammonium salts
	SO_2, smell of burning sulphur	Sulphite and thiosulphate.
C.	Coloured, odorous gas	
	Cl_2, yellow-green pungent smelling gas.	Chloride
	I_2, violet gas	Iodides
	Br_2, red-brown gas	Bromides
	NO_2, brown gas	Nitrates or nitrites of heavy metals

(c) Smell of Compound

Smell of compound also gives an idea about the radical present in the salt.

Smell	Inference
Ammoniacal smell	Ammonium salts
Vinegar like smell	Acetates
Chlorine like smell	Hypochlorites

(d) Solubility of Salts

Type of the salts	Observation
Nitrates and nitrites	All metal salts are soluble in water
Acetates	All metal acetates are soluble in water
Chlorides	All common chlorides are soluble in water except AgCl, Hg_2Cl_2 and $PbCl_2$.
Bromides	All common bromides are soluble in water except AgBr, Hg_2Br_2, $PbBr_2$ and $HgBr_2$.
Iodides	All common iodides are soluble in water except AgI, Hg_2I_2, HgI_2, PbI_2.
Sulphides	All common sulphides are insoluble in water except sulphides of group I and group II metals and ammonium ion.
Carbonates	All common carbonates are insoluble in water except carbonates of group I and $(NH_4)_2CO_3$.
Sulphates	All common sulphates are soluble in water except $PbSO_4$, Hg_2SO_4, $BaSO_4$, $CaSO_4$ and Ag_2SO_4 which are sparingly soluble.
Phosphates	All common phosphates are insoluble in water except phosphates of group I and $(NH_4)_3PO_4$.
Hydroxides	All common metal hydroxides are insoluble in water except group I hydroxides and $Ba(OH)_2$, $Sr(OH)_2$ and $Ca(OH)_2$.

(e) Flame Test

This test is bases upon the fact that in a state of high ionisation of chloride some of the cations impart characteristic colour to the flame, as the cation absorbs energy from the flame and transmit the same as light of characteristic colour.

Paste of the salt and conc. HCl is taken into the lower oxidising zone and colour imparted to the flame by salts is observed. Salts particularly of group V (Ba^{2+}, Ca^{2+}, Sr^{2+}) are identified by colours of the flame.

Colour	Cation
Golden yellow	Na^+
Violet	K^+
Carmine red	Li^+
Brick red	Ca^{2+}
Apple-green	Ba^{2+}, Mo^{2+}
Green	Cu^{2+}, BO_3^{3-}, Tl^{3+}
Crimson red	Sr^{2+}
Blue	Cu^{2+}, As^{3+}, Sb^{3+}, Bi^{3+}

(f) Charcoal Cavity Test

When a salt is fused with anhydrous Na_2CO_3 or oxidising mixture in a cavity on charcoal block in reducing flame, first metallic carbonates and finally metallic oxides are formed.

$$Pb(NO_3)_2 + Na_2CO_3 \xrightarrow{\Delta} PbCO_3 + 2NaNO_3$$

$$PbCO_3 \xrightarrow{\Delta} PbO + CO_2\uparrow$$

or

$$CuSO_4 + Na_2CO_3 \xrightarrow{\Delta} CuCO_3 + Na_2SO_4$$

$$CuCO_3 \xrightarrow{\Delta} CuO + CO_2\uparrow$$

These metallic oxides reduce to metals by the action of carbon present in reducing flame. On cooling these metals form beads.

$$PbO + C \longrightarrow Pb + CO\uparrow$$
$$CuO + C \longrightarrow Cu + CO\uparrow$$

Conclusions can be made by the following table.

Table 16.4 **Colour in Charcoal Cavity Test**

S.N.	Bead	Crust	Inference
(i)	Greyish white soft bead which marks paper.	Brown which turns yellow on cooling	Pb^{2+}
(ii)	Lustrous white bead	—	Ag^+
(iii)	White-browm bead	Orange which turns yellow on cooling	Bi^{3+}
(iv)	Garlic like smelly fumes without bead	—	As^{3+}
(v)	—	Red-brown precipitate, easily turns into vapour	Cd^{2+}
(vi)	Smell of ammonia	Red	NH_4^+
(vii)	—	Black precipitate	$Fe^{3+}, Co^{2+}, Mn^{2+}$

(g) Cobalt Nitrate Test

This test is performed only when infusible mass is obtained in charcoal-cavity test. Infusible mass contains metallic oxides like CaO, Al_2O_3, MgO and ZnO.

In this test, 1-2 drops cobalt nitrate is added to infusible mass obtained in charcoal cavity and heat the mixture in oxidising flame.

Conclusions can be made by the following table.

Table 16.5 **Colour Shown in Cobalt Nitrate Test**

S.N.	Colour of the residue	Inference
1.	Green	Zn^{2+}
2.	Pink-dirty residue	Mg^{2+}
3.	Bluish green	Sn^{2+}
4.	Blue	$Al^{3+}, PO_4^{3-}, BO_3^{3-}$

Cobalt nitrate should not be used in excess otherwise black coloured cobalt oxide (Co_3O_4), may be formed and it is different to identify other colours in the presence of black colour.

(h) **Borax Bead Test**

If borax, $Na_2B_4O_7 \cdot 10\,H_2O$ is heated on the platinum loop, a transparent colourless glass like bead of sodium metaborate ($NaBO_2$) and boric anhydride (B_2O_3) is formed.

$$Na_2B_4O_7 \xrightarrow{\Delta} 2NaBO_2 + B_2O_3.$$

Characteristics coloured beads are produced with salts of Cu, Fe, Cr, Mn, Co and Ni. The colour of the bead depends upon the flame in which it has been heated.

$$CuO + B_2O_3 \longrightarrow \underset{\substack{\text{copper (II) metaborate} \\ \text{(green when hot} \\ \text{blue when cold)}}}{Cu(BO_2)_2} \qquad \text{(oxidising flame)}$$

$$2Cu(BO_2)_2 + C \longrightarrow 2CuBO_2 + B_2O_3 + CO\uparrow \qquad \text{(reducing flame)}$$

$$2CuBO_2 + C \xrightarrow{\text{Colourless}} \underset{\text{red}}{2Cu\downarrow} + B_2O_3 + CO\uparrow$$

Conclusions can be made by the following table

Table 16.6 **Colour in Borax Bead Test**

	Oxidising flame		Reducing flame		Metal
S.N.	Hot	Cold	Hot	Cold	
1.	Green	Blue	Colourless	Opaque red-brown	Cu
2.	Yellowish- brown	Yellow	Green	Green	Fe
3.	Yellow	Green	Green	Green	Cr
4.	Violet	Amethyst	Colourless	Colourless	Mn
5.	Blue	Blue	Blue	Blue	Co
6.	Violet	Reddish-brown	Grey	Grey	Ni
7.	Yellow	Colourless	Brown	Brown	Mo
8.	Rose-violet	Rose-violet	Red	Violet	Au
9.	Yellow	Colourless	Yellow	Yellowish to brown	W
10.	Yellow	Pale yellow	Green	Bottle Green	U
11.	Yellow	Greenish yellow	Brownish	Emerald green	V
12.	Yellow	Colourless	Grey	Pale violet	Ti
13.	Orange-red	Colourless	Colourless	Colourless	Ce

(i) **Microcosmic Salt Bead Test**

A test similar to borax bead test is used for identification of coloured cations, if microcosmic salt $Na(NH_4)HPO_4 \cdot 4H_2O$ is used.

$$Na(NH_4)HPO_4 \xrightarrow{\Delta} \underset{\text{transparent bead}}{NaPO_3} + H_2O\uparrow + NH_3\uparrow$$

$$NaPO_3 + CoO \longrightarrow \underset{\text{blue bead}}{NaCoPO_4}$$

Conclusions can be made by the following table

Table 16.7 **Colour Obtained in Microcosmic Salt Bead Test**

S.N.	Oxidising flame	Reducing flame	Metal
1.	Green when hot, blue when cold	Colourless when hot, red when cold	Cu
2.	Yellow or red-brown when hot, yellow when cold	Yellow when hot, colourless to green when cold	Fe
3.	Green, hot and cold	Green, hot and cold	Cr
4.	Violet, hot and cold	Colourless, hot and cold	Mn
5.	Blue, hot and cold	Blue, hot and cold	Co
6.	Brown, hot and cold	Grey when cold	Ni
7.	Yellow, hot and cold	Green when cold	V
8.	Yellow when hot, yellow green when cold	Green hot and cold	U
9.	Pale yellow when hot, colourless when cold	Green when hot, blue when cold	W
10.	Colourless, hot and cold.	Yellow when hot, violet when cold	Ti

(j) **Sodium Carbonate Bead Test**

The sodium carbonate bead is prepared by fusing small quantity of sodium carbonate on a platinum wire loop in the Bunsen flame, a white opaque bead is formed. If this is moistened, dipped into a little KNO_3 and then into a small quantity of the given salt and the whole is heated in the oxidising flame, a coloured bead is formed. For example.

$$MnO + Na_2CO_3 + O_2 \xrightarrow{\Delta} \underset{\substack{\text{sodium manganate}\\ \text{(green bead)}}}{Na_2MnO_4} + CO_2$$

$$2Cr_2O_3 + 4Na_2CO_3 + 3O_2 \xrightarrow{\Delta} \underset{\substack{\text{sodium chromate}\\ \text{(yellow bead)}}}{4Na_2CrO_4} + 4CO_2$$

Wet Tests

In wet analysis, the substance is first dissolved in water to bring it in solution form and is analysed for acid and basic radicals. In the analysis of inorganic salt mixture, first acid radicals are analysed and then basic radicals.

Analysis of Acid Radicals

Analysis of acid radicals (anions) is done in the following sequence.

Analysis of First Group Anions $(CO_3^{2-}, S^{2-}, NO_2^-)$

Acidic radicals or anions of first group, when treated with dil H_2SO_4, (Group reagent) evolve gases with characteristic colour and smell. On the basis of action of these gases, anions are identified.

Table 16.8 **Test for CO_3^{2-}**

S.N.	Experiment	Observation	Inference
1.	Take mixture in a dry test tube and add dill HCl or H_2SO_4. Warm gently	Brisk effervescence with the evolution of colourless and odourless gas (CO_2)	CO_3^{2-} may be
2.	Pass the evolved gas into limewater [$Ca(OH)_2$]	Lime water turns milky	CO_3^{2-} confirmed
3.	If, in lime water the gas is passed in excess	Milkiness disappears	CO_3^{2-} confirmed

Reactions Involved in the Test of Carbonate (CO_3^{2-})

(i) $Na_2CO_3 + 2HCl \longrightarrow 2NaCl + H_2O + \underset{\substack{\text{colourless,}\\ \text{odourless}\\ \text{gas}}}{CO_2 \uparrow}$

(ii) $Ca(OH)_2 + CO_2 \longrightarrow \underset{\substack{\text{calcium carbonate}\\ \text{(milky)}}}{CaCO_3} \downarrow + H_2O$

(iii) $CaCO_3 + H_2O + CO_2(\text{excess}) \longrightarrow \underset{\substack{\text{calcium bicarbonate}\\ \text{(colourless)}}}{Ca(HCO_3)_2}$

Table 16.9 **Tests for S^{2-}**

S.N.	Experiment	Observation	Inference
1.	Take mixture in a dry test tube and add dil HCl or H_2SO_4 and warm gently	A colourless gas (H_2S) with smell of rotten eggs evolved	S^{2-} may be
2.	Take filter paper dipped in lead acetate on the mouth of test tube	Filter paper turns black due to formation of PbS	S^{2-} confirmed

Reactions Involved in the Test of Sulphide (S^{2-})

(i) $Na_2S + H_2SO_4 \longrightarrow H_2S + Na_2SO_4$ (ii) $(CH_3COO)_2Pb + H_2S \longrightarrow \underset{\text{black}}{PbS\downarrow} + 2CH_3COOH$

Table 16.10 **Tests for Nitrate**

S.N.	Experiment	Observation	Inference
1.	Take mixture in a dry test tube and add dil HCl. Warm gently	Brown fumes (NO_2) with pungent odour are evolved	NO_2^- may be
2.	Take filter paper dipped in (strach + KI) solution, on the mouth of test tube	The evolved gas turns filter paper blue	NO_2^- confirmed
3.	Add 2-3 drops of KI and starch solution in the test tube	Deep blue or violet colour appears	NO_2^- confirmed

Reactions Involved in the Test of Nitrite (NO_2^-)

(i)

$$2NaNO_2 + H_2SO_4 \longrightarrow Na_2SO_4 + 2HNO_2$$

$$3HNO_2 \longrightarrow HNO_3 + 2NO\uparrow + H_2O$$

$$2NO + O_2 \longrightarrow \underset{\text{(brown)}}{2NO_2\uparrow}$$

(ii)

$$2KI + 2NO_2 \longrightarrow 2KNO_2 + I_2$$

$$I_2 + \text{starch} \longrightarrow \text{Blue colour}$$

Analysis of Second Group Anions (Cl^-, Br^-, I^-, NO_3^-)

Acidic radicals or anions of second group give no response with dil. acids but with conc. acids (Conc. H_2SO_4 group reagent), they evolve gases with characteristic colour and smell, thus can be identified by using conc. acids.

Table 16.11 **Tests for Chloride**

S.N.	Experiment	Observation	Inference
1.	Heat the mixture with 1-2 mL conc H_2SO_4 in a dry test tube	A colourless, pungent gas (HCl) is evolved	Cl^- may be
2.	Bringe a glass rod dipped in NH_4OH near the mouth of test tube	White dense fumes of NH_4Cl is evolved	Cl^- confirmed
3.	Heat the mixture with conc H_2SO_4 and MnO_2 in a dry test tube	Greenish-yellow (Cl_2) pungent gas is evolved	Cl^- confirmed
4.	**Chromyl chloride test** Heat the mixture with solid $K_2Cr_2O_7$ and conc H_2SO_4. Now collect these vapours in a test tube containing NaOH. Acidified it with acetic acid and add lead acetate solution	Orange yellow vapours of chromyl-chloride (CrO_2Cl_2) are evolved A yellow ppt or solution of lead chromate is formed	Cl^- confirmed

Reactions Involved in the Test of Chloride (Cl^-)

(i) $NaCl + H_2SO_4 \longrightarrow NaHSO_4 + \underset{\text{pungent smelling gas}}{HCl\uparrow}$

(ii) $HCl + NH_4OH \longrightarrow \underset{\text{white fumes}}{NH_4Cl\uparrow} + H_2O$

(iii) $2NaCl + MnO_2 + 3H_2SO_4 \longrightarrow 2NaHSO_4 + MnSO_4 + 2H_2O + \underset{\text{yellowish-green}}{Cl_2\uparrow}$

(iv) **Chromyl chloride test**

$$4NaCl + K_2Cr_2O_7 + 3H_2SO_4 \longrightarrow \underset{\substack{\text{chromyl chloride} \\ \text{(orange yellow gas)}}}{2CrO_2Cl_2} + 2Na_2SO_4 + K_2SO_4 + 3H_2O$$

$$CrO_2Cl_2 + 4NaOH \longrightarrow \underset{\text{yellow}}{Na_2CrO_4} + 2NaCl + 2H_2O$$

$$(CH_3COO)_2Pb + Na_2CrO_4 \longrightarrow \underset{\text{yellow}}{PbCrO_4\downarrow} + 2CH_3COONa$$

Caution Point *If a mixture contains chlorates, chromyl chloride test for chloride anion is not performed because chlorates on reaction with* H_2SO_4 *form chlorine dioxide gas which dissolves in* H_2SO_4 *and form highly explosive orange yellow solution.*

$3KClO_3 + 3H_2SO_4 \longrightarrow 2ClO_2\uparrow + ClO_4^- + 3SO_4^{2-} + 4H^+ + 3K^+ + H_2O$

Table 16.12 **Test for Bromide**

S.N.	Experiment	Observation	Inference
1.	Heat the mixture with 1-2 mL conc H_2SO_4 in a dry test tube	A colourless, pungent gas (HBr) or sometimes brown fumes are evolved	Br^- may be
2.	Heat the mixture with MnO_2 and conc H_2SO_4	Red brown vapour of Br_2 evolved	Br^- confirmed
3.	To the solution of mixture in dil HNO_3, add $AgNO_3$ solution	A pale yellow ppt of AgBr is formed (hardly soluble in NH_4OH)	Br^- confirmed

Reactions Involved in The Test of Bromide (Br^-)

(i) $NaBr + \underset{\text{conc}}{H_2SO_4} \longrightarrow NaHSO_4 + HBr\uparrow$

$2HBr + H_2SO_4(\text{conc}) \longrightarrow 2H_2O + SO_2\uparrow + \underset{\text{reddish brown}}{Br_2\uparrow}$

(ii) $2NaBr + MnO_2 + 3H_2SO_4 \longrightarrow 2NaHSO_4 + MnSO_4 + 2H_2O + \underset{\text{reddish brown}}{Br_2\uparrow}$

(iii) $NaBr + AgNO_3 \longrightarrow \underset{\text{pale yellow}}{AgBr\downarrow} + NaNO_3$

$AgBr + 2NH_4OH \longrightarrow \underset{\substack{\text{diammine silver (I)}\\\text{bromide}}}{[Ag(NH_3)_2]Br} + 2H_2O$

Table 16.13 **Test for Iodide**

S.N.	Experiment	Observation	Inference
1.	Heat the mixture with 1-3 mL conc H_2SO_4 in a dry test tube	Dark violet fumes (I_2) are evolved	I^- may be
2.	Heat the mixture with MnO_2 and conc H_2SO_4	Violet vapours in excess are evolved	I^- may be
3.	Take a paper dipped in starch solution on the mouth of test tube	Paper turns blue	I^- confirmed
4.	To the solution of mixture in dil HNO_3, add $AgNO_3$ solution	A yellow ppt of AgI is formed (insoluble in NH_4OH)	I^- confirmed

Reactions Involved in the Test of Iodide (I^-)

(i) $NaI + \underset{\text{conc}}{H_2SO_4} \longrightarrow HI + NaHSO_4$

$H_2SO_4 + 2HI \longrightarrow \underset{\substack{\text{violet}\\\text{vapours}}}{I_2\uparrow} + SO_2 + 2H_2O$

(ii) $2NaI + MnO_2 + 3H_2SO_4 \longrightarrow I_2\uparrow + 2NaHSO_4 + MnSO_4 + 2H_2O$

(iii) $I_2 + \text{starch} \longrightarrow \text{Blue colour}$

(iv) $NaI + AgNO_3 \longrightarrow \underset{\text{yellow}}{AgI\downarrow} + NaNO_3$

Sample Problem 7 *Which one of the following is more soluble in ammonia?*

(*a*) AgCl (*b*) AgBr (*c*) AgI (*d*) *None of these*

Interpret (*a*) The order of solubility in ammonia is AgCl > AgBr > AgI.

Table 16.14 **Tests for Nitrate**

S.N.	Experiment	Observation	Inference
1.	Heat the mixture with 1-2 mL conc H_2SO_4 in a dry test tube	Pungent light brown gas (NO_2) is evolved	NO_3^- may be
2.	Heat the mixture with copper turnings and conc H_2SO_4	Deep brown fumes (NO_2) in excess are evolved	NO_3^- may be
3.	**Ring test** To the solution of mixture in dil HCl, add freshly prepared solution of $FeSO_4$. Shake well gradually and add conc H_2SO_4 by the sides of test tube	A brown ring of $FeSO_4 \cdot NO$ is formed at the junction of two liquids	NO_3^- confirmed

Reactions Involved in the Test of Nitrate (NO_3^-)

(i) $NaNO_3 + \underset{\text{(conc)}}{H_2SO_4} \longrightarrow NaHSO_4 + HNO_3$

$4HNO_3 \longrightarrow \underset{\text{brown}}{4NO_2\uparrow} + O_2\uparrow + 2H_2O$

(ii) $3Cu + 8HNO_3 \longrightarrow 3Cu(NO_3)_2 + 2NO\uparrow + 4H_2O$

$2NO + O_2 \longrightarrow 2NO_2\uparrow$

(iii) **Ring test**

$$6FeSO_4 + 2HNO_3 + 3H_2SO_4 \longrightarrow 3Fe_2(SO_4)_3 + 4H_2O + 2NO\uparrow$$

$$FeSO_4 + NO \longrightarrow \underset{\substack{\text{ferrous nitroso} \\ \text{sulphate} \\ \text{(Brown ring)}}}{FeSO_4 \cdot NO}$$

Sample Problem 8 *The brown ring in the test of* NO_3^- *is formed due to the formation of ferrous nitroso sulphate. This test depends upon*

(a) *the reduction of nitrate to nitric oxide*
(b) *oxidation of nitric oxide to nitrogen dioxide*
(c) *reduction of ferrous sulphate to iron*
(d) *oxidising action of sulphuric acid*

Interpret (a) Reduction of nitrate ions by Fe^{2+} ions

$$NO_3^- + 3Fe^{2+} + 4H^+ \longrightarrow NO + 3Fe^{3+} + 2H_2O$$

$$Fe^{2+} + NO + 5H_2O \longrightarrow [Fe(H_2O)_5NO]^{2+}$$

Analysis of Third Group Anion (SO_4^{2-})

Third group radical is identified on the basis of precipitate obtained.

Table 16.15 **Tests for Sulphate**

Radical or anion	S.N.	Experiment	Observation	Inference
Sulphate (SO_4^{2-})	1.	In the solution of mixture in dil HNO_3 add $BaCl_2$ solution	A curdy white ppt ($BaSO_4$) is formed (insoluble in all conc acids)	SO_4^{2-} may be
	2.	In the solution of mixture, add lead acetate solution	White ppt of $PbSO_4$ is formed	SO_4^{2-} confirmed

Reactions Involved in the Test of Sulphate (SO_4^{2-})

(i) $Na_2SO_4 + BaCl_2 \longrightarrow \underset{\text{white}}{BaSO_4}\downarrow + 2NaCl$

(ii) $(CH_3COO)_2Pb + Na_2SO_4 \longrightarrow \underset{\text{white}}{PbSO_4}\downarrow + 2CH_3COONa$

Analysis of Basic Radical (Cations)

Based on the values of solubility products (K_{sp}), basic radicals are classified into following groups.

Table 16.16 **Classification of Basic Radicals into Groups Based on K_{sp} Values**

Group	Basic radicals	Group reagent	Precipitate as	Explanation
(I)	Ag^+, Hg_2^{2+}, Pb^{2+}	Dil. HCl	Chlorides ($AgCl$, Hg_2Cl_2, $PbCl_2$)	K_{sp} values of chlorides are low, hence precipitated. Other have higher K_{sp} values, hence not precipitated.
(II)	Cu^{2+}, Cd^{2+}, Pb^{2+}, Hg^{2+} Bi^{3+}, Sb^{3+}, Sn^{2+}, As^{3+}	H_2S gas in presence of dil. HCl	Sulphides (CuS, As_2S_3 etc.)	K_{sp} values of IInd group sulphides are low, hence precipitated by low $[S^{2-}]$ ion. HCl (due to H^+ common ion) decreases the ionisation of weak acid H_2S which gives low $[S^{2-}]$ ions. Hence, group II sulphides are precipitated while others with high K_{sp} values are not precipitated.
(III)	Al^{3+}, Cr^{3+}, Fe^{3+}	NH_4OH in presence of NH_4Cl	Hydroxides $[Al(OH)_3$ etc.]	K_{sp} values of IIIrd group hydroxides are low. NH_4Cl decreases ionisation of weak NH_4OH due to common ion effect. Low $[OH^-]$ is only sufficient to precipitate group III cations as their hydroxides.
(IV)	Zn^{2+}, Ni^{2+}, Mn^{2+}, Co^{2+}	H_2S in ammoniacal medium	Sulphides (ZnS, NiS etc.)	K_{sp} values of sulphides of group IV are high. Ionisation of H_2S increases in basic medium. Hence, group IV cations are precipitated as sulphides due to increasing $[S^{2-}]$.
(V)	Ca^{2+}, Ba^{2+}, Sr^{2+}	$(NH_4)_2CO_3$ + NH_4Cl	Carbonates ($CaCO_3$, $BaCO_3$, $SrCO_3$)	K_{sp} values of carbonates are less than that of group VI (Mg^{2+}) hence, precipitated before Mg^{2+}.
(VI)	Mg^{2+} (Na^+, K^+) also included	NH_4OH + Na_2HPO_4 (only for Mg^{2+})	White precipitate ($MgHPO_4$)	
Zero	NH_4^+	Dilute NaOH	NH_3 gas is evolved	

Sample **Problem 9** *The principle involved in the classification of basic radicals is*

(*a*) *common ion effect* (*b*) *solubility product* (*c*) *valency of radicals* (*d*) *strength of salt*

Interpret (*b*) Basic radicals have been classified into six groups on the basis of the solubility products of their salts with group reagent. The radicals have been grouped in the order of increasing solubility product. That's why $NiCl_2$ does not precipitate with 1st group chlorides or $Zn(OH)_2$ doesn't precipitate with $Al(OH)_3$ in third group.

Preparation of Original Solution

To prepare transparent solution of salt, following solvents are used strictly in the order given below :

(i) cold water (ii) hot water (iii) dilute HCl (iv) conc. HCl

Caution Point HNO_3 *or* H_2SO_4 *cannot be used to prepare original solution because both are oxidising agents.*

Analysis of Group I Cations (Basic Radicals)

In cold original solution, dilute HCl is added drop by drop. Formation of white precipitate indicates the presence of group I. Cations of group I are precipitated as chlorides such as AgCl, $PbCl_2$ and Hg_2Cl_2. Among these chlorides, only $PbCl_2$ is soluble in hot water. Hence, hot filtrate contain Pb^{2+} ions.

Table 16.17 **Test for Lead**

S.N.	Experiment	Observation	Inference
1.	Hot filtrate is taken in the test tube and add K_2CrO_4	Yellow ppt. of $PbCrO_4$ is obtained which is soluble in NaOH but insoluble in CH_3COOH	Indicates the presence of Pb^{2+}.
2.	Hot filtrate is taken in the test tube and add KI.	Yellow ppt. of PbI_2 is formed	Pb^{2+} confirmed
3.	Dilute H_2SO_4 is added to hot filtrate and mixture is cooled.	White precipitate of $PbSO_4$ is obtained which is soluble in CH_3COONH_4 solution	Pb^{2+} confirmed

Reactions Involved in the Tests of Cation Pb^{2+}

$$\underset{\text{in cold O.S.}}{Pb^{2+}} + \underset{\text{from HCl}}{2Cl^-} \longrightarrow \underset{\text{white ppt.}}{PbCl_2\downarrow}$$

$PbCl_2$ is soluble in hot water, hence filtrate contains $PbCl_2$.

1.

$$\underset{\text{(hot and soluble)}}{PbCl_2} + K_2CrO_4 \longrightarrow \underset{\text{yellow ppt}}{PbCrO_4\downarrow} + 2KCl$$

$$PbCrO_4 + 4NaOH \longrightarrow \underset{\substack{\text{sodium plumbite}\\\text{(soluble)}}}{Na_2PbO_2} + Na_2CrO_4$$

2.

$$PbCl_2 + 2KI \longrightarrow \underset{\text{yellow}}{PbI_2} + 2KCl$$

3.

$$PbCl_2 + H_2SO_4 \longrightarrow \underset{\text{white ppt.}}{PbSO_4\downarrow} + 2HCl$$

$$PbSO_4 + 2CH_3COONH_4 \longrightarrow \underset{\text{soluble}}{(CH_3COO)_2Pb} + (NH_4)_2SO_4$$

Analysis of Group IInd Cations

Add dilute HCl in filtrate of group I and pass H_2S gas in warm solution. Formation of coloured ppt. indicates the presence of group II cations. Sulphides of group II B cations (As_2S_3, SnS, Sb_2S_3) are soluble in yellow ammonium sulphide while sulphides of group II A (PbS, CdS, CuS, Bi_2S_3) cations are soluble in HNO_3 (HgS is soluble in aquaregia).

Table 16.18 **Tests for Copper**

S.N.	Experiment	Observation	Inference
1.	Black ppt of CuS is taken in the test tube and add HNO_3(1 :)	Blue coloured solution is obtained	It indicates the presence of Cu^{2+}.
2.	Blue solution obtained above is divided into three parts.		
(i)	Add CH_3COOH and $K_4[Fe(CN)_6]$ to first part.	Chocolate brown ppt. is formed	Cu^{2+} confirmed
(ii)	Add aqueous NH_3 (excess) in second part of blue solution.	deep blue solution is obtained	Cu^{2+} confirmed
(iii)	Add KSCN is the third part of blue solution	Black ppt is obtained	Cu^{2+} confirmed

Reactions Involved in the Test of Cation Cu^{2+}

1.

$$\underset{\substack{\text{black}\\\text{ppt}}}{3CuS} + 8HNO_3 \longrightarrow \underset{\text{soluble blue}}{3Cu(NO_3)_2} + 2NO + 3S + 4H_2O$$

2.

$$Cu(NO_3)_2 + 2CH_3COOH \longrightarrow (CH_3COO)_2Cu + 2HNO_3$$

$$2(CH_3COO)_2Cu + K_4[Fe(CN)_6] \longrightarrow \underset{\text{chocolate brown ppt}}{Cu_2[Fe(CN)_6]} + 4CH_3COOK$$

3.

$$Cu^{2+} + 4NH_3(\text{excess}) \longrightarrow \underset{\text{deep blue}}{[Cu(NH_3)_4]^{2+}}$$

4.

$$Cu(NO_3)_2 + 2KSCN \longrightarrow \underset{\text{black ppt}}{Cu(SCN)_2} + 2KNO_3$$

Analysis of Group III Cations

Add few drops of conc. HNO_3 in the filtrate of group II to remove H_2S. Add NH_4Cl and NH_4OH. group III cations (if present) are precipitated as their hydroxides. ($Fe(OH)_3$-raddish brown ppt, $Cr(OH)_3$-dirty green ppt. $Al(OH)_3$-white gelatinous ppt).

Table 16.19 **Tests for Aluminium**

S.N.	Experiment	Observation	Inference
1.	Add NaOH solution in excess to white ppt.	white ppt dissolves due to the formation of sodium meta aluminate.	It indicates the presence of Al^{3+}
2.	In soluble meta-aluminate add NH_4Cl and boil	White ppt of $Al(OH)_3$ reappears	Al^{3+} confirmed

Reactions Involved in the Test of Cation Al^{3+}

1. $$\underset{\text{white ppt}}{Al(OH)_3} + NaOH \longrightarrow \underset{\substack{\text{sodium meta-aluminate}\\ \text{(soluble)}}}{NaAlO_2} + 2H_2O$$

2. $$NaAlO_2 + NH_4Cl + H_2O \xrightarrow{\Delta} NaCl + \underset{\text{white ppt.}}{Al(OH)_3} + NH_3$$

Table 16.20 **Tests for Iron**

S.N.	Experiment	Observation	Inference
1.	Add dilute HCl in reddish brown ppt. and divide it into two parts.	Precipitate dissolves	Fe^{3+} confirmed
(i)	Add $K_4[Fe(CN)_6]$ in the first part of the above solution.	Dark blue colour is obtained	Fe^{3+} confirmed
(ii)	Add KCNS in the second part of the solution.	Dark (Blood) red colour is obtained	Fe^{3+} confirmed

Reactions Involved in the Test of Cation Fe^{3+}

1. $$Fe(OH)_3 + \underset{\text{reddish brown ppt}}{3HCl} \longrightarrow \underset{\text{soluble}}{FeCl_3} + 3H_2O$$

2. $$4FeCl_3 + 3K_4[Fe(CN)_6] \longrightarrow \underset{\text{dark blue colour}}{Fe_4[Fe(CN)_6]_3} + 12KCl$$

3. $$FeCl_3 + \underset{\substack{\text{potassium}\\ \text{sulphocyanide}}}{KCNS} \longrightarrow \underset{\text{blood red colour}}{[Fe(CNS)]Cl_2} + KCl$$

Analysis of Group IV Cations

Add NH_4OH to the filtrate of group III and pass H_2S. In alkaline medium, H_2S is highly ionised so, concentration of S^{2-} is high. Due to this, group IV cations are precipitated as sulphides (ZnS, MnS, CoS and NiS).

Table 16.21 **Tests for Nickel**

S.N.	Experiment	Observation	Inference
1.	Dissolve black ppt of NiS in aquaregia (3 part conc. HCl + 1 part conc. HNO_3) and divide it into two parts.	Soluble chloride is formed	It indicates the presence of Ni^{2+}
(i)	Add NH_4OH and dimethyl glyoxime to the solution	Cherry red ppt.	Ni^{2+} confirms
(ii)	Add sodium bicarbonate and heat and add $NaOH/Br_2$ water and again heat.	Black ppt is obtained	Ni^{2+} confirms

Reactions Involved in the Test of Cation Ni^{2+}

1. $3NiS + \underbrace{6HCl + 2HNO_3}_{\text{aquaregia}} \longrightarrow 3NiCl_2 + 2NO + 3S + 4H_2O$

2. 
cherry red ppt.
(dimethyl glyoximate)

3. $NiCl_2 + 2NaHCO_3 \xrightarrow{\Delta} NiCO_3 + 2NaCl + H_2O + CO_2$

$$2NiCO_3 + 4NaOH + O(Br_2\ \text{water}) \xrightarrow{\Delta} \underset{\text{black ppt.}}{Ni_2O_3\downarrow} + 2Na_2CO_3 + 2H_2O$$

Table 16.22 **Tests for Zinc**

S.N.	Experiment	Observation	Inference
1.	Dissolve white ppt. of ZnS in dil. HCl and divide it into two parts.	Soluble chloride is formed.	It indicates the presence of Zn^{2+}.
(i)	Add NaOH in the solution. White ppt is obtained which is soluble in excess of NaOH.	White ppt. of ZnS reappears on passing H_2S into soluble sodium zincate solution	Zn^{2+} confirmed
(ii)	Solution is acidified with acetic acid and add $K_4[Fe(CN)_6]$	Bluish white ppt. is obtained	Zn^{2+} confirmed

Reactions Involved in the Test of Cation Zn^{2+}

1. $ZnS + 2HCl \longrightarrow ZnCl_2 + H_2S$
2. $ZnCl_2 + 2NaOH \longrightarrow \underset{\text{white ppt}}{Zn(OH)_2\downarrow} + 2NaCl$

$$Zn(OH)_2 + 2NaOH \longrightarrow \underset{\substack{\text{sodium zincate}\\ \text{(soluble)}}}{Na_2ZnO_2} + 2H_2O$$

$$Na_2ZnO_2 + H_2S \longrightarrow 2NaOH + \underset{\text{white ppt.}}{ZnS\downarrow}$$

3. $2ZnCl_2 + K_4[Fe(CN)_6] \longrightarrow \underset{\text{bluish white ppt.}}{Zn_2[Fe(CN)_6]\downarrow} + 4KCl$

Analysis of Group V Cations

Boil off H_2S from the filtrate of group IV and add NH_4OH and $(NH_4)_2CO_3$. Formation of white ppt. indicates the presence of group V cations. Group V cations are precipitated as their carbonates. ($CaCO_3$, $BaCO_3$ and $SrCO_3$).

Table 16.23 **Tests for Barium**

Experiment	Observation	Inference
Dissolve the ppt in acetic acid, and heat gently and add potassium chromate solution and again heat	Yellow ppt appears	Ba^{2+} confirmed

Reactions Involved in the Test of Cation Ba^{2+}

$$\underset{\text{white ppt.}}{BaCO_3} + 2CH_3COOH \xrightarrow{\Delta} (CH_3COO)_2Ba + H_2O + CO_2$$

$$(CH_3COO)_2Ba + K_2CrO_4 \longrightarrow \underset{\text{yellow ppt.}}{BaCrO_4 \downarrow} + 2CH_3COOK$$

Table 16.24 **Tests for Calcium**

S.N.	Experiment	Observation	Inference
1.	Dissolve the ppt. in acetic acid ,add ammonium oxalate solution (excess) and heat.	White ppt. appears	Ca^{2+} confirmed
2.	Acidified white ppt. obtained above by adding dilute CH_3COOH and add $KMnO_4$ solution drop wise and HCl	Pink colour of $KMnO_4$ disappears	Ca^{2+} confirmed

Reactions Involved in The Test of Cation Ca^{2+}

1.

$$\underset{\text{white ppt}}{CaCO_3} + 2CH_3COOH \xrightarrow{\Delta} (CH_3COO)_2Ca + H_2O + CO_2$$

$$(CH_3COO)_2Ca + (NH_4)_2C_2O_4 \longrightarrow \underset{\text{white ppt}}{CaC_2O_4 \downarrow} + 2CH_3COONH_4$$

$$5CaC_2O_4 + \underset{\text{pink}}{2KMnO_4} + 16HCl \longrightarrow 5CaCl_2 + \underset{\text{colourless}}{2MnCl_2} + 10CO_2 + 8H_2O + 2KCl$$

Analysis of Group VI Cation

Table 16.25 **Tests for Ammonium**

Experiment	Observation	Inference
Filtrate of group V is heated with NH_4OH and Na_2HPO_4	A fine crystalline ppt on scratching the side of the test tube.	Mg^{2+} confirmed

Reactions Involve in the Test of Cation Mg^{2+}

$$MgCl_2 + \underset{\substack{\text{disodium}\\\text{hydrogen}\\\text{phosphate}}}{Na_2HPO_4} + NH_4OH \longrightarrow \underset{\substack{\text{magnesium ammonium}\\\text{phosphate (white ppt)}}}{Mg(NH_4)PO_4} + 2NaCl + H_2O$$

Analysis of Zero Group Cation, NH_4^+

Ammonium salts are decomposed by alkali and NH_3 is liberated which can be identified by a number of methods.

Table 16.26 **Tests for Ammonium**

S.N.	Experiment	Observation	Inference
1.	Small amount of mixture is taken in the test tube and heat it with NaOH solution.	Smell of ammonia	NH_4^+ confirmed
2.	On bringing the moisted glass rod with conc. HCl near the mouth of the test tube.	White fumes are formed	NH_4^+ confirmed
3.	Take small amount of salt in the test tube and add NaOH and heat. Add Nessler's reagent to the solution.	Brown ppt is obtained	NH_4^+ confirmed

Reactions Involved in the Tests of Cation NH_4^+

1. $\underset{\text{from mixture}}{NH_4Cl} + NaOH \xrightarrow{\Delta} NH_3(g) + NaCl + H_2O$
2. $NH_3(g) + HCl \longrightarrow \underset{\text{white fumes}}{NH_4Cl}$
3. $NH_3 + 3\,NaOH + \underset{\text{Nessler's reagent}}{2K_2HgI_4} \longrightarrow$ 
iodide of Millon's base (brown ppt)

$+ 4KI + 3NaI + 2H_2O$

Check Point 4

1. Chromyl chloride test for chlorides is not performed if mixture contains chlorates, why?
2. Both NO_2 and Br_2 are brown gas. How can they be identified if placed separately in two containers?
3. Why a salt containing lead turns black in colour, when placed for a long time in laboratory?
4. Why original solution is not prepared in conc HNO_3?
5. Hydrochloric acid contains Cl^- ions but it does not give positive chromyl chloride test, why?

   Hint Because in the presence of water, chromic acid is formed in place of chromyl chloride.

   $$K_2Cr_2O_7 + 2HCl + H_2O \longrightarrow 2H_2CrO_4 + 2KCl$$

16.4 Chemical Principles Involved in Some Experiments

Enthalpy of Solution of Copper Sulphate

Enthalpy of solution of a substance is defined as the change in heat enthalpy when 1 mole of a substance is dissolved in excess of water, so that further dilution does not involve any heat change. Enthalpy of solution of copper sulphate is determined by dissolving a known amount of salt in a measured volume of water in a calorimeter. The rise or fall in temperature is recorded as Δt. ΔH is calculated by using the following formula.

$$\Delta H = \frac{(W - w) \times \Delta t \times M}{m}$$

where, W = water equivalent of calorimeter
w = mass of water taken
M = molar mass of solute
m = mass of solute

$$\Delta t = t_{\text{final}} - t_{\text{initial}}$$

The dissolution of solute in a solvent is exothermic or endothermic depending upon the nature of solute. If heat is absorbed, enthalpy changes comes with **positive sign** and if heat is evolved, enthalpy changes comes with negative sign

$$\Delta H_{\text{solution}} = \Delta H_{\text{ionisation}} + \Delta H_{\text{hydration}}$$

Enthalpy of Neutralisation of Strong Acid and Strong Base

(See chapter 5 XI chemical Thermodynamics)

Preparation of Lyophilic and Lyophobic Sol

(See chapter 5 XII Surface chemistry)

Kinetic Study of Reaction of Iodide ion with Hydrogen Peroxide at Room Temperature

In acidic medium, iodide ions are oxidised to I_2 by H_2O_2. The reaction is studied by adding a known amount of sodium thiosulphate solution and a little of strach solution to the reaction mixture. The addition of thiosulphate ions $(S_2O_3^{2-})$ allows an accurate measurement of the rate at which the peroxide iodide reaction is taking place. Iodine which is liberated after the oxidation of iodide ions reacts immediately with thiosulphate ions.

(i) $H_2O_2 + 2I^- + 2H^+ \longrightarrow 2H_2O + I_2$

(ii) $I_2 + \underset{\substack{\text{thiosulphate}\\\text{colourless}}}{2S_2O_3^{2-}} \longrightarrow 2I^- + \underset{\substack{\text{dithionate}\\\text{colourless}}}{S_4O_6^{2-}}$

As long as the excess thiosulphate ions are present in the solution, no free iodine can accumulate because it is immediately turned into iodide ions which are colourless. Here thiosulphate ions are limiting reagent. So once all the thiosulphate ions are consumed, iodine starts to form in the solution, it reacts with starch to give blue colour.

Rate of reaction is compared by taking various concentration of iodide ions and time taken from the blue colour to appear.

Check Point 5

1. Lyophilic sols are more stable than lyophobic colloids why?
2. Why heat of solutions of electrolytes are sometimes positive and sometime negative?
3. Heat of neutralization of HF is much higher than that of strong acid and strong base. Explain.

WORKED **OUT** *Examples*

Example 1 *For the given aqueous reaction which of the statement(s) is false?*

$$KI + K_3[Fe(CN)_6] \xrightarrow{\text{dil. } H_2SO_4} \textit{brownish yellow solution.}$$

$$\downarrow ZnSO_4$$

$$\text{Colourless solution} \longleftarrow \textit{(White ppt. + brownish yellow filtrate)}$$

$$\downarrow$$

(a) *The first reaction is redox reaction*
(b) *White ppt. is* $Zn_3[Fe(CN)_6]_2$
(c) *Addition of filtrate to starch solution gives blue colour*
(d) *White ppt. is soluble in* NaOH *solution*

Solution (*b*)

$$K_3[\overset{+3}{Fe}(CN)_6] + \overset{-1}{KI}\text{(excess)} \longrightarrow K_4[\overset{+2}{Fe}(CN_6] + \underset{\substack{\text{brownish yellow}\\ \text{solution}}}{\overset{-1,0}{KI_3}}$$

(redox)

$$K_4[Fe(CN)_6] + ZnSO_4 \longrightarrow \underset{\text{white ppt}}{K_2Zn[Fe(CN)_6]}$$

$$\underset{\substack{\text{brownish}\\ \text{yellow}\\ \text{filtrate}}}{I_3^-} + 2Na_2S_2O_3 \longrightarrow \underset{\text{clear solution}}{Na_2S_4O_6} + 2NaI + \underset{\substack{\text{turns starch}\\ \text{solution blue}}}{I_2}$$

$K_2Zn[Fe(CN)_6]$ reacts with NaOH as

$$K_2Zn[Fe(CN)_6] + 4NaOH \longrightarrow [Zn(OH)_4]^{2-} + [Fe(CN)_6]^{4-}$$

Example 2 *An organic compound 'A' burns with a sooty flame. It is negative towards Tollen's reagent test and positive for Brady's reagent test. The compound 'A' is*

(a) *acetophenone*
(b) *acetone*
(c) *salicylic acid*
(d) *benzaldehyde*

Solution (*a*) Since, given compound '*A*' burns with flame therefore it must be aromatic compound. Again when it reacts with Brady's reagent (acidic 2, 4-dinitrophenyl hydrazine solution), it yields orange precipitate. Therefore, it must be aldehyde or ketone. But ketone does not perform Tollen's reagent test therefore, it must be a ketone. Hence, '*A*' is acetophenone.

Example 3 *A white crystalline salt 'A' reacts with dilute* HCl *to liberate a suffocating gas 'B' and also forms a yellow precipitate. The gas 'B' turns potassium dichromate acidified with dilute* H_2SO_4 *to a green coloured solution 'C'. A, B and C are respectively*

(a) Na_2SO_3, SO_2, $Cr_2(SO_4)_3$ (b) Na_2S, SO_2, $Cr_2(SO_4)_3$
(c) $Na_2S_2O_3$, SO_2, $Cr_2(SO_4)_3$ (d) Na_2SO_4, SO_2, $Cr_2(SO_4)_3$

Solution (*c*) Gas '*B*' turns the colour of acidified $K_2Cr_2O_7$ green thus it is SO_2 and SO_2 is obtained along with yellow precipitate of S when thiosulphate is treated with dilute acids. Thus, *A* is $Na_2S_2O_3$, *B* is SO_2 and *C* is $Cr_2(SO_4)_3$.

Example 4 $CuSO_4$ *decolourises on addition of* KCN, *the product is*

(a) $[Cu(CN)_4]^{2-}$ (*b*) $[Cu(CN)_4]^{3-}$
(c) $Cu(CN)_2$ (*d*) CuCN

Solution (*b*) $CuSO_4$ decolourises on addition of KCN. The product is CuCN along with $(CN)_2$ but in excess of KCN, colourless potassium tetracyanocuperate (I). is obtained.

$$CuSO_4 + 2KCN \longrightarrow Cu(CN)_2 + [K_2SO_4] \times 2$$

$$\underset{\text{unstable}}{2Cu(CN)_2} \rightleftharpoons 2CuCN + \underset{\text{cyanogen}}{(CN)_2}$$

$$CuCN + 3KCN \rightleftharpoons \underset{\text{colourless}}{K_3[Cu(CN)_4]}$$

Example 5 *The mass of potassium dichromate crystals required to oxidise 750* cm^3 *of 0.6 M Mohr's salt solution is (Given, molar mass; potassium dichromate = 294, Mohr's salt = 392)*

(a) 0.49 g (*b*) 0.45 g (*c*) 22.05 g (*d*) 2.2 g

Solution (*c*)

$$\underset{\text{from Mohr's salt}}{Fe^{2+}} \longrightarrow Fe^{3+} + e^-] \times 6$$

$$Cr_2O_7^{2-} + 14H^+ + 6e^- \longrightarrow 2Cr^{3+} + 7H_2O$$

$$6Fe^{2+} + Cr_2O_7^{2-} + 14H^+ \longrightarrow 6Fe^{3+} + 2Cr^{3+} + 7H_2O$$

$$\text{Millimoles of } Fe^{2+} = 750 \times 0.6 = 450$$

$$\text{Moles of } Fe^{2+} = \frac{450}{1000} = 0.450 = 0.450 \text{ mol}$$

$$6 \text{ mol } Fe^{2+} \equiv 1 \text{ mol } Cr_2O_7^{2-}$$

$$\therefore \quad 0.450 \text{ mol } Fe^{2+} = \frac{0.450}{6} = 0.075 \text{ mol } Cr_2O_7^{2-}$$

$$= 0.075 \times 294 \text{ g} = 22.05 \text{ g}$$

Round I (Topically Divided Problems)

Qualitative Organic Analysis

1. In organic analysis, the reagent 2, 4-dinitrophenyl hydrazine is used for the detection of which of the following functional groups?

(a) Alcohol (b) Acid

(c) Aldehyde (d) Amines

2. An organic compound gave positive iodoform and Tollen's tests. The organic compound is

(a) CH_3CH_2OH (b) $CH_3CH_2CH_2CHO$

(c) CH_3CHO (d) CH_3COCH_3

3. A compound liberates CO_2 with $NaHCO_3$ and also gives colour with neutral $FeCl_3$ solution. The compound can be

(a) 
(b) 
(c) 
(d) 
Chemistry Involved in the Preparation of Compounds

4. During the preparation of acetanilide from aniline a small amount of zinc is added to the reaction mixture because

(a) zinc induces the precipitation

(b) zinc prevents the reduction of aniline during the reaction

(c) zinc reduces the coloured impurities in the aniline and also prevents its oxidation during the reaction

(d) zinc forms a white crystalline complex with aniline

5. In the preparation of *p*-nitro acetanilide from aniline, nitration is not done by nitrating mixture (a mixture of conc H_2SO_4 and conc HNO_3) because

(a)on nitration it gives *o*-nitroacetanilide

(b) it gives a mixture of *o*-and *p*-nitroaniline

(c) —NH_2 group gets oxidised

(d) it forms a mixture of *o*-and *p*-nitro acetanilide

6. Which of the following compounds cannot used in preparation of iodoform?

(a) CH_3CHO (b) CH_3COCH_3

(c) HCHO (d) 2-propanol

7. Which of the following statement is wrong about aniline yellow?

(a) It is carcinogenic

(b) It is also called *p*-aminoazobenzene

(c) It is an acid dye

(d) It is also called 4-phenylazoaniline

8. Which of the following substances is not used in the preparation of Mohr's salt?

(a) Ferrous sulphate (b) Ammonium sulphate

(c) Dil. sulphuric acid (d) All are used

Chemistry Involved in the Titrimetric Exercises

9. Phenolphthalein is an indicator for acid-base titration, it exists as

(a) benzenoid form in acid and quinonoid form in basic solution

(b) quinonoid form in acid and benzenoid form in basic solution

(c) quinonoid form in both

(d) benzenoid form in both

10. In the titration of oxalic acid *vs* potassium permanganate, potassium permanganate acts as

(a) external indicator (b) self indicator

(c) reductant (d) Both (b) and (c)

11. In the reaction of $KMnO_4$ with an oxalate in acidic medium, MnO_4^- is reduced to Mn^{2+} and $C_2O_4^{2-}$ is oxidised to CO_2 · Hence, 50 mL of 0.04 M $KMnO_4$ is equivalent to

(a) 100 mL of 0.1 M $H_2C_2O_4$
(b) 50 mL of 0.2 M $H_2C_2O_4$
(c) 50 mL of 0.1 M $H_2C_2O_4$
(d) 25 mL of 0.1 $H_2C_2O_4$

12. For preparing 250 mL of N/20 solution of Mohr's salt, the amount of Mohr's salt needed is

(a) 9.8 g (b) 4.9 g (c) 19.6 g (d) 3.2 g

13. 0.5 g mixture of $K_2Cr_2O_7$ and $KMnO_4$ was treated with excess of KI in acidic medium. I_2 liberated required 100 cm^3 of 0.15 N $Na_2S_2O_3$ solution for titration. The percentage amount of $K_2Cr_2O_7$ in the mixture is

(a) 85.36% (b) 14.64%
(c) 58.63% (d) 26.14%

14. Which of the following will oxidise 126 g of oxalic acid ($H_2C_2O_4 \cdot 2H_2O$) in acidic medium?

(a) 1/3 mole of $K_2Cr_2O_7$ (b) 2 mole of $K_2Cr_2O_7$
(c) 1/3 mole of $KMnO_4$ (d) 5/2 mole of $KMnO_4$

15. The titration of Mohr's salt *vs* $KMnO_4$ is an example of redox titration. In this titration, $KMnO_4$ oxidises only ferrous salt to the ferric salt (no effect on other ions) but we can not use ferrous sulphate in place of Mohr's salt because

(a) it is less stable than Mohr's salt
(b) in air it is oxidised to ferric sulphate
(c) in air it loses water of crystallisation
(d) All of the above

16. 3.92 g of ferrous ammonium sulphate (Mohr's salt) react completely with 50 mL $\frac{N}{10}$ $KMnO_4$ solution. The percentage purity of the sample is

(a) 50 (b) 78.4 (c) 80 (d) 39.2

17. Which of the following statements is not true?

(a) An acidified solution of $K_2Cr_2O_7$ liberates iodine from iodides
(b) In acidic solution, dichromate ions are converted to chromate ions
(c) $(NH_4)_2Cr_2O_7$ on heating undergo exothermic decomposition to give Cr_2O_3
(d) Potassium dichromate is used as a titrant for estimation of Fe^{2+} ions

18. An aqueous solution of 6.3 g oxalic acid dihydrate is made up to 250 mL. The volume of 0.1 N NaOH required to completely neutralize 10 mL of this solution is

(a) 40 mL (b) 20 mL (c) 10 mL (d) 4 mL

Chemical Principles Involved in the Qualitative Salt Analysis

19. Which statement is correct?

(a) Fe^{2+} gives brown colour with ammonium thiocyanate
(b) Fe^{2+} gives blue precipitate with potassium ferricyanide
(c) Fe^{3+} gives brown colour with potassium ferricyanide
(d) Fe^{3+} gives red colour with potassium ferrocyanide

20. An aqueous solution of colourless metal sulphate *M* gives a white precipitate with NH_4OH. This was soluble in excess of NH_4OH. On passing H_2S through this solution a white ppt is formed. The metal *M* in the salt is

(a) Ca (b) Ba (c) Al (d) Zn

21. A white sodium salt dissolves readily in water to give a solution which is neutral to litmus. When silver nitrate solution is added to the solution, a white precipitate is obtained which does not dissolve in dill HNO_3. The anion could be

(a) CO_3^{2-} (b) Cl^- (c) SO_4^{2-} (d) S^{2-}

22. A laboratory reagent imparts green colour to the flame. On heating with solid $K_2Cr_2O_7$ and conc H_2SO_4, it evolves a orange red gas. Identify the reagent.

(a) $CaCl_2$ (b) $BaCl_2$
(c) $CuCl_2$ (d) None of these

23. Which reagent can be used to identify nickel ion?

(a) Resorcinol (b) Dimethyl glyoxime
(c) Diphenyl benzidine (d) Potassium ferrocyanide

24. Which of the following reagents can be used to distinguish between sodium carbonate and sodium sulphite?

(a) Lime water
(b) Baryta water
(c) Acidified $K_2Cr_2O_7$ solution
(d) H_2SO_4 solution

25. The gas liberated on treating a mixture of two salts with dil H_2SO_4 turns lime water milky and turbidity disappears with the passage of excess of gas. The aqueous solution of mixture gives white crystalline ppt with NaCl solution. The filtrate gives a black precipitate, when H_2S is passed into it. The aqueous solution of mixture on heating gives reddish brown gas and when treated with ammonium hydroxide and excess of disodium hydrogen phosphate gives a white crystalline precipitate. The mixture contains

(a) CO_3^{2-}, Pb^{2+}, NO_3^{2-}, Mg^{2+} (b) CO_3^{2-}, Pb^{2+}, NO_3^{2-}, Ca^{2+}
(c) CO_3^{2-}, Pb^{2+}, Cl^-, Mg^{2+} (d) CO_3^{2-}, Pb^{2+}, Cl^-, Ca^{2+}

Chemical Principles Involved in Some Experiments

26. Four samples of acids and bases are taken for an experiment

(1) 100 mL of 1 M NaOH and 100 mL of 1 M HCl

(2) 100 mL of 2 M KOH and 100 mL of 1 M H_2SO_4

(3) 100 mL of 1 M CH_3COOH and 100 mL of 1 M NaOH

(4) 100 mL of 0.5 M KOH and 100 mL of 0.5 M HNO_3

Now for each sample enthalpy of neutralisation is calculated. Now the result shows that

(a) enthalpy of neutralisation calculated in each case is found same

(b) in case (1) and (4), the value of enthalpy of neutralisation is same

(c) in case (1) and (2) and (4) the value of enthalpy calculated is same

(d) the value of enthalpy calculated is different for each sample

27. During the preparation of egg albumin sol (lyophilic sol), water taken should be cold because

(a) in cold water precipitation of egg albumin takes place which helps in preparation of sol

(b) in cold water precipitation of egg albumin does not take place

(c) in cold water egg albumin mix well whereas yolk get separated

(d) cold water is purest form of water

28. In the kinetic study of reaction of iodide ion with hydrogen peroxide, a known volume of sodium thiosulphate solution is added to

(a) oxidise iodide ion to iodine

(b) reduce iodine to iodide ion

(c) form a soluble blue complex

(d) induce the reaction rate

29. Which of the following pairs has heat of neutralisation equal to 13.7 kcals?

(a) HCl, NH_4OH (b) HNO_3, KOH

(c) NaOH, CH_3COOH (d) H_2SO_4, NH_4OH

30. One desires to prepare a positively charged sol of silver iodide. This can be achieved by

(a) adding a little $AgNO_3$ solution to KI solution in slight excess

(b) adding a little KI solution to $AgNO_3$ solution in slight excess

(c) mixing equal volumes of equimolar solutions of $AgNO_3$ and KI

(d) None of the above

31. Leveling bulb is used during experiment to study kinetics of the dissociation of hydrogen peroxide to ensure

(a) uniform pressure difference between the room and the gases in the system

(b) pressure within the reaction vessel is same as that in the room

(c) same temperature as that of room

(d) None of the above

32. The enthalpy of neutralisation of weak acid in 1 M solution with a strong base is -56.1 kJ mol^{-1}. If the enthalpy of ionisation of acid is 1.5 kJ mol^{-1} and enthalpy of neutralisation of the strong acid with a strong base is -57.3 kJ eq^{-1}, what is the percentage ionisation of the weak acid in molar solution (assume the acid is monobasic)?

(a) 25 (b) 20 (c) 15 (d) 10

33. In case of weak acid and strong base, the heat of neutralisation is less than 13.7 kcal because some part of heat is utilized in

(a) dissociation of base

(b) association of base

(c) dissociation of acid

(d) association of acid

34. The methods used for the preparation of lyophilic and lyophobic sols are respectively

(a) oxidation and reduction

(b) dissolution in water and peptisation

(c) peptisation and oxidation

(d) All of the above

Round II (Mixed Bag)

Only One Correct Option

1. How H_2S is liberated in laboratory?

(a) $FeSO_4 + H_2SO_4$

(b) FeS + dil H_2SO_4

(c) FeS + conc. H_2SO_4

(d) Elementary H_2 + elementary S

2. On addition of conc. H_2SO_4 to a chloride salt, colourless fumes are evolved but in case of iodide salt, violet fumes come out. This is because **[NCERT Exemplar]**

(a) H_2SO_4 reduces HI to I_2

(b) HI is of violet colour

(c) HI gets oxidised to I_2

(d) HI changes to HIO_3

3. A brown ring is formed in the ring tests for NO_3^- ion. It is due to the formation of **[NCERT Exemplar]**

(a) $[Fe(H_2O)_5(NO)]^{2+}$ (b) $FeSO_4 \cdot NO_2$

(c) $[Fe(H_2O)_4(NO_2)]^{2+}$ (d) $FeSO_4 \cdot HNO_3$

4. In qualitative analysis when H_2S is passed through an aqueous solution of salt acidified with dilute HCl, a black ppt. is obtained. On boiling the precipitate with dil. HNO_3, it forms a solution of blue colour. Addition of excess of aq. solution of NH_3 to this solution gives **[NCERT Exemplar]**

(a) deep blue ppt. of $Cu(OH)_2$

(b) deep blue solution of $[Cu(NH_3)_4]^{2+}$

(c) deep blue solution of $Cu(NO_3)_2$

(d) deep blue solution of $Cu(OH)_2 \cdot Cu(NO_3)_2$

5. When $KMnO_4$ solution is added to oxalic acid solution, the decolourisation is slow in the beginning but becomes instantaneous after sometime because **[NCERT Exemplar]**

(a) CO_2 is formed as the products

(b) reaction is exothermic

(c) MnO_4^- catalyses the reaction

(d) Mn^{2+} acts as auto catalyst

6. Why is HCl not used to make the medium acidic in oxidation reaction of $KMnO_4$ in acidic medium? **[NCERT Exemplar]**

(a) Both HCl and $KMnO_4$ act as oxidising agent

(b) $KMnO_4$ oxidises HCl into Cl_2 which is also an oxidising agent

(c) $KMnO_4$ is a weaker oxidising agent than HCl

(d) $KMnO_4$ acts as a reducing agent in the presence of HCl

7. The reagent which does not react with both, acetone and benzaldehyde is **[NCERT Exemplar]**

(a) sodium hydrogen sulphite

(b) phenyl hydrazine

(c) Fehling's solution

(d) Grignard reagent

8. Which of the following will give blood red colour with $FeCl_3$ in sodium extract?

(a) NH_2CONH_2 (b) NH_2CSNH_2

(c) $C_2H_5NHNH_2$ (d) $CH_3C \equiv N$

9. Sodium nitroprusside, $Na_2[Fe(CN)_5NO]$ is used as a reagent for detection of —and the compound formed is

(a) sulphur, $Na_4[Fe(CN)_5NOS]$

(b) nitrogen, $Na_4[Fe(CN)_6]$

(c) sulphur, $Na_2[Fe(CN_4)NOS]$

(d) sulphur, $Na_2[Fe(CN)NOS]$

10. Detection of chlorine is possible without preparing sodium extract in

(a) 
(b) $CHCl_3$

(c) 
(d) $CH_2{=}CH{-}CH_2Cl$

11. In Nessler's reagent for the detection of ammonia the active species is

(a) Hg_2Cl_2 (b) Mg^{2+} (c) Hg_2I_2 (d) HgI_4^{2-}

12. Nessler's reagent is used to detect

(a) CrO_4^{2-} (b) PO_4^{3-} (c) MnO_4^- (d) NH_4^+

13. 100 mL of HCl + 35 mL of NaOH, colour of methyl orange in the solution will be

(a) red

(b) yellow

(c) can't be predicted

(d) methyl orange is not suitable indicator.

14. Titration of 0.1467 g of primary standard $Na_2C_2O_4$ required 28.85 mL of $KMnO_4$ solution. Calculate the molar concentration of $KMnO_4$ solution.

(a) 0.01518 M (b) 0.001518 M

(c) 0.15180 M (d) 1.5180 M

15. Volume of 0.02 M MnO_4^- solution required to oxidise 40.0 mL of 0.1 M Fe^{2+} solution is

(a) 200 mL (b) 100 mL (c) 40 mL (d) 20 mL

More than One Correct Option

16. 1 g equivalent of a substance is the weight of that amount of a substance which is equivalent to

(a) 0.25 mol O_2 (b) 8 g O_2

(c) 16 g O_2 (d) 0.50 mol O_2

17. Phenol can be distinguished from ethanol by the reactions with **[NCERT Exemplar]**

(a) Br_2/water (b) Na

(c) neutral $FeCl_3$ (d) All of these

18. $K_4[Fe(CN)_6]$ can be used to test

(a) Fe^{3+} (b) Zn^{2+}

(c) Cd^{2+} (d) Cr^{3+}

19. Compound '*A*' reacts with $CHCl_3$ and KOH gives offensive smelling compound. Compound '*A*' can be

(a) primary aliphatic amine

(b) primary aromatic amine

(c) secondary amine

(d) tertiary amine

20. Which of the following compounds may give blood red colouration while performing Lassaigne's test for nitrogen

(a) $(NH_2)_2C=O$

(b) $(NH_2)_2C=S$

(c) p—$NH_2C_6H_4SO_3H$

(d) $C_6H_5SO_3H$

Assertion and Reason

Directions (Q. Nos. 21 to 25) *Each of these questions contains two statements. Statement I (Assertion) and statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c), (d) given below* :

(a) Statement I is true, statement II is true ; statement II is a correct explanation for statement I

(b) Statement I is true, statement II is true, statement II is not a correct explanation for statement I.

(c) Statement I is true ; statement II is false

(d) Statement I is false ; statement II is true

21. Statement I $PbCl_2$ and Hg_2Cl_2 precipitates can be separated by hot water.

Statement II Hg_2Cl_2 is blackened by aq. NH_3.

22. Statement I Sodium carbonate extract of a salt containing sulphide gives a violet colour with appropriate reagent.

Statement II The appropriate reagent sodium nitroprusside gives violet colour due to the formation of sodium thionitroprusside.

23. Statement I Aldehydes and ketones both react with Tollen's reagent to form silver mirror.

Statement II Both aldehydes and ketones contain a carbonyl group. [**NCERT** Exemplar]

24. Statement I Coloured cations can be identified by borax bead test.

Statement II Transparent bead $(NaBO_2 + B_2O_3)$ forms coloured bead with coloured cation.

25. Statement I Phenolic compounds give characteristic colour with neutral $FeCl_3$ ·

Statement II It is the property of all the enolic compounds.

Comprehension Based Questions

Directions (Q. Nos. 26 to 28) p-amino-N, N-dimethyl aniline is added to a strongly acidic solution of X. The resulting solution is treated with a few drops of aqueous solution of Y to yield blue colouration due to the formation of an intense blue precipitate. The precipitate dissolves in excess of reagent. Similarly, treatment of the solution of Y with the solution of potassium hexacyanoferrate (III) leads to a brown colouration due to the formation of Z.

26. The compound X is

(a) $NaNO_3$ (b) $NaCl$

(c) Na_2SO_4 (d) Na_2S

27. The compound Y is

(a) $MgCl_2$ (b) $FeCl_2$

(c) $FeCl_3$ (d) $ZnCl_2$

28. The compound Z is

(a) $Mg_2[Fe(CN)_6]$ (b) $Fe[Fe(CN)_6]$

(c) $Fe_4[Fe(CN)_6]_3$ (d) $K_2Zn_3[Fe(CN)_6]_2$

Directions (Q. Nos. 29 to 31) Both $Cr_2O_7^-(aq)$ and $MnO_4^-(aq)$ can be used to titrate $Fe^{2+}(aq)$. You have been provided with 0.1 M solution of each and volumetric estimation is carried in acidic medium. Suppose for the given volume of Fe^{2+} solution,

V_1 = volume of MnO_4^-, V_2 = volume of $Cr_2O_7^{2-}$ required in the oxidation to Fe^{3+}

29. Select the correct alternate ; Fe^{2+} is equivalent to

(a) $\frac{1}{5}$ mol of MnO_4^-

(b) $\frac{1}{6}$ mol of $Cr_2O_7^{2-}$

(c) 1 equivalent each of MnO_4^- and $Cr_2O_7^{2-}$

(d) All of the above

30. Select the correct relation between V_1 and V_2 , if Fe^{2+} is 1M.

(a) $V_1 = V_2$

(b) $V_1 > V_2$

(c) $V_1 < V_2$

(d) nothing can be predicted

31. 24.50 mL of 0.1 M $Cr_2O_7^{2-}$ is required in the oxidation of given volume of 0.1 M Fe^{2+}. 0.1 M MnO_4^- required will be

(a) 29.40 mL (b) 24.50 mL

(c) 20.42 mL (d) 20.10 mL

Previous Years' Questions

32. The compound formed in the positive test for nitrogen with the Lassaigne solution of an organic compound is [AIEEE 2004]

(a) $Fe_4[Fe(CN)_6]_3$ (b) $Na_3[Fe(CN)_6]$
(c) $Fe(CN)_3$ (d) $Na_4[Fe(CN)_5NOS]$

33. If Fe^{3+} and Cr^{3+} both are present in group III of qualitative analysis, then distinction can be made by [AIEEE 2002]

(a) addition of NH_4OH in the presence of NH_4Cl when only $Fe(OH)_3$ is precipitated
(b) addition of NH_4OH in the presence of NH_4Cl when $Cr(OH)_3$ and $Fe(OH)_3$ both are precipitated and on adding Br_2 water and NaOH, $Cr(OH)_3$ dissolves
(c) precipitate of $Cr(OH)_3$ and $Fe(OH)_3$ as obtained in (b) are treated with conc HCl when only $Fe(OH)_3$ dissolves
(d) Both (b) and (c)

Answers

Round I

1. (c)	**2.** (c)	**3.** (b)	**4.** (c)	**5.** (c)	**6.** (c)	**7.** (c)	**8.** (d)	**9.** (a)	**10.** (b)

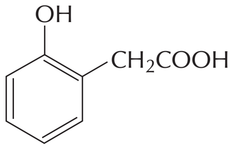
the Guidance

Round I

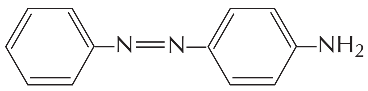
2. The compound which contains —CHO group, gives positive Tollen's test and the compound with  $CH_3-\underset{\underset{O}{\|}}{C}-$ group gives positive iodoform test. Thus, the structure of the compound should be  $CH_3-\underset{\underset{H}{|}}{C}=O$

3. The compound liberates CO_2 with $NaHCO_3$, so it contains —COOH group and it also gives colour with neutral $FeCl_3$ solution, so it also contains a —OH group directly attached to the benzene ring (*i.e*, phenol). Hence, the structure of the compound is



6. Formaldehyde cannot produce iodoform, as only those compound which contains either  $CH_3-\underset{\underset{OH}{|}}{CH}-$ group or  $CH_3-\underset{\underset{O}{\|}}{C}-$ group on reaction with iodine and sodium hydroxide (alkali) yield iodoform.

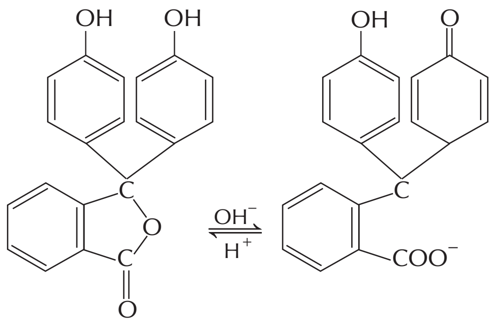
7.



aniline yellow
(*p*-amino azobenzene or 4-phenyl azoaniline)

It is a carcinogenic compound and a basic dye.

9. Phenolphthalein is colourless in acid solution (benzenoid form) and pink in alkali (basic) solution (quinonoid form).



colourless (acid medium)
benzenoid form

red (alkaline medium)
quinonoid form

10. In the titation of oxalic acid *vs* $KMnO_4$, $KMnO_4$ acts as a oxidant as well as a self indicator.

$$2KMnO_4 + 3H_2SO_4 \longrightarrow K_2SO_4 + 2MnSO_4 + 3H_2O + 5[O]$$

$$5\begin{vmatrix} COOH \\ COOH \end{vmatrix} + 5[O] \longrightarrow 5H_2O + 10CO_2 \uparrow$$

11. Equivalent mass of $MnO_4^- = \dfrac{\text{molar mass}}{7-2} = \dfrac{\text{molar mass}}{5}$.

Equivalent mass of $C_2O_4^{2-} = \dfrac{\text{molar mass}}{2(4-3)} = \dfrac{\text{molar mass}}{2}$

Milliequivalent of $KMnO_4 = 50 \times 5 \times 0.04 = 10 =$ M eq. of $H_2C_2O_4 = 50 \times 2 \times 0.1 = 10$.

13. Let the amount of $K_2Cr_2O_7$ in the mixture be $x\ g$, then amount of $KMnO_4$ will be $(0.5 - x)g$

$$\therefore \quad \left(\frac{x}{49} + \frac{0.5 - x}{31.6}\right) = \frac{100 \times 0.15}{1000}$$

where, 49 is eq. wt. of $K_2Cr_2O_7$ and 3.16 is equivalent wt. of $KMnO_4$ on solving we get $x = 0.0732$ g percentage of

$$K_2Cr_2O_7 = \frac{0.0732 \times 100}{0.5} = 14.64\%$$

14. 126 g of oxalic acid $= 1$ mol of $H_2C_2O_4$

$$2MnO_4^- + 5C_2O_4^{2-} + 16H^+ \longrightarrow 2Mn^{2+} + 10CO_2 + 8H_2O$$

1 mole of oxalate ion require $= 2/5$ mol $KMnO_4$

$$Cr_2O_7^{2-} + 3C_2O_4^{2-} + 14H^+ \longrightarrow 2Cr^{3+} + 6CO_2 + 7H_2O$$

1 mole of oxalate ion require $= 1/3$ mol $K_2Cr_2O_7$

16. Eq. of $KMnO_4$ used $= \dfrac{50 \times 1}{1000 \times 10} = 0.005$

$\therefore$ Eq. of Mohr's salt reacted $= 0.005$

$\therefore$ Weight of Mohr's salt needed $= 0.005 \times 392 = 1.96$ g

Thus, percentage purity of Mohr's salt $= \dfrac{1.96}{3.92} \times 100 = 50\%$

18. Normality of oxalic acid $= \dfrac{6.3 \times 1000}{63 \times 250} = 0.4$

$$N_1V_1 = N_2V_2$$
$$V_1 \times 0.1 = 10 \times 0.4$$
$$V_1 = 40 \text{ mL}$$

19. The blue precipitate of Fe^{2+} ions with potassium ferricyanide is due to the formation of Turnbull's blue $K\overset{II}{Fe}[\overset{III}{Fe}(CN)_6]$

$$\underset{}{Fe^{2+}} + \underset{\text{potassium ferricyanide}}{K_3[Fe(CN)_6]} \longrightarrow \underset{\text{Turnbull's blue}}{K\overset{II}{Fe}[\overset{III}{Fe}(CN)_6]} + 2K^+$$

21. NaCl is a salt of strong acid and strong base, hence on dissolution will give neutral solution. As white ppt is obtained by the addition of $AgNO_3$ to the solution of Na salt, it can be of AgCl. Futher AgCl is also insoluble in HNO_3. Hence, the anion is Cl^-.

$$NaCl + AgNO_3 \longrightarrow AgCl \downarrow HNO_3$$

22. Ba^{2+} ion imparts green colour to the falme and Cl^- ion forms chromyl chloride (which is orange red in colour) when treated with $K_2Cr_2O_7$ and conc H_2SO_4. Thus, the reagent is

$$Ba^{2+} + 2Cl^- \longrightarrow BaCl_2$$

$$2BaCl_2 + K_2Cr_2O_7 + 3H_2SO_4 \longrightarrow K_2SO_4 + 2BaSO_4 + \underset{\substack{\text{chromyl chloride} \\ \text{(orange red gas)}}}{2CrO_2Cl_2} + 3H_2O$$

26. As in cases (1), (2) and (4), the acids and bases taken are strong and the enthalpy of neutralisation of all strong acids with strong bases is same, *i. e*, –57.3 kJ.

27. During the fromation of egg albumin sol, hot water is not used because in hot water precipitation of egg albumin takes place whereas in cold water formation of precipitate does not occur.

28. In the given experiment following reaction occurs

$$H_2O_2 + 2I^- + 2H^+ \longrightarrow 2H_2O + I_2$$

Iodine liberated in this reaction reacts with sodium thiosulphate solution and is reduced to iodide ions.

$$I_2 + \underset{\text{thiosulphate ion}}{2S_2O_3^{2-}} \xrightarrow{\text{Fast}} \underset{\text{tetrathionate ion}}{S_4O_6^{2-}} + 2I^-$$

30. $KI + AgNO_3$ (slight excess) $\longrightarrow AgI + KNO_3$

$$AgNO_3 \longrightarrow Ag^+ + NO_3^-$$

$$AgI(s) + Ag^+ \longrightarrow \underset{\text{silver iodide sol}}{[AgI]\ Ag^+}$$

31. The main purpose of using leveling bulb is to assure that pressure within the reaction vessel is same as that in the room.

32. The enthalpy of ionisation of weak acid is given by

$$\Delta H_{\text{ion(HA)}} = \Delta H_{\text{N(weak acid/strong base)}} - \Delta H_{\text{N(strong acid/strong base)}}$$
$$= -56.1 - (-57.3) = 1.2 \text{ kJ mol}^{-1}$$

$$\Delta H_{\text{(ionisation)}} = 1.5 \text{ kJ mol}^{-1}$$

Hence, percentage ionisation in 1 M solution

$$= \frac{(1.5 - 1.2)}{1.5} \times 100 = 20$$

Round II

1. $FeS + H_2SO_4(\text{dilute}) \longrightarrow FeSO_4(aq) + H_2S(g)$

2. $\underset{\text{chloride salt}}{NaCl} + H_2SO_4 \longrightarrow NaHSO_4 + \underset{\text{colourless}}{HCl\uparrow}$

$\underset{\text{iodide salt}}{NaI} + H_2SO_4 \longrightarrow NaHSO_4 + HI$

$2HI + H_2SO_4 \longrightarrow \underset{\text{violet colur}}{I_2\uparrow} + SO_2 + 2H_2O$

3. **Brown ring test**

$NO_3^- + 3Fe^{2+} + 4H^+ \longrightarrow NO + 3Fe^{3+} + 2H_2O$

$[Fe(H_2O)_6]^{2+} + NO \longrightarrow \underset{\text{brown complex}}{[Fe(H_2O)_5(NO)]^{2+}} + H_2O$

In the ring test of NO_3^- ion, Fe^{2+} ion reduces nitrate ion to nitric oxide, which combines with Fe^{2+} (*aq*) ion to form brown complex.

4. On passing H_2S gas in the aqueous solution of salt in the presence of dilute. HCl, black ppt of CuS is formed.

$3CuS + 8HNO_3 \longrightarrow 3Cu(NO_3)_2 + 2NO + 3S + 4H_2O$

$Cu^{2+} + 4NH_4OH \longrightarrow \underset{\text{deep blue complex}}{[Cu(NH_3)_4]^{2+}} + 4H_2O$

5. $5C_2O_4^{2-} + \underset{\text{purple}}{2MnO_4^-} + 16H^+ \longrightarrow \underset{\substack{\text{colourless}\\ \text{(auto catalyst)}}}{2Mn^{2+}} + 8H_2O + 10CO_2$

6. Because $KMnO_4$ oxidises HCl into Cl_2 which is also an oxidising agent.

$2Cl^- \longrightarrow Cl_2 + 2e^-] \times 5$

$MnO_4^- + 8H^+ + 5e^- \longrightarrow Mn^{2+} + 4H_2O] \times 2$

7. Benzaldehyde does not reduce Fehling's solution (a distinction from other aldehydes). Acetone (ketone) does not give any test with Fehling's solution.

8. Compound (b) contains both N and S, therefore it will form NaSCN which reacts with $FeCl_3$ to give ferric thiocyanate which is blood red in colour.

9. $Na_2[FeCN)_5NO] + Na_2S \longrightarrow Na_4[Fe(CN)_5NOS]$ violet colour, sulphur is confirmed.

10. Silver ion can easily pull out chlorine from $CH_2{=}CH{-}CH_2{-}Cl$ because $CH_2{=}CH{-}\overset{+}{C}H_2$ is allylic carbocation which is resonance stabilized.

11. $[HgI_4]^{2-} + NH_4Cl + 4OH^- \longrightarrow NH_2HgOHgI$

12. Nessler's reagent $K_2[HgI_4]$ in alkaline medium is used to detect NH_4^+ ion.

13. When 100 mL HCl is added to 35 mL NaOH, 35 mL HCl is utilized to neutralise NaOH, while 65 mL HCl remains as such. Hence, solution becomes acidic. In acid solution, the colour of methyl orange is red due to presence of Me^+ ions as

$$\underset{\substack{\text{methyl orange}\\ \text{(yellow)}}}{MeOH} \rightleftharpoons \underset{\text{red}}{Me^+} + OH^-$$

14. $5C_2O_4^{2-} + 2MnO_4^- + 16H^+ \longrightarrow 2Mn^{2+} + 10CO_2 + 8H_2O$

Note In a reaction (redox/neutralisation) number of equivalents of different reactants are same.

$$\text{Equivalents of } C_2O_4^{2-} = \text{eq. of } MnO_4^-$$

$$\text{eq. wt. of } C_2O_4^{2-} = \frac{\text{mol . wt}}{2}$$

$\therefore$ $$\text{molarity} = 2 \times \text{normality}$$

$$\text{eq. wt of } MnO_4^- = \frac{\text{mol. wt.}}{5}$$

$$\text{Molarity} = 5 \times \text{normality}$$

$$\text{Number of equivalents of } MnO_4^- = \frac{28.85 \times 5\, M_1}{1000}$$

$$\text{Number of equivalents of } Na_2C_2O_4^- = \frac{0.1467}{67}$$

$\therefore$ $$\frac{28.85 \times 5\, M_1}{1000} - \frac{0.1467}{67}$$

$$M_1 = 0.01518\ \text{M}$$

15. $MnO_4^- + 5Fe^{2+} \longrightarrow 5Fe^{3+} + Mn^{2+}$

$M_1V_1(MnO_4^-) = 5N_1V_1(MnO_4^-)$ milliequivalent

$M_2V_2(Fe^{2+}) = 5N_2V_2(Fe^{2+})$ milliequivalent

$N_1V_1(MnO_4^-) = N_2V_2(Fe^{2+})$

$5 \times 0.02 \times V_1 = 40 \times 0.1$

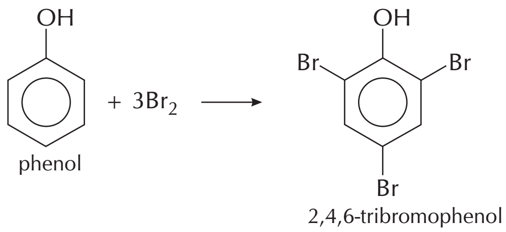
$V_1 = 40\ \text{mL}$

16. $O_2 + 4e^- \longrightarrow 2O^{2-}$

$4e^- \equiv 1\,\text{mol}\ O_2$

$0.25\ \text{mol} = 8\ \text{g}\ O_2$

17. Aqueous or alcoholic solution of phenol with excess of bromine water gives a yellowish white precipitate.



Phenols on treatment with neutral $FeCl_3$ form violet, red, blue or green coloured complexes.

18. (a) $4FeCl_3 + 3K_4[Fe(CN)_6] \longrightarrow \underset{\text{Prussian blue}}{Fe_4[Fe(CN)_6]_3} + 12KCl$

(b) and (c) $M^{2+} + [Fe(CN)_6]^{4-} \xrightarrow[\text{of } CH_3COOH]{\text{In presence}} \underset{\text{bluish white ppt}}{M_2[Fe(CN)_6]\downarrow}$

$M = Zn^{2+}, Cd^{2+}$

19. $RNH_2 + CHCl_3 + 3KOH \longrightarrow RNC + 3KCl + 3H_2O$

(where, R may be alkyl or aryl group)

20. Only $(NH_2)_2C{=}S$ and $p-NH_2C_6H_4SO_3H$ contain both N and S which are required for observing blood red colouration in Lassaigne's test.

21. $PbCl_2$ is soluble in hot water while Hg_2Cl_2 is soluble in aquaregia.

$$Hg_2Cl_2 + 2NH_3 \longrightarrow HgNH_2Cl(\text{black}) + Hg + NH_4Cl$$

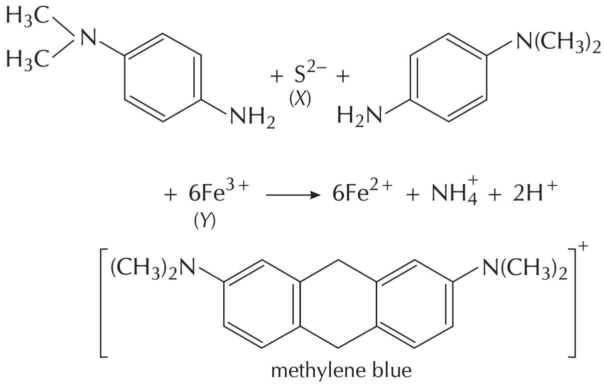
22. $Na_2S + \underset{\text{sodium nitroprusside}}{Na_2[Fe(NO)(CN)_5]} \longrightarrow \underset{\text{violet sodium thionitroprusside}}{Na_4[Fe(NOS)(CN)_5]}$

23. Tollen's reagent is not reduced by ketones.

24. Statement II is the correct explanation of statement I.

25. Statement II is the correct explanation of statement I.

26.



methylene blue

The compound X is Na_2S.

27. The compound Y is $FeCl_3$.

28. $Fe^{3+} + [Fe(CN)_6]^{3-} \longrightarrow \underset{(Z)}{Fe[Fe(CN)_6]}$ brown colouration

29. $6Fe^{2+} \longrightarrow 6Fe^{3+} + 6e^-$

$$Cr_2O_7^{2-} + 14H^+ + 6e^- \longrightarrow 2Cr^{3+} + 7H_2O$$

$$N(Cr_2O_7^{2-}) = 6 \times M(Cr_2O_7^{2-}) = 0.6\text{ N}$$

$$5Fe^{2+} \longrightarrow 5Fe^{3+} + 5e^-$$

$$N(MnO_4^-) = 5 \times M\,(MnO_4^-) = 0.5\text{ N}$$

$$\text{Volume of } Fe^{2+} = V \text{ mL (say)}$$

$$\text{Molarity of } Fe^{2+} = 1M \text{ (say)} = 1N$$

$$6Fe^{2+} \equiv Cr_2O_7^{2-} \text{ or } 1Fe^{2+} \equiv \frac{Cr_2O_7^{2-}}{6}$$

$$5Fe^{2+} \equiv MnO_4^- \text{ or } 1Fe^{2+} \equiv \frac{MnO_4^{2-}}{5}$$

In all cases, 1 equivalent of $x \equiv 1$ equivalent of y hence option (d) is correct.

30. $V \times 1 = 0.5 \times V_1$ (For MnO_4^-)

$$V_1 = 2V$$

$$V \times 1 = 0.6 \times V_2 \qquad (\text{For } Cr_2O_7^{2-})$$

$$V_2 = 1.33\text{ V}$$

Hence, option (b) is correct.

31. 24.5 of mL 0.1 M $Cr_2O_7^{2-} \equiv$ 24.5 mL of 0.6 N $Cr_2O_7^{2-}$

V mL of 0.1 M $MnO_4^- \equiv V$ mL of 0.5 N MnO_4^-

Thus, $24.5 \times 0.6 = V \times 0.5$

$$V = 29.4\text{ mL}$$

32. $Na + C + N \xrightarrow{\text{Fuse}} NaCN$

$$FeSO_4 + 6NaCN \longrightarrow Na_4[Fe(CN)_6] + Na_2SO_4$$

$$4FeCl_3 + 3Na_4[Fe(CN)_6] \longrightarrow Fe_4[Fe(CN)_6]_3 + 12NaCl$$

33. $2NaOH + Br_2 \longrightarrow NaOBr + NaBr + H_2O$

$NaOBr \longrightarrow NaBr + [O]$

$2Cr(OH)_3 + 4NaOH + 3[O] \longrightarrow \underset{\text{yellow solution}}{2Na_2CrO_4} + 5H_2O$

While $Fe(OH)_3$ is soluble in HCl.

Online Exam Held on 09-4-2013

JEE Main

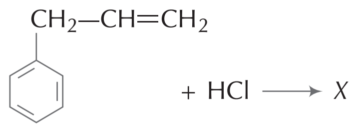
Solved Paper 2013

Instructions

- This test consists of 30 questions.
- Each question is allotted 4 marks for correct response.
- Candidates will be awarded marks as stated above for correct response of each question. 1/4 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
- There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.

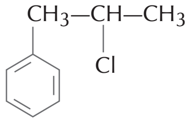
---

1. Given,

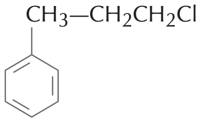


X is

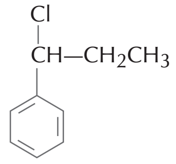
(a)



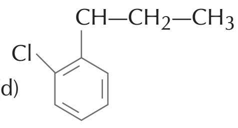
(b)



(c)



(d)



2. Given, $x\,Na_2HAsO_3 + y\,NaBrO_3 + z\,HCl \longrightarrow$

$$NaBr + H_3AsO_4 + NaCl$$

The value of x, y and z in the above redox reaction are respectively.

(a) 2, 1, 2 (b) 2, 1, 3

(c) 3, 1, 6 (d) 3, 1, 4

3. The migration of dispersion medium under the influence of an electric potential is called

(a) cataphoresis (b) electroosmosis

(c) electrophoresis (d) sedimentation

4. The addition of HI in the presence of peroxide catalyst does not follow anti-Markownikoff's rule because

(a) HI is a strong reducing agent

(b) HI bond is too strong to be broken homolytically

(c) I atom combines with H atom to give back HI

(d) Iodine atom is not reactive enough to add across a double bond

5. In reaction $A + 2B \rightleftharpoons 2C + D$ initial concentration of B was 1.5 times of [A], but at equilibrium the concentrations of A and B became equal. The equilibrium constant for the reaction is

(a) 8 (b) 4 (c) 12 (d) 6

6. Trigonal bipyramidal geometry is shown by

(a) $XeOF_2$ (b) XeO_3F_2

(c) $FXeOSO_2F$ (d) $[XeF_8]^{2-}$

7. If a polythene sample contains two monodisperse fractions in the ratio 2 : 3 with degree of polymerization 100 and 200 respectively, then its weight average molecular weight will be

(a) 4900 (b) 4600 (c) 4300 (d) 5200

8. The instantaneous rate of disappearance of MnO_4^- ion in the following reaction is 4.56×10^{-3} Ms^{-1}

$$2MnO_4^- + 10\,I^- + 16H^+ \longrightarrow 2Mn^{2+} + 5I_2 + 8H_2O$$

The rate of appearance I_2 is

(a) 4.56×10^{-4} Ms^{-1} (b) 1.14×10^{-2} Ms^{-1}

(c) 1.14×10^{-3} Ms^{-1} (d) 5.7×10^{-3} Ms^{-1}

9. Which one of the following is most stable?

(a) 
(b) 
(c) 
(d) 
10. In an atom how many orbital(s) will have the quantum numbers $n = 3$, $l = 2$ and $m_l = +2$?
(a) 5 (b) 3
(c) 1 (d) 7

11. Potassium dichromate when heated with concentrated sulphuric acid and a soluble chloride, gives brown-red vapours of
(a) CrO_3 (b) $CrCl_3$
(c) CrO_2Cl_2 (d) Cr_2O_3

12. Rate of dehydration of alcohols follows the order
(a) $2° > 1° < CH_3OH > 3°$
(b) $3° > 2° > 1° > CH_3OH$
(c) $2° > 3° > 1° > CH_3OH$
(d) $CH_3OH > 1° > 2° > 3°$

13. Given, (a) $H_2(g) + \frac{1}{2} O_2(g) \longrightarrow H_2O(l)$

$$\Delta H°_{298\,K} = -285.9 \text{ kJmol}^{-1}$$

(b) $H_2(g) + \frac{1}{2} O_2(g) \longrightarrow H_2O(g)$;

$$\Delta H°_{298\,K} = -241.8 \text{ kJ mol}^{-1}$$

the molar enthalpy of vaporization of water will be
(a) 241.8 kJ mol^{-1} (b) 22.0 kJ mol^{-1}
(c) 44.1 kJ mol^{-1} (d) 527.7 kJ mol^{-1}

14. Calcination is the process in which
(a) removal of water takes place
(b) decomposition of carbonates takes place
(c) oxidation of sulphides takes place
(d) All of the above

15. Sodium carbonate cannot be used in place of $(NH_4)_2CO_3$ for the identification of Ca^{2+}, Ba^{2+} and Sr^{2+} ions (*in group V*) during mixture analysis because
(a) Mg^{2+} ions will be precipitated
(b) concentration of CO_3^{2-} ions is very low
(c) sodium ions will react with acid radicals
(d) Na^+ ions will interfere with the detection of Ca^{2+}, Ba^{2+}, Sr^{2+} ions

16. Which one of the following molecules is polar?
(a) XeF_4 (b) IF_5
(c) SbF_5 (d) CF_4

17. Type of isomerism which exists between $[Pd(C_6H_5)_2(SCN)_2]$ and $[Pd(C_6H_5)_2(NCS)_2]$ is
(a) linkage isomerism
(b) coordination isomerism
(c) ionisation isomerism
(d) solvate isomerism

18. In which of the following ionization processes the bond energy has increased and also the magnetic behaviour has changed from paramagnetic to diamagnetic?
(a) $NO \longrightarrow NO^+$ (b) $N_2 \longrightarrow N_2^+$
(c) $C_2 \longrightarrow C_2^+$ (d) $O_2 \longrightarrow O_2^+$

19. 12 g of a non-volatile solute dissolved in 108 g of water produces the relative lowering of vapour pressure of 0.1. The molecular mass of the solute is
(a) 80 (b) 60
(c) 20 (d) 40

20. Which of the following enzyme converts starch into maltose?
(a) Diastase (b) Maltase
(c) Zymase (d) Invertase

21. Electrode potentials ($E°$) are given below

$$Cu^+ / Cu = +0.52 \text{ V}$$
$$Fe^{3+} / Fe^{2+} = +0.77 \text{ V}$$
$$\frac{1}{2} I_2(s) / I^- = +0.54 \text{ V}$$
$$Ag^+ / Ag = +0.88 \text{ V}$$

Based on the above potentials strongest oxidizing agent will be
(a) Cu (b) Fe^{3+}
(c) Ag^+ (d) I_2

22. Aryl fluoride may be prepared from a diazonium chloride using
(a) HBF_4 / Δ (b) $HBF_4 / NaNO_2Cu, \Delta$
(c) CuF / HF (d) Cu / HF

23. An ether (A), $C_5H_{12}O$ when heated with excess of hot concentrated HI produced two alkyl halides which when treated with NaOH yielded compounds (B) and (C). Oxidation of (B) and (C) gave a propanone and an ethanoic acid respectively. The IUPAC name of the ether (A) is
(a) 2-ethoxypropane (b) ethoxypropane
(c) methoxybutane (d) 2-methoxybutane

24. Electron gain enthalpy with negative sign of fluorine is less than that of chlorine due to
(a) high ionization enthalpy of fluorine
(b) smaller size of chlorine atom
(c) smaller size of fluorine atom
(d) bigger size of 2p orbital of fluorine

25. Solid $Ba(NO_3)_2$ is gradually dissolved in a 1.0×10^{-4} M Na_2CO_3 solution. At which concentration of Ba^{2+}, precipitate of $BaCO_3$ begins to form? (K_{sp} for $BaCO_3 = 5.1 \times 10^{-9}$)

(a) 5.1×10^{-5} M (b) 7.1×10^{-5} M
(c) 4.1×10^{-5} M (d) 8.1×10^{-2} M

26. An element having an atomic radius of 0.14 nm crystallizes in an fcc unit cell. What is the length of a side of the cell?

(a) 0.56 nm (b) 0.24 nm
(c) 0.96 nm (d) 0.4 nm

27. Which of the following compounds is not expected to show 'Lassaignes' test for nitrogen?

(a) Propanenitrile
(b) Hydroxylamine hydrochloride
(c) Nitromethane
(d) Ethanamine

28. Formaldehyde can be distinguished from acetaldehyde by the use of

(a) Schiff's reagent
(b) Tollen's reagent
(c) I_2, Alkali
(d) Fehling's solution

29. By how many folds the temperature of a gas would increase when the root mean square velocity of the gas molecules in a container of fixed volume is increased by 5×10^4 cm/s to 10×10^4 cm/s?

(a) Two (b) Three
(c) Six (d) Four

30. The element with which of the following outer electron configuration may exhibit the largest number of oxidation states in its compounds

(a) $3d^5 4s^2$ (b) $3d^8 4s^2$
(c) $3d^7 4s^2$ (d) $3d^6 4s^2$

Answers

1. (c)	**2.** (c)	**3.** (b)	**4.** (c)	**5.** (b)	**6.** (b)	**7.** (a)	**8.** (b)	**9.** (a)	**10.** (c)
11. (c)	**12.** (b)	**13.** (c)	**14.** (b)	**15.** (a)	**16.** (b)	**17.** (a)	**18.** (a)	**19.** (c)	**20.** (a)

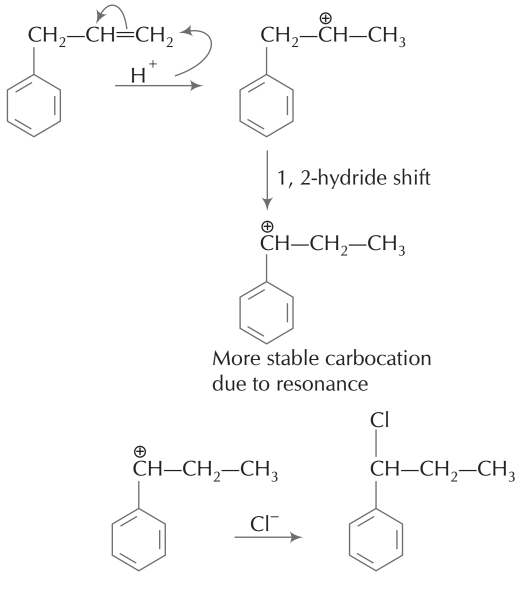
Hints and **Solutions**

1.



More stable carbocation due to resonance

2. $3Na_2HAsO_3 + NaBrO_3 + 6HCl \longrightarrow NaBr + 3H_3AsO_4 + 6NaCl$

3. Electroosmotic flow is caused by the coulomb force induced by an electric field on net mobile electric charge in a solution. When an electric field is applied to the fluid, the net charge in the electrical double layer (a layer of mobile ions forms in the region near the interface) is induced to move by the resulting coulomb force.

4. Addition of HI in the presence of peroxide catalyst does not follow anti Markownikoff's rule because iodine radicals have tendency to form I_2 molecule.

$$I^\bullet + I^\bullet \longrightarrow I_2$$

5. Let the degree of dissociation = x

	A	$+$	$2B$	$\rightleftharpoons$	$2C$	$+$	D
Initial concentration	1		1.5		0		0
At equilibrium	$(1-x)$		$(1.5-2x)$		$2x$		x

Given, $(1-x) = (1.5 - 2x)$

$$1 = 1.5 - 2x + x$$
$$1 = 1.5 - x$$
$$x = 1.5 - 1 = 0.5$$

Equilibrium constant for the reaction

$$K_C = \frac{[C]^2\,[D]}{[A]\,[B]^2} = \frac{(2x)^2\,(x)}{(1-x)\,(1.5-2x)^2}$$

$\because$ $x = 0.5$

$$K_C = \frac{(2\times 0.5)^2\,(0.5)}{(1-0.5)\,(1.5-2\times 0.5)^2}$$

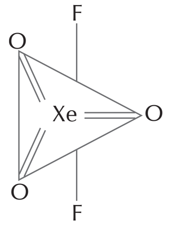
$$= \frac{(1)\times(0.5)}{(0.5)\,(0.5)^2} = \frac{0.5}{0.5\times 0.25} = \frac{0.5}{0.125} = 4$$

6. Trigonal bipyramidal geometry is shown by XeO_3F_2. Hybridization on Xe atom,

$$H = \frac{1}{2}(V + M - C + A) = \frac{1}{2}(8 + 2 - 0 + 0)$$

$$= \frac{10}{2} = 5 = sp^3d$$

Trigonal bipyramidal geometry.



7. Degree of polymerisation $= \dfrac{\overline{M}_n}{M_o}$

so $\overline{M}_w = 4900$

where, $\overline{M}_n$ = number average molecular weight

M_o = molecular weight of monomer

and $\overline{M}_w = \overline{M}_n$ for monodispersed sample

8. Rate of reaction $= -\dfrac{1}{2}[MnO_4] = \dfrac{1}{5}[I_2]$

$\therefore$ Given, Rate of disappearance of MnO_4^-

$$= \frac{d\,[MnO_4^-]}{dt} = 4.56\times 10^{-3}$$

$\because$ Rate of appearance of $I_2 = \dfrac{5}{2}\times 4.56\times 10^{-3}$

$$= 11.4\times 10^{-3}$$

$$= 1.14\times 10^{-2}\ Ms^{-1}$$

9. Due to the presence of electron releasing group —CH_3 and resonance effect  is most stable.

10. Quantum numbers $n = 3, l = 2, m = +2$ represents only one orbital.

11. $$K_2Cr_2O_7 + 4NaCl + 3H_2SO_4 \xrightarrow{\Delta} \underset{\substack{\text{chromyl chloride}\\ \text{(red vapours)}}}{2CrO_2Cl_2} + K_2SO_4 + 2Na_2SO_4 + 3H_2O$$

12. Dehydration of alcohols takes place according to Saytzeff rule. In acid catalysed dehydration, formation of most stable carbocation takes place.

Thus, the order of dehydration of alcohols is

$$3° > 2° > 1° > CH_3OH$$

13. Molar enthalpy of vaporization = 285.9 − 241.8

$= 44.1\,kJ\ mol^{-1}$

14. Calcination is a thermal treatment in the presence of air to ores and other solid materials to bring about a thermal decomposition, phase transition or removal of volatile fractions.

$$M_2CO_3 \xrightarrow{\Delta} M_2O + CO_2$$

15. In fifth group, $(NH_4)_2CO_3$ is used in the presence of NH_4Cl. In presence of NH_4Cl dissociation of $(NH_4)_2CO_3$ decreases and due to low concentration of CO_3^{2-} ions only V group radical are precipitated out. If Na_2CO_3 is used, concentration of CO_3^{2-} ions will increase and Mg^{2+} ions will also be precipitated.

16. Only IF_5 is polar because of its unsymmetrical structure. Rest of the molecules have zero dipole moment.

17. Given compound shows linkage isomerism.

18. (a) $NO\,(7+8=15) = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 \approx \pi 2p_y^2, \pi^* 2p_x^1 \approx \pi 2p_y^0$

Bond order $= \dfrac{10-5}{2} = 2.5$

(Because of the presence of one unpaired electron, it is paramagnetic.

$NO^+\,(7+8-1=14) = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 \approx \pi 2p_y^2$

$$BO = \frac{10-4}{2} = 3$$

(it is diamagnetic as have no unpaired electron)

Bond energy $\propto$ BO

So $NO^+ > NO$ (Bond energy)

(b) $N_2(14)$, BO = 3 and diamagnetic

$N_2^+(13)$, BO $= \dfrac{9-4}{2} = 2.5$ and paramagnetic

(c) $C_2(12)$, BO $= \dfrac{8-4}{2} = 2$, diamagnetic

$C_2^+(6+6-1)$, BO $= \dfrac{7-4}{2} = 1.5$, paramagnetic

(d) $O_2(8+8=16)$, BO $= \dfrac{10-6}{2} = 2$, paramagnetic

$O_2^+\,(8+8-1=15)$, BO = 2.5, paramagnetic

Thus, only the $NO \longrightarrow NO^+$

transition involves increase in bond energy and change of magnetic character from paramagnetic to diamagnetic.

19. From Raoult's law

Relative lowering in vapour pressure

$$\Delta p = \frac{p^\circ - p}{p^\circ}$$

$$= \frac{n}{N} = \frac{w}{m} \times \frac{M}{W}$$

$w = 12$ g; $W = 108$ g, $m = ?$ $M = 18$ g, $\Delta p = 0.1$

$$\Delta p = \frac{w}{m} \times \frac{M}{W}$$

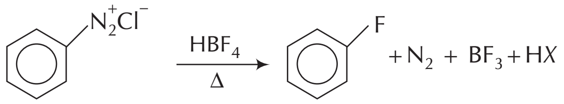
$$0.1 = \frac{12}{m} \times \frac{18}{108}$$

$$m = \frac{12 \times 18}{10.8} = 20$$

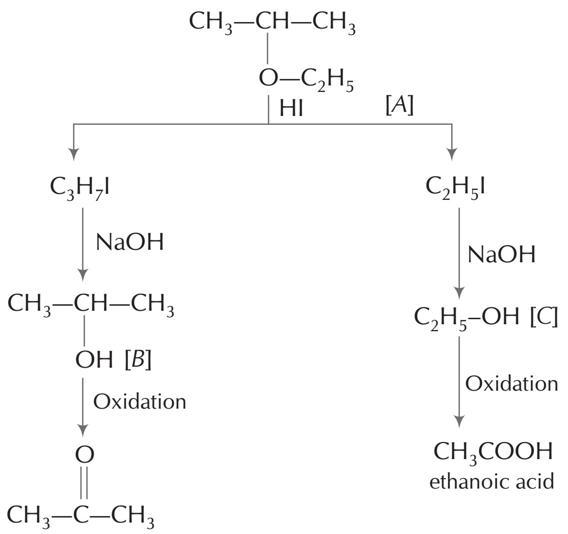
20. $\underset{\text{starch}}{(C_6H_{10}O_5)_n} + nH_2O \xrightarrow{\text{Diastase}} \underset{\text{maltose}}{C_{12}H_{22}O_{11}}$

21. More positive value of electrode potential represents that Ag^+ is the strongest oxidizing agent.

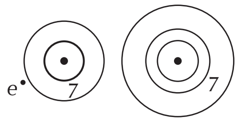
22.



23. Ether (*A*) is 2-ethoxypropane



24. Due to smaller size and high repulsive force within the outermost orbit of fluorine its electron gain enthalpy is less negative.



High repulsion

25. Concentration of CO_3^{2-} ions $= 1.0 \times 10^{-4}$ M

For precipitation $K_{sp} \le [Ba^{2+}][CO_3^{2-}]$

Given, $K_{sp} = 5.1 \times 10^{-9}$

Hence, minimum concentration of Ba^{2+} ions should be

$$= \frac{K_{sp}}{[CO_3^{2-}]} = \frac{5.1 \times 10^{-9}}{1.0 \times 10^{-4}} = 5.1 \times 10^{-5} \text{ M}$$

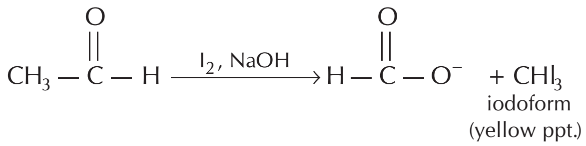
26. For fcc unit cell, $r = \frac{\sqrt{2}}{4}a$

$$0.14 = \frac{\sqrt{2}}{4}a$$

$$a = \frac{4 \times 0.14}{\sqrt{2}} = 0.396 \text{ nm} = 0.4 \text{ nm}$$

27. Hydroxylamine hydrochloride does not contain carbon, so in lassaigne's test does not result in the formation of NaCN. Hence, it does not give the test of nitrogen, for which formation of NaCN is essential.

28.



$$CH_3—\overset{\overset{\displaystyle O}{\|}}{C}—H \xrightarrow{I_2,\ NaOH} H—\overset{\overset{\displaystyle O}{\|}}{C}—O^- + \underset{\substack{\text{iodoform}\\\text{(yellow ppt.)}}}{CHI_3}$$

Formaldehyde does not form iodoform.

29. Relation between root mean square velocity and temperature

$$v_{rms} = \sqrt{\frac{3RT}{M}}$$

$$v_{rms} \propto \sqrt{T}$$

$$T \propto v_{rms}^2$$

if *v* is doubled, *T* will be four times.

30. Due to the presence of maximum number of unpaired electrons, element having $3d^5, 4s^2$, configuration may exhibit the largest number of oxidation states in its compounds.

Online Exam Held on
22-4-2013

---

1. Oxidation state of sulphur in anions SO_3^{2-}, $S_2O_4^{2-}$ and $S_2O_6^{2-}$ increases in the order

(a) $S_2O_6^{2-} < S_2O_4^{2-} < SO_3^{2-}$

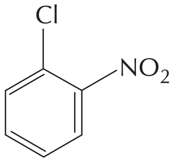
(b) $SO_3^{2-} < S_2O_4^{2-} < S_2O_6^{2-}$

(c) $S_2O_4^{2-} < SO_3^{2-} < S_2O_6^{2-}$

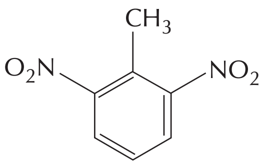
(d) $S_2O_4^{2-} < S_2O_6^{2-} < SO_3^{2-}$

2. A major component of Borsch reagent is obtained by reacting hydrazine hydrate with which of the following?

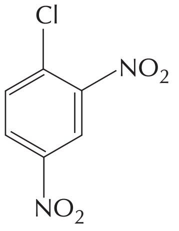
(a)



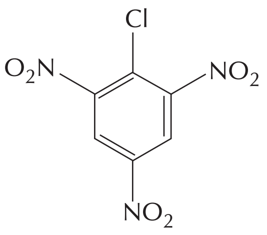
(b)



(c)



(d)



3. Given,

Reaction	Energy change (in kJ)
$Li(s) \longrightarrow Li(g)$	161
$Li(g) \longrightarrow Li^+(g)$	520
$\frac{1}{2}F_2(g) \longrightarrow F(g)$	77
$F(g) + e^- \longrightarrow F^-(g)$	(Electron gain enthalpy)
$Li^+(g) + F^-(g) \longrightarrow LiF(s)$	−1047
$Li(s) + \frac{1}{2}F_2(g) \longrightarrow LiF(s)$	−617

Bases on data provided, the value of electron gain enthalpy of fluorine would be

(a) -300 kJ mol^{-1} (b) -350 kJ mol^{-1}

(c) -328 kJ mol^{-1} (d) -228 kJ mol^{-1}

4. A molecule M associates in a given solvent according to the equation $M \rightleftharpoons (M)_n$. For a certain concentration of M, the van't Hoff factor was found to be 0.9 and the fraction of associated molecules was 0.2. The value of n is

(a) 3 (b) 5

(c) 2 (d) 4

5. The solubility order of alkali metal fluoride in water is
(a) LiF < RbF < KF < NaF
(b) RbF < KF < NaF < LiF
(c) LiF > NaF > KF > RbF
(d) LiF < NaF < KF < RbF

6. XeO_4 molecule is tetrahedral having
(a) two $p\pi - d\pi$ bonds (b) one $p\pi - d\pi$ bond
(c) four $p\pi - d\pi$ bonds (d) three $p\pi - d\pi$ bonds

7. The reaction, $X \longrightarrow Y$ is an exothermic reaction. Activation energy of the reaction for conversion of X into Y is 150 kJ mol^{-1}. Enthalpy is 135 kJ mol^{-1}. The activation energy for the reverse reaction, $Y \longrightarrow X$ will be
(a) 280 kJ mol^{-1} (b) 285 kJ mol^{-1}
(c) 270 kJ mol^{-1} (d) 15 kJ mol^{-1}

8. For which of the following compounds Kjeldahl method can be used to determine the percentage of nitrogen?
(a) Nitrobenzene (b) Pyridine
(c) Alanine (d) Diazomethane

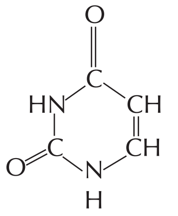
9. Which of the following statements about aspirin is not true?
(a) It is effective in relieving pain
(b) It is a neurologically active drug
(c) It has antiblood clotting action
(d) It belongs to narcotic analgesics

10. The density of 3M solution of sodium chloride is 1.252 g mL^{-1}. The molality of the solution will be

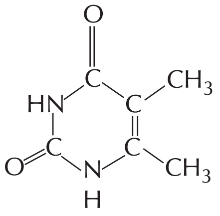
(molar mass, NaCl = 58.5 g mol^{-1})
(a) 2.60 m (b) 2.18 m
(c) 2.79 m (d) 3.00 m

11. Which of the following structures represents thymine?

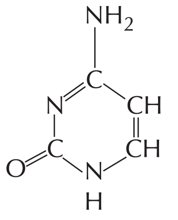
(a)



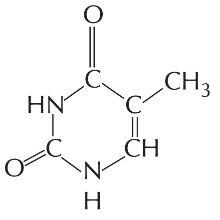
(b)



(c)



(d)



12. The polymer used for optical lenses is
(a) polypropylene
(b) polyvinyl chloride
(c) polythene
(d) polymethyl methacrylate

13. Which of the following is diamagnetic?
(a) $[Fe(CN)_6]^{3-}$ (b) $[Co(OX)_3]^{3-}$
(c) $[FeF_6]^{3-}$ (d) $[Co(F_6)]^{3-}$

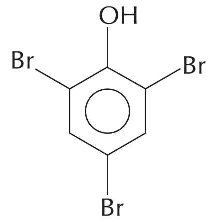
14. Bond order normally gives idea of stability of a molecular species. All the molecules *viz*. H_2, Li_2 and B_2 have the same bond order yet they are not equally stable. Their stability order is
(a) $H_2 > B_2 > Li_2$ (b) $Li_2 > H_2 > B_2$
(c) $Li_2 > B_2 > H_2$ (d) $B_2 > H_2 > Li_2$

15. Which one of the following arrangements represents the correct order of solubilities of sparingly soluble salts Hg_2Cl_2, $Cr_2(SO_4)_3$, $BaSO_4$ and $CrCl_3$ respectively?
(a) $\left(\frac{K_{sp}}{108}\right)^{1/5}, \left(\frac{K_{sp}}{27}\right)^{1/4}, (K_{sp})^{1/2}, \left(\frac{K_{sp}}{4}\right)^{1/3}$
(b) $(K_{sp})^{1/2}, \left(\frac{K_{sp}}{4}\right)^{1/3}, \left(\frac{K_{sp}}{27}\right)^{1/4}, \left(\frac{K_{sp}}{108}\right)^{1/5}$
(c) $(K_{sp})^{1/2}, \left(\frac{K_{sp}}{108}\right)^{1/5}, \left(\frac{K_{sp}}{27}\right)^{1/4}, \left(\frac{K_{sp}}{4}\right)^{1/3}$
(d) $\left(\frac{K_{sp}}{4}\right)^{1/3}, \left(\frac{K_{sp}}{108}\right)^{1/5}, (K_{sp})^{1/2}, \left(\frac{K_{sp}}{27}\right)^{1/4}$

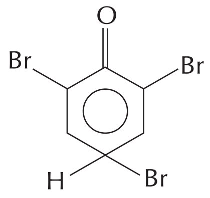
16. The wave number of the first emission line in the Balmer series of H—spectrum is (R = Rydberg constant)
(a) $\frac{5}{36}R$ (b) $\frac{9}{400}R$
(c) $\frac{7}{6}R$ (d) $\frac{3}{4}R$

17. What is the structure of the major product when phenol is treated with bromine water?

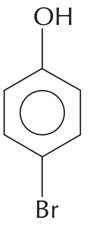
(a)



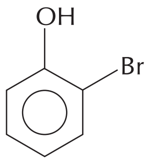
(b)



(c)



(d)



18. NaOH is a strong base. What will be pH of 5.0×10^{-2}M NaOH solution? (log 2 = 0.3)
(a) 14.00 (b) 13.70
(c) 13.00 (d) 12.70

19. Flocculation value of $BaCl_2$ is much less than that of KCl for sol *A* and flocculation value of Na_2SO_4 is much less than that of NaBr for sol *B*. The correct statement among the following is
(a) Both the sols *A* and *B* are negatively charged
(b) Sol *A* is positively charged and sol *B* is negatively charged
(c) Both the sols *A* and *B* are positively charged
(d) Sol *A* is negatively charged and sol *B* is positively charged

20. Amongst the following alcohols which would react fastest with conc. HCl and $ZnCl_2$?
(a) Pentanol (b) 2-methylbutanol
(c) 2-pentanol (d) 2-methylbutan-2-ol

21. Values of dissociation constant, K_a are given as follows

Acid	K_a
HCN	6.2×10^{-10}
HF	7.2×10^{-4}
HNO_2	4.0×10^{-4}

Correct order of increasing base strength of the base CN^-, F^- and NO_2^- will be
(a) $F^- < CN^- < NO_2^-$ (b) $NO_2^- < CN^- < F^-$
(c) $F^- < NO_2^- < CN^-$ (d) $NO_2^- < F^- < CN^-$

22. Clemmensen reduction of a ketone is carried out in the presence of
(a) $LiAlH_4$ (b) Zn–Hg with HCl
(c) glycol with KOH (d) H_2 with Pt as catalyst

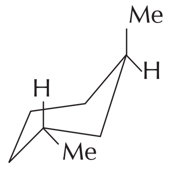
23. Which of the following statements is incorrect?
(a) Fe^{3+} ion also gives blood red colour with SCN^- ion
(b) Fe^{3+} ion gives red colour with SCN^- ion
(c) On passing H_2S into Na_2ZnO_2 solution, a white ppt of ZnS is formed
(d) Cupric ion reacts with excess of ammonia solution to give deep blue colour of $[Cu(NH_3)_4]^{2+}$ ion

24. The order of increasing sizes of atomic radii among the elements O, S, Se and As is
(a) As < S < O < Se (b) Se < S < As < O
(c) O < S < As < Se (d) O < S < Se < As

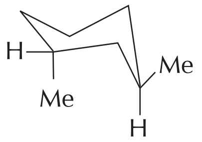
25. In Williamson synthesis of mixed ether having a primary and a tertiary alkyl group if tertiary halide is used, then
(a) rate of reaction will be slow due to slow cleavage of carbon halogen bond
(b) alkene will be the main product
(c) simple ether will form instead of mixed ether
(d) expected mixed ether will be formed

26. Which of the following would not give 2-phenylbutane as the major product in a Friedel-Crafts alkylation reaction?
(a) 1-butene + HF
(b) 2-butanol + H_2SO_4
(c) Butanoyl chloride + $AlCl_3$ then Zn, HCl
(d) Butyl chloride + $AlCl_3$

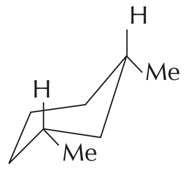
27. Arrange in the correct order of stability (decreasing order) for the following molecules



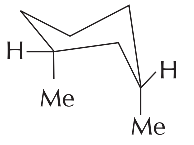
(I)



(II)



(III)



(IV)

(a) (I) > (II) > (III) > (IV)
(b) (IV) > (III) > (II) ≈ (I)
(c) (I) > (II) ≈ (III) > (IV)
(d) (III) > (I) ≈ (II) > (IV)

28. Which one of the following statements about packing in solids is incorrect?
(a) Coordination number in bcc mode of packing is 8
(b) Coordination number in hcp mode of packing is 12
(c) Void space in hcp mode of packing is 32%
(d) Void space in ccp mode of packing is 26%

29. The Wurtz-Fittig reaction involves condensation of
(a) two molecules of aryl halides
(b) one molecule of each of aryl-halide and alkyl-halide
(c) one molecule of each aryl-halide and phenol
(d) two molecules of a alkyl-halides

30. In Goldschmidt alumino thermic process which of the following reducing agent is used?
(a) Calcium (b) Coke
(c) Al powder (d) Sodium

Answers

1. (c)	**2.** (c)	**3.** (c)	**4.** (c)	**5.** (d)	**6.** (c)	**7.** (b)	**8.** (c)	**9.** (d)	**10.** (c)
11. (d)	**12.** (d)	**13.** (b)	**14.** (*)	**15.** (d)	**16.** (a)	**17.** (a)	**18.** (d)	**19.** (b)	**20.** (d)
21. (c)	**22.** (b)	**23.** (a)	**24.** (d)	**25.** (b)	**26.** (c)	**27.** (d)	**28.** (c)	**29.** (b)	**30.** (c)

(*) No option is correct.

Hints *and* Solutions

1. Let the oxidation state of S be x.

SO_3^{2-}

$$\begin{aligned} x + (-2) \times 3 &= -2 \\ x - 6 &= -2 \\ \therefore \quad x &= +4 \end{aligned}$$

$S_2O_4^{2-}$

$$\begin{aligned} 2 \times x + (-2)\,4 &= -2 \\ 2x - 8 &= -2 \\ 2x = 6 \text{ or } x &= +3 \end{aligned}$$

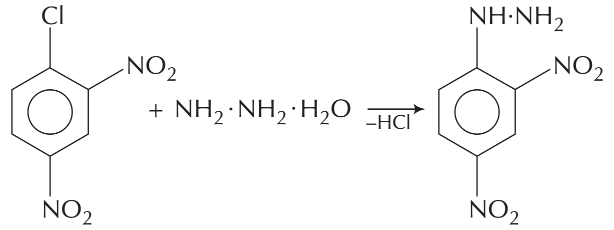
$S_2O_6^{2-}$

$$\begin{aligned} 2x + (-2)\,6 &= -2 \\ 2x &= 10 \\ x &= +5 \end{aligned}$$

$\therefore$ The increasing order of oxidation states is

$$S_2O_4^{2-} < SO_3^{2-} < S_2O_6^{2-}$$

2. Borsch reagent is 2, 4-dinitrophenyl hydrazine, thus, it is obtained by treating 2, 4-dinitrochlorobenzene with hydrazine hydrate.



2,4-dinitrochlorobenzene

2,4-dinitrophenyl hydrazine (Borsch reagent)

3. From Born-Haber cycle,

$$Q = S + I + D + \text{EA} + U$$

$$-617 = 161 + 520 + 77 + \text{EA} - 1047$$

[$\because$ Here, S = sublimation energy, I = ionisation energy, D = dissociation energy, EA = electron gain enthalpy and U = lattice energy.

$$\begin{aligned} \therefore \quad \text{EA} &= 289 - 617 \\ &= -328 \text{ kJ mol}^{-1} \end{aligned}$$

4. Let the degree of association be α.

$$\begin{array}{lll} M & \rightleftharpoons & (M)_n \\ 1 & 0 & \text{Initially} \\ 1-\alpha & \dfrac{\alpha}{n} & \text{At time } t \end{array}$$

$$\text{Total moles after association} = 1 - \alpha + \frac{\alpha}{n} = 1 + \left(\frac{1}{n} - 1\right)\alpha$$

$$i = \frac{\text{moles after association}}{\text{initial moles}}$$

$$i = \frac{1 + \left(\frac{1}{n} - 1\right)\alpha}{1}$$

$$\text{or} \qquad (i - 1) = \left(\frac{1}{n} - 1\right)\alpha$$

We have, $i = 0.9$ and $\alpha = 0.2$

On putting values,

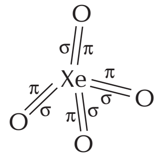
$$\begin{aligned} 0.9 - 1 &= \left(\frac{1}{n} - 1\right)0.2 \\ -0.1 &= -0.2 + \frac{0.2}{n} \\ -0.1 + 0.2 &= \frac{0.2}{n} \\ n &= \frac{0.2}{0.1} = 2 \end{aligned}$$

5. For a substance to dissolve, the hydration energy must be greater than lattice energy. Due to small size of Li^+ ion, the hydration energy of LiF is considerably high, but it has low solubility in water because of its higher lattice energy.

On moving down the group lattice energy decreases which results in increased solubility. Thus, the order of solubility for alkali metal fluorides in water is

$$\text{LiF} < \text{NaF} < \text{KF} < \text{RbF}$$

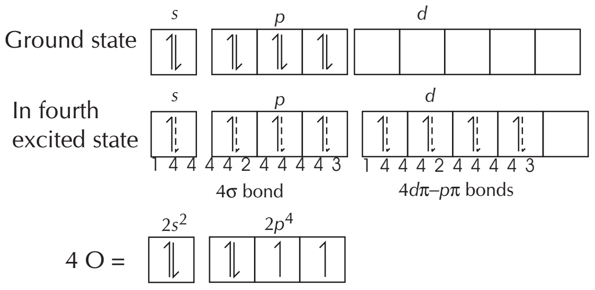
6. The structure of XeO_4 molecule is as



Thus, it contains four $p\pi$-$d\pi$ bonds.

Alternatively

$$\text{Xe} = 5s^2, 5p^6, 5d^0$$

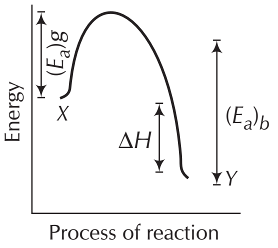


7. An exothermic reaction can be represented as

$$X \longrightarrow Y + \text{energy}$$

i.e., energy of $Y << X$

So, the energy profile diagram is



$$\therefore \quad (E_a)_f + \Delta H = (E_a)_b$$
$$150 + 135 = (E_a)_b$$
$$(E_a)_b = 285 \text{ kJ mol}^{-1}$$

8. Kjeldahl method can be used to determine nitrogen in nitro and azo groups and nitrogen present in the ring. Among the given, only alanine [$H_2N\,CH(CH_3)\,COOH$] have nitrogen in open chain and as amino group, so it can be estimated by using Kjeldahl method.

9. Aspirin is a non-narcotic (non habit forming) analgesic *i.e.*, give relief from pain and also it have antiblood clotting action. It is a neurologically active drug.

10. 3*M* solution means 3 moles of solute (NaCl) are present in 1000 L of solution.

Mass of solution = volume of solution × density

$$= 1000 \times 1.252$$
$$= 1252 \text{ g}$$

Mass of solute = No. of moles × molar mass of NaCl

$$= 3 \times 58.5 \text{ g} = 175.5 \text{ g}$$

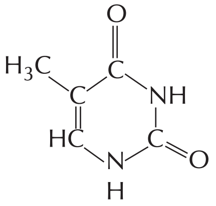
Mass of solvent = (1252 − 175.5) g

$$= 1076.5 \text{ g}$$
$$= 1.076 \text{ kg}$$

$$\text{Molality} = \frac{\text{moles of solute}}{\text{mass of solvent (in kg)}}$$

$$= \frac{3}{1.076} = 2.79 \text{ m}$$

11. The structure of thymine is

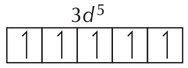


12. Polymethyl methacrylate (PMMA or plexi glass) is used as a substitute of glass so used to prepare optical lenses.

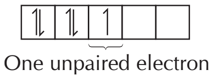
13. If there is no unpaired electrons, the species is diamagnetic.

Fe^{3+} and Co^{3+} both the ions have unpaired electrons in their ground state, but strong field ligands, like CN^-, OX if present, pair up the unpaired electrons resulting to reduce paramagnetism.

$Fe^{3+} = 3d^5 4s^0$

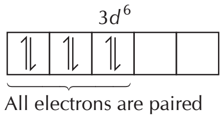


In $[Fe(CN^-)_6]^{3-}$,



$Co^{3+} = 3d^6 4s^0$

In $[Co(OX)_3]^{3-}$,



Thus, $[Co(OX)_3]^{3-}$ is a diamagnetic species as all the electrons are paired in it.

14. The MO configuration of the given species can be written as

$H_2\,(1 + 1 = 2) = \sigma\, 1s^2$

$Li_2\,(3 + 3 = 6) = \sigma\, 1s^2, \sigma^* 1s^2, \sigma\, 2s^2$

$B_2 (5 + 5 = 10) = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2px^1 \approx \pi 2py^1$

As the number of antibonding electrons (σ^* or π^*) increases, energy increases and stability decreases. Thus, the correct order of stability is

$$H_2 > Li_2 > B_2$$

(*) No answer is found true.

15. (i) $\underset{s_1 \text{ mol L}^{-1}}{Hg_2Cl_2} \rightleftharpoons \underset{s_1}{Hg_2^{2+}} + \underset{2s_1}{2Cl^-}$

$$K_{sp} = [Hg_2^{2+}][Cl^-]^2$$
$$= (s_1)(2s_1)^2 = s_1 \cdot 4s_1^2 = 4s_1^3$$

$$\therefore \text{Solubility, } s_1 = \left(\frac{K_{sp}}{4}\right)^{1/3}$$

(ii) $\underset{s_2 \text{ mol L}^{-1}}{Cr_2(SO_4)_3} \rightleftharpoons \underset{2s_2}{2Cr^{3+}} + \underset{3s_2}{3SO_4^{2-}}$

$$K_{sp} = [Cr^{3+}]^2 [SO_4^{2-}]^3 = (2s_2)^2 (3s_2)^3$$
$$= 4s_2^2 \times 27s_2^3 = 108 s_2^5$$

$$\therefore \text{Solubility, } s_2 = \left(\frac{K_{sp}}{108}\right)^{1/5}$$

(iii) $\underset{s_3 \text{ mol L}^{-1}}{BaSO_4} \rightleftharpoons \underset{s_3}{Ba^{2+}} + \underset{s_3}{SO_4^{2-}}$

$$K_{sp} = [Ba^{2+}][SO_4^{2-}] = (s_3)^2$$

$\therefore$ Solubility, $s_3 = (K_{sp})^{1/2}$

(iv) $\underset{s_4 \text{ mol L}^{-1}}{CrCl_3} \rightleftharpoons \underset{s_4}{Cr^{3+}} + \underset{3s_4}{3Cl^-}$

$$\begin{aligned} K_{sp} &= [Cr^{3+}][Cl^-]^3 \\ &= (s_4)(3s_4)^3 \\ &= 27s_4^4 \end{aligned}$$

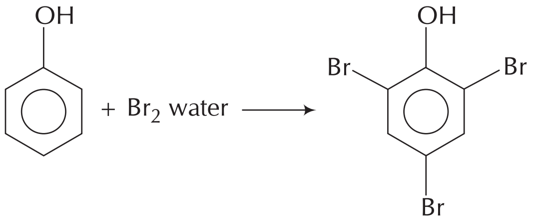
$\therefore$ Solubility, $s_4 = \left(\dfrac{K_{sp}}{27}\right)^{1/4}$

16. For Balmer series, $n_1 = 2$ and $n_2 = (n_1 + 1)$ for first emission line $= (2 + 1) = 3$

We know that,

$$\begin{aligned} \text{wave number, } \bar{v} &= R_H\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right) \\ &= R\left(\frac{1}{(2)^2} - \frac{1}{(3)^2}\right) \\ &= R\left(\frac{1}{4} - \frac{1}{9}\right) \\ &= \frac{5R}{36} \end{aligned}$$

17. When phenol reacts with bromine water, it results in the formation of white crystalline precipitate of 2,4,6-tribromophenol because of the generation of highly reactive phenoxide ion.



2, 4, 6-tribromo phenol

18. 5.0×10^{-2} M NaOH $\equiv [OH^-] = 5 \times 10^{-2}$M

$$\begin{aligned} [H^+][OH^-] &= 1 \times 10^{-14} \\ [H^+] \cdot 5 \times 10^{-2} &= 1 \times 10^{-14} \\ [H^+] &= \frac{1 \times 10^{-14}}{5 \times 10^{-2}} = 2 \times 10^{-13} \\ pH &= -\log[H^+] \\ &= -\log(2 \times 10^{-13}) \\ &= 12.69 \approx 12.70 \end{aligned}$$

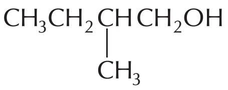
19. Flocculation value of $BaCl_2$ is less than that of KCl so sol *A* must not be negatively charged. It should be positively charged.

Similarly, flocculation value of Na_2SO_4 is much less than that of NaBr, it means sol *A* must not be positively charged. It should be negatively charged.

20. Conc. HCl and $ZnCl_2$ is Lucas reagent and 3° alcohols (alcohols having $\rightarrow$C—OH group) react fastest with it.

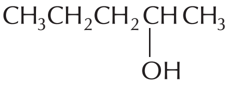
The structures of the given alcohols are as

$CH_3CH_2CH_2CH_2CH_2OH$
pentanol (1° alcohol)



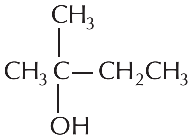
$\underset{\displaystyle CH_3}{CH_3CH_2\underset{|}{C}HCH_2OH}$

2-methylbutanol
(1° alcohol)



$CH_3CH_2CH_2\underset{\underset{\displaystyle OH}{|}}{C}HCH_3$

2-pentanol
(2° alcohol)



$CH_3\overset{\overset{\displaystyle CH_3}{|}}{\underset{\underset{\displaystyle OH}{|}}{C}}-CH_2CH_3$

2-methylbutan-2-ol
(3° alcohol)

Hence, 2-methylbutan-2-ol reacts fastest with the given reagent.

21. We know that acidic strength $\propto K_a$ value.

Thus, on the basis of K_a value, order of acidic strength is

$$HCN < HNO_2 < HF$$

Conjugate base of a strong acid is weak.

Therefore, the order of base strength of conjugate base is

$$F^- < NO_2^- < CN^-$$

22. Zn—Hg with HCl is called Clemmensen reagent. It reduces the $>C=O$ group of a ketone into $>CH_2$ group. Thus, the reaction.

$$>C=O \xrightarrow[\text{Conc. HCl}]{\text{Zn—Hg}} >CH_2$$

is called Clemmensen reduction.

23. $Fe^{3+} + SCN^- \longrightarrow [Fe(SCN)]^{2+}$
red colour, not
blood red colour

All other given statements are correct.

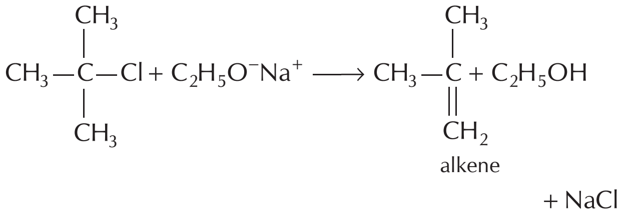
24. Atomic radii decreases along a period due to increase in effective nuclear charge and increases on moving down a group.

Therefore, atomic radii of element of group 15, *i.e.*, As is greater than the elements of group 16.

Hence, the correct order of atomic radii is

$$O < S < Se < As.$$

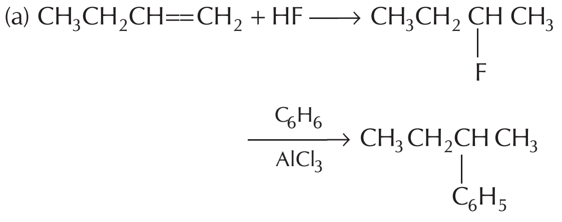
25. Tertiary (3°) halides are more reactive towards elimination than substitution in the presence of a base like alkoxide ion. That's why in Williamson synthesis, if tertiary halide is taken, alkene will be the major product.



$$CH_3-\overset{\overset{CH_3}{|}}{\underset{\underset{CH_3}{|}}{C}}-Cl + C_2H_5O^-Na^+ \longrightarrow CH_3-\overset{\overset{CH_3}{|}}{\underset{\underset{CH_2}{\|}}{C}} + C_2H_5OH + NaCl$$

alkene

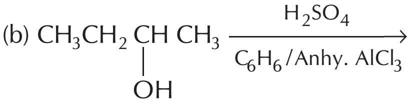
26. (a)



$$CH_3CH_2CH{=\!=}CH_2 + HF \longrightarrow CH_3CH_2\underset{\underset{F}{|}}{CH}CH_3 \xrightarrow[AlCl_3]{C_6H_6} CH_3CH_2\underset{\underset{C_6H_5}{|}}{CH}CH_3$$

2-phenylbutane

(b)

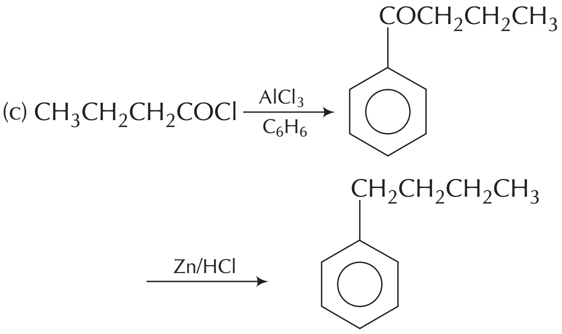


$$CH_3CH_2\underset{\underset{OH}{|}}{CH}CH_3 \xrightarrow[C_6H_6/\text{Anhy. }AlCl_3]{H_2SO_4}$$

$CH_3CH_2CH(C_6H_5)CH_3$

2-phenylbutane

(c)



1-phenyl butane

(d) $CH_3CH_2CH_2CH_2Cl \xrightarrow[\substack{\text{Anhy }AlCl_3\\ \text{(involves}\\ \text{rearrangement)}}]{C_6H_6}$

$CH_3CH_2CH(CH_6H_5)CH_3$

2-phenyl butane

27. The structure in which bulkier groups (which is Me group here) occupy equatorial positions is more stable than the one in which bulkier group are at axial positions. Here, the order of stability is

$$\text{III} > \text{I} \approx \text{II} > \text{IV}$$

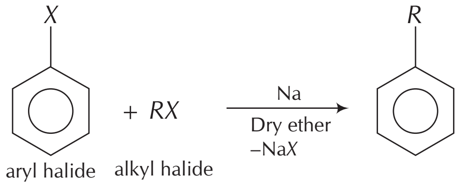
28. For hcp and ccp packing both packing fraction is 74%.

$\therefore$ Fraction of free space or void $= 100 - 74$

$= 26\%$

Coordination number in bcc packing is 8 and in hcp packing is 12.

29. When one molecule of alkyl halide undergoes condensation with one molecule of aryl halide in the presence of Na in dry ether, the reaction is called Wurtz–Fittig reaction *e.g.*,



30. In Goldschmidt aluminothermic process, oxides of Cr, Fe etc., are treated with Al powder which reduces these oxides into crude metal. Thus, acts as reducing agent here.

$$Fe_2O_3 + \underset{\text{reducing agent}}{2Al} \longrightarrow Al_2O_3 + 2Fe$$

Online Exam Held on
23-4-2013

JEE Main

Solved Paper 2013

Instructions

- This test consists of 30 questions.
- Each question is allotted 4 marks for correct response.
- Candidates will be awarded marks as stated above for correct response of each question. 1/4 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
- There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.

---

1. Which of the following polymer is a polyamide?
(a) Terylene (b) Nylon
(c) Rubber (d) Vulcanised rubber

2. The magnetic moment of the complex anion $[Cr(NO)(NH_3)(CN)_4]^{2-}$ is
(a) 5.91 BM (b) 3.87 BM
(c) 1.73 BM (d) 2.82 BM

3. Glycosidic linkage is actually an
(a) carbonyl bond (b) ether bond
(c) ester bond (d) amide bond

4. Equimolar solutions of the following compounds are prepared separately in water. Which will have the lowest pH value ?
(a) $BeCl_2$ (b) $SrCl_2$
(c) $CaCl_2$ (d) $MgCl_2$

5. The number of protons, electrons and neutrons in a molecule of heavy water are respectively
(a) 8, 10, 11 (b) 10, 10, 10
(c) 10, 11, 10 (d) 11, 10,10

6. Number of atoms in the following samples of substances is the largest in
(a) 4.0 g of hydrogen (b) 70.0g of chlorine
(c) 127.0 g of iodine (d) 48.0 g of magnesium

7. Which has trigonal bipyramidal shape?
(a) $XeOF_4$ (b) XeO_3
(c) XeO_3F_2 (d) $XeOF_2$

8. Which is the correct order of second ionization potential of C, N, O and F in the following?
(a) $O > N > F > C$ (b) $O > F > N > C$
(c) $F > O > N > C$ (d) $C > N > O > F$

9. Natural glucose is termed D-glucose because
(a) —OH on the second carbon is on the right side in the Fischer projection
(b) —OH on the sixth carbon is on the right side in the Fischer projection
(c) —OH on the fifth carbon is on the right side in Fischer projection
(d) It is dextrorotatory

10. The shape of IF_6^- is
(a) trigonally distorted octahedron
(b) pyramidal
(c) octahedral
(d) square antiprism

11.
$$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g), K_1 \quad \ldots(i)$$
$$N_2(g) + O_2(g) \rightleftharpoons 2NO(g), K_2 \quad \ldots(ii)$$
$$H_2(g) + \frac{1}{2}O_2(g) \rightleftharpoons H_2O(g), K_3 \quad \ldots(iii)$$

The equation for the equilibrium constant of the reaction $2NH_3(g) + \frac{5}{2}O_2(g) \rightleftharpoons 2NO(g) + 3H_2O(g)$, (K_4) in terms of K_1, K_2 and K_3 is
(a) $\frac{K_1K_2}{K_3}$ (b) $\frac{K_1K_3^2}{K_2}$
(c) $K_1K_2K_3$ (d) $\frac{K_2K_3^3}{K_1}$

12. H_1-receptor antagonists is a term associated with
(a) antiseptics (b) antihistamines
(c) antacids (d) analgesics

13. The correct order of viscosity of the following liquids will be
(a) water < methyl alcohol < dimethyl ether < glycerol
(b) methyl alcohol < glycerol < water < dimethyl ether
(c) dimethyl ether < methyl alcohol < water < glycerol
(d) glycerol < dimethyl ether < water < methyl alcohol

14. What is the pH of a 10^{-4} M OH^- solution at 330K, if K_w at 330 K is $10^{-13.6}$?
(a) 4 (b) 9.0 (c) 10 (d) 9.6

15. The order of reactivity of the given haloalkanes towards nucleophile is
(a) $RI > RBr > RCl$ (b) $RCl > RBr > RI$
(c) $RBr > RCl > RI$ (d) $RBr > RI > RCl$

16. Identify the incorrect statement.
(a) In $(Si_3O_9)^{6-}$, tetrahedral SiO_4 units share two oxygen atoms
(b) Trialkyl chlorosilane on hydrolysis gives R_3SiOH
(c) $SiCl_4$ undergoes hydrolysis to give H_4SiO_4
(d) $(Si_3O_9)^{6-}$ has cyclic structure

17. When a small amount of $KMnO_4$ is added to concentrated H_2SO_4, a green oily compound is obtained which is highly explosive in nature. Compound may be
(a) $MnSO_4$ (b) Mn_2O_7
(c) MnO_2 (d) Mn_2O_3

18. The reaction of phenol with benzoyl chloride to give phenyl benzoate is known as
(a) Claisen reaction
(b) Schotten-Baumann reaction
(c) Reimer-Tiemann reaction
(d) Gatterman-Koch reaction

19. Identify the incorrect statement.
(a) Cu_2O is colourless
(b) Copper (I) compounds are colourless except where colour results from charge transfer.
(c) Copper (I) compounds are diamagnetic
(d) Cu_2S is black

20. Vapour pressure of pure benzene is 119 torr and that of toluene is 37.0 torr at the same temperature. Mole fraction of toluene in vapour phase which is in equilibrium with a solution of benzene and toluene having a mole fraction of toluene 0.50, will be
(a) 0.137 (b) 0.237
(c) 0.435 (d) 0.205

21. In a face centred cubic lattice, atoms of *A* form the corner points and atoms of *B* form the face centered points. If two atoms of *A* are missing from the corner points, the formula of the ionic compound is
(a) AB_3 (b) AB_4 (c) A_2B_5 (d) AB_2

22. The de-Broglie wavelength of a car of mass 1000 kg and velocity 36 km/h is
($h = 6.63 \times 10^{-34}$ Js)
(a) 6.626×10^{-34} m (b) 6.626×10^{-38} m
(c) 6.626×10^{-31} m (d) 6.626×10^{-30} m

23. Given, $E^0_{\frac{1}{2}Cl_2/Cl} = 1.36$ V, $E^0_{Cr^{3+}/Cr} = -0.74$ V,

$E^0_{Cr_2O_7^{2-}/Cr^{3+}} = 1.33$ V, $E^0_{MnO_4^-/Mn^{2+}} = 1.51$ V

The correct order of reducing power of the species (Cr, Cr^{3+}, Mn^{2+} and Cl^-) will be
(a) $Mn^{2+} < Cl^- < Cr^{3+} < Cr$
(b) $Mn^{2+} < Cr^{3+} < Cl^- < Cr$
(c) $Cr^{3+} < Cl^- < Mn^{2+} < Cr$
(d) $Cr^{3+} < Cl^- < Cr < Mn^{2+}$

24. Smoke is an example of
(a) solid dispersed in solid (b) gas dispersed in liquid
(c) solid dispersed in gas (d) gas dispersed in solid

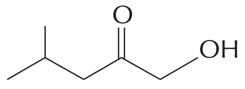
25. Which of the following statements/relationships is not correct in thermodynamic changes?
(a) $\Delta U = 0$ (isothermal reversible expansion of a gas)
(b) $W = -nRT \ln\frac{V_2}{V_1}$ (isothermal reversible expansion of an ideal gas)
(c) $q = -nRT \ln\frac{V_2}{V_1}$ (isothermal reversible expansion of an ideal gas)
(d) For a system, at constant volume, heat involved completely changes to internal energy

26. Bond distance in HF is 9.17×10^{-11} m. Dipole moment of HF is 6.104×10^{-30} Cm. The per cent ionic character in HF will be (electron charge $= 1.60 \times 10^{-19}$ C)
(a) 61.0% (b) 38.0%
(c) 35.5% (d) 41.5%

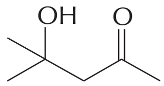
27. The rate constant of a zero order reaction is 2.0×10^{-2} mol L^{-1} s^{-1}. If the concentration of the reactant after 25 s is 0.5 M, what is the initial concentration?
(a) 0.5 M (b) 1.25 M
(c) 12.5 M (d) 1.0 M

28. Which of the following is the product of aldol condensation?

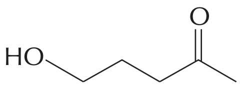
(a)



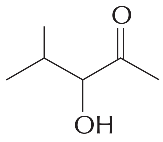
(b)



(c)



(d)



29. The order of basicity of amines in gaseous state is
(a) $1° > 2° > 3° > NH_3$
(b) $3° > 2° > NH_3 > 1°$
(c) $3° > 2° > 1° > NH_3$
(d) $NH_3 > 1° > 2° > 3°$

30. Monocarboxylic acids are functional isomers of
(a) ethers
(b) amines
(c) esters
(d) alcohols

Answers

1. (b)	**2.** (c)	**3.** (b)	**4.** (a)	**5.** (b)	**6.** (a)	**7.** (c)	**8.** (b)	**9.** (c)	**10.** (a)

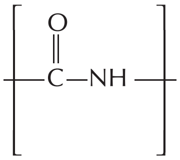
Hints *and* Solutions

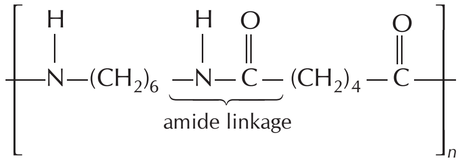
1. Among the given polymers, only nylon contains



$$\left[\overset{\displaystyle O}{\overset{\|}{C}}—NH \right]$$

or amide linkage, so it is also called a polyamide *e.g.*, nylon-66

$$\underset{\text{hexamethylene diamine}}{nH_2N(CH_2)_6NH_2} + \underset{\text{adipic acid}}{nHOOC(CH_2)_4COOH} \xrightarrow[-H_2O]{}$$



$$\left[\overset{\displaystyle H}{\overset{|}{N}}—(CH_2)_6\underbrace{—\overset{\displaystyle H}{\overset{|}{N}}—\overset{\displaystyle O}{\overset{\|}{C}}—}_{\text{amide linkage}}(CH_2)_4—\overset{\displaystyle O}{\overset{\|}{C}} \right]_n$$

nylon-66

2. In $[Cr(NO)(NH_3)(CN)_4]^{2-}$,

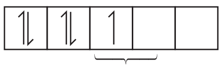
Let the oxidation state of Cr is x.

$$\therefore \quad x + (+1) + (0) + (-1)4 = -2$$
$$x - 3 = -2$$
$$x = 1$$
$$Cr^+ = [Ar]\,3d^5\,4s^0$$

But CN^- and NO being strong field ligands pair up the unpaired electrons of Cr^+.

$$[Cr(NO)(NH_3)(CN)_4]^{2-}$$

[Ar] =

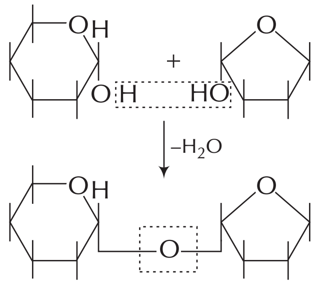


One unpaired electron

$$\therefore \quad n = 1$$

Magnetic moment, $\mu = \sqrt{n(n+2)}$
$$= \sqrt{1(1+2)} = \sqrt{3} = 1.73 \text{ BM}$$

3. A linkage between two monosaccharide units through oxygen atom is called glycosidic linkage *e.g.*,



glycosidic linkage

Thus, glycosidic linkage (*R*—O—*R*) is actually an ether bond.

4. Alkaline earth metal chlorides form strong acid HCl and base $M(OH)_2$ (where, M = alkaline earth metal) when dissolved in water. On moving down the group, the strength of $M(OH)_2$ increases, hence, it neutralises the acid more and reduces the acidity of solution or increases the pH of solution. (as pH varies inversely with acidity) Thus, the solution of $BeCl_2$ because of the less basic nature of $Be(OH)_2$ is most acidic and hence, have lowest pH value.

5. Heavy water is D_2O.

In it,

Number of $p^+ = 1 \times 2 + 8 = 10$

Number of $e^- = 1 \times 2 + 8 = 10$

Number of $n^0 = 1 \times 2 + 8 = 10$

(∵ D have 1 n^0 because it is actually, ${}_1H^2$.)

6. $$\text{Number of atoms} = \frac{\text{weight}}{\text{atomic weight}} \times N_A \times \text{species}$$

∴ In 4 g of hydrogen,

$$\text{Number of atoms} = \frac{4}{2} \times N_A \times 2 = 4N_A$$

[Here species = 2 because hydrogen is present as H_2]

In 71 g of chlorine, $= 2N_A$

$$\text{Number of atoms} = \frac{71}{71} \times N_A \times 2 = 2\,N_A$$

In 127 g of iodine,

$$\text{Number of atoms} = \frac{127}{127} \times N_A \times 2 = 2N_A$$

In 48 g of magnesium,

$$\text{Number of atoms} = \frac{48}{24} \times N_A \times 1 = 2N_A$$

[Here Mg is present as Mg so species = 1]

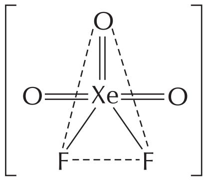
Thus, the number of atoms are largest in 4 g of hydrogen.

7. The shape is trigonal bipyramidal, if a compound have 5 bond pairs and 0 lone pairs.

$XeOF_4 = 5bp + 1lp$ = square pyramidal shape

$XeO_3 = 3bp + 1lp$ = pyramidal shape

$XeO_3F_2 = 5bp + 0lp$ = trigonal bipyramidal shape



$XeOF_2 = 3bp + 2lp$ = T-shape

8. Second ionisation potential represents the amount of energy required to remove an electron from a unipositive ion. The electronic configuration of unipositive ions of given atoms is as

$$C^+(6-1=5) = 1s^2, 2s^2, 2p^1$$

$$N^+(7-1=6) = 1s^2, 2s^2, 2p^2$$

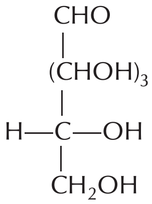
$$O^+(8-1=7) = 1s^2, 2s^2, 2p^3$$

$$F^+(9-1=8) = 1s^2, 2s^2, 2p^4$$

From the electronic configuration, it is clear that the second IP of O is highest because here the electron which is to be removed belongs to half-filled (so more stable) *p* orbital. Moreover, along a period, as the number of electrons increases, size decreases, effective nuclear charge increases and hence, IP increases. Thus, the correct order of second IP is

$$O > F > N > C$$

9. Depending upon the configuration of glyceraldehyde (where the configuration is D if —OH present at the C attached to CH_2OH group is on right side), glucose is called D-glucose, if the —OH group present at the C bearing —CH_2OH group (which is fifth carbon here) is on the right hand side, *i.e.*,



$$\begin{array}{c} CHO \\ | \\ (CHOH)_3 \\ | \\ H{-}C{-}OH \\ | \\ CH_2OH \end{array}$$

right hand side

10. Number of hybrid orbital,

$$H = \frac{1}{2}[V - C + A + M]$$

[Here V = valence e^- of central atom, C and A = positive and negative charge respectively, M = monovalent atoms]

In IF_6^-,

$$H = \frac{1}{2}[7 - 0 + 1 + 6] = 7$$

So, the hybridisation is sp^3d^3 and structure should be pentagonal bipyramidal.

But it contains one lone pair, so bond pair = 6

Hence, its actual geometry is trigonally distorted octahedron.

11. In the required equation NH_3 is on LHS, so invert the equation (i)

$$2NH_3(q) \rightleftharpoons N_2(g) + 3H_2(g);\ K_5 = \frac{1}{K_1} \qquad \text{...(iv)}$$

Moreover, there are three moles of H_2O, so multiply Eq. (iii) by 3

$$3H_2(g) + \frac{3}{2}O_2(g) \rightleftharpoons 3H_2O(g);\ K_6 = K_3^3 \qquad \text{...(v)}$$

(because when a reaction is multiplied by n, K becomes K^n).

$$N_2(g) + O_2(g) \rightleftharpoons 2\,NO\,(g),\ K_2$$

On adding Eqs. (iv), (ii) and (v) we get

$$2NH_3(g) + \frac{5}{2}O_2(g) \rightleftharpoons 2NO(g) + 3H_2O(g)$$

$$K_4 = K_2 \times K_5 \times K_6$$

[because equilibrium constants are multiplied, when two or more reactions are added.]

On putting the values of K_5 and K_6, we get

$$K_4 = K_2 \cdot \frac{1}{K_1} \cdot K_3^3$$

$$= \frac{K_2K_3^3}{K_1}$$

12. The term antihistamine refers only to compounds not have inhibit action at the H_1-receptor so the term H_1-receptor antagonists is related with antihistamines.

13. Viscosity shows the rate of flow of a liquid. It is actually the measure of frictional resistance, and frictional resistance is more, when bonding is strong. In glycerol, there is excessive H-bonding because of the presence of three —OH groups, so it is highly viscous. H-bonding is least in dimethyl ether, so it is least viscous.

Hence, the order of viscosity is

$$\underset{(\text{no —OH})}{\text{dimethylether}} < \underset{\text{One —OH}}{\text{methyl alcohol}} < \underset{(2\text{ —OH})}{H_2O} < \underset{(3\text{ —OH})}{\text{glycerol}}$$

14. At 330 K,

$$[H^+][OH^-] = K_w = 1\times10^{-13.6}$$
$$[H^+](10^{-4}\text{ M}) = 1\times10^{-13.6}$$
$$[H^+] = \frac{1\times10^{-13.6}}{10^{-4}}$$
$$= 10^{-9.6}$$
$$\text{pH} = -\log[H^+]$$
$$= -\log(10^{-9.6})$$
$$= 9.6$$

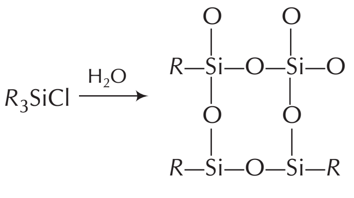
15. As the size of halogen atom increases, R—X bond length increases and hence, R—X bond becomes weak. Thus, reactivity increases. Hence, the order of reactivity is

$$R\text{—}\underbrace{\text{I}}_{\text{larger}} > R\text{—Br} > R\text{—}\underbrace{\text{Cl}}_{\text{small}}$$

16. When two oxygen per SiO_4 tetrahedron are shared,cyclic silicates containing $Si_3O_9^{6-}$ or $Si_6O_{15}^{12-}$ units may be obtained.

$SiCl_4$ when subjected to hydrolysis results in the formation of silicic acid, $Si(OH)_4$ or H_4SiO_4.

Hydrolysis of trialkyl chlorosilane gives very complex cross-linked polymer.

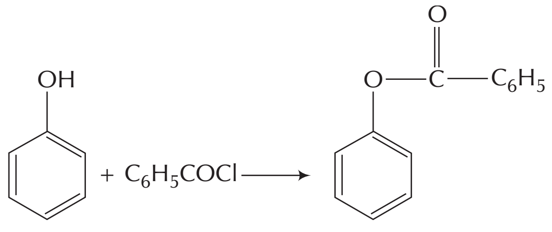


17. When a small amount of $KMnO_4$ is added to concentrated H_2SO_4, manganese heptoxide is obtained, which on warming decomposes with a mild explosion into MnO_2 and O_2.

$$2KMnO_4 + H_2SO_4 \longrightarrow \underset{\text{green liquid}}{Mn_2O_7} + K_2SO_4 + H_2O$$

$$2Mn_2O_7 \longrightarrow 4MnO_2 + 3O_2$$

18. The reaction of phenol with benzoyl chloride to give phenyl benzoate is also known as Schotten-Baumann reaction.



phenyl benzoate

19. Cu_2O is not colourless, it is coloured because of the presence of one unpaired electron, which makes d-d transition possible.

$Cu^{2+} = [Ar]\,3d^9$

All other given statements are correct.

20. From Raoult's law, for ideal solution,

$$p = p_B^0 x_B + p_T^0 x_T$$
$$[B = \text{Benzene}, T = \text{Toluene}]$$
$$= 119\times0.5 + 37\times0.5 \qquad (\because x_B = 1 - x_T)$$
$$= 59.5 + 18.5$$
$$= 78\text{ torr}$$

Mole fraction of toluene in vapour phase

$$(x_T)_v = \frac{p_T^o x_T}{p}$$
$$= \frac{18.5}{78}$$
$$= 0.237$$

21. While solving such problems always remember that each corner atom is shared by 8 unit cells and each face centre atom is shared by 2 unit cells.

$\therefore$ Number of A atoms per unit cell $= (8-2)\times\frac{1}{8} = \frac{6}{8} = \frac{3}{4}$

Number of B atoms per unit cell $= 6\times\frac{1}{2} = 3$

$$A : B = \frac{3}{4} : 3 = 1 : 4$$

$\therefore$ Formula of the ionic compound is AB_4.

22. de-Broglie equation is

$$\lambda = \frac{h}{mv}$$

Given, $m = 1000$ kg and $v = 36$ km/h

$$= \frac{36\times1000}{60\times60} = 10\text{ m/s}$$

On putting values,

$$\lambda = \frac{6.63 \times 10^{-34}}{1000 \times 10}$$

$$= 6.63 \times 10^{-38} \text{ m}$$

23. More the negative value of reduction potential, higher the reducing power. Thus, the correct order of reducing tendency is

$$\underset{(1.51\text{ V})}{\text{Mn}^{2+}} < \underset{(1.36\text{ V})}{\text{Cl}^{-}} < \underset{(1.33\text{ V})}{\text{Cr}^{3+}} < \underset{(-0.74\text{ V})}{\text{Cr}}$$

24. Smoke is a colloid in which dispersed phase is solid and dispersion medium is gas or in other words, in smoke, a solid is dispersed in a gas.

25. For isothermal process, $\Delta U = 0$

From first law of thermodynamics

$$\Delta U = q + W$$

At constant volume, $\Delta V = 0$

$\therefore \quad W = 0$

so, $\quad \Delta U = q$

i.e., heat involved completely changes to internal energy.

If $\quad \Delta U = 0$

$$q = -W$$

$$= -\left(-nRT \ln \frac{V_2}{V_1}\right)\left[\because W_{\text{rev}} = -nRT \ln \frac{V_2}{V_1}\right]$$

$$= nRT \ln \frac{V_2}{V_1}$$

26. $$\% \text{ ionic character} = \frac{\mu_{\text{observed}}}{\mu_{\text{calculated}}} \times 100$$

$$\mu_{\text{observed}} = 6.104 \times 10^{-30} \text{ Cm}$$

$$\mu_{\text{calculated}} = e \times d$$

$$= 1.6 \times 10^{-19} \text{ C} \times 9.17 \times 10^{-11} \text{ m}$$

$$= 1.467 \times 10^{-29} \text{ Cm}$$

$$\therefore \% \text{ ionic character} = \frac{6.104 \times 10^{-30}}{1.467 \times 10^{-29}} \times 100$$

$$= 41.6\%$$

27. For zero order reaction,

$$\text{rate } = \frac{dx}{dt} = k$$

$$= \frac{x_1 - x_2}{dt}$$

$$= 2.0 \times 10^{-2}$$

$$\frac{x_1 - 0.5}{25} = 2.0 \times 10^{-2}$$

(Here, $x_1 =$ initial concentration)

$$x_1 - 0.5 = 0.5$$

$$x_1 = 0.5 + 0.5$$

$$= 1.0 \text{ M}$$

28. When two aldehydes or ketones (or carbonyl compounds) having α-hydrogen atoms react in the presence of a base, they result in the formation of β-hydroxy aldehyde or ketone, called the aldol or ketol and the reaction is called aldol condensation.

Thus, 
is the product of aldol condensation.

29. In gaseous state, as the number of alkyl group increases, electron density and hence, the availability of electrons for donation increases, thus, basicity increases.
Hence, the correct order of basicity of amines in gaseous state is

$$3° > 2° > 1° > \text{NH}_3$$

30. Monocarboxylic acids and esters have the same general formula but different functional groups, so these are called functional isomers. *e.g.*, $C_3H_6O_2$ can be CH_3CH_2COOH or CH_3COOCH_3.

Online Exam Held on
25-4-2013

JEE Main

Solved Paper 2013

Instructions

- This test consists of 30 questions.
- Each question is allotted 4 marks for correct response.
- Candidates will be awarded marks as stated above for correct response of each question. 1/4 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
- There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.

---

1. The catenation tendency of C, Si and Ge is in the order Ge < Si < C. The bond energies (in kJ mol^{-1}) of C—C, Si—Si and Ge—Ge bonds are respectively

(a) 348, 297, 260 (b) 297, 348, 260
(c) 348, 260, 297 (d) 260, 297, 348

2. In which of the following exothermic reactions, the heat liberated per mole is the highest ?

(a) $CaO + H_2O \longrightarrow Ca(OH)_2$
(b) $SrO + H_2O \longrightarrow Sr(OH)_2$
(c) $BaO + H_2O \longrightarrow Ba(OH)_2$
(d) $MgO + H_2O \longrightarrow Mg(OH)_2$

3. Given,

(i) $n = 5, m_l = +1$
(ii) $n = 2, l = 1, m_l = -1, m_s = -1/2$

The maximum number of electron(s) in an atom that can have the quantum numbers as given in (i) and (ii) are respectively

(a) 25 and 1 (b) 8 and 1
(c) 2 and 4 (d) 4 and 1

4. Which one of the following cannot function as an oxidising agent?

(a) I^- (b) $S(s)$
(c) $NO_3^-(aq)$ (d) $Cr_2O_7^{2-}$

5. Given,

(i) 
(ii) 
(iii) 
(iv) 
In the above compounds correct order of reactivity in electrophilic substitution reactions will be

(a) (ii) > (i) > (iii) > (iv)
(b) (iv) > (iii) > (ii) > (i)
(c) (i) > (ii) > (iii) > (iv)
(d) (ii) > (iii) > (i) > (iv)

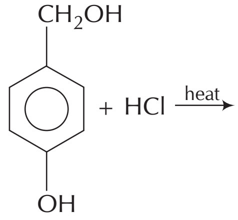
6. Which one of the following is the wrong assumption of kinetic theory of gases ?

(a) Momentum and energy always remain conserved
(b) Pressure is the result of elastic collision of molecules with the container's wall
(c) Molecules are separated by great distances compared to their sizes
(d) All the molecules move in straight line between collision and with same velocity

7. A radioactive isotope having a half-life period of 3 days was received after 12 days. If 3 g of the isotope is left in the container, what would be the initial mass of the isotope ?
(a) 12 g (b) 36 g
(c) 48 g (d) 24 g

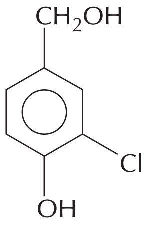
8. Which of the following statement is not correct ?
(a) Amylopectin is a branched polymer of α-glucose
(b) Cellulose is linear polymer of β-glucose
(c) Glycogen is the food reserve of plants
(d) All proteins are polymers of α-amino acids

9. The major product in the following reaction

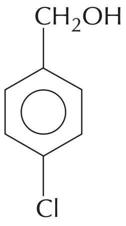


is

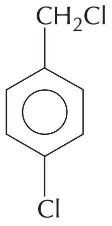
(a)



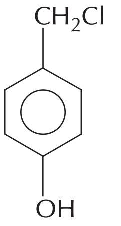
(b)



(c)



(d)



10. The ratio $\frac{K_p}{K_c}$ for the reaction,

$$CO(g) + \frac{1}{2}O_2(g) \rightleftharpoons CO_2(g) \text{ is}$$

(a) $\frac{1}{\sqrt{RT}}$ (b) $(RT)^{1/2}$
(c) RT (d) 1

11. Copper crystallises in fcc with a unit length of 361 pm. What is the radius of copper atom?
(a) 157 pm (b) 128 pm
(c) 108 pm (d) 181 pm

12. In which of the following sets, all the given species are isostructural ?
(a) CO_2, NO_2, ClO_2, SiO_2 (b) PCl_3, $AlCl_3$, BCl_3, $SbCl_3$
(c) BF_3, NF_3, PF_3, AlF_3 (d) BF_4^-, CCl_4, NH_4^+, PCl_4^+

13. Given that
(i) $\Delta_f H°$ of N_2O is 82 kJ mol^{-1}
(ii) Bond energies of $N{\equiv}N$, $N{=}N$, $O{=}O$ and $N{=}O$ are 946, 418, 498 and 607 kJ mol^{-1} respectively. The resonance energy of N_2O is
(a) -88 kJ (b) -66 kJ
(c) -62 kJ (d) -44 kJ

14. What would be the pH of a solution obtained by mixing 5 g of acetic acid and 7.5 g of sodium acetate and making the volume equal to 500 mL?
($K_a = 1.75 \times 10^{-5}$, $pK_a = 4.76$)
(a) pH = 4.70
(b) pH < 4.70
(c) pH of solution will be equal to pH of acetic acid
(d) 4.76 < pH < 5.0

15. 6 L of an alkene require 27 L of oxygen at constant temperature and pressure for complete combustion. The alkene is
(a) ethene (b) propene
(c) 1-butene (d) 2-butene

16. Bakelite is obtained from phenol by reacting with
(a) acetal
(b) CH_3CHO
(c) HCHO
(d) chlorobenzene

17. How many grams of methyl alcohol should be added to 10 L tank of water to prevent its freezing at 268 K?
(K_f for water is 1.86 K kg mol^{-1})
(a) 880.07 g (b) 899.04 g
(c) 886.02 g (d) 868.06 g

18. In which of the following octahedral complex species the magnitude of Δ_o will be maximum?
(a) $[Co(H_2O)_6]^{2+}$ (b) $[Co(CN)_6]^{3-}$
(c) $[Co(C_2O_4)_3]^{3-}$ (d) $[Co(NH_3)_6]^{3+}$

19. In nucleophilic substitution reaction, order of halogens as incoming (attacking) nucleophile is

$$I^- > Br^- > Cl^-$$

The order of halogens as departing nucleophile should be
(a) $Br^- > I^- > Cl^-$ (b) $I^- > Br^- > Cl^-$
(c) $Cl^- > Br^- > I^-$ (d) $Cl^- > I^- > Br^-$

20. The Gibbs energy for the decomposition of Al_2O_3 at 500°C is as follows

$$\frac{2}{3}Al_2O_3 \longrightarrow \frac{4}{3}Al + O_2, \ \Delta_r G = +940 \text{ kJ mol}^{-1}$$

The potential difference needed for the electrolytic reduction of aluminium oxide at 500°C should be atleast
(a) 4.5 V (b) 3.0 V
(c) 5.0 V (d) 2.5 V

21. Cannizzaro's reaction is not given by

(a) 
(b) 
(c) CH_3CHO (d) HCHO

22. Phenol on heating with $CHCl_3$ and NaOH gives salicylaldehyde. The reaction is called
(a) Reimer-Tiemann reaction
(b) Claisen reaction
(c) Cannizzaro's reaction
(d) Hell-Volhard-Zelinsky reaction

23. The internuclear distances in O—O bonds for O_2^+, O_2, O_2^- and O_2^{2-} respectively are
(a) 1.30 Å, 1.49 Å, 1.12 Å, 1.21 Å
(b) 1.49 Å, 1.21 Å, 1.12 Å, 1.30 Å
(c) 1.21 Å, 1.12 Å, 1.49 Å, 1.30 Å
(d) 1.12 Å, 1.21 Å, 1.30 Å, 1.49 Å

24. Among the following vitamins the one whose deficiency causes rickets (bone deficiency) is
(a) vitamin A (b) vitamin B
(c) vitamin D (d) vitamin C

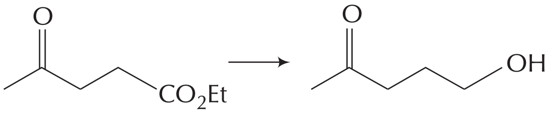
25. Which one of the following arrangements represents the correct order of the proton affinity of the given species?
(a) $I^- < F^- < HS^- < NH_2^-$ (b) $HS^- < NH_2^- < F^- < I^-$
(c) $F^- < I^- < NH_2^- < HS^-$ (d) $NH_2^- < HS^- < I^- < F^-$

26. Carbylamine forms from aliphatic or aromatic primary amine *via* which of the following intermediates?
(a) Carbanion (b) Carbene
(c) Carbocation (d) Carbon radical

27. 10 mL of 2M NaOH solution is added to 200 mL of 0.5 L M of NaOH solution. What is the final concentration?
(a) 0.57 M (b) 5.7 M
(c) 11.4 M (d) 1.14 M

28. The structure of which of the following chloro species can be explained on the basis of dsp^2 hybridization?
(a) $PdCl_4^{2-}$ (b) $FeCl_4^{2-}$
(c) $CoCl_4^{2-}$ (d) $NiCl_4^{2-}$

29. Which of the following reagent(s) used for the conversion?



(a) glycol/$LiAlH_4/H_3O^+$ (b) glycol/NaH/H_3O^+
(c) $LiAlH_4$ (d) $NaBH_4$

30. A solution of copper sulphate ($CuSO_4$) is electrolysed for 10 min with a current of 1.5 A. The mass of copper deposited at the cathode (atomic mass of Cu = 63 u) is
(a) 0.3892 g (b) 0.2938 g
(c) 0.2398 g (d) 0.3928 g

Answers

1. (a)	**2.** (d)	**3.** (b)	**4.** (a)	**5.** (a)	**6.** (d)	**7.** (c)	**8.** (c)	**9.** (d)	**10.** (a)

Hints and **Solutions**

1. Higher the catenation tendency, higher is the bond energy.
∴ The bond energies of C—C, Si—Si and Ge—Ge bonds are respectively 348, 297 and 260 kJ mol^{-1}.

2. Higher the stability of oxide, more will be the heat liberated per mole. On moving down the group, stability of oxides decreases, thus, MgO is most stable among the given and hence, heat liberated is highest in case of MgO.

3. (i) When $n = 5$

$l = 0, 1, 2, 3, 4$

When $l = 0, m_l = 0$

When $l = 1, m_l = 0, +1, -1$ (two e^-)

When $l = 2, m_l = 0, \pm 1, \pm 2$ (two e^-)

When $l = 3, m_l = 0, \pm 1, \pm 2, \pm 3$ (two e^-)

When $l = 4, m_l = 0, \pm 1, \pm 2, \pm 3, \pm 4$ (two e^-)

(because each orbital can accommodate a maximum of two electrons.)

∴ Total electrons having $n = 5$

and $m_l = \pm 1$

$= 2 + 2 + 2 + 2$
$= 8$

(ii) Only one electron is associated with $n = 2, l = 1$, $m_l = -1$ and $m_s = -1/2$ because Pauli's principle states that no two electrons can have same value for all the four quantum numbers.

4. In I^-, iodine is present in its lowest possible oxidation state. Further reduction in oxidation state is not possible. That's why its further reduction is not possible. Hence, it cannot function as oxidising agent.

5. Presence of electron releasing groups, (like—R) increases the electron density over benzene nucleus and makes it more reactive towards electrophile.
Electron withdrawing groups (like Cl^-, NO_2^-; NO_2^- is more electron withdrawing than Cl^-) make the benzene nucleus electrons deficient and hence, decrease its reactivity towards electrophile.
Hence, the correct order of reactivity towards electrophilic substitution reaction will be

$$\text{(ii)} > \text{(i)} > \text{(iii)} > \text{(iv)}$$

6. According to kinetic theory of gases, the gaseous molecules are so far apart that the actual volume of the molecules is negligible as compared to the total volume of the gas.
The gaseous molecules move in straight lines with uniform speed and change direction on collision with other molecules or the walls of container.
All the collisions are perfectly elastic, hence there is no loss of kinetic energy during the collision. The pressure of the gas is caused by the hits recorded by molecules on the walls of the container.

7. We know that,
total time, $t = n \times t_{1/2} \Rightarrow 12 = n \times 3$

$$\therefore \quad n = 4 \quad \text{and} \quad N = N_0 \times \left(\frac{1}{2}\right)^n$$

[where, N = amount left and N_0 = initial amount]

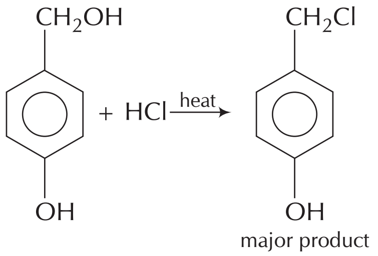
$$3 = N_0 \left(\frac{1}{2}\right)^4$$

$$3 = N_0 \frac{1}{16}$$

$$N_0 = 3 \times 16 = 48 \text{ g}$$

8. Glycogen serves as the reserve food for animals and is stored in the liver and muscles (hence known as animal starch).
All other given statements are true.

9.



Only aliphatic —OH is substituted by Cl^-. In phenol the C—O bond is stabilised by resonance.

10. We know that,

$$K_p = K_c (RT)^{\Delta n_g}$$

where, Δn_g = No. of moles of gaseous products – No. of moles of gaseous reactants
For the given reaction,

$$\Delta n_g = 1 - \left(1 + \frac{1}{2}\right) = -0.5$$

On putting the value of Δn_g,

$$K_p = K_c (RT)^{-0.5}$$

$$K_p = \frac{K_c}{\sqrt{RT}}$$

$$\frac{K_p}{K_c} = \frac{1}{\sqrt{RT}}$$

11. For fcc unit cell,

$$\text{Radius, } r = \frac{\sqrt{2} \times a}{4} = \frac{\sqrt{2} \times 361}{4} \text{ pm} = 128 \text{ pm}$$

12. Species having the same number of bond pairs and lone pairs are generally isostructural.
BF_4^-, CCl_4, NH_4^+ and PCl_4^+ all have four bond pairs and zero lone pairs, so all of these are isostructural.

> **Note :** In set (a) structure of CO_2 is quite different from NO_2, SiO_2 etc. Similarly in set (b) PCl_3 and $SbCl_3$ have a lone pair but BCl_3 and $AlCl_3$ do not, so they have different structures. In set (c) also NF_3 and PF_3 have lone pair, but remaining two do not have.

13. $N_2 + \frac{1}{2} O_2 \longrightarrow N_2O$

$$\text{or} \quad N{\equiv}N + \frac{1}{2} O{=}O \longrightarrow N{=}N{=}O$$

$$\therefore \quad \Delta H = BE_{N\equiv N} + \frac{1}{2} BE_{O=O} - [BE_{N=N} + BE_{N=O}]$$

$$= 946 + \frac{1}{2} \times 498 - [418 + 607]$$

$$= 1195 - 1025 = +170$$

Resonance energy = Experimental value – calculated value

$$= 82 - 170 = -88 \text{ kJ}$$

14. Concentration $= \dfrac{\text{mass}}{\text{molar mass} \times V\ (\text{mL})}$

$$\therefore \quad [CH_3COOH] = \frac{5 \times 1000}{60 \times 500}$$

[Molar mass of $CH_3COOH = 60 \text{ g mol}^{-1}$]

$$= 0.166 \text{ M}$$

Similarly, $[CH_3COONa] = \frac{7.5 \times 1000}{82 \times 500}$

$= 0.183\ M$

For the buffer of $CH_3COOH—CH_3COONa$,

$$pH = pK_a + \log \frac{[CH_3COONa]}{[CH_3COOH]}$$

$$= 4.76 + \log\left[\frac{0.183}{0.166}\right]$$

$$= 4.76 + \log (1.10)$$

$$= 4.76 + 0.042$$

$$= 4.80$$

$\therefore \qquad 4.76 < pH < 5.0$

15. General reaction for the combustion of alkene is

$$C_nH_{2n} + \frac{3n}{2}O_2 \longrightarrow nCO_2 + nH_2O$$

Given, 6 L alkene require $O_2 = 27\ L$

$\therefore$ 1 L alkene will require $O_2 = \frac{27}{6}\ L$

$= 4.5\ L$ or $\frac{9}{2}\ L$

On comparing the amount of O_2,

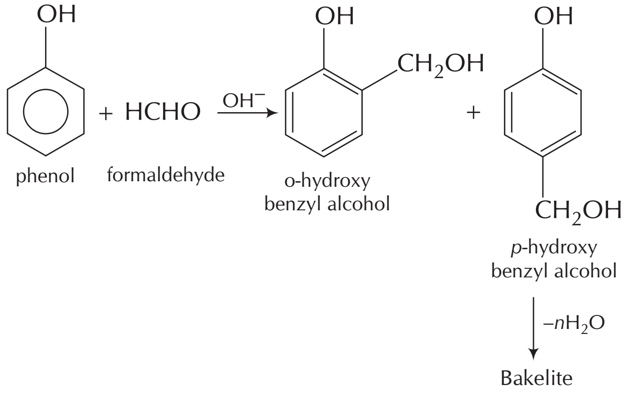
$$\frac{3n}{2} = \frac{9}{2}$$

$\therefore \qquad 3n = 9$

or $\qquad n = 3$

On putting the value of n in general formula of alkene, we get $C_3H_{2\times 3} = C_3H_6$. Hence, the alkene is propene ($CH_3CH{=}CH_2$).

16. When phenol reacts with formaldehyde in the presence of a base, a mixture of *o*- and *p*- benzoyl phenol is obtained, which further undergo condensation polymerisation to give a highly cross-linked polymer, called bakelite.



17. Normal freezing point of water = 273.15 K. In order to prevent freezing at 268 K, let the amount of methanol added be x g.

$\therefore$ Molality, $\qquad m = \frac{x}{32 \times 10} = \frac{x}{320}$

[$\because$ Molar mass of $CH_3OH{=}32\ g\ mol^{-1}$ and mass of $H_2O = V$ of H_2O because density of water $\simeq 1\ g\ mL^{-1}$]

Lowering in freezing point $= K_f \cdot m$

$$273 \cdot 15 - 268 = 1.86 \times \frac{x}{320}$$

$$5.15 = \frac{1.86x}{320}$$

or $\qquad x = \frac{5.15 \times 320}{1.86} = 886.02\ g$

18. Δ_o magnitude depends upon the charge of central metal atom and strength of ligand. Among the given, CN^- is the strongest field ligand and in the complex $[Co(CN)_6]^{3-}$, Co is present as Co^{3+}. So, this complex will exhibit the maximum value of Δ_o.

19. The order of departing nature of halides is

$$I^- > Br^- > Cl^-$$

This is because of large size and low electronegativity and nucleophilicity of I^-.

20. $\frac{2}{3}Al_2O_3 \longrightarrow \frac{4}{3}Al + O_2;\ \Delta_rG = +940\ kJ\ mol^{-1}$

Half cell reactions are $\frac{2}{3}Al_2^{3+} + 4e^- \longrightarrow \frac{4}{3}Al$

$$2O^{2-} \longrightarrow O_2 + 4e^-$$

$$\frac{2}{3}Al_2^{3+} + 2O^{2-} \longrightarrow \frac{4}{3}Al + O_2$$

Number of electrons involved, $n = 4$

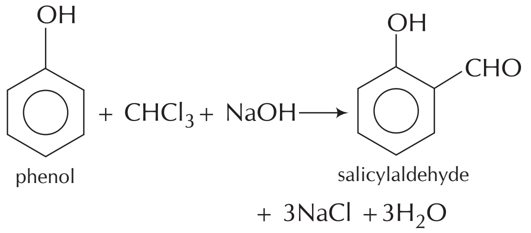
We know that, $\Delta_rG = nFE_{cell}$

$$E_{cell} = \frac{\Delta_rG}{nF} = \frac{940 \times 10^3\ J\ mol^{-1}}{4 \times 96500} = 2.5\ V$$

21. Only those aldehydes undergo Cannizzaro reaction in the presence of concentrated base, which have lack of α-H atom.

CH_3CHO contains three α-H atoms, that's why it does not undergo Cannizzaro's reaction, rather it undergoes aldol condensation.

22. When phenol is treated with chloroform in the presence of alkali, it results in the formation of salicylaldehyde. This reaction is known as Reimer-Tiemann reaction.



23. Internuclear distances in O—O bonds *i.e*, O—O bond length increases as the bond order decreases.

$$O_2(8+8=16) = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 \approx \pi 2p_y^2, \pi^* 2p_x^1 \approx \pi^* 2p_y^1$$

Bond order, $BO = \frac{10-6}{2} = 2$

$O_2^+(8+8-1=15)$,

$$BO = \frac{10-5}{2} = 2.5$$

$O_2^-(8+8+1=17)$,

$$BO = \frac{10-7}{2} = 1.5$$

$O_2^{2-}(8+8+2=18)$,

$$BO = \frac{10-8}{2} = 1$$

∴ The order of BO is

$$O_2^{2-} < O_2^- < O_2 < O_2^+$$

and the order of O—O bond length or internuclear distances in O—O bonds is

$$O_2^+ < O_2 < O_2^- < O_2^{2-}$$

Thus, the bond lengths corresponds to

$$1.12 < 1.21 < 1.30 < 1.49$$

24. Rickets is because of the deficiency of vitamin D.

> **Note :** Vitamin D is the only vitamin which is synthesised in the human body.

25. Proton affinity means basicity and the conjugate base of a strong acid is weak and *vice-versa*.

The order of acidity of acids of given base is

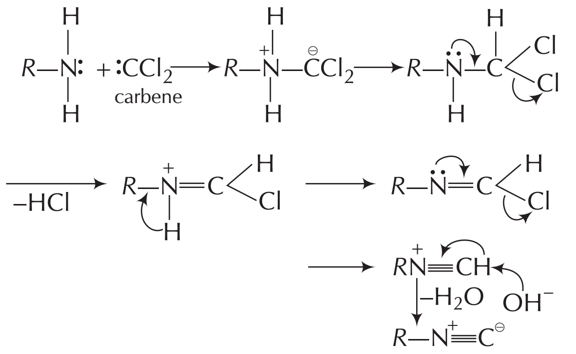
$$NH_3 < H_2S < HF < HI$$

∴ The order of proton affinity (or basicity) is

$$I^- < F^- < HS^- < NH_2^-$$

26. The mechanism of carbylamine reaction is given below

$$CHCl_3 \xrightarrow[\alpha\text{-elimination}]{OH^-} \underset{\text{dichlorocarbene}}{:CCl_2}$$



27. Final concentration, $M = \frac{M_1V_1 + M_2V_2}{V_1 + V_2}$

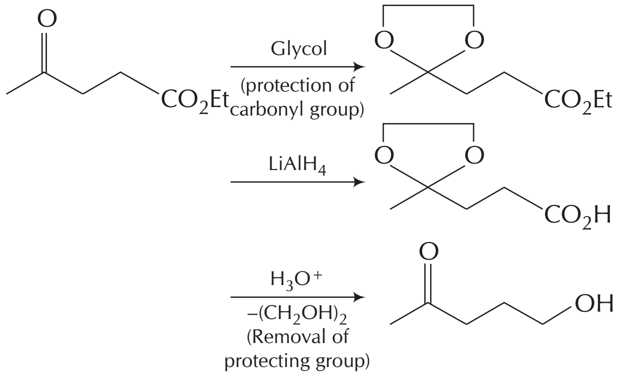
$$= \frac{10 \times 2 + 200 \times 0.5}{200 + 10} = \frac{20 + 100}{210}$$

$$= \frac{120}{210} = 0.57\,M$$

28. Although Cl^- is a weak field ligand but in case of $[PdCl_4]^{2-}$, it pair up the electrons of Pd and results in dsp^2-hybridisation because of the large size of Pd^{2+}.

In all other pairing is not possible, so hybridisation is sp^3 with tetrahedral structure.

29.



30. From Faraday's first law,

Mass of Cu deposited,

$$w = Z\,it = \frac{E}{96500} \cdot i \cdot t = \frac{63}{2 \times 96500} \times 1.5\text{ A} \times 10 \times 60\text{ s}$$

$$= 0.2938\text{ g}$$

JEE Main

Solved Paper 2013

Instructions

- This test consists of 30 questions.
- Each question is allotted 4 marks for correct response.
- Candidates will be awarded marks as stated above for correct response of each question. 1/4 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
- There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.

---

1. Which of the following complex species is not expected to exhibit optical isomerism?

(a) $[Co(en)_3]^{3+}$ (b) $[Co(en)_2Cl_2]^+$
(c) $[Co(NH_3)_3Cl_3]$ (d) $[Co(en)(NH_3)Cl_2]^+$

2. Which one of the following molecules is expected to exhibit diamagnetic behaviour?

(a) C_2 (b) N_2 (c) O_2 (d) S_2

3. A solution of $(-l)$ 1-chloro-1-phenylethane in toluene racemises slowly in the presence of a small amount of $SbCl_5$, due to the formation of

(a) carbanion (b) carbene
(c) carbocation (d) free radical

4. Given, $E^\circ_{Cr^{3+}/Cr} = -0.74$ V; $E^\circ_{MnO_4^-/Mn^{2+}} = 1.51$ V

$E^\circ_{Cr_2O_7^{2-}/Cr^{3+}} = 1.33$ V; $E^\circ_{Cl/Cl^-} = 1.36$ V

Based on the data given above strongest oxidising agent will be

(a) Cl (b) Cr^{3+}
(c) Mn^{2+} (d) MnO_4^-

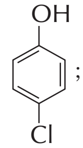
5. A piston filled with 0.04 mole of an ideal gas expands reversibly from 50.0 mL to 375 mL at a constant temperature of 37.0°C. As it does so, it absorbs 208 J of heat. The values of q and W for the process will be ($R = 8.314$ J / mol K log 7.5 = 2.01)

(a) $q = +208$ J, $W = -208$ J
(b) $q = -208$ J, $W = -208$ J
(c) $q = -208$ J, $W = +208$ J
(d) $q = +208$ J, $W = +208$ J

6. The molarity of a solution obtained by mixing 750 mL of 0.5 (M) HCl with 250 mL of 2(M) HCl will be

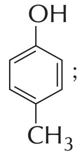
(a) 0.875 M (b) 1.00 M
(c) 1.75 M (d) 0.0975 M

7. Arrange the following compounds in the order of decreasing acidity



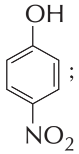
(I)

;



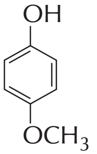
(II)

;



(III)

;



(IV)

(a) II > IV > I > III (b) I > II > III > IV
(c) III > I > II > IV (d) IV > III > I > II

8. For gaseous state, if most probable speed is denoted by C^*, average speed by $\overline{C}$ and mean square speed by C, then for a large number of molecules, the ratios of these speeds are

(a) $C^* : \overline{C} : C = 1.225 : 1.128 : 1$
(b) $C^* : \overline{C} : C = 1.128 : 1.225 : 1$
(c) $C^* : \overline{C} : C = 1 : 1.128 : 1.225$
(d) $C^* : \overline{C} : C = 1 : 1.225 : 1.128$

9. The rate of a reaction double when its temperature changes from 300 K to 310 K. Activation energy of such a reaction will be ($R = 8.314$ JK^{-1} mol^{-1} and log 2 = 0.301)

(a) 53.6 kJ mol^{-1} (b) 48.6 kJ mol^{-1}
(c) 58.5 kJ mol^{-1} (d) 60.5 kJ mol^{-1}

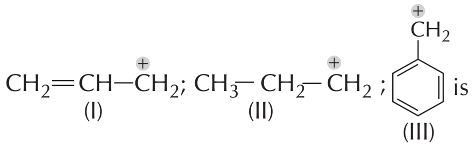
10. A compound with molecular mass 180 is acylated with CH_3COCl to get a compound with molecular mass 390. The number of amino groups present per molecule of the former compound is

(a) 2 (b) 5 (c) 4 (d) 6

11. Which of the following arrangements does not represent the correct order of the property stated against it?

(a) $V^{2+} < Cr^{2+} < Mn^{2+} < Fe^{2+}$: paramagnetic behaviour
(b) $Ni^{2+} < Co^{2+} < Fe^{2+} < Mn^{2+}$: ionic size
(c) $Co^{3+} < Fe^{3+} < Cr^{3+} < Sc^{3+}$: stability in aqueous solution
(d) Sc < Ti < Cr < Mn : number of oxidation states

12. The order of stability of the following carbocations



$CH_2{=}CH{-}\overset{+}{C}H_2$; $CH_3{-}CH_2{-}\overset{+}{C}H_2$; is
(I) (II) (III)

(a) III > II > I (b) II > III > I
(c) I > II > III (d) III > I > II

13. Consider the following reaction,

$$xMnO_4^- + yC_2O_4^{2-} + zH^+ \longrightarrow xMn^{2+} + 2\,y\,CO_2 + \frac{z}{2}H_2O$$

The values of x, y and z in the reaction are, respectively

(a) 5, 2 and 16 (b) 2, 5 and 8
(c) 2, 5 and 16 (d) 5, 2 and 8

14. Which of the following is the wrong statement?

(a) ONCl and ONO^- are not isoelectronic
(b) O_3 molecule is bent
(c) Ozone is violet-black in solid state
(d) Ozone is diamagnetic gas

15. A gaseous hydrocarbon gives upon combustion 0.72 g of water and 3.08 g of CO_2. The empirical formula of the hydrocarbon is

(a) C_2H_4 (b) C_3H_4
(c) C_6H_5 (d) C_7H_8

16. In which of the following pairs of molecules/ions both the species are not likely to exist?

(a) H_2^+, He_2^{2-} (b) H_2^-, He_2^{2-}
(c) H_2^{2+}, He_2 (d) H_2^-, He_2^{2+}

17. Which of the following exists as covalent crystals in the solid state?

(a) Iodine (b) Silicon
(c) Sulphur (d) Phosphorus

18. Synthesis of each molecule of glucose in photosynthesis involves

(a) 18 molecules of ATP
(b) 10 molecules of ATP
(c) 8 molecules of ATP
(d) 6 molecules of ATP

19. The coagulating power of electrolytes having ions Na^+, Al^{3+} and Ba^{2+} for arsenic sulphide sol increases in the order

(a) $Al^{3+} < Ba^{2+} < Na^+$
(b) $Na^+ < Ba^{2+} < Al^{3+}$
(c) $Ba^{2+} < Na^{2+} < Al^{3+}$
(d) $Al^{3+} < Na^+ < Ba^{2+}$

20. Which of the following represents the correct order of increasing first ionization enthalpy for Ca, Ba, S, Se and Ar

(a) Ca < S < Ba < Se < Ar
(b) S < Se < Ca < Ba < Ar
(c) Ba < Ca < Se < S < Ar
(d) Ca < Ba < S < Se < Ar

21. Energy of an electron is given by

$$E = -\,2.178 \times 10^{-18}\ \text{J}\left(\frac{Z^2}{n^2}\right)$$

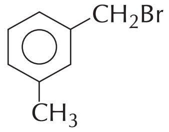
Wavelength of light required to excite an electron in an hydrogen atom from level $n = 1$ to $n = 2$ will be

($h = 6.62 \times 10^{-34}$ Js and $c = 3.0 \times 10^8$ ms^{-1})

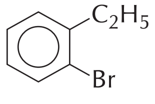
(a) 1.214×10^{-7} m
(b) 2.816×10^{-7} m
(c) 6.500×10^{-7} m
(d) 8.500×10^{-7} m

22. Compound (A), C_8H_9Br gives a white precipitate when warmed with alcoholic $AgNO_3$. Oxidation of (A) gives an acid (B), $C_8H_6O_4$. (B) easily forms anyhydride on heating. Identify the compound (A).

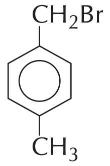
(a)



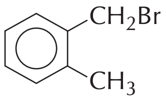
(b)



(c)



(d)



23. Four successive members of the first row transition elements listed below with atomic numbers. Which one of them is expected to have the highest $E^{\circ}_{M^{3+}/M^{2+}}$ value?

(a) Cr (Z = 24) (b) Mn (Z = 25)
(c) Fe (Z = 26) (d) Co (Z = 27)

24. How many litres of water must be added to 1 L of an aqueous solution of HCl with a pH of 1 to create an aqueous solution with pH of 2?

(a) 0.1 L (b) 0.9 L
(c) 2.0 L (d) 9.0 L

25. The first ionisation potential of Na is 5.1 eV. The value of electron gain enthalpy of Na^+ will be

(a) − 2.55 eV (b) − 5.1 eV
(c) − 10.2 eV (d) + 2.55 eV

26. An organic compound *A* upon reacting with NH_3 gives *B*. On heating, *B* gives *C*. *C* in the presence of KOH reacts with Br_2 to give $CH_3CH_2NH_2$. *A* is

(a) CH_3COOH (b) $CH_3CH_2CH_2COOH$

(c) $CH_3—\underset{\substack{|\\ CH_3}}{CH}—COOH$
(d) CH_3CH_2COOH

27. Stability of the species Li_2, Li_2^- and Li_2^+ increases in the order of

(a) $Li_2 < Li_2^+ < Li_2^-$ (b) $Li_2^- < Li_2^+ < Li_2$
(c) $Li_2 < Li_2^- < Li_2^+$ (d) $Li_2^- < Li_2 < Li_2^+$

28. An unknown alcohol is treated with the "Lucas reagent" to determine whether the alcohol is primary, secondary or tertiary. Which alcohol reacts fastest and by what mechanism?

(a) Secondary alcohol by S_N1
(b) Tertiary alcohol by S_N1
(c) Secondary alcohol by S_N2
(d) Tertiary alcohol by S_N2

29. The gas leaked from a storage tank of the Union Carbide plant in Bhopal gas tragedy was

(a) Methylisocyanate (b) Methylamine
(c) Ammonia (d) Phosgene

30. Experimentally it was found that a metal oxide has formula $M_{0.98}O$. Metal *M*, present as M^{2+} and M^{3+} in its oxide. Fraction of the metal which exists as M^{3+} would be

(a) 7.01% (b) 4.08%
(c) 6.05% (d) 5.08%

Answers

1. (c)	**2.** (a,b)	**3.** (c)	**4.** (d)	**5.** (a)	**6.** (a)	**7.** (c)	**8.** (c)	**9.** (a)	**10.** (b)
11. (a)	**12.** (d)	**13.** (c)	**14.** (*)	**15.** (d)	**16.** (c)	**17.** (b)	**18.** (a)	**19.** (b)	**20.** (c)

* No option is correct.

Hints and **Solutions**

1. Optical isomerism is exhibited by only those complexes which lacks elements of symmetry.

$[Co(NH_3)_3Cl_3]$ shows facial as well as meridional isomerism. But both the forms contain plane of symmetry. Thus, this complex does not exhibit optical isomerism.

2. $C_2\ (6+6=12) = \sigma 1s^2, \overset{*}{\sigma}\ 1s^2, \sigma 2s^2, \overset{*}{\sigma}\ 2s^2,\ \pi 2p_x^2 \approx \pi 2p_y^2$

Since, all the electrons are paired, it is a diamagnetic species.

$N_2\ (7+7=14) = \sigma 1s^2, \overset{*}{\sigma}\ 1s^2, \sigma 2s^2,$
$\overset{*}{\sigma} 2s^2,\ \pi 2p_x^2 \approx \pi 2p_y^2, \sigma 2p_z^2$

It is also a diamagnetic species because of the absence of unpaired electrons.

$O_2\ (8+8=16)$

or $S_2 = \sigma 1s^2, \overset{*}{\sigma}\ 1s^2, \sigma 2s^2, \overset{*}{\sigma}\ 2s^2,\ \sigma 2p_z^2, \pi 2p_x^2 \approx \pi 2p_y^2$
$\overset{*}{\pi}\ 2p_x^1 \approx \overset{*}{\pi}\ 2p_y^1$

Due to the presence of two unpaired electrons O_2 and S_2 both are paramagnetic molecules.

3. $$Cl—\underset{\substack{|\\ Ph\\ (-)}}{CH}—CH_3 \xrightarrow[\text{Toluene}]{SbCl_5} \underset{\substack{\text{(carbocation)}\\ \text{(planar)}}}{Ph—\overset{\oplus}{C}H—CH_3} + SbCl_6^-$$
$$\longrightarrow \underset{(d\text{ and }l)\text{ mixture}}{Ph—\underset{\substack{|\\ Cl}}{CH}—CH_3} + SbCl_5$$

4. Higher the SRP, better is oxidising agent. Among the given $E^{\circ}_{MnO_4^-/Mn^{2+}}$ is highest, hence MnO_4^- is the strongest oxidising agent.

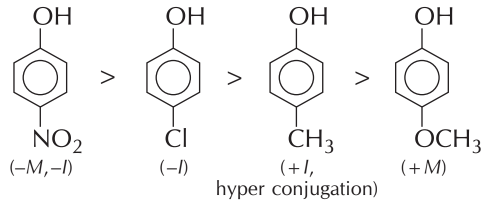
5. The process is isothermal expansion, hence

$$q = -W.$$
$$\Delta E = 0$$
$$q = +208\ J$$
$$W = -208\ J \quad (\textit{expansion work})$$

6. $M_f = \dfrac{M_1V_1 + M_2V_2}{V_1 + V_2} = \dfrac{750 \times 0.5 + 250 \times 2}{750 + 250} = \dfrac{875}{1000}$

$= 0.875\ M$

7.



Electron releasing group decreases while electron withdrawing group increases acidic strength by destabilising and stabilising the phenoxide ion formed respectively.

8. $C^* =$ most probable speed $= \sqrt{\dfrac{2RT}{M}}$

$\overline{C} =$ average speed $= \sqrt{\dfrac{8RT}{\pi M}}$

C = Mean square speed corrected as

$$\text{rms} = \sqrt{\frac{3RT}{M}},$$

$$\overset{*}{C} < \overline{C} < C$$

$$\overset{*}{C} : \overline{C} : C = 1 : \sqrt{\frac{4}{\pi}} : \sqrt{\frac{3}{2}}$$

$$= 1 : 1.128 : 1.225$$

As no option correspond to mean square speed, it is understood as misprint. It should be root mean square speed.

9. From Arrehenius equation,

$$\log \frac{k_2}{k_1} = \frac{-E_a}{2.303\,R}\left(\frac{1}{T_2} - \frac{1}{T_1}\right)$$

Given, $\dfrac{k_2}{k_1} = 2$; $T_2 = 310$ K, $T_1 = 300$ K

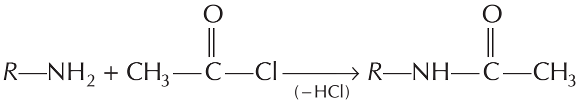
On putting values,

$$\Rightarrow \qquad \log 2 = \frac{-E_a}{2.303 \times 8.314}\left(\frac{1}{310} - \frac{1}{300}\right)$$

$$\Rightarrow \qquad E_a = 53598.6\ J/mol$$

$$= 53.6\ kJ/mol$$

10.



$$R\text{—}NH_2 + CH_3\text{—}\overset{O}{\overset{\|}{C}}\text{—}Cl \xrightarrow[(-HCl)]{} R\text{—}NH\text{—}\overset{O}{\overset{\|}{C}}\text{—}CH_3$$

Since each —$COCH_3$ group displace one H atom in the reaction of one mole of $CH_3\text{—}\overset{O}{\overset{\|}{C}}\text{—}Cl$ with one —NH_2 group, the molecular mass increases with 42 unit. Since the mass increases by $(390 - 180) = 210$ hence the number of —NH_2 group is $\dfrac{210}{42} = 5$.

11. (a) $V^{2+} = 3$ unpaired electrons

$Cr^{2+} = 4$ unpaired electrons

$Mn^{2+} = 5$ unpaired electrons

$Fe^{2+} = 4$ unpaired electrons

Hence, the order of paramagnetic behaviour should be $V^{2+} < Cr^{2+} = Fe^{2+} < Mn^{2+}$

(b) Ionic size decreases from left to right in the same period.

(c) (As per data from NCERT)

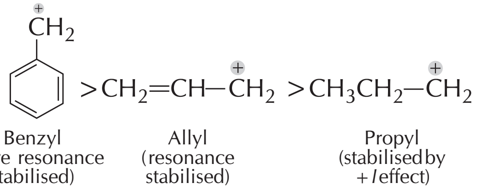
$Co^{3+}/Co^{2+} = 1.97$; $Fe^{3+}/Fe^{2+} = 0.77$;

$Cr^{3+}/Cr^{2+} = -0.41$

Sc^{3+} is highly stable (It does not show + 2).

(d) The oxidation states increases as we go from group 3 to group 7 in the same period.

12. The order of stability of carbocation will be



13. The half equations of the reaction are

$$MnO_4^- \longrightarrow Mn^{2+}$$
$$C_2O_4^{2-} \longrightarrow CO_2$$

The balanced half equations are

$$MnO_4^- + 8H^+ + 5e^- \longrightarrow Mn^{2+} + 4H_2O$$
$$C_2O_4^{2-} \longrightarrow 2CO_2 + 2e^-$$

On equating number of electrons we get

$$2MnO_4^- + 16\,H^+ + 10e^- \longrightarrow 2Mn^{2+} + 8H_2O$$
$$5C_2O_4^{2-} \longrightarrow 10CO_2 + 10e^-$$

On adding both the equations we get

$$2MnO_4^- + 5C_2O_4^- + 16H^+ \longrightarrow 2Mn^{2+} + 2 \times 5CO_2 + \frac{16}{2}H_2O$$

Thus x, y and z are 2, 5 and 16 respectively.

14. (a) $ONCl = 8 + 7 + 17 = 32e^-$

$ONO^- = 8 + 7 + 8 + 1 = 24e^-$ (correct)

(b) 
Central O atom is sp^2 hybridised with 1 lone pair, so bent shape (correct).

(c) In solid state, ozone is violet-black. (correct).

(d) O_3 has no unpaired electrons, so diamagnetic (correct).

(*) No option is correct.

15. 18 g H_2O contains 2 g H

$\therefore$ 0.72 g H_2O contains 0.08 g H.

44 g CO_2 contains 12 g C

$\therefore$ 3.08 g CO_2 contains 0.84 g C

$$\therefore \quad C : H = \frac{0.84}{12} : \frac{0.08}{1} = 0.07 : 0.08 = 7 : 8$$

$\therefore$ Empirical formula = C_7H_8

16. Species having zero or negative bond order do not exist.

$$H_2^{2+} (1 + 1 - 2 = 0) = \sigma 1s^0$$

Bond order = 0

$$He_2 \ (2 + 2 = 4) = \sigma 1s^2, \overset{*}{\sigma} 1s^2$$

$$\text{Bond order } = \frac{N_b - N_a}{2} = \frac{2-2}{2} = 0$$

So, both H_2^{2+} and He_2 do not exist.

17. Silicon exists as covalent crystal in solid state. (Network like structure, like diamond).

18. $6CO_2 + 12NADPH + 18\ ATP \longrightarrow C_6H_{12}O_6 + 12NADP + 18\ ADP$

19. According to Hardy Schulze rule, greater the charge on oppositely charged ion, greater is its coagulating power. Since arsenic sulphide is a negatively charged sol, thus, the order of coagulating power is $Na^+ < Ba^{2+} < Al^{3+}$.

20. Ionisation energy increases along a period from left to right and decreases down a group. The position of given elements in the Periodic Table is as

2	16	18
Ca	S	Ar
Ba	Se	

Thus, the order of increasing ΔH_{IE_1} is

Ba< Ca< Se< S< Ar

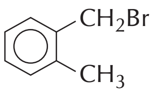
21. $$\Delta E = 2.178 \times 10^{-18} \left(\frac{1}{1^2} - \frac{1}{2^2} \right) = \frac{hc}{\lambda}$$

$$2.178 \times 10^{-18} \left(\frac{1}{1^2} - \frac{1}{2^2} \right) = \frac{6.62 \times 10^{-34} \times 3.0 \times 10^8}{\lambda}$$

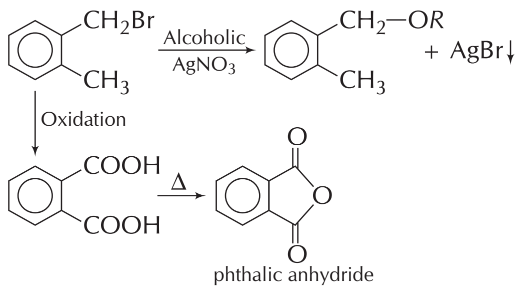
$$\therefore \quad \lambda \approx 1.21 \times 10^{-7} \text{ m}$$

22. Compound *A* gives a precipitate with alcoholic $AgNO_3$ (here white is misprinting because the colour of ppt is light yellow), so it must contains Br in side chain. On oxidation, it gives $C_8H_6O_4$, which shows the presence of two alkyl chains attached directly with the benzene nucleus.

Since compound *B* gives anhydride on heating, the two alkyl substituent must occupy adjacent (1, 2) positions. Thus, *A* must be



and the reactions are as follows



23. SRP value normally increases from left to right in the period of *d*-block elements. Some SRP value are exceptionally higher due to stability of product ion. *e.g.*,

$$E^\circ_{Mn^{3+}/Mn^{2+}} = +1.57 \text{ V}; \ E^\circ_{Co^{3+}/Co^{2+}} = +\ 1.97 \text{ V}.$$

Thus, $E^\circ_{M^{3+}/M^{2+}}$ is highest for Co.

24. $pH = 1 \ \therefore \ [H^+] = 10^{-1} = 0.1$ M

$pH = 2 \ \therefore \ [H^+] = 10^{-2} = 0.01$ M

For dilution of HCl, $M_1V_1 = M_2V_2$

$$0.1 \times 1 = 0.01 \times V_2$$

$$V_2 = 10 \text{ L}$$

Volume of water to be added = 10 − 1 = 9 L

25. $Na \longrightarrow Na^+ + e^-$ (First IE)

$Na^+ + e^- \longrightarrow Na$ (Electron gain enthalpy of Na^+)

Because reaction is reverse so,

$$\Delta H(e_g) = -\ 5.1 \text{ eV}$$

26. 
$$\underset{(A)}{CH_3CH_2-\overset{\overset{\large O}{\|}}{C}-OH} \xrightarrow{NH_3} \underset{(B)}{CH_3CH_2CO\overset{\ominus}{O}\overset{\oplus}{N}H_4}$$

$$\xrightarrow{\Delta} \underset{(C)}{CH_3-CH_2-\overset{\overset{\large O}{\|}}{C}-NH_2}$$

$$\xrightarrow[\text{Hofmann bromamide reaction}]{Br_2,\ KOH} CH_3-CH_2-NH_2$$

27. Li_2 $(3+3=6)=\sigma 1s^2, \overset{*}{\sigma} 1s^2, \sigma 2s^2$

$$\text{Bond order} = \frac{N_b - N_a}{2} = \frac{4-2}{2} = 1$$

Li_2^+ $(3+3-1=5)=\sigma 1s^2, \overset{*}{\sigma} 1s^2, \sigma 2s^1$

$$\text{Bond order} = \frac{3-2}{2} = \frac{1}{2} = 0.5$$

Li_2^- $(3+3+1=7)=\sigma 1s^2, \overset{*}{\sigma} 1s^2, \sigma 2s^2 \; \overset{*}{\sigma} 2s^1$

$$\text{Bond order} = \frac{4-3}{2} = \frac{1}{2} = 0.5$$

Stability order is $Li_2 > Li_2^+ > Li_2^-$ (because Li_2^- have more number of electrons in antibonding orbitals which destabilises the species).

28. The reaction of alcohol with Lucas reagent is mostly an S_N1 reaction and the rate of reaction is directly proportional to the stability of carbocation formed in the reaction. Since 3° R—OH forms 3° carbocation (most stable) hence it will react fastest.

29. Methyl isocyanate $CH_3—N═C═O$ (MIC gas) gas was leaked from the storage tank of the Union Carbide plant in Bhopal gas tragedy.

30. $M_{0.98}O$

Consider one mole of the oxide.

Moles of $M = 0.98$ moles of $O^{2-} = 1$

Let moles of $M^{3+} = x$

$\Rightarrow$ Moles of $M^{2+} = 0.98 - x$

$\Rightarrow$ On balancing charge,

$$(0.98 - x) \times 2 + 3x - 2 = 0$$

$$\Rightarrow \quad 1.96 - 2x + 3x - 2 = 0$$

$$\Rightarrow \quad x = 0.04$$

$$\Rightarrow \text{Percentage of } M^{3+} = \frac{0.04}{0.98} \times 100$$

$$= 4.08\%$$

Solved Paper 2014

JEE Main

Joint Entrance Examination

Instructions

- This test consists of 30 questions.
- Each question is allotted 4 marks for correct response.
- Candidates will be awarded marks as stated above for correct response of each question. 1/4 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
- There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.

---

1. The correct set of four quantum numbers for the valence electrons of rubidium atom $(Z = 37)$ is

(a) $5, 0, 0, +\frac{1}{2}$ (b) $5, 1, 0, +\frac{1}{2}$

(c) $5, 1, ,1, +\frac{1}{2}$ (d) $5, 0, 1, +\frac{1}{2}$

2. If Z is a compressibility factor, van der Waals' equation at low pressure can be written as

(a) $Z = 1 + \frac{RT}{pb}$ (b) $Z = 1 - \frac{a}{VRT}$

(c) $Z = 1 - \frac{pb}{RT}$ (d) $Z = 1 + \frac{pb}{RT}$

3. CsCl crystallises in body centred cubic lattice. If a its edge length, then which of the following expressions is correct?

(a) $r_{\text{Cs}^+} + r_{\text{Cl}^-} = 3a$

(b) $r_{\text{Cs}^+} + r_{\text{Cl}^-} = \frac{3a}{2}$

(c) $r_{\text{Cs}^+} + r_{\text{Cl}^-} = \frac{\sqrt{3}}{2}a$

(d) $r_{\text{Cs}^+} + r_{\text{Cl}^-} = \sqrt{3}a$

4. For the estimation of nitrogen, 1.4 g of an organic compound was digested by Kjeldahl's method and the evolved ammonia was absorbed in 60 mL of $\frac{M}{10}$ sulphuric acid. The unreacted acid required 20 mL of $M/10$ sodium hydroxide for complete neutralisation. The percentage of nitrogen in the compound is

(a) 6% (b) 10% (c) 3% (d) 5%

5. Resistance of 0.2 M solution of an electrolyte is 50 Ω. The specific conductance of the solution of 0.5 M solution of same electrolyte is 1.4 S m^{-1} and resistance of same solution of the same electrolyte is 280 Ω. The molar conductivity of 0.5 M solution of the electrolyte in $\text{Sm}^2\text{mol}^{-1}$ is

(a) 5×10^{-4} (b) 5×10^{-3} (c) 5×10^{3} (d) 5×10^{2}

6. For the complete combustion of ethanol, $C_2H_5OH(l) + 3O_2(g) \longrightarrow 2CO_2(g) + 3H_2O(l)$, the amount of heat produced as measured in bomb calorimeter, is 1364.47 kJ mol^{-1} at 25°C. Assuming ideality of the enthalpy of combustion, $\Delta_C H$, for the reaction will be $(R = 8.314 \text{ JK}^{-1}\text{mol}^{-1})$

(a) $-1366.95 \text{kJ mol}^{-1}$ (b) $-1361.95 \text{kJ mol}^{-1}$

(c) $-1460.50 \text{kJ mol}^{-1}$ (d) $-1350.50 \text{kJ mol}^{-1}$

7. The equivalent conductance of NaCl at concentration C and at infinite dilution are λ_C and λ_∞, respectively. The correct relationship between λ_C and λ_∞ is given as (where, the constant B is positive)

(a) $\lambda_C = \lambda_\infty + (B)C$
(b) $\lambda_C = \lambda_\infty - (B)C$
(c) $\lambda_C = \lambda_\infty - (B)\sqrt{C}$
(d) $\lambda_C = \lambda_\infty + (B)\sqrt{C}$

8. Consider separate solution of 0.500 M $C_2H_5OH\,(aq)$, 0.100 M $Mg_3(PO_4)_2\,(aq)$, 0.250 M $KBr(aq)$ and 0.125 M $Na_3PO_4\,(aq)$ at 25°C. Which statement is true about these solution, assuming all salts to be strong electrolytes?

(a) They all have the same osmotic pressure
(b) 0.100 M $Mg_3(PO_4)_2(aq)$ has the highest osmotic pressure
(c) 0.125 M $Na_3PO_4(aq)$ has the highest osmotic pressure
(d) 0.500 M $C_2H_5OH\,(aq)$ has the highest osmotic pressure

9. For the reaction,

$$SO_2(g) + \frac{1}{2}O_2(g) \rightleftharpoons SO_3(g)$$

if $K_p = K_C(RT)^x$

where the symbols have usual meaning, then the value of x is (assuming ideality)

(a) -1
(b) $-\frac{1}{2}$
(c) $\frac{1}{2}$
(d) 1

10. For the non-stoichiometric reaction $2A + B \rightarrow C + D$, the following kinetic data were obtained in three separate experiments, all at 298 K.

	Initial concentration (A)	Initial concentration (B)	Initial rate of formation of C (mol $L^{-1}S^{-1}$)
(i)	0.1 M	0.1 M	1.2×10^{-3}
(ii)	0.1 M	0.2 M	1.2×10^{-3}
(iii)	0.2 M	0.1 M	2.4×10^{-3}

The rate law for the formation of C is

(a) $\frac{dc}{dt} = k[A]\,[B]$
(b) $\frac{dc}{dt} = k[A]^2[B]$
(c) $\frac{dc}{dt} = k[A][B]^2$
(d) $\frac{dc}{dt} = k[A]$

11. Among the following oxoacids, the correct decreasing order of acid strength is

(a) $HOCl > HClO_2 > HClO_3 > HClO_4$
(b) $HClO_4 > HOCl > HClO_2 > HClO_3$
(c) $HClO_4 > HClO_3 > HClO_2 > HOCl$
(d) $HClO_2 > HClO_4 > HClO_3 > HOCl$

12. The metal that can not be obtained by electrolysis of an aqueous solution of its salts is

(a) Ag
(b) Ca
(c) Cu
(d) Cr

13. The octahedral complex of a metal ion M^{3+} with four monodentate ligands L_1, L_2, L_3 and L_4 absorb wavelengths in the region of red, green, yellow and blue, respectively. The increasing order of ligand strength of the four ligands is

(a) $L_4 < L_3 < L_2 < L_1$
(b) $L_1 < L_3 < L_2 < L_4$
(c) $L_3 < L_2 < L_4 < L_1$
(d) $L_1 < L_2 < L_4 < L_3$

14. Which of the following properties is not shown by NO?

(a) It is diamagnetic in gaseous state
(b) It is a neutral oxide
(c) It combines with oxygen to form nitrogen dioxide
(d) It is bond order is 2.5

15. In which of the following reactions H_2O_2 acts as a reducing agent?

I. $H_2O_2 + 2H^+ + 2e^- \longrightarrow 2H_2O$
II. $H_2O_2 - 2e^- \longrightarrow O_2 + 2H^+$
III. $H_2O_2 + 2e^- \longrightarrow 2OH^-$
IV. $H_2O_2 + 2OH^- - 2e^- \longrightarrow O_2 + 2H_2O$

(a) I and II
(b) III and IV
(c) I and III
(d) II and IV

16. The correct statement for the molecule CsI_3 is

(a) it is a covalent molecule
(b) it contains Cs^+ and I_3^-
(c) it contains Cs^{3+} and I^- ions
(d) it contains Cs^+, I^- and lattice I_2 molecule

17. The ratio of masses of oxygen and nitrogen of a particular gaseous mixture is 1 : 4. The ratio of number of their molecule is

(a) 1 : 4
(b) 7 : 32
(c) 1 : 8
(d) 3 : 16

18. Given below are the half-cell reactions

$$Mn^{2+} + 2e^- \longrightarrow Mn\,; \quad E^\circ = -1.18 \text{ eV}$$

$$2\,(Mn^{3+} + e^- \longrightarrow Mn^{2+})\,; \quad E^\circ = +1.51 \text{eV}$$

The E° for $3Mn^{2+} \longrightarrow Mn + 2Mn^{3+}$ will be

(a) -2.69 V; the reaction will not occur
(b) -2.69 V; the reaction will occur
(c) -0.33 V; the reaction will not occur
(d) -0.33 V; the reaction will occur

19. Which series of reactions correctly represents chemical relations related to iron and its compound?

(a) $Fe \xrightarrow{\text{Dil } H_2SO_4} FeSO_4 \xrightarrow{H_2SO_4,\,O_2} Fe_2(SO_4)_3 \xrightarrow{\text{Heat}} Fe$
(b) $Fe \xrightarrow{O_2,\text{ Heat}} FeO \xrightarrow{\text{Dil } H_2SO_4} FeSO_4 \xrightarrow{\text{Heat}} Fe$
(c) $Fe \xrightarrow{Cl_2,\text{ Heat}} FeCl_3 \xrightarrow{\text{Heat, air}} FeCl_2 \xrightarrow{Zn} Fe$
(d) $Fe \xrightarrow{O_2,\text{ Heat}} Fe_3O_4 \xrightarrow{CO,\ 600^\circ C} FeO \xrightarrow{CO,\ 700^\circ C} Fe$

20. The equation which is balanced and represents the correct product(s) is

(a) $Li_2O + 2KCl \longrightarrow 2LiCl + K_2O$

(b) $[CoCl(NH_3)_5]^+ + 5H^+ \longrightarrow Co^{2+} + 5NH_4^+ + Cl^-$

(c) $[Mg(H_2O)_6]^{2+} + (EDTA)^{4-} \xrightarrow{\text{Excess NaOH}} [Mg(EDTA)]^{2+} + 6H_2O$

(d) $CuSO_4 + 4KCN \longrightarrow K_2[Cu(CN)_4] + K_2SO_4$

21. In S_N2 reactions, the correct order of reactivity for the following compounds $CH_3Cl, CH_3CH_2Cl, (CH_3)_2CHCl$ and $(CH_3)_3CCl$ is

(a) $CH_3Cl > (CH_3)_2CHCl > CH_3CH_2Cl > (CH_3)_3CCl$

(b) $CH_3Cl > CH_3CH_2Cl > (CH_3)_2CHCl > (CH_3)_3CCl$

(c) $CH_3CH_2Cl > CH_3Cl > (CH_3)_2CHCl > (CH_3)_3CCl$

(d) $(CH_3)_2CHCl > CH_3CH_2Cl > CH_3Cl > (CH_3)_3CCl$

22. On heating an aliphatic primary amine with chloroform and ethanolic potassium hydroxide, the organic compound formed is

(a) an alkanol

(b) an alkanediol

(c) an alkyl cyanide

(d) an alkyl isocyanide

23. The most suitable reagent for the conversion of $R—CH_2—OH \longrightarrow R—CHO$ is

(a) $KMnO_4$

(b) $K_2Cr_2O_7$

(c) CrO_3

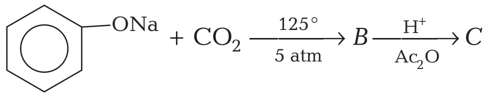
(d) PCC (pyridinium chlorochromate)

24. The major organic compound formed by the reaction of 1,1,1-trichloroethane with silver powder is

(a) acetylene (b) ethene

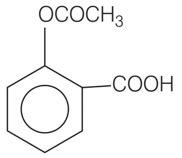
(c) 2-butyne (d) 2-butene

25. Sodium phenoxide when heated with CO_2 under pressure at 125°C yields a product which on acetylation produces *C*.

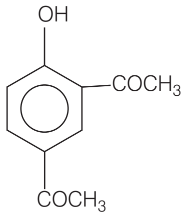


The major product *C* would be

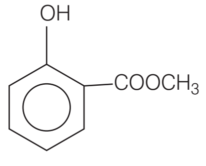
(a)



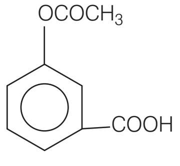
(b)



(c)



(d)

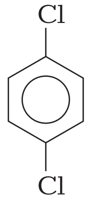


26. Considering the basic strength of amines in aqueous solution, which one has the smallest pK_b value?

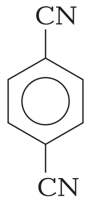
(a) $(CH_3)_2NH$ (b) CH_3NH_2

(c) $(CH_3)_3N$ (d) $C_6H_5NH_2$

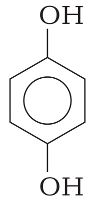
27. For which of the following molecule significant $\mu \neq 0$?



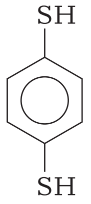
I



II



III



IV

(a) Only I (b) I and II (c) Only III (d) III and IV

28. Which one is classified as a condensation polymer?

(a) Dacron (b) Neoprene (c) Teflon (d) Acrylonitrile

29. Which one of the following bases is not present in DNA?

(a) Quinoline (b) Adenine (c) Cytosine (d) Thymine

30. In the reaction,

$$CH_3COOH \xrightarrow{LiAlH_4} A \xrightarrow{PCl_5} B \xrightarrow{\text{Alc. KOH}} C$$

The product *C* is

(a) acetaldehyde (b) acetylene

(c) ethylene (d) acetyl chloride

Answers

1. (a) **2.** (b) **3.** (c) **4.** (b) **5.** (a) **6.** (a) **7.** (c) **8.** (a) **9.** (b) **10.** (d)
11. (c) **12.** (b) **13.** (b) **14.** (a) **15.** (d) **16.** (b) **17.** (b) **18.** (a) **19.** (d) **20.** (b)
21. (b) **22.** (d) **23.** (d) **24.** (c) **25.** (a) **26.** (a) **27.** (d) **28.** (a) **29.** (a) **30.** (c)

Solutions

1. Given, Atomic number of Rb, $Z = 37$

Thus, its electronic configuration is $[\mathrm{Kr}]\,5s^1$. Since the last electron or valence electron enter in $5s$ subshell.

So, the quantum numbers are

$$n = 5,$$
$$l = 0 \text{ (from } s \text{ orbital)},$$
$$m = 0 \; (\because m = +l \text{ to } -l),$$
$$s = +\frac{1}{2} \text{ or } -\frac{1}{2}$$

2. *To solve this problem, the stepwise approach required i.e.,*

(i) Write the van der Waals' equation, then apply the condition that at low pressure, volume become high, i.e.,

$$V - b \simeq V$$

(ii) Now calculate the value of compressibility factor (Z).
$[Z = pV / RT]$

According to van der Waals' equation,

$$\left(p + \frac{a}{V^2}\right)(V - b) = RT$$

At low pressure, $\left(p + \frac{a}{V^2}\right)V = RT$

$$pV + \frac{a}{V} = RT$$
$$pV = RT - \frac{a}{V}$$

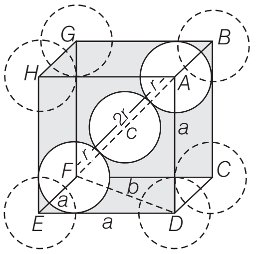
Divide both sides by RT, $\frac{pV}{RT} = 1 - \frac{a}{RTV}$

3. In CsCl, Cl^- lie at corners of simple cube and Cs^+ at the body centre, Hence, along the body diagonal, Cs^+ and Cl^- touch each other so,

$$r_{Cs^+} + r_{Cl^-} = 2r$$

Calculation of *r*

In ΔEDF,



Body centred cubic unit cell

$$FD = b = \sqrt{a^2 + a^2} = \sqrt{2}\,a$$

In ΔAFD,

$$c^2 = a^2 + b^2 = a^2 + (\sqrt{2}\,a)^2$$
$$= a^2 + 2a^2$$
$$c^2 = 3a^2$$
$$c = \sqrt{3}\,a$$

As Δ AFD is an equilateral triangle

$$\sqrt{3}\,a = 4r \;\Rightarrow\; r = \frac{\sqrt{3}\,a}{4}$$

$$\therefore \quad r_{Cs^+} + r_{Cl} = 2r = 2 \times \frac{\sqrt{3}}{4}a = \frac{\sqrt{3}}{2}a$$

4. *This problem is based on the estimation of percentage of* N *in organic compound using Kjeldahl's method. Use the concept of stoichiometry and follow the steps given below to solve the problem.*

(i) Write the balanced chemical reaction for the conversion of N *present in organic compound to ammonia, ammonia to ammonium sulphate and ammonium sulphate to sodium sulphate.*

(ii) Calculate millimoles (m moles) of N *present in organic compound followed by mass of* N *present in organic compound using the concept of stoichiometry.*

(iii) At last, calculate % of N *present in organic compound using formula*

$$\%\text{ of N} = \frac{\text{Mass of N} \times 100}{\text{Mass of organic compound}}$$

Mass of organic compound = 1.4 g

Let it contain x mmole of N atom.

$$\text{Organic compound} \longrightarrow \underset{x \text{ m mole}}{NH_3}$$

$$2NH_3 + \underset{\substack{6 \text{ m mole} \\ \text{initially taken}}}{H_2SO_4} \longrightarrow (NH_4)_2SO_4 \qquad \text{...(i)}$$

$$H_2SO_4 + 2\,NaOH \longrightarrow Na_2SO_4 + 2H_2O \qquad \text{...(ii)}$$

2 mmole NaOH reacted.

Hence, mmoles of H_2SO_4 reacted in Eq. (ii) = 1

$\Rightarrow$ mmoles of H_2SO_4 reacted from Eq. (i) = 6 − 1 = 5 mmoles

$\Rightarrow$ mmoles of NH_3 in Eq. (i) = 2 × 5 = 10 mmoles

$\Rightarrow$ mmoles of N atom in the organic compound = 10 mmoles

$\Rightarrow$ Mass of N = $10 \times 10^{-3} \times 14 = 0.14$ g

$$\%\text{ of N} = \frac{\text{Mass of N present in organic compound}}{\text{Mass of organic compound}} \times 100$$

$$\Rightarrow \quad \%\text{ of N} = \frac{0.14}{1.4} \times 100 = 10\%$$

5. *In order to solve the problem, calculate the value of cell constant of the first solution and then use this value of cell constant to calculate the value of k of second solution. Afterwards, finally calculate molar conductivity using value of k and m.*

For first solution, $\quad k = 1.4\ \mathrm{Sm^{-1}},\ R = 50\,\Omega,\ M = 0.2$

Specific conductance $(\kappa) = \frac{1}{R} \times \frac{l}{A}$

$$1.4\ \mathrm{S\,m^{-1}} = \frac{1}{50} \times \frac{l}{A}$$
$$\frac{l}{A} = 50 \times 1.4\ \mathrm{m^{-1}}$$

For second solution, $\quad R = 280,\ \frac{l}{A} = 50 \times 1.4\ \mathrm{m^{-1}}$

$$\kappa = \frac{1}{280} \times 1.4 \times 50 = \frac{1}{4}$$

Now, molar conductivity

$$\lambda_m = \frac{\kappa}{1000 \times m}$$
$$= \frac{1/4}{1000 \times 0.5} = \frac{1}{2000}$$
$$= 5 \times 10^{-4}\ \mathrm{Sm^2mol^{-1}}$$

6. $C_2H_5OH(l) + 3O_2(g) \longrightarrow 2CO_2(g) + 3H_2O(l)$

$$\Delta U = -1364.47 \text{ kJ/mol}$$
$$\Delta H = \Delta U + \Delta n_g RT$$
$$\Delta n_g = -1$$
$$\Delta H = -1364.47 + \frac{-1 \times 8.314 \times 298}{1000}$$

[Here, value of R in unit of J must be converted into kJ]

$$= -1364.47 - 2.4776$$
$$= -1366.94 \text{ kJ/mol}$$

During solving such problem, students are advised to give much importance to unit conversion. As here, value of R (8.314 $J K^{-1} mol^{-1}$) in $JK^{-1}mol^{-1}$ must be converted into kJ by dividing the unit by 1000.

7. According to Debye Huckel Onsager equation,

$$\lambda_C = \lambda_\infty - B\sqrt{C}$$

where, λ_C = limiting equivalent conductivity at concentration C
λ_∞ = limiting equivalent conductivity at infinite dilution
C = concentration

8. *This problem includes concept of colligative properties (osmotic pressure here) and van't Hoff factor. Calculate the effective molarity of each solution.*
i.e., effective molarity = van't Hoff factor × molarity

0.5 M $C_2H_5OH\,(aq)$ $i = 1$
Effective molarity = 0.5

0.25 M KBr (aq) $i = 2$
Effective molarity = 0.5 M

0.1 M $Mg_3(PO_4)_2(aq)$ $i = 5$
Effective molarity = 0.5 M

0.125 M $Na_3PO_4(aq)$ $i = 4$
Effective molarity = 0.5 M

Hence, all colligative properties are same.

Note *This equation is solved by assuming that the examiner has taken* $Mg_3(PO_4)_2$ *to be completely soluble. However, the fact is that it is insoluble (sparingly soluble).*

9. For the given reaction, $\Delta n_g = n_p - n_R$

where, n_p = number of moles of products
n_R = number of moles of reactants

$$K_p = K_c(RT)^{\Delta n_g}$$
$$\Delta n_g = -\frac{1}{2}$$

10. *This problem can be solved by determining the order of reaction wrt each reactant and then writing rate law equation of the given equation accordingly as*

$$r = \frac{dc}{dt} = k[A]^x[B]^y$$

where, x = order of reaction wrt A
y = order of reaction wrt B

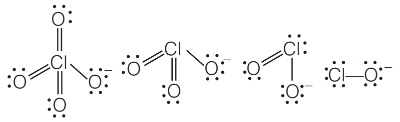
$$1.2 \times 10^{-3} = k(0.1)^x(0.1)^y$$
$$1.2 \times 10^{-3} = k(0.1)^x(0.2)^y$$
$$2.4 \times 10^{-3} = k(0.2)^x(0.1)^y$$
$$R = k[A]^1[B]^0$$

As shown above, rate of reaction remains constant as the concentration of reactant (B) changes from 0.1 M to 0.2 M and becomes double when concentration of A change from 0.1 to 0.2 (*i.e.,* doubled).

11. **Decreasing order of strength of oxoacids**

$$HClO_4 > HClO_3 > HClO_2 > HOCl$$

Reason Consider the structures of conjugate bases of each oxoacids of chlorine.



Negative charge is more delocalised on ClO_4^- due to resonance, hence, ClO_4^- is more stable (and less basic).

Hence, we can say as the number of oxygen atom(s) around Cl-atom increases as oxidation number of Cl-atom increases and thus, the ability of loose the H^+ increases.

12. Higher the position of element in the electrochemical series, more difficult is the reduction of its cations.

If $Ca^{2+}(aq)$ is electrolysed, water is reduced in preference to it. Hence, it cannot be reduced electrolytically from their aqueous solution.

$$Ca^{2+}(aq) + H_2O \longrightarrow Ca^{2+} + OH^- + H_2\uparrow$$

13. *Arrange the complex formed by different ligands L_1, L_2, L_3 and L_4 according to wavelength of their absorbed light, then use the following relation to answer the question.*

Ligand field strength ∝ Energy of light absorbed

$$\propto \frac{1}{\text{Wavelength of light absorbed}}$$

λ	L_1	L_2	L_3	L_4
Absorbed light	Red	Green	Yellow	Blue

Wavelength of absorbed light decreases

∴ Increasing order of energy of wavelengths absorbed reflect greater extent of crystal-field splitting. Hence, higher field strength of the ligand.

Energy Blue (L_4) > green (L_2) > yellow (L_3) > red (L_1)

∴ $L_4 > L_2 > L_3 > L_1$ in field strength of ligands.

14. NO is paramagnetic in gaseous state because in gaseous state, it has one unpaired electron.

Total number of electron present = $7 + 8 = 15\ e^-$.

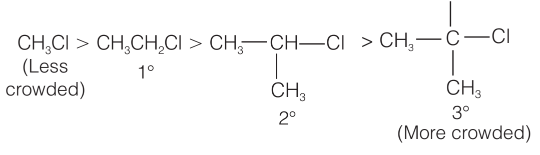
Hence, there must be the presence of unpaired electron in gaseous state while in liquid state, it dimerises due to unpaired electron.

15. Release of electron is known as reduction. So, H_2O_2 acts as reducing agent when it releases electrons.

Here, in reaction (II) and (IV), H_2O_2 releases two electrons, hence reaction (II) and (IV) is known as reduction.

In reaction (I) and (III), two electrons are being added so (I) and (III) represents oxidation.

16. I_3^- is an ion made up of I_2 and I^- which has linear shape.



$$CH_3Cl > CH_3CH_2Cl > CH_3-\underset{\underset{CH_3}{|}}{CH}-Cl > CH_3-\overset{\overset{CH_3}{|}}{\underset{\underset{CH_3}{|}}{C}}-Cl$$

while Cs^+ is an alkali metal cation.

17.
$$\frac{n_{O_2}}{n_{N_2}} = \frac{\dfrac{(m_{O_2})}{(M_{O_2})}}{\dfrac{(m_{N_2})}{(M_{N_2})}}$$

where, m_{O_2} = given mass of O_2
m_{N_2} = given mass of N_2
M_{O_2} = molecular mass of O_2
M_{N_2} = molecular mass of N_2
n_{O_2} = number of moles of O_2
n_{N_2} = number of moles of N_2

$$= \left[\frac{m_{O_2}}{m_{N_2}}\right]\frac{28}{32} = \frac{1}{4} \times \frac{28}{32} = \frac{7}{32}$$

18. Standard electrode potential of reaction $[E^0]$ can be calculated as

$$E^0_{\text{cell}} = E_R - E_P$$

where, E_R = SRP of reactant
E_P = SRP of product

If E^0_{cell} = +ve, then reaction is spontaneous, otherwise non-spontaneous.

$$Mn^{3+} \xrightarrow{E_1^\circ = 1.51\,V} Mn^{2+}$$
$$Mn^{2+} \xrightarrow{E_2^\circ = -1.18\,V} Mn$$

$\therefore$ For Mn^{2+} disproportionation,

$$E^\circ = -1.51\,V - 1.18\,V = -2.69\,V < 0$$

19. *Analyse each reaction given in the question and choose the correct answer on the basis of oxidation state and stability of iron compounds. Use the concept of Ellingham diagram to solve this problem.*

The correct reactions are as follows

(a) $Fe + dil.H_2SO_4 \longrightarrow FeSO_4 + H_2$

$$H_2SO_4 + 2FeSO_4 + \frac{1}{2}O_2 \longrightarrow Fe_2(SO_4)_3 + H_2O$$
$$Fe_2(SO_4)_3 \xrightarrow{\Delta} Fe_2O_3\,(s) + 3SO_3\uparrow$$

The given reaction is incorrect in question.

(b) $Fe \xrightarrow{O_2} FeO$ (It could also be Fe_2O_3 or Fe_3O_4)

$$FeO + H_2SO_4 \xrightarrow{\Delta} FeSO_4 + H_2O$$
$$2FeSO_4 \xrightarrow{\Delta} Fe_2O_3 + SO_2 + SO_3$$

(c) $Fe \xrightarrow[Cl_2]{\Delta} FeCl_3 \xrightarrow[Air]{\Delta}$ No reaction (It cannot give $FeCl_2$)

(d) $Fe \xrightarrow[\Delta]{O_2} Fe_3O_4 \xrightarrow[600°C]{CO} FeO \xrightarrow[700°C]{CO} Fe$

This is correct reaction.

20. *This problem is based on conceptual mixing of properties of lithium oxide and preparation, properties of coordination compounds. To answer this question, keep in mind that on adding acid ammine complexes get destroyed.*

(a) $Li_2O + KCl \longrightarrow 2LiCl + K_2O$

This is wrong equation, since a stronger base K_2O cannot be generated by a weaker base Li_2O.

(b) $[CoCl(NH_3)_5]^+ + 5H^+ \longrightarrow Co^{2+}(aq) + 5NH_4^+ + Cl^-$

This is correct. All ammine complexes can be destroyed by adding $H^\oplus$. Hence, on adding acid to $[CoCl(NH_3)_5]$, it gets converted to Co^{2+} (*aq*), NH_4^+ and Cl^-.

(c) $[Mg(H_2O)_6]^{2+} + EDTA^{4-} \xrightarrow[\text{excess}]{OH^-} [Mg(EDTA)]^{2+} + 6H_2O$

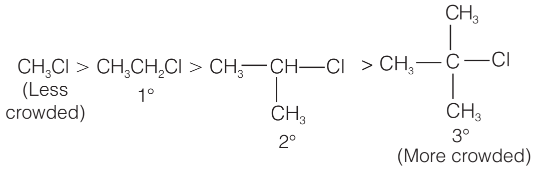
This is wrong, since the formula of complex must be $[Mg(EDTA)]^{2+}$ as EDT.

(d) The 4th reaction is incorrect. It can be correctly represented as

$$2CuSO_4 + 10KCN \longrightarrow 2K_3[Cu(CN)_4] + 2K_2SO_4 + (CN)_2\uparrow$$

21. *Steric hindrance (crowding) is the basis of S_N2 reaction, by using which we can arrange the reactant in correct order of their reactivity towards S_N2 reaction.*

$$\text{Rate of } S_N2 \propto \frac{1}{\text{Steric crowding of 'C'}}$$



$$CH_3Cl > CH_3CH_2Cl > CH_3-CH(CH_3)-Cl > CH_3-C(CH_3)_2-Cl$$

(Less crowded) 1° 2° 3° (More crowded)

As steric hinderance (crowding) increases, rate of S_N2 reaction decreases.

Note *The order of reactivity towards S_N2 reaction for alkyl halides is*

Primary halides (1°) > Secondary halides (2°) > Tertiary halides (3°)

22. This reaction is an example of carbylamine reaction which includes conversion of amine to isocyanide.

$$\underset{1°\text{ amine}}{R-\ddot{N}H_2} + CHCl_3 \xrightarrow[KOH]{C_2H_5OH} \underset{\text{Alkyl isocyanide}}{R-\overset{+}{N}\equiv\overset{-}{C}:}$$

Note *This reaction include rearrangement reaction of nitrene in which migration of alkyl group from carbon to nitrogen takes place.*

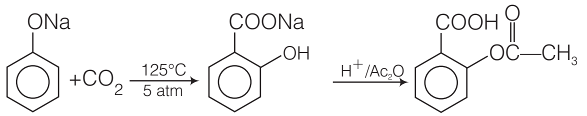
23. $R-CH_2OH \xrightarrow{PCC} R-CH=O$

Pyridinium chlorochromate is the mild oxidising agent which causes conversion of alcohol to aldehyde stage. While others causes conversion of alcohol to acid.

24. The reaction is

$$2CH_3-CCl_3 \xrightarrow[\Delta]{6Ag} \underset{\text{But-2-yne}}{CH_3-C\equiv C-CH_3} + 6AgCl$$

25. It is a Kolbe Schmidt reaction.



Aspirin (pain killer)

The second step of the reaction is an example of acetylation reaction.

26. *This problem can be solved by using the concept of effect of steric hindrance, hydration and H-bonding in basic strength of amines.*

Order of basic strength of aliphatic amine in aqueous solution is as follows (order of K_b)

$$(CH_3)_2\ddot{N}H > CH_3\ddot{N}H_2 > (CH_3)_3\ddot{N} > C_6H_5\ddot{N}H_2$$

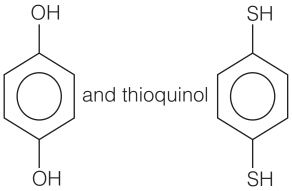
As we know, $pK_b = -\log K_b$

So, $(CH_3)_2\ddot{N}H$ will have smallest pK_b value.

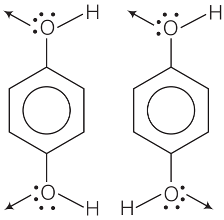
In case of phenyl amine, N is attached to sp^2 hybridised carbon. Hence, it has highest pK_b and least basic strength.

27. *Draw the structures of organic compounds indicating net dipole moment which includes lone pair and bond angle also.*

In the quinol and thioquinol

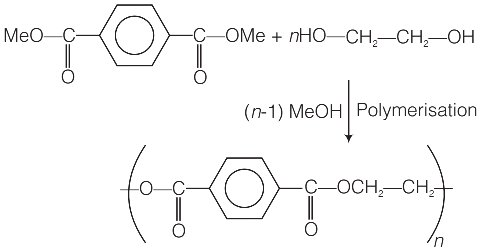


—OH groups and —SH groups do not cancel their dipole moment as they exist in different confirmation.



same as in thioquinol.

28. Dacron is a condensation polymer of ethylene glycol and methyl terepthalate. Formation of dacron can be shown as



Dacron

Here, elimination of MeOH occurs as a by product. So, this reaction is known as condensation polymerisation.

29. Quinoline is an alkaloid. It is not present in DNA. DNA has four nitrogen bases in adenine, guanine, cytosine and thymine.

30. *This problem is based on successive reduction, chlorination and elimination reaction. To solve such problem, use the function of the given reagents.*

(i) $LiAlH_4$ *causes reduction* (ii) PCl_5 *causes chlorination*

(iii) Alc.KOH *causes elimination reaction*

$$\underset{}{CH_3COOH} \xrightarrow{LiAlH_4} \underset{(A)}{CH_3CH_2OH} \xrightarrow{PCl_5} \underset{(B)}{CH_3CH_2Cl} \xrightarrow[-HCl]{Alc.KOH} \underset{\substack{(C)\\ \text{Ethylene}}}{CH_2{=}CH_2}$$

Solved Paper 2015

JEE Main

Joint Entrance Examination

Instructions

- This test consists of 30 questions.
- Each question is allotted 4 marks for correct response.
- Candidates will be awarded marks as stated above for correct response of each question. 1 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
- There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.

---

1. The molecular formula of a commercial resin used for exchanging ions in water softening is $C_8H_7SO_3Na$ (mol. wt. = 206). What would be the maximum uptake of Ca^{2+} ions by the resin when expressed in mole per gram resin?

(a) $\frac{1}{103}$ (b) $\frac{1}{206}$ (c) $\frac{2}{309}$ (d) $\frac{1}{412}$

2. Sodium metal crystallises in a body centred cubic lattice with a unit cell edge of 4.29 Å. The radius of sodium atom is approximately

(a) 1.86 Å (b) 3.22 Å (c) 5.72 Å (d) 0.93 Å

3. Which of the following is the energy of a possible excited state of hydrogen?

(a) + 13.6 eV (b) – 6.8 eV
(c) – 3.4 eV (d) + 6.8 eV

4. The intermolecular interaction that is dependent on the inverse cube of distance between the molecules is

(a) ion-ion interaction (b) ion-dipole interaction
(c) London force (d) hydrogen bond

5. The following reaction is performed at 298K

$$2NO(g) + O_2(g) \rightleftharpoons 2NO_2(g)$$

The standard free energy of formation of NO (g) is 86.6 kJ/mol at 298 K. What is the standard free energy of formation of $NO_2(g)$ at 298 K? $(K_p = 1.6 \times 10^{12})$

(a) $R(298)\ \ln\ (1.6 \times 10^{12}) - 86600$

(b) $86600 + R(298)\ \ln\ (1.6 \times 10^{12})$

(c) $86600 - \frac{\ln\ (1.6 \times 10^{12})}{R(298)}$

(d) $0.5\ [2 \times 86600 - R(298)\ \ln\ (1.6 \times 10^{12})]$

6. The vapour pressure of acetone at 20°C is 185 torr. When 1.2 g of a non-volatile substance was dissolved in 100 g of acetone at 20°C, its vapour pressure was 183 torr. The molar mass $(g\ mol^{-1})$ of the substance is

(a) 32 (b) 64
(c) 128 (d) 488

7. The standard Gibbs energy change at 300K for the reaction, $2A \rightleftharpoons B + C$ is 2494. 2 J. At a given time, the composition of the reaction mixture is $[A] = \frac{1}{2}$, $[B] = 2$ and $[C] = \frac{1}{2}$. The reaction proceeds in the $[R = 8.314\ JK/mol, e = 2.718]$

(a) forward direction because $Q > K_c$
(b) reverse direction because $Q > K_c$
(c) forward direction because $Q < K_c$
(d) reverse direction because $Q < K_c$

8. Two Faraday of electricity is passed through a solution of $CuSO_4$. The mass of copper deposited at the cathode is (at. mass of Cu = 63.5 u)

(a) 0g (b) 63.5g
(c) 2g (d) 127g

9. Higher order (>3) reactions are rare due to

(a) low probability of simultaneous collision of all the reacting species
(b) increase in entropy and activation energy as more molecules are involved
(c) shifting of equilibrium towards reactants due to elastic collisions
(d) loss of active species on collision

10. 3 g of activated charcoal was added to 50 mL of acetic acid solution (0.06 N) in a flask. After an hour it was filtered and the strength of the filtrate was found to be 0.042 N. The amount of acetic acid adsorbed (per gram of charcoal) is

(a) 18 mg (b) 36 mg
(c) 42 mg (d) 54 mg

11. The ionic radii (in Å) of N^{3-}, O^{2-} and F^- respectively are

(a) 1.36, 1.40 and 1.71 (b) 1.36, 1.71 and 1.40
(c) 1.71, 1.40 and 1.36 (d) 1.71, 1.36 and 1.40

12. In the context of the Hall-Heroult process for the extraction of Al, which of the following statements is false?

(a) CO and CO_2 are produced in this process
(b) Al_2O_3 is mixed with CaF_2 which lowers the melting point of the mixture and brings conductivity
(c) Al^{3+} is reduced at the cathode to form Al
(d) Na_3AlF_6 serves as the electrolyte

13. From the following statements regarding H_2O_2, choose the incorrect statement.

(a) It can act only as an oxidising agent
(b) It decomposed on exposure to light
(c) It has to be stored in plastic or wax lined glass bottles in dark
(d) It has to be kept away from dust

14. Which one of the following alkaline earth metal sulphates has its hydration enthalpy greater than its lattice enthalpy?

(a) $CaSO_4$ (b) $BeSO_4$
(c) $BaSO_4$ (d) $SrSO_4$

15. Which among the following is the most reactive?

(a) Cl_2 (b) Br_2
(c) I_2 (d) ICl

16. Match the catalysts to the correct processes.

Catalyst	Process
(A) $TiCl_3$	(i) Wacker process
(B) $PdCl_2$	(ii) Ziegler- Natta polymerisation
(C) $CuCl_2$	(iii) Contact process
(D) V_2O_5	(iv) Deacon's process

(a) (A)- (iii), (B) - (ii), (C) - (iv), (D) - (i)
(b) (A)- (ii), (B) - (i), (C) - (iv), (D) - (iii)
(c) (A)- (ii), (B) - (iii), (C) - (iv), (D) - (i)
(d) (A)- (iii), (B) - (i), (C) - (ii), (D) - (iv)

17. Which one has the highest boiling point?

(a) He (b) Ne
(c) Kr (d) Xe

18. The number of geometric isomers that can exist for square planar $[Pt(Cl)(py)(NH_3)(NH_2OH)]^+$ is (py = pyridine)

(a) 2 (b) 3
(c) 4 (d) 6

19. The colour of $KMnO_4$ is due to

(a) $M \to L$ charge transfer transition
(b) $d - d$ transition
(c) $L \to M$ charge transfer transition
(d) $\sigma - \overset{*}{\sigma}$ transition

20. **Assertion (A)** Nitrogen and oxygen are the main components in the atmosphere but these do not react to form oxides of nitrogen.

Reason (R) The reaction between nitrogen and oxygen requires high temperature.

(a) Both Assertion and Reason are correct and the reason is the correct explanation for the Assertion.
(b) Both Assertion and Reason are correct but the reason is not the correct explanation for the Assertion.
(c) The Assertion is incorrect but the Reason is correct.
(d) Both the Assertion and Reason are incorrect.

21. In Carius method of estimation of halogens, 250 mg of an organic compound gave 141 mg of AgBr. The percentage of bromine in the compound is

(at. mass Ag = 108, Br = 80)

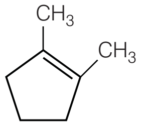
(a) 24 (b) 36 (c) 48 (d) 60

22. Which of the following compound will exhibit geometrical isomerism?

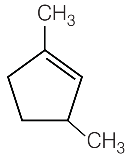
(a) 1-phenyl-2-butene
(b) 3-phenyl-1-butene
(c) 2-phenyl-1-butene
(d) 1, 1-diphenyl-1-propane

23. Which compound would give 5-keto-2-methyl hexanal upon ozonolysis?

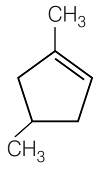
(a)



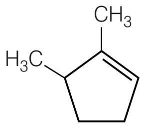
(b)



(c)



(d)



24. The synthesis of alkyl fluorides is best accomplished by

(a) free radical fluorination (b) Sandmeyer's reaction
(c) Finkelstein reaction (d) Swarts reaction

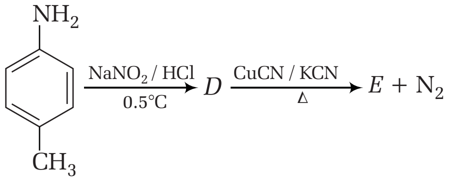
25. In the following sequence of reaction,

$$\text{Toluene} \xrightarrow{KMnO_4} A \xrightarrow{SOCl_2} B \xrightarrow[BaSO_4]{H_2/Pd} C$$

The product C is

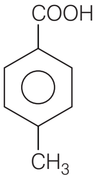
(a) C_6H_5COOH
(b) $C_6H_5CH_3$
(c) $C_6H_5CH_2OH$
(d) C_6H_5CHO

26. In the reaction,

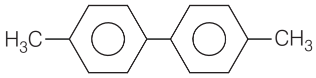


The product E is

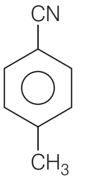
(a)



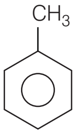
(b)



(c)



(d)



27. Which polymer is used in the manufacture of paints and lacquers?

(a) Bakelite
(b) Glyptal
(c) Polypropene
(d) Polyvinyl chloride

28. Which of the vitamins given below is water soluble?

(a) Vitamin C
(b) Vitamin D
(c) Vitamin E
(d) Vitamin K

29. Which of the following compounds is not an antacid?

(a) Aluminium hydroxide
(b) Cimetidine
(c) Phenelzine
(d) Ranitidine

30. Which of the following compounds is not coloured yellow?

(a) $Zn_2[Fe(CN)_6]$
(b) $K_3[Co(NO_2)_6]$
(c) $(NH_4)_3[As(Mo_3O_{10})_4]$
(d) $BaCrO_4$

Answer *with* Explanations

1. *(d)* We know the molecular weight of $C_8H_7SO_3Na$

$$= 12 \times 8 + 1 \times 7 + 32 + 16 \times 3 + 23 = 206$$

We have to find, mole per gram of resin.

$\therefore$ 1 g of $C_8H_7SO_3Na$ has number of mole

$$= \frac{\text{Weight of given resin}}{\text{Molecular weight of resin}} = \frac{1}{206} \text{ mol}$$

Now, reaction looks like

$$2C_8H_7SO_3Na + Ca^{2+} \longrightarrow (C_8H_7SO_3)_2Ca + 2Na^+$$

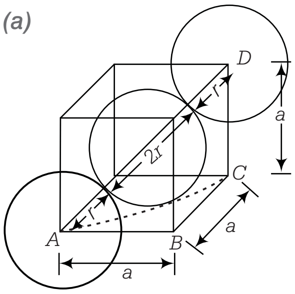
$\because$ 2 moles of $C_8H_7SO_3Na$ combines with 1 mol Ca^{2+}

$\therefore$ 1 mole of $C_8H_7SO_3Na$ will combine with $\frac{1}{2}$ mol Ca^{2+}

$\therefore \frac{1}{206}$ mole of $C_8H_7SO_3Na$ will combine with $\frac{1}{2} \times \frac{1}{206}$ mol Ca^{2+}

$$= \frac{1}{412} \text{ mol } Ca^{2+}$$

2. *(a)*



From this figure ,

$$(AC)^2 = (AB)^2 + (BC)^2$$
$$(AC)^2 = a^2 + a^2 = 2a^2$$

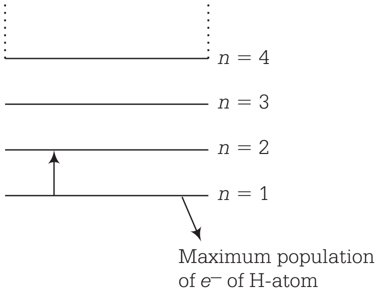
Also, $$(AD)^2 = (AC)^2 + (DC)^2$$
$$(4r)^2 = 2a^2 + a^2$$
$$16r^2 = 3a^2$$
$$r = \frac{\sqrt{3}}{4}a$$

Now, when Na metal crystallises in bcc unit cell with unit cell edge, $a = 4.29 \text{Å}$

We have the formula for radius,

i.e. $$r = \frac{\sqrt{3}}{4} \times 4.29 \text{ Å} = 1.86 \text{Å}$$

3. *(c)*



Since, at $n = 1$, the population of electrons is maximum *i.e.* at ground state. So, maximum excitation will take place from $n = 1$ to $n = 2$.

Hence, $n = 2$ is the possible excited state.

Now, we have the formula for energy of H-atom

$$(E_n)_H = -13.6 \frac{Z^2}{n^2} \text{eV}$$

where, Z = atomic number

Z for H-atom $= 1$

$$\therefore \quad (E_n)_{\text{H}} = -13.6 \times \frac{1}{2^2}\,\text{eV} = -\frac{13.6}{4}\,\text{eV} = -3.4\text{ eV}$$

4. *(b)* Ion-ion interaction is dependent on the square of distance, i.e. ion-ion interaction $\propto \dfrac{1}{r^2}$

Similarly,

$$\text{ion-dipole interaction} \propto \frac{1}{r^3}$$

$$\text{London forces} \propto \frac{1}{r^6}$$

$$\text{and dipole-dipole interactions} \propto \frac{1}{r^3}$$

Superficially it seems as both ion dipole interaction and hydrogen bonding vary with the inverse cube of distance between the molecules but when we look at the exact expressions of field (force) created in two situations it comes as

$$|\mathbf{E}| \text{or } |\mathbf{F}| = \frac{2|\mathbf{P}|}{4\pi\varepsilon_0 r^3} \qquad \text{(In case of ion-dipole interaction)}$$

$$\text{and} \qquad F = \frac{2q^2 r - 4q^2 a}{4\pi\varepsilon_0 r^3} \quad \text{(In case of dipole-dipole interaction)}$$

From the above it is very clear, the ion-dipole interaction is the better answer as compared to dipole-dipole interaction i.e. hydrogen bonding.

5. *(d)* For the given reaction,

$$2\text{NO}(g) + \text{O}_2(g) \rightleftharpoons 2\text{NO}_2(g)$$

Given, $\Delta G_f^\circ\,(\text{NO}) = 86.6\text{ kJ/mol}$

$\Delta G_f^\circ\,(\text{NO}_2) = ?$

$K_p = 1.6 \times 10^{12}$

Now, we have,

$$\Delta G_f^\circ = 2\Delta G^\circ_{f(\text{NO}_2)} - [2\Delta G^\circ_{f(\text{NO})} + \Delta G^\circ_{f(\text{O}_2)}]$$

$$= -RT\ln K_p = 2\Delta G^\circ_{f(\text{NO}_2)} - [2 \times 86{,}600 + 0]$$

$$\Delta G^\circ_{f(\text{NO}_2)} = \frac{1}{2}[2 \times 86{,}600 - R \times 298 \ln(1.6 \times 10^{12})]$$

$$\Delta G^\circ_{f(\text{NO}_2)} = 0.5\,[2 \times 86{,}600 - R \times (298)\ln(1.6 \times 10^{12})]$$

6. *(b)* Given,

$p_o = 185$ torr at 20°C

$p_s = 183$ torr at 20°C

Mass of non-volatile substance, $m = 1.2$ g

Mass of acetone taken $= 100$ g

$M = ?$

As , we have

$$\frac{p_o - p_s}{p_s} = \frac{n}{N}$$

Putting the values, we get,

$$\frac{185 - 183}{183} = \frac{\dfrac{1.2}{M}}{\dfrac{100}{58}} \Rightarrow \frac{2}{183} = \frac{1.2 \times 58}{100 \times M}$$

$$\therefore \qquad M = \frac{183 \times 1.2 \times 58}{2 \times 100}$$

$$M = 63.684 \approx 64\text{ g/mol}$$

7. *(b)* Given, $\Delta G^\circ = 2494.2\text{J}$

$$Q = \frac{[B][C]}{[A]^2} = \frac{2 \times \frac{1}{2}}{\left(\frac{1}{2}\right)^2} = 4$$

$\therefore$ We know,

$$\Delta G = \Delta G^\circ + RT\ln Q$$

$$= 2494.2 + 8.314 \times 300\ \ln 4$$

$$= 28747.27\text{J}$$

$$= \text{positive value}$$

Also, we have

$$\Delta G = RT\ln\frac{Q}{K}$$

if ΔG is positive, $Q > K$.

Therefore, reaction shifts in reverse direction.

8. *(b)* Given,

$$Q = 2F$$

Atomic mass of $\text{Cu} = 63.5\,\text{u}$

Valency of the metal $Z = 2$

We have,

$$\text{CuSO}_4 \longrightarrow \text{Cu}^{2+} + \text{SO}_4^{2-}$$

$$\underset{1\text{mol}}{\text{Cu}^{2+}} + \underset{\substack{2\text{ mol}\\2\text{F}}}{2e^-} \longrightarrow \underset{1\text{mol} = 63.5\,\text{g}}{\text{Cu}}$$

Alternatively,

$$W = ZQ$$

$$= \frac{E}{F} \cdot 2F$$

$$= 2E$$

$$= \frac{2 \times 63.5}{2} = 63.5$$

9. *(a)* The main conditions for the occurrence of a reaction is proper orientation and effective collision of the reactants.

Since the chances of simultaneous collision with proper orientation between more than 3 species is very rare, so reaction with order greater than 3 are rare.

10. *(a)* Given, initial strength of acetic acid $= 0.06$N

Final strength $= 0.042$ N

Volume given $= 50$ mL

$\therefore$ Initial m moles of CH_3COOH

$$= 0.06 \times 50 = 3$$

Final m moles of CH_3COOH

$$= 0.042 \times 50 = 2.1$$

$\therefore$ m moles of CH_3COOH adsorbed

$$= 3 - 2.1$$

$$= 0.9\text{ m mol}$$

Hence, mass of CH_3COOH absorbed per gram of charcoal

$$= \frac{0.9 \times 60}{3} \ (\because \text{molar mass of CH}_3\text{COOH} = 60\text{ gmol}^{-1})$$

$$= \frac{54}{3} = 18\text{ mg.}$$

11. *(c)* Number of electrons in $N^{3-} = 7 + 3 = 10$

Number of electrons in $O^{2-} = 8 + 2 = 10$

Number of electrons in $F^{-} = 9 + 1 = 10$

Since, all the three species have each 10 electrons hence they are isoelectronic species.

It is considered that, in case of isoelectronic species as the negative charge increases, ionic radii increases and therefore the value of ionic radii are

$N^{3-} = 1.71$ (highest among the three)

$O^{2-} = 1.40$

$F^{-} = 1.36$ (lowest among the three)

Time Saving Technique *There is no need to mug up the radius values for different ions. This particular question can be solved through following time saving.*

Trick *The charges on the ions indicate the size as* $N^{3-} > O^{2-} > F^{-}$. *Thus, you have to look for the option in which the above trend is followed. Option (c) is the only one in which this trend is followed. Hence, it is the correct answer.*

12. *(d)* (a) In Hall-Heroult process for extraction of Al, carbon anode is oxidised to CO and CO_2.

(b) When Al_2O_3 is mixed with CaF_2, it lowers the melting point of the mixture and brings conductivity.

(c) Al^{3+} is reduced at cathode to form Al.

(d) Here, Al_2O_3 is an electrolyte, undergoing the redox process. Na_3AlF_6 although is an electrolyte but serves as a solvent, not electrolyte.

13. *(a)* H_2O_2 acts as an oxidising as well as reducing agent, because oxidation number of oxygen in H_2O_2 is –1. So, it can be oxidised to oxidation state 0 or reduced to oxidation state –2.

H_2O_2 decomposes on exposure to light. So, it has to be stored in plastic or wax lined glass bottles in dark for the prevention of exposure. It also has to be kept away from dust.

14. *(b)* As we move down the group, size of metal increases. Be has lower size while SO_4^{2-} has bigger size, that's why $BeSO_4$ breaks easily and lattice energy becomes smaller but due to lower size of Be, water molecules are gathered around and hence hydration energy increases.

On the other hand, rest metals i.e. Ca, Ba, Sr have bigger size and that's why lattice energy is greater than hydration energy.

Time Saving Technique *In the question of finding hydration energy only check the size of atom. Smaller sized atom has more hydration energy.*

Thus, in this question Be *is placed upper most in the group has lesser size and not comparable with the size of sulphates. Hence,* $BeSO_4$ *is the right response.*

15. *(d)* Cl_2, Br_2 and I_2 are homonuclear diatomic molecule in which electronegativity of the combining atoms is same, so they are more stable and less reactive, whereas, I and Cl have different electronegativities and bond between them are polarised and hence, reactive. Therefore, interhalogen compounds are more reactive.

Time Saving Technique *In this type of question of halogen, only go through the polarity of the molecule. As we know, diatomic molecule does not have polarity but molecules with dissimilar sizes have polarity resulting in more reactivity.*

16. *(b)* (a) $TiCl_3$ is used as Ziegler-Natta catalyst for the polymerisation of ethene.

(b) $PdCl_2$ is used in Wacker process, in which alkene changed into aldehyde *via* catalytic cyclic process initiated by $PdCl_2$.

(c) $CuCl_2$ is used in Deacon's process. (for Cl_2)

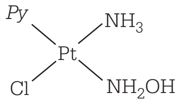
(d) V_2O_5 is used in contact process of manufacturing sulphuric acid.

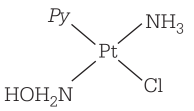
Time Saving Technique *This type of questions can also be solved through elimination technique. There is no need to know all the four matches to select the correct response. Even if you know (b) matches then also you can solve the problem. e.g. suppose you know the usage of* V_2O_5 *in contact process (i.e. D matches with (iii) and* $TiCl_3$ *is connected to Ziegler-Natta catalyst (i.e. A matches with ii). These two combinations are present only in option number (b). Likewise, for this question particularly if you know that* V_2O_5 *is used in contact process then this combination is present in option (b) only out of all the four option given. In this way you can eliminate wrong options to get the correct response.*

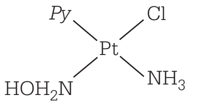
17. *(d)* As we move down the group of noble gases , molecular mass increases by which dipole produced for a moment and hence London forces increases from He to Xe. Therefore more amount of energy is required to break these forces, thus boiling point also increases from He to Xe.

18. *(b)* $[Pt(Cl)(py)(NH_3)(NH_2OH)]^+$ is square planar complex.

The structures are formed by fixing a group and then arranging all the groups.







Hence, this complex shows three geometrical isomers.

19. *(c)* $KMnO_4 \longrightarrow K^+ + MnO_4^-$

$\therefore$ In MnO_4^-, Mn has +7 oxidation state having no electron in *d*-orbitals.

It is considered that higher the oxidation state of metal, greater is the tendency to occur $L \rightarrow M$ charge transfer, because ligand is able to donate the electrons into the vacant *d*- orbital of metal.

Since, charge transfer is Laporte as well as spin allowed, therefore, it shows colour.

Time Saving Technique *There is no need to check all the four options. Just find out the oxidation state of metal ion. If oxidation state is highest and ligand present there is of electron donating nature, gives LMCT, which shows more intense colour.*

20. *(a)* Nitrogen is an inert gas because of the presence of strong bond. That's why although there is 78% N_2 in the atmosphere but nitrogen oxide in not formed under ordinary conditions.

But when temperature is high enough i.e. ≈ 2000 K, it reacts with oxygen to form nitrogen oxide.

$$N_2 + O_2 \xrightarrow{\approx 2000\text{ K}} 2NO$$

Thus, Assertion and Reason are true and Reason is the correct explanation of the Assertion.

21. *(a)* Given,

Weight of organic compound = 250 mg

Weight of AgBr = 141 mg

∴ According to formula of % of bromine by Carius method

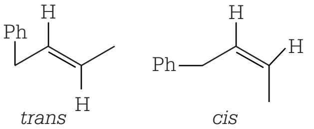
$$\%\text{ of Br} = \frac{\text{Atomic weight of Br}}{\text{Molecular weight of AgBr}} \times \frac{\text{Weight of AgBr}}{\text{Weight of organic bromide}} \times 100$$

$$\therefore \quad \%\text{ of Br} = \frac{80}{188} \times \frac{141}{250} \times 100$$

$$= \frac{1128000}{47000} = 24\ \%$$

22. *(a)* Alkene in which different groups are attached with the double bonded carbon atoms, exhibit geometrical isomerism.

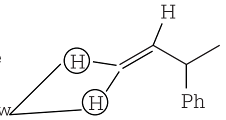
1-phenyl -2-butene =



trans *cis*

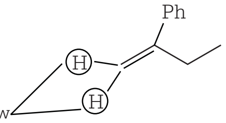
It will show geometrical isomerism.

3-phenyl-1-butene



Same group, does not show geometrical isomerism.

2-phenyl-1-butene



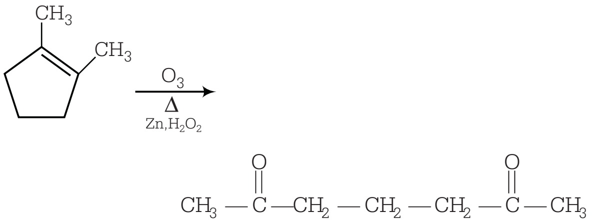
Same group, does not show geometrical isomerism.

1,1-diphenyl-1-propane being an alkane (saturated compound) does not show geometrical isomerism.

Time Saving Technique *We do not need the check all options, but it should remind that double bonded compounds show geometrical isomerism. Thus, (d) is eliminated, (i.e. propane). Now, eliminate the terminal alkene and get the correct response.*

23. *(b)*

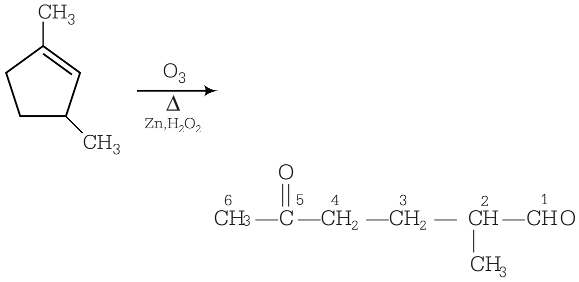
(a)



$$CH_3-\overset{\overset{O}{\|}}{C}-CH_2-CH_2-CH_2-\overset{\overset{O}{\|}}{C}-CH_3$$

Heptan-2,6-dione

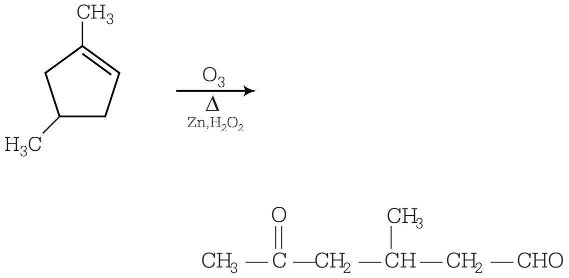
(b)



$$\overset{6}{C}H_3-\overset{\overset{O}{\|}}{\overset{5}{C}}-\overset{4}{C}H_2-\overset{3}{C}H_2-\underset{\underset{CH_3}{|}}{\overset{2}{C}H}-\overset{1}{C}HO$$

5-keto-2-methyl hexanal

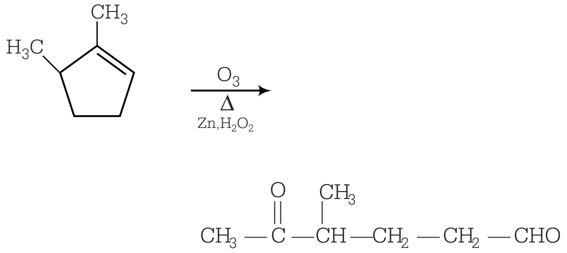
(c)



$$CH_3-\overset{\overset{O}{\|}}{C}-CH_2-\overset{\overset{CH_3}{|}}{C}H-CH_2-CHO$$

5-keto-3-methyl hexanal

(d)



$$CH_3-\overset{\overset{O}{\|}}{C}-\overset{\overset{CH_3}{|}}{C}H-CH_2-CH_2-CHO$$

5-keto-4-methyl hexanal

24. *(d)* Alkyl fluorides can be prepared by action of mercurous fluoride or antimony trifluorides (inorganic fluorides) on corresponding alkyl halide. This reaction is known as Swarts reaction.

$$CH_3Br + AgF \longrightarrow \underset{\substack{\text{Methyl}\\ \text{fluoride}}}{CH_3F} + AgBr$$

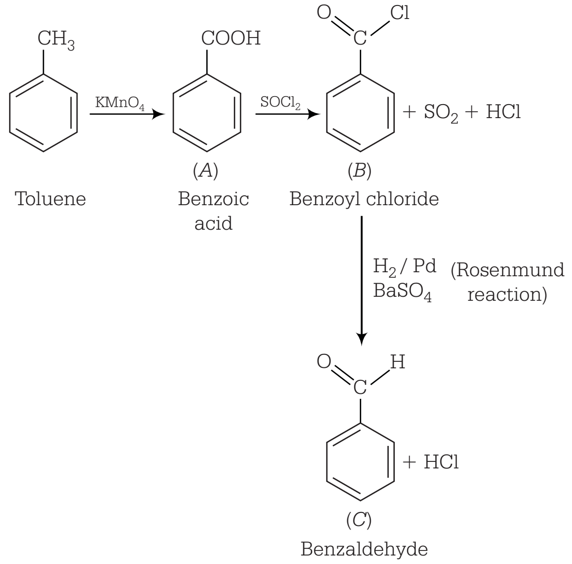
But, when action of NaI/acetone takes place on alkyl chloride or bromide, alkyl iodide forms. This reaction is called 'Finkelstein reaction'.

$$C_2H_5Cl \xrightarrow[\text{acetone}]{\text{NaI}} C_2H_5I + NaCl$$

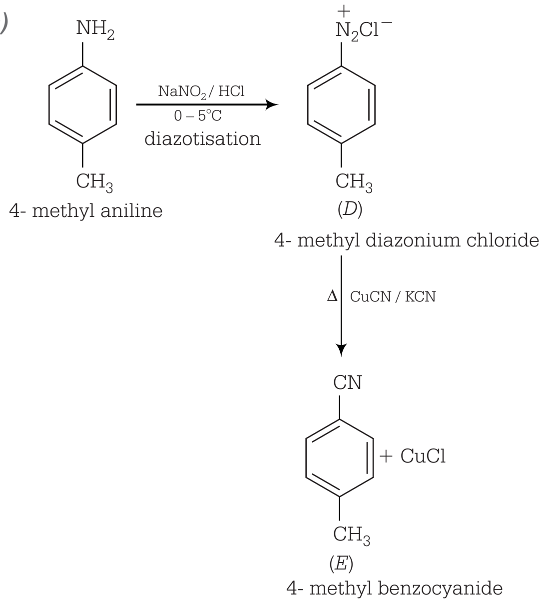
Free radical fluorination is highly explosive reaction. so not preferred for the preparation of fluoride.

25. *(d)* Toluene undergoes oxidation with $KMnO_4$, forms benzoic acid. In this conversion, alkyl part of toluene converts into carboxylic group. Further, benzoic acid reacts with thionyl chloride ($SOCl_2$) to give benzoyl chloride which upon reduction with H_2/Pd or $BaSO_4$ forms benzaldehyde (Rosenmund Reduction).

The conversion look like,



26. *(c)*



27. *(b)* (a) Bakelite is used for making gears, protective coating and electrical fittings.

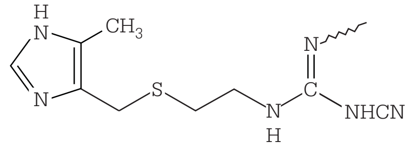
(b) Glyptal is used in the manufacture of paints and lacquers.

(c) PP is used in the manufacture of textile, packaging materials etc.

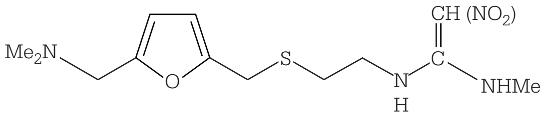
(d) Polyvinyl chloride (PVC) is used in the manufacture of rain coats, hand bags, leather clothes etc.

28. *(a)* Vitamin B and C are water soluble while vitamin A,D,E and K are fat soluble or water insoluble.

29. *(c)* Aluminium hydroxide Al $(OH)_3$, cimetidine and ranitidine are antacids while phenelzine is not.

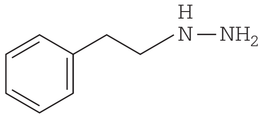


Cimetidine



Ranitidine

Phenelzine is a tranquilizer, not an antacid.



30. *(a)* $Zn_2[Fe(CN)_6]$, $K_3[Co(NO_2)_6]$ and $[(NH_4)_3As(Mo_3O_{10})_4]$ show colour due to *d-d* transition while $BaCrO_4$ is coloured due to charge transfer phenomenon.

Further, according to spectrochemical series the strong ligand possessing complex has higher energy and hence lower wavelength. Therefore, complexes containing NO_2, NH_4^+, O^{2-} etc ligands show yellow colour while CN^- forces the complex to impart white colour.

Spectrochemical Series

$$I^- < Br^- < S^{2-} < SCN^- < Cl^- < NO_3^- < N_3^- < F^- < OH^- < C_2O_4^{2-} \approx H_2O < NCS^- < CH_3CN < py < NH_3 < en < bipy < Phen < NO_2^- < PPh_3 < CN^- \approx CO$$

SOLVED PAPER 2016 **{OFFLINE}**

JEE MAIN

Joint Entrance Examination

INSTRUCTIONS

1. This test consists of 30 questions.
2. Each question is allotted 4 marks for correct response.
3. Candidates will be awarded marks as stated above in instruction no. 2 for correct response of each question. 1 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
4. There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.

Chemistry

1. A stream of electrons from a heated filament was passed between two charged plates kept at a potential difference V esu. If e and m are charge and mass of an electron, respectively, then the value of h/λ (where, λ is wavelength associated with electron wave) is given by

(a) $2\,meV$ (b) $\sqrt{meV}$
(c) $\sqrt{2\,meV}$ (d) meV

2. 2-chloro-2-methylpentane on reaction with sodium methoxide in methanol yields

I. 
$C_2H_5CH_2-\overset{\displaystyle CH_3}{\underset{\displaystyle CH_3}{C}}-OCH_3$

II. 
$C_2H_5CH_2-\underset{\displaystyle CH_3}{C}=CH_2$

III. 
$C_2H_5CH=\underset{\displaystyle CH_3}{C}-CH_3$

(a) Both I and III (b) Only III
(c) Both I and II (d) All of these

3. Which of the following compounds is metallic and ferromagnetic?

(a) CrO_2 (b) VO_2
(c) MnO_2 (d) TiO_2

4. Which of the following statements about low density polythene is false?

(a) It is a poor conductor of electricity
(b) Its synthesis required dioxygen or a peroxide initiator as a catalyst
(c) It is used in the manufacture of buckets, dustbins etc.
(d) Its synthesis requires high pressure

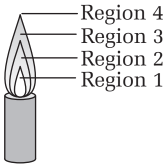
5. For a linear plot of $\log(x/m)$ *versus* $\log p$ in a Freundlich adsorption isotherm, which of the following statements is correct? (k and n are constants)

(a) $1/n$ appears as the intercept
(b) Only $1/n$ appears as the slope
(c) $\log\left(\frac{1}{n}\right)$ appears as the intercept
(d) Both k and $1/n$ appear in the slope term

6. The heats of combustion of carbon and carbon monoxide are -393.5 and -283.5 kJ mol^{-1}, respectively. The heat of formation (in kJ) of carbon monoxide per mole is

(a) 676.5
(b) -676.5
(c) -110.5
(d) 110.5

7. The hottest region of Bunsen flame shown in the figure given below is



(a) region 2 (b) region 3 (c) region 4 (d) region 1

8. Which of the following is an anionic detergent?

(a) Sodium lauryl sulphate
(b) Cetyltrimethyl ammonium bromide
(c) Glyceryl oleate
(d) Sodium stearate

9. 18 g of glucose $(C_6H_{12}O_6)$ is added to 178.2 g water. The vapour pressure of water (in torr) for this aqueous solution is

(a) 76.0 (b) 752.4 (c) 759.0 (d) 7.6

10. The distillation technique most suited for separating glycerol from spent lye in the soap industry is

(a) fractional distillation
(b) steam distillation
(c) distillation under reduced pressure
(d) simple distillation

11. The species in which the N-atom is in a state of *sp* hybridisation is

(a) NO_2^- (b) NO_3^- (c) NO_2 (d) NO_2^+

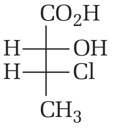
12. Decomposition of H_2O_2 follows a first order reaction. In 50 min, the concentration of H_2O_2 decreases from 0.5 to 0.125 M in one such decomposition. When the concentration of H_2O_2 reaches 0.05 M, the rate of formation of O_2 will be

(a) 6.93×10^{-4} mol min^{-1} (b) 2.66 L min^{-1} at STP
(c) 1.34×10^{-2} mol min^{-1} (d) 6.93×10^{-2} mol min^{-1}

13. The pair having the same magnetic moment is [at. no. Cr = 24, Mn = 25, Fe = 26 and Co = 27]

(a) $[Cr(H_2O)_6]^{2+}$ and $[Fe(H_2O)_6]^{2+}$
(b) $[Mn(H_2O)_6]^{2+}$ and $[Cr(H_2O)_6]^{2+}$
(c) $[CoCl_4]^{2-}$ and $[Fe(H_2O)_6]^{2+}$
(d) $[Cr(H_2O)_6]^{2+}$ and $[CoCl_4]^{2-}$

14. The absolute configuration of



is

(a) (2S, 3R) (b) (2S, 3S)
(c) (2R, 3R) (d) (2R, 3S)

15. The equilibrium constant at 298 K for a reaction, $A + B \rightleftharpoons C + D$ is 100. If the initial concentrations of all the four species were 1 M each, then equilibrium concentration of D (in mol L^{-1}) will be

(a) 0.818 (b) 1.818 (c) 1.182 (d) 0.182

16. Which one of the following ores is best concentrated by froth floatation method?

(a) Siderite (b) Galena
(c) Malachite (d) Magnetite

17. At 300 K and 1 atm, 15 mL of a gaseous hydrocarbon requires 375 mL air containing 20% O_2 by volume for complete combustion. After combustion, the gases occupy 330 mL. Assuming that the water formed is in liquid form and the volumes were measured at the same temperature and pressure, the formula of the hydrocarbon is

(a) C_3H_8 (b) C_4H_8
(c) C_4H_{10} (d) C_3H_6

18. The pair in which phosphorus atoms have a formal oxidation state of +3 is

(a) pyrophosphorous and hypophosphoric acids
(b) orthophosphorous and hypophosphoric acids
(c) pyrophosphorous and pyrophosphoric acids
(d) orthophosphorous and pyrophosphorous acids

19. Which one of the following complexes shows optical isomerism?

(a) *cis* $[Co(en)_2Cl_2]Cl$ (b) *trans* $[Co(en)_2Cl_2]Cl$
(c) $[Co(NH_3)_4Cl_2]Cl$ (d) $[Co(NH_3)_3Cl_3]$

20. The reaction of zinc with dilute and concentrated nitric acid, respectively, produce

(a) NO_2 and NO (b) NO and N_2O
(c) NO_2 and N_2O (d) N_2O and NO_2

21. Which one of the following statements about water is false?

(a) Water can act both as an acid and as a base
(b) There is extensive intramolecular hydrogen bonding in the condensed phase
(c) Ice formed by heavy water sinks in normal water
(d) Water is oxidised to oxygen during photosynthesis

22. The concentration of fluoride, lead, nitrate and iron in a water sample from an underground lake was found to be 1000 ppb, 40 ppb, 100 ppm and 0.2 ppm, respectively. This water is unsuitable for drinking due to high concentration of

(a) lead (b) nitrate
(c) iron (d) fluoride

23. The main oxides formed on combustion of Li, Na and K in excess of air respectively are

(a) LiO_2, Na_2O_2 and K_2O
(b) Li_2O_2, Na_2O_2 and KO_2
(c) Li_2O, Na_2O_2 and KO_2
(d) Li_2O , Na_2O and KO_2

24. Thiol group is present in

(a) cystine (b) cysteine
(c) methionine (d) cytosine

25. Galvanisation is applying a coating of

(a) Cr (b) Cu
(c) Zn (d) Pb

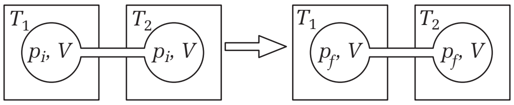
26. Which of the following atoms has the highest first ionisation energy?

(a) Na (b) K
(c) Sc (d) Rb

27. In the Hofmann-bromamide degradation reaction, the number of moles of NaOH and Br_2 used per mole of amine produced are

(a) four moles of NaOH and two moles of Br_2
(b) two moles of NaOH and two moles of Br_2
(c) four moles of NaOH and one mole of Br_2
(d) one mole of NaOH and one mole of Br_2

28. Two closed bulbs of equal volume (V) containing an ideal gas initially at pressure p_i and temperature T_1 are connected through a narrow tube of negligible volume as shown in the figure below. The temperature of one of the bulbs is then raised to T_2. The final pressure p_f is

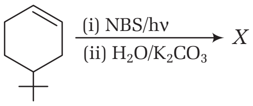


(a) $2p_i\left(\frac{T_1}{T_1+T_2}\right)$ (b) $2p_i\left(\frac{T_2}{T_1+T_2}\right)$
(c) $2p_i\left(\frac{T_1T_2}{T_1+T_2}\right)$ (d) $p_i\left(\frac{T_1T_2}{T_1+T_2}\right)$

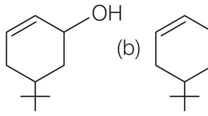
29. The reaction of propene with HOCl $(Cl_2 + H_2O)$ proceeds through the intermediate

(a) $CH_3-\overset{+}{C}H-CH_2-Cl$ (b) $CH_3-CH(OH)-\overset{+}{C}H_2$
(c) $CH_3-CHCl-\overset{+}{C}H_2$ (d) $CH_3-\overset{+}{C}H-CH_2-OH$

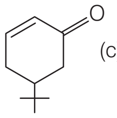
30. The product of the reaction given below is



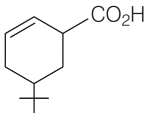
(a)



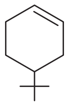
(b)



(c)



(d)



ANSWER WITH EXPLANATION

1. *(c)* ***Plan*** As you can see in options, energy term is mentioned hence, we have to find out relation between $\frac{h}{\lambda}$ and energy.

For this, we shall use de-Broglie wavelength and kinetic energy term in eV.

de-Broglie wavelength for an electron $(\lambda) = \frac{h}{p}$

$$\Rightarrow \quad p = \frac{h}{\lambda} \quad \ldots(i)$$

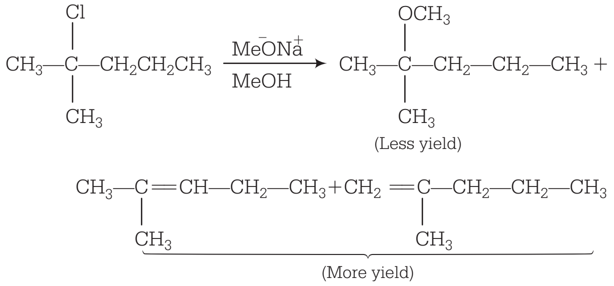
Kinetic energy of an electron = eV

As we know that, $KE = \frac{p^2}{2m}$

$$\therefore \quad eV = \frac{p^2}{2m} \quad \text{or} \quad p = \sqrt{2meV} \quad \ldots(ii)$$

From equations (i) and (ii), we get $\frac{h}{\lambda} = \sqrt{2meV}$

2. *(d)* ***Key concept*** Strong nucleophile ($\bar{O}$Me) in polar solvent (MeOH) gives elimination products over substitution products but all products are possible in different yields.



$$CH_3-\underset{CH_3}{\overset{Cl}{C}}-CH_2CH_2CH_3 \xrightarrow[MeOH]{Me\bar{O}\overset{+}{Na}} \underset{\text{(Less yield)}}{CH_3-\underset{CH_3}{\overset{OCH_3}{C}}-CH_2-CH_2-CH_3} +$$

$$\underbrace{CH_3-\underset{CH_3}{C}=CH-CH_2-CH_3+CH_2=\underset{CH_3}{C}-CH_2-CH_2-CH_3}_{\text{(More yield)}}$$

3. *(a)* Only three elements iron (Fe), cobalt (Co) and nickel (Ni) show ferromagnetism at room temperature. CrO_2 is also a metallic and ferromagnetic compound which is used to make magnetic tapes for cassette recorders.

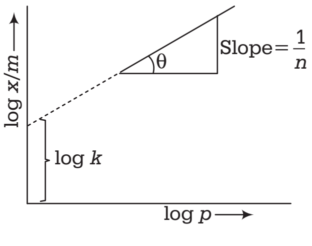
4. *(c)* High density polythene is used in the manufacture of buckets, dustbins etc.

5. *(b)* According to Freundlich adsorption isotherm, $\frac{x}{m} = kp^{1/n}$

On taking logarithm of both sides, we get

$$\log\frac{x}{m} = \log k + \log p^{1/n} \text{ or } \log\frac{x}{m} = \log k + \frac{1}{n}\log p$$

$$y = c + mx$$



$y = \log\frac{x}{m}$, c = intercept = $\log k$, m = slope = $\frac{1}{n}$ and $x = \log p$

6. *(c)* $C(s) + O_2(g) \longrightarrow CO_2(g)$; $\Delta H = -393.5 \text{ kJ mol}^{-1}$ …(i)

$CO + \frac{1}{2}O_2 \longrightarrow CO_2(g)$; $\Delta H = -283.5 \text{ kJ mol}^{-1}$ …(ii)

On subtracting Eq. (ii) from Eq. (i), we get

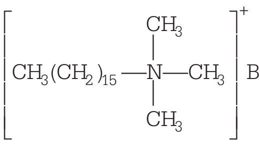
$C(s) + \frac{1}{2}O_2(g) \longrightarrow CO(g)$;

$$\Delta H = (-393.5 + 283.5) \text{ kJ mol}^{-1} = -110 \text{ kJ mol}^{-1}$$
(approx.)

7. *(a)* Region 1 (Pre-heating zone)
Region 2 (Primary combustion zone, hottest zone)
Region 3 (Internal zone)
Region 4 (Secondary reaction zone)

8. *(a)* Sodium lauryl sulphate $[(CH_3(CH_2)_{10}CH_2OSO_3^-Na^+)]$ = Anionic detergent

Cetyltrimethyl ammonium bromide



$$\left[CH_3(CH_2)_{15}-\overset{\overset{\large CH_3}{|}}{\underset{\underset{\large CH_3}{|}}{N}}-CH_3\right]^+ Br^- = \text{Cationic detergent}$$

Glyceryl oleate $[(C_{17}H_{32}COO)_3C_3H_5]$ = Non-ionic detergent
Sodium stearate $[C_{17}H_{35}COO^-Na^+]$ = Anionic soap

9. *(b)* ***Key concept*** Vapour pressure of water $(p^\circ) = 760$ torr

$$\text{Number of moles of glucose} = \frac{\text{Mass (g)}}{\text{Molecular mass (g mol}^{-1})}$$

$$= \frac{18\text{ g}}{180\text{ gmol}^{-1}} = 0.1\text{ mol}$$

Molar mass of water = 18 g/mol
Mass of water (given) = 178.2g
Number of moles of water

$$= \frac{\text{Mass of water}}{\text{Molar mass of water}} = \frac{178.2\text{g}}{18\text{g/mol}} = 9.9\text{ mol}$$

Total number of moles = (0.1 + 9.9) moles = 10 moles

Now, mole fraction of glucose in solution = Change in pressure with respect to initial pressure

i.e. $$\frac{\Delta p}{p^\circ} = \frac{0.1}{10}$$

or $\Delta p = 0.01p^\circ = 0.01 \times 760 = 7.6$ torr

$\therefore$ Vapour pressure of solution = (760 − 7.6) torr = 752.4 torr

10. *(c)* Glycerol with high boiling point (290°C) can be separated from spent lye by distillation under reduced pressure. This process is used to purify liquids having very high boiling points. By this process, liquid is made to boil at lower temperature than its boiling point by lowering the pressure on its surface.

11. *(d)*

Species	Hybridisation
	sp^2
	sp^2
	sp^2
$O=\overset{+}{N}=O$	sp

12. *(a)* For first order reaction, $k = \frac{2.303}{t}\log\frac{a}{a-x}$

Given, $t = 50$ min, $a = 0.5$ M, $a - x = 0.125$ M

$$\therefore \quad k = \frac{2.303}{50}\log\frac{0.5}{0.125} = 0.0277\text{ min}^{-1}$$

Now, as per reaction

$$2H_2O_2 \longrightarrow 2H_2O + O_2$$

$$-\frac{1}{2}\frac{d[H_2O_2]}{dt} = \frac{1}{2}\frac{d[H_2O]}{dt} = \frac{d[O_2]}{dt}$$

Rate of reaction, $-\frac{d[H_2O_2]}{dt} = k[H_2O_2]$

$$\therefore \quad \frac{d[O_2]}{dt} = -\frac{1}{2}\frac{d[H_2O_2]}{dt} = \frac{1}{2}k[H_2O_2] \quad \text{...(i)}$$

When the concentration of H_2O_2 reaches 0.05 M,

$$\frac{d[O_2]}{dt} = \frac{1}{2} \times 0.0277 \times 0.05 \quad \text{[from Eq. (i)]}$$

or $$\frac{d[O_2]}{dt} = 6.93 \times 10^{-4}\text{ mol min}^{-1}$$

Alternative Method

In fifty minutes, the concentration of H_2O_2 decreases from 0.5 to 0.125 M or in one half-life, concentration of H_2O_2 decreases from 0.5 to 0.25 M. In two half-lives, concentration of H_2O_2 decreases from 0.5 to 0.125 M or $2t_{1/2} = 50$ min

$$t_{1/2} = 25\text{ min}$$

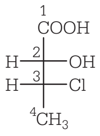
$$\therefore \quad k = \left(\frac{0.693}{25}\right)\text{min}^{-1}$$

or $$\frac{d[O_2]}{dt} = -\frac{1}{2}\frac{d[H_2O_2]}{dt} = \frac{k[H_2O_2]}{2} = 6.93 \times 10^{-4}\text{ mol min}^{-1}$$

13. *(a)*

Complex ion	Electronic configuration of metal ion	Number of unpaired electrons (*n*)
$[Cr(H_2O)_6]^{2+}$	Cr^{2+}; [Ar] $3d^4$	↿ ↿ ↿ ↿ ☐ ; 4
$[Fe(H_2O)_6]^{2+}$	Fe^{2+}; [Ar] $3d^6$	⥮ ↿ ↿ ↿ ↿ ; 4
$[Mn(H_2O)_6]^{2+}$	Mn^{2+}; [Ar] $3d^5$	↿ ↿ ↿ ↿ ↿ ; 5
$[CoCl_4]^{2-}$	Co^{2+}; [Ar] $3d^7$	⥮ ⥮ ↿ ↿ ↿ ; 3

14. *(a)*



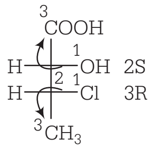
For C-2, order of priority of substituents is

$$OH > CH(Cl)(CH_3) > COOH$$

For C-3, order of priority of substituents is

$$Cl > CH(OH)COOH > CH_3$$

Hence, according to CIP rules,



15. *(b)*

$$\begin{array}{lcccc} & A\ + & B \rightleftharpoons & C\ + & D \\ \text{Initially at } t=0 & 1 & 1 & 1 & 1 \\ \text{At equilibrium} & 1-x & 1-x & 1+x & 1+x \end{array}$$

$$K_{eq} = \frac{[C][D]}{[A][B]} = \frac{(1+x)(1+x)}{(1-x)(1-x)} = \frac{(1+x)^2}{(1-x)^2}$$

$$\text{or} \quad 100 = \left(\frac{1+x}{1-x}\right)^2$$

$$\text{or} \quad 10 = \frac{1+x}{1-x}$$

$$\text{or} \quad 10 - 10x = 1 + x$$

$$10 - 1 = x + 10x$$

$$9 = 11x$$

$$x = \frac{9}{11} = 0.818$$

$$\therefore \quad [D] = 1 + x = 1 + 0.818 = 1.818$$

16. *(b)* Sulphide ores are concentrated by froth floatation method e.g. Galena (PbS)

17. *(None)* $C_xH_y(g) + \underset{75\text{ mL}}{\left(x + \frac{y}{4}\right)O_2(g)} \longrightarrow \underset{30\text{ mL}}{xCO_2(g)} + \frac{y}{2}H_2O(l)$

O_2 used = 20% of 375 = 75 mL

Inert part of air = 80% of 375 = 300 mL

Total volume of gases = CO_2 + Inert part of air

= 30 + 300 = 330 mL

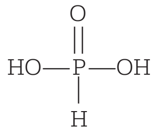
$$\frac{x}{1} = \frac{30}{15} \Rightarrow x = 2$$

$$\frac{x + \frac{y}{4}}{1} = \frac{75}{15}$$

$$\Rightarrow \quad x + \frac{y}{4} = 5$$

$$\Rightarrow \quad x = 2,\ y = 12 \Rightarrow C_2H_{12}$$

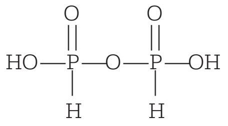
18. *(d)* Orthophosphorous acid, $H_3\ PO_3$:



$$HO-\overset{\overset{\displaystyle O}{||}}{\underset{\underset{\displaystyle H}{|}}{P}}-OH$$

$$H_3\overset{x}{P}O_3 = 3 + x + 3(-2) = 0 \text{ or } x = +3$$

Pyrophosphorous acid, $H_4P_2O_5$:



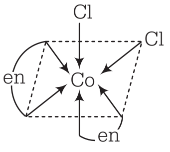
$$HO-\overset{\overset{\displaystyle O}{||}}{\underset{\underset{\displaystyle H}{|}}{P}}-O-\overset{\overset{\displaystyle O}{||}}{\underset{\underset{\displaystyle H}{|}}{P}}-OH$$

$$H_4\overset{x}{P_2}O_5 = 4 + 2x + 5(-2) = 0$$

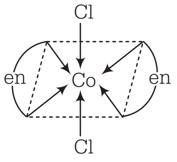
$$4 + 2x - 10 = 0$$

$$x = +3$$

19. *(a)*

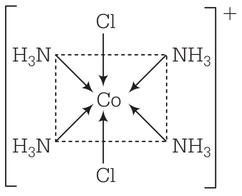


cis-$[Co(en)_2Cl_2]Cl$
(optically active)

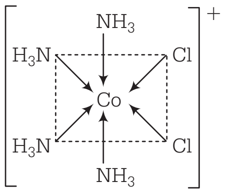


trans-$[Co(en)_2Cl_2]Cl$
(optically inactive due to plane of symmetry)

$[Co(NH_3)_4Cl_2]Cl$ can exist in both *cis* and *trans* forms that are given below:

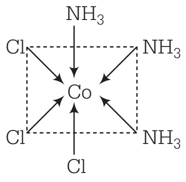


trans-$[Co(NH_3)_4Cl_2]Cl$
(optically inactive)

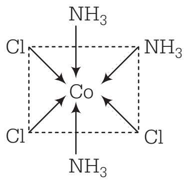


cis-$[Co(NH_3)_4Cl_2]Cl$
(optically inactive)

$[Co(NH_3)_3Cl_3]$ exists in *fac* and *mer*-isomeric forms and both are optically inactive.



fac-isomer
(optically inactive)



mer-isomer
(optically inactive)

20. *(d)* $Zn + \underset{(\text{Conc.})}{4HNO_3} \longrightarrow Zn(NO_3)_2 + 2H_2O + 2NO_2$

$$4Zn + \underset{(\text{Dil.})}{10HNO_3} \longrightarrow 4Zn(NO_3)_2 + N_2O + 5H_2O$$

21. *(b)* There is extensive intermolecular H-bonding in the condensed phase.

22. *(b)* This water is unsuitable for drinking due to high concentration of nitrate. In drinking water, maximum permissible concentration of

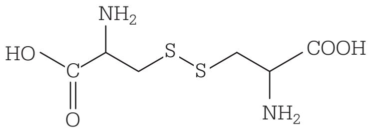
Lead ≃ 50 ppb
Nitrate ≃ 50 ppb
Iron ≃ 0.2 ppm
Fluoride ≃ 1 ppm

23. *(c)* $2Li + \underset{(\text{Excess})}{\frac{1}{2}O_2(g)} \longrightarrow Li_2O$

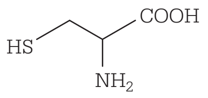
$$2Na + \underset{(\text{Excess})}{O_2(g)} \longrightarrow Na_2O_2; \quad K + \underset{(\text{Excess})}{O_2(g)} \longrightarrow KO_2$$

24. *(b)*

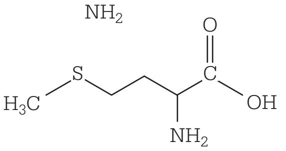
Cystine



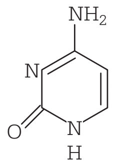
Cysteine



Methionine



Cytosine



Thiol group (SH) is present in cysteine.

25. *(c)* Zinc metal is the most stable metal to cover iron surfaces. The process of coating the iron surface by zinc is called galvanisation.

26. *(c)* Order of first ionisation energy is Sc > Na > K > Rb.

Due to poor shielding effect, removal of one electron from $4s$ orbital is difficult as compared to $3s$-orbital.

27. *(c)* Hofmann-bromamide degradation reaction is given as:

$$RCONH_2 + 4NaOH + Br_2 \longrightarrow \underset{(1^\circ \text{ amine})}{RNH_2} + Na_2CO_3 + 2NaBr + 2H_2O$$

Hence, four moles of NaOH and one mole of Br_2 are used.

28. *(b)* Initially,

Number of moles of gases in each container $= \dfrac{p_iV}{RT_1}$

Total number of moles of gases in both containers $= 2\dfrac{p_iV}{RT_1}$

After mixing, number of moles in left chamber $= \dfrac{p_fV}{RT_1}$

Number of moles in right chamber

$$= \frac{p_fV}{RT_2}$$

Total number of moles

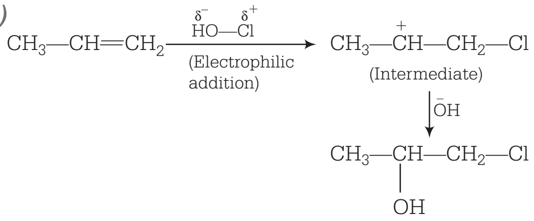
$$= \frac{p_fV}{RT_1} + \frac{p_fV}{RT_2} = \frac{p_fV}{R}\left(\frac{1}{T_1} + \frac{1}{T_2}\right)$$

As total number of moles remains constant.

Hence, $$\frac{2p_iV}{RT_1} = \frac{p_fV}{RT_1} + \frac{p_fV}{RT_2}$$

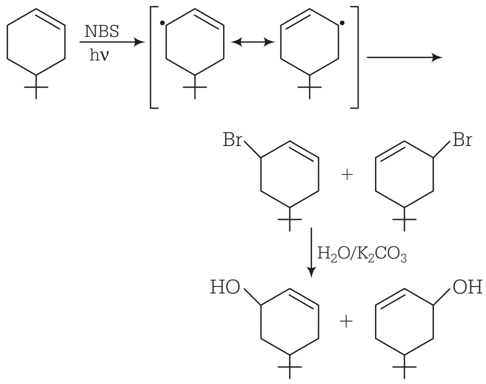
$$\Rightarrow \quad p_f = 2p_i\left(\frac{T_2}{T_1 + T_2}\right)$$

29. *(a)*



$$CH_3-CH=CH_2 \xrightarrow[\text{(Electrophilic addition)}]{\overset{\delta^-}{HO}-\overset{\delta^+}{Cl}} \underset{\text{(Intermediate)}}{CH_3-\overset{+}{C}H-CH_2-Cl} \xrightarrow{\overset{-}{O}H} CH_3-\underset{\displaystyle OH}{\underset{|}{C}H}-CH_2-Cl$$

30. *(a)*



SOLVED PAPER 2017

JEE MAIN

Joint Entrance Examination

INSTRUCTIONS

1. This test consists of 30 questions.
2. Each question is allotted 4 marks for correct response.
3. Candidates will be awarded marks as stated above in instruction no. 2 for correct response of each question. 1 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
4. There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.

Chemistry

1. Which of the following compounds will give significant amount of *meta*-product during mononitration reaction?

(a) 
(b) 
(c) 
(d) 
2. ΔU is equal to

(a) isochoric work (b) isobaric work
(c) adiabatic work (d) isothermal work

3. The increasing order of reactivity of the following halides for the S_N1 reaction is

I. $CH_3CH(Cl)CH_2CH_3$
II. $CH_3CH_2CH_2Cl$
III. p-$H_3CO—C_6H_4—CH_2Cl$

(a) (III) < (II) < (I)
(b) (II) < (I) < (III)
(c) (I) < (III) < (II)
(d) (II) < (III) < (I)

4. The radius of the second Bohr orbit for hydrogen atom is (Planck's constant $(h) = 6.6262 \times 10^{-34}$ Js; mass of electron $= 9.1091 \times 10^{-31}$ kg ; charge of electron $(e) = 1.60210 \times 10^{-19}$ C; permitivity of vacuum $(\in_0) = 8.854185 \times 10^{-12} \text{kg}^{-1}\text{m}^{-3}\text{A}^2$)

(a) 1.65 Å (b) 4.76 Å
(c) 0.529 Å (d) 2.12 Å

5. pK_a of a weak acid (HA) and pK_b of a weak base (BOH) are 3.2 and 3.4, respectively. The pH of their salt (AB) solution is

(a) 7.2 (b) 6.9 (c) 7.0 (d) 1.0

6. The formation of which of the following polymers involves hydrolysis reaction?

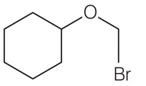
(a) Nylon-6 (b) Bakelite
(c) Nylon-6, 6 (d) Terylene

7. The most abundant elements by mass in the body of a healthy human adult are Oxygen (61.4%); Carbon (22.9%), Hydrogen (10.0 %); and Nitrogen (2.6%). The weight which a 75 kg person would gain if all ^{1}H atoms are replaced by ^{2}H atoms is

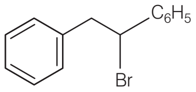
(a) 15 kg (b) 37.5 kg
(c) 7.5 kg (d) 10 kg

8. Which of the following, upon treatment with *tert*-BuONa followed by addition of bromine water, fails to decolourise the colour of bromine ?

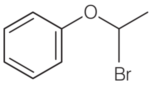
(a)



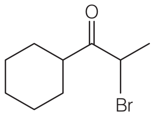
(b)



(c)



(d)



9. In the following reactions, ZnO is respectively acting as a/an

(i) $ZnO + Na_2O \longrightarrow Na_2ZnO_2$

(ii) $ZnO + CO_2 \longrightarrow ZnCO_3$

(a) base and acid (b) base and base
(c) acid and acid (d) acid and base

10. Both lithium and magnesium display several similar properties due to the diagonal relationship; however, the one which is incorrect is

(a) Both form basic carbonates
(b) Both form soluble bicarbonates
(c) Both form nitrides
(d) nitrates of both Li and Mg yield NO_2 and O_2 on heating

11. 3-methyl-pent-2-ene on reaction with HBr in presence of peroxide forms an addition product. The number of possible stereoisomers for the product is

(a) six (b) zero (c) two (d) four

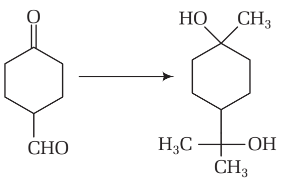
12. A metal crystallises in a face centred cubic structure. If the edge length of its unit cell is 'a', the closest approach between two atoms in metallic crystal will be

(a) $2a$ (b) $2\sqrt{2}\,a$ (c) $\sqrt{2}\,a$ (d) $\frac{a}{\sqrt{2}}$

13. Two reactions R_1 and R_2 have identical pre-exponential factors. Activation energy of R_1 exceeds that of R_2 by 10 kJ mol^{-1}. If k_1 and k_2 are rate constants for reactions R_1 and R_2, respectively at 300 K, then $\ln\left(\frac{k_2}{k_1}\right)$ is equal to $(R = 8.314 \text{ J mol}^{-1}\text{K}^{-1})$

(a) 8 (b) 12 (c) 6 (d) 4

14. The correct sequence of reagents for the following conversion will be



(a) $[Ag(NH_3)_2]^+ OH^-$, H^+ / CH_3OH, CH_3MgBr
(b) CH_3MgBr, H^+ / CH_3OH, $[Ag(NH_3)_2]^+ OH^-$
(c) CH_3MgBr, $[Ag(NH_3)_2]^+ OH^-$, H^+ / CH_3OH
(d) $[Ag(NH_3)_2]^+ OH^-$, CH_3MgBr, H^+ / CH_3OH

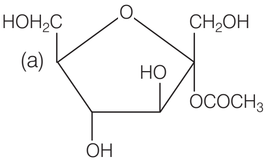
15. The Tyndall effect is observed only when following conditions are satisfied

1. The diameter of the dispersed particles is much smaller than the wavelength of the light used.
2. The diameter of the dispersed particle is not much smaller than the wavelength of the light used.
3. The refractive indices of the dispersed phase and dispersion medium are almost similar in magnitude.
4. The refractive indices of the dispersed phase and dispersion medium differ greatly in magnitude.

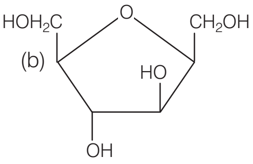
(a) 1 and 4 (b) 2 and 4
(c) 1 and 3 (d) 2 and 3

16. Which of the following compounds will behave as a reducing sugar in an aqueous KOH solution?

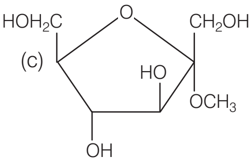
(a)



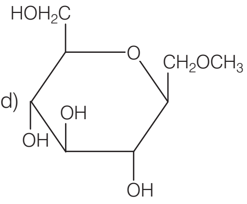
(b)



(c)



(d)



17. Given, $C_{(graphite)} + O_2(g) \longrightarrow CO_2(g)$;

$$\Delta_r H° = -393.5 \text{ kJ mol}^{-1}$$

$H_2(g) + \frac{1}{2}O_2(g) \longrightarrow H_2O(l)$;

$$\Delta_r H° = -285.8 \text{ kJ mol}^{-1}$$

$CO_2(g) + 2\,H_2O(l) \longrightarrow CH_4(g) + 2O_2(g)$;

$$\Delta_r H° = +890.3 \text{ kJ mol}^{-1}$$

Based on the above thermochemical equations, the value of $\Delta_r H°$ at 298 K for the reaction,

$$C_{(graphite)} + 2\,H_2(g) \longrightarrow CH_4(g) \text{ will be}$$

(a) + 78.8 kJ mol^{-1} (b) + 144.0 kJ mol^{-1}
(c) − 74.8 kJ mol^{-1} (d) − 144.0 kJ mol^{-1}

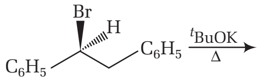
18. Which of the following reactions is an example of a redox reaction?

(a) $XeF_4 + O_2F_2 \longrightarrow XeF_6 + O_2$
(b) $XeF_2 + PF_5 \longrightarrow [XeF]^+PF_6^-$
(c) $XeF_6 + H_2O \longrightarrow XeOF_4 + 2HF$
(d) $XeF_6 + 2H_2O \longrightarrow XeO_2F_2 + 4HF$

19. The products obtained when chlorine gas reacts with cold and dilute aqueous NaOH are

(a) ClO^- and ClO_3^- (b) ClO_2^- and ClO_3^-
(c) Cl^- and ClO^- (d) Cl^- and ClO_2^-

20. The major product obtained in the following reaction is



(a) (±) $C_6H_5CH(O^tBu)CH_2C_6H_5$

(b) $C_6H_5CH = CHC_6H_5$

(c) (+) $C_6H_5CH(O^tBu)CH_2C_6H_5$

(d) (−)$C_6H_5CH(O^tBu)CH_2C_6H_5$

21. Sodium salt of an organic acid '*X*' produces effervescence with conc. H_2SO_4. '*X*' reacts with the acidified aqueous $CaCl_2$ solution to give a white precipitate which decolourises acidic solution of $KMnO_4$. '*X*' is

(a) C_6H_5COONa (b) $HCOONa$

(c) CH_3COONa (d) $Na_2C_2O_4$

22. Which of the following species is not paramagnetic?

(a) NO (b) CO

(c) O_2 (d) B_2

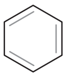
23. The freezing point of benzene decreases by 0.45°C when 0.2 g of acetic acid is added to 20 g of benzene. If acetic acid associates to form a dimer in benzene, percentage association of acetic acid in benzene will be (K_f for benzene = 5.12 K kg mol^{-1})

(a) 64.6 % (b) 80.4 %

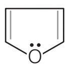
(c) 74.6 % (d) 94.6 %

24. Which of the following molecules is least resonance stabilised?

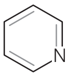
(a)



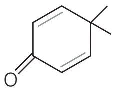
(b)



(c)



(d)



25. On treatment of 100 mL of 0.1 M solution of $CoCl_3.6H_2O$ with excess of $AgNO_3$; 1.2×10^{22} ions are precipitated. The complex is

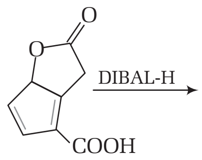
(a) $[Co(H_2O)_4Cl_2]\,Cl.2H_2O$

(b) $[Co(H_2O)_3Cl_3].3H_2O$

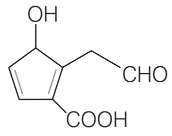
(c) $[Co(H_2O)_6]Cl_3$

(d) $[Co(H_2O)_5Cl]\,Cl_2.H_2O$

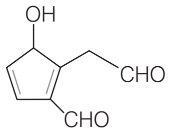
26. The major product obtained in the following reaction is



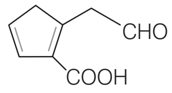
(a)



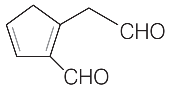
(b)



(c)



(d)



27. A water sample has ppm level concentration of following anions

$F^- = 10;\ SO_4^{2-} = 100;\ NO_3^- = 50$

the anion/anions that make/makes the water sample unsuitable for drinking is/are

(a) Only NO_3^-

(b) Both SO_4^{2-} and NO_3^-

(c) Only F^-

(d) Only SO_4^{2-}

28. 1 g of a carbonate (M_2CO_3) on treatment with excess HCl produces 0.01186 mole of CO_2. The molar mass of M_2CO_3 in g mol^{-1} is

(a) 1186 (b) 84.3

(c) 118.6 (d) 11.86

29. Given, $E^\circ_{Cl_2/Cl^-} = 1.36$ V, $E^\circ_{Cr^{3+}/Cr} = -0.74$ V

$E^\circ_{Cr_2O_7^{2-}/Cr^{3+}} = 1.33$ V, $E^\circ_{MnO_4^-/Mn^{2+}} = 1.51$ V

Among the following, the strongest reducing agent is

(a) Cr (b) Mn^{2+}

(c) Cr^{3+} (d) Cl^-

30. The group having isoelectronic species is

(a) O^{2-}, F^-, Na^+, Mg^{2+}

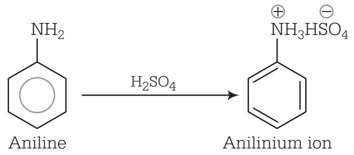
(b) O^-, F^-, Na, Mg^+

(c) O^{2-}, F^-, Na, Mg^{2+}

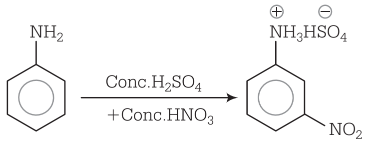
(d) O^-, F^-, Na^+, Mg^{2+}

Answer with Explanation

1. ***(c)*** Aniline in presence of nitrating mixture (conc. HNO_3 + conc. H_2SO_4) gives significance amount ($\approx$47%) of meta-product because in presence of H_2SO_4 its protonation takes place and anilinium ion is formed.



Here, anilinium ion is strongly deactivating group and *meta*-directing in nature. So, it gives *meta*-nitration product.



2. ***(c)*** According to first law of thermodynamics,

$$\Delta U = q + W = q - p\Delta V$$

In isochoric process ($\Delta V = 0$),

$$\Delta U = q$$

In isobaric process ($\Delta p = 0$),

$$\Delta U = q$$

In adiabatic process ($q = 0$)

$$\Delta U = W$$

In isothermal process ($\Delta T = 0$) and $\Delta U = 0$

$\therefore$ ΔU is equal to adiabatic work.

3. ***(b)*** ***(i) The rate of S_N1 reaction depends only upon the concentration of the alkyl halide.***

(ii) S_N1 reaction proceeds through the formation of carbocation.

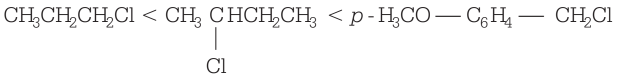
The reactivity is decided by ease of dissociation of alkyl halide.

$$R—X \rightleftharpoons R^{\oplus} + X^{\ominus}$$

Higher the stability of R^+ (carbocation), higher would be the reactivity towards S_N1 reaction.

p-$H_3CO—C_6H_4—CH_2^{\oplus}$ is the most stable carbocation due to resonance and then $CH_3\underset{\oplus}{C}HCH_2CH_3$ (2° carbocation) while $CH_3CH_2\overset{\oplus}{C}H_2$ (1°) is least stable.

Thus, the correct increasing order of the reactivity of the given halides towards the S_N1 reaction is



$$\underset{\text{(II)}}{CH_3CH_2CH_2Cl} < \underset{\text{(I)}}{CH_3\underset{\displaystyle Cl}{\underset{|}{C}}HCH_2CH_3} < \underset{\text{(III)}}{p\text{-}H_3CO—C_6H_4—CH_2Cl}$$

(II) (I) (III)

4. ***(d)*** Bohr radius $(r_n) = \epsilon_0\, n^2h^2$

$$r_n = \frac{n^2h^2}{4\pi^2me^2kZ}$$

$$k = \frac{1}{4\pi\epsilon_0}$$

$$\therefore \quad r_n = \frac{n^2h^2\epsilon_0}{\pi me^2Z}$$

$$= n^2\frac{a_0}{Z}$$

where, m = mass of electron

e = charge of electron

h = Planck's constant

k = Coulomb constant

$$r_n = \frac{n^2 \times 0.53}{Z}\,\text{Å}$$

Radius of n^{th} Bohr orbit for H-atom

$= 0.53\, n^2$ Å [Z = 1 for H-atom]

$\therefore$ Radius of 2^{nd} Bohr orbit for H-atom

$= 0.53 \times (2)^2 = 2.12$ Å

5. ***(b)*** For a salt of weak acid and weak base,

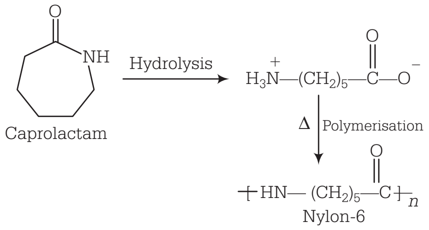
$$\text{pH} = 7 + \frac{1}{2}\,\text{p}K_a - \frac{1}{2}\,\text{p}K_b$$

Given, $\text{p}K_a(HA) = 3.2$, $\text{p}K_a(BOH) = 3.4$

$$\therefore \quad \text{pH} = 7 + \frac{1}{2}(3.2) - \frac{1}{2}(3.4)$$

$$= 7 + 1.6 - 1.7 = 6.9$$

6. ***(a)*** Nylon-6 or perlon is prepared by polymerisation of amino caproic acid at high temperature. Caprolactam is first hydrolysed with water to form amino acid which on heating undergoes polymerisation to give nylon-6.



7. ***(c)*** Given, abundance of elements by mass oxygen = 61.4%, carbon = 22.9%, hydrogen = 10% and nitrogen = 2.6%

Total weight of person = 75 kg

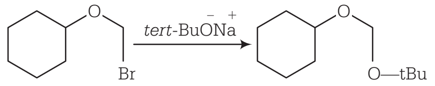
$$\text{Mass due to } {}^1\text{H} = \frac{75 \times 10}{100} = 7.5 \text{ kg}$$

^{1}H atoms are replaced by ^{2}H atoms,

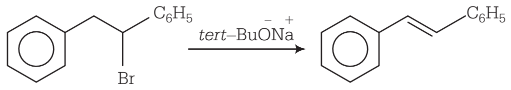
Mass due to ${}^2\text{H} = (7.5 \times 2)$ kg

$\therefore$ Mass gain by person = 7.5 kg

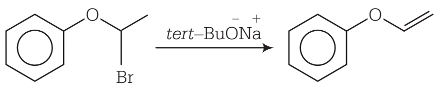
8. *(a)* To show decolourisation, compound must be unsaturated.



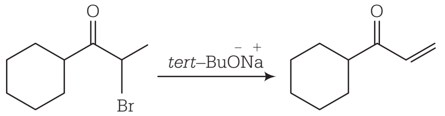
(Saturated)
(cannot decolourise Br_2 water)



(Unsaturated)
(decolourise Br_2 water)



(Unsaturated)
(decolourise Br_2 water)



(Unsaturated)
(decolourise Br_2 water)

9. *(d)* Zinc oxide (ZnO) when react with Na_2O it act as acid while with CO_2 it act as base. Therefore, it is an amphoteric oxide.

$$\underset{\text{Acid}}{ZnO} + \underset{\text{Base}}{Na_2O} \longrightarrow \underset{\text{Salt}}{Na_2ZnO_2}$$

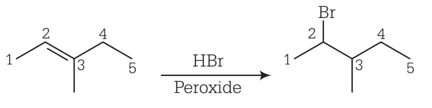
$$\underset{\text{Base}}{ZnO} + \underset{\text{Acid}}{CO_2} \longrightarrow \underset{\text{Salt}}{ZnCO_3}$$

10. *(a)* **Mg** can form basic carbonate while **Li** can not.

$$5\,Mg^{2+} + 6\,CO_3^{2-} + 7H_2O \longrightarrow 4MgCO_3 \cdot Mg(OH)_2 \cdot 5H_2O + 2\,HCO_3^-$$

11. *(d)* The number of stereoisomers in molecules which are not divisible into two equal halves and have n number of asymmetric C-atoms $= 2^n$.

3-methyl-pent-2-ene on reaction with HBr in presence of peroxide forms an addition product i.e. 2-bromo-3-methyl pentane. It has two chiral centres. Therefore, 4 stereoisomers are possible



3-methylpent-2-ene

Anti-Markownikoff's addition
Four stereoisomers are possible
(As molecule has two chiral centres and asymmetric).

12. *(d)* For fcc arrangement, $4r = \sqrt{2}a$

where, r = radius and a = edge length

$\therefore$ Closest distance $= 2r = \dfrac{\sqrt{2}\,a}{2} = \dfrac{a}{\sqrt{2}}$

13. *(d)* According to Arrhenius equation

$$k = Ae^{-E_a/RT}$$

where, A = collision number or pre-exponential factor.

R = gas constant

T = absolute temperature

E_a = energy of activation

For reaction R_1, $k_1 = Ae^{-E_{a_1}/RT}$ ...(i)

For reaction R_2, $k_2 = Ae^{-E_{a_2}/RT}$ ...(ii)

On dividing Eq. (ii) by Eq. (i), we get

$$\frac{k_2}{k_1} = e^{-\frac{(E_{a_2} - E_{a_1})}{RT}} \quad \text{...(iii)}$$

[$\because$ Pre-exponential factor 'A' is same for both reactions]

Taking ln on both the sides of Eq. (iii), we get

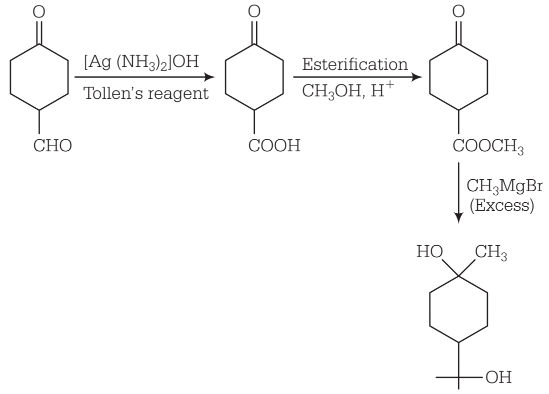
$$\ln\left(\frac{k_2}{k_1}\right) = \frac{E_{a_1} - E_{a_2}}{RT}$$

Given, $E_{a_1} = E_{a_2} + 10\text{ kJ mol}^{-1}$

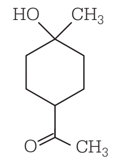
$= E_{a_2} + 10{,}000\text{ J mol}^{-1}$

$$\therefore \quad \ln\frac{k_2}{k_1} = \frac{10{,}000\text{ J mol}^{-1}}{8.314\text{ J mol}^{-1}\text{K}^{-1} \times 300\text{ K}} = 4$$

14. *(a)*



Before final product is formed, intermediate is

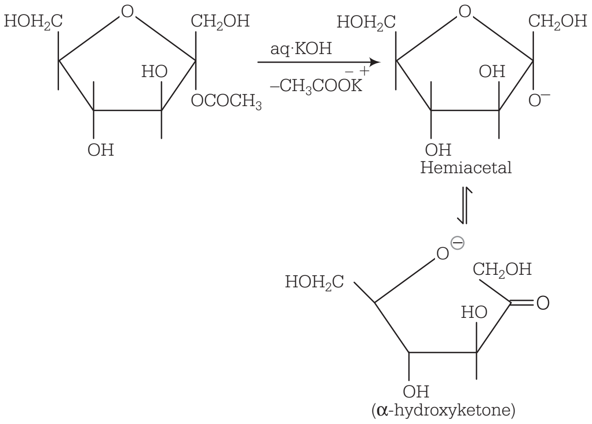


15. *(b)* Colloidal solutions show Tyndall effect due to scattering of light by colloidal particles in all directions in space. It is observed only under the following conditions.

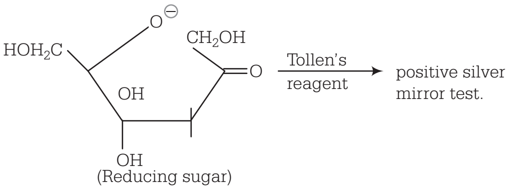
(i) The diameter of the colloids should not be much smaller than the wavelength of light used.

(ii) The refractive indices of the dispersed phase and dispersion medium should differ greatly in magnitude.

16. *(a)* Sugars that have an aldehyde, a ketone, a hemiacetal or a hemiketal group is able to reduce an oxidising agent. These sugars are classified as reducing sugars.



Hemiacetal can be easily reduced by oxidising agent such as Tollen's reagent.



17. *(c)* Based on given $\Delta_r H^\circ$

$$\Delta_f H^\circ = H^\circ_{CO_2} = -393.5 \text{ kJ mol}^{-1} \quad \ldots(i)$$

$$\Delta_f H^\circ = H^\circ_{H_2O} = -285.8 \text{ kJ mol}^{-1} \quad \ldots(ii)$$

$$\Delta_f H^\circ = H^\circ_{O_2} = 0.00 \text{ (elements)} \quad \ldots(iii)$$

Required thermal reaction is for $\Delta_f H^\circ$ of CH_4

Thus, from III

$$890.3 = [\Delta_f H^\circ(CH_4) + 2\Delta_f H^\circ(O_2)]$$

$$-[\Delta_f H^\circ(CO_2) + 2\Delta_f H^\circ(H_2O)]$$

$$= \Delta_f H^\circ(CH_4) + 0] - [-393.5 - 2 \times 285.5]$$

$$\therefore \quad \Delta_f H^\circ(CH_4) = -74.8 \text{ kJ/mol}$$

18. *(a)* The reaction in which oxidation and reduction occur simultaneously are termed as redox reaction.

$$(\overset{+4}{X})eF_4 + \overset{+1}{O_2}(F_2) \longrightarrow \overset{+6}{X}eF_6 + \overset{0}{O_2}$$

Since, Xe undergoes oxidation while O undergoes reduction.

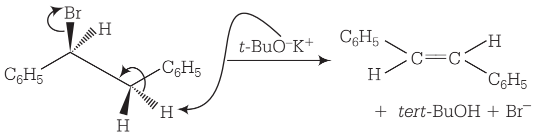
So, it is an example of redox reaction.

19. *(c)* Cl_2, Br_2 and I_2 form a mixture of halide and hypohalites when react with cold dilute alkalies while a mixture of halides and haloate when react with concentrated cold alkalies.

$$\underset{\text{Cold and dilute}}{Cl_2 + 2NaOH} \longrightarrow NaCl + NaClO + H_2O$$

$\therefore$ Cl^- and ClO^- are obtained as products when chlorine gas reacts with cold and dilute aqueous NaOH.

20. *(b)* An alkyl halide in presence of a bulkier base removes a proton from a carbon adjacent to the carbon bonded to the halogen. This reaction is called E2 (β-elimination reaction).



21. *(d)* The reaction takes place as follows

$$\underset{(X)}{Na_2C_2O_4} + \underset{\text{(conc.)}}{H_2SO_4} \longrightarrow Na_2SO_4 + H_2O \underset{\text{Effervescence}}{+ CO\uparrow + CO_2\uparrow}$$

$$\underset{(X)}{Na_2C_2O_4} + CaCl_2 \longrightarrow \underset{\text{White ppt.}}{CaC_2O_4} + 2NaCl$$

$$5CaC_2O_4 + \underset{\text{Purple}}{2KMnO_4} + 8H_2SO_4 \longrightarrow K_2SO_4 + 5CaSO_4 + \underset{\text{Colourless}}{2MnSO_4} + 10CO_2 + 8H_2O$$

Hence, X is $Na_2C_2O_4$.

22. *(b)* To identify the magnetic nature we need to check the molecular orbital configuration. If all orbitals are fully occupied, species is diamagnetic while when one or more molecular orbitals is/are singly occupied, species is paramagnetic.

(a) NO (7 + 8 = 15) – $\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2,$

$$\pi 2p_x^2 = \pi 2p_y^2, \pi 2p_z^2, \pi^* 2p_x^1 = \pi^* 2p_y^0$$

One unpaired electron is present.

Hence, it is paramagnetic.

(b) CO (6 + 8 = 14) – $\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2,$

$$\pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^2$$

No unpaired electron is present.

Hence, it is diamagnetic.

(c) O_2 (8 + 8 = 16) – $\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2,$

$$\pi 2p_x^2 = \pi 2p_x^2, \pi^* 2p_x^1 = \pi^* 2p_y^1$$

Two unpaired electrons are present.
Hence, it is paramagnetic.

(d) B_2(5 + 5) – $\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^1 = \pi 2p_y^1$

Two unpaired electrons are present.

Hence, it is paramagnetic.

23. *(d)* Let the degree of association of acetic acid (CH_3COOH) in benzene is α, then

	$2CH_3COOH \rightleftharpoons$	$(CH_3COOH)_2$
Initial moles	1	0
Moles at equilibrium	$1-\alpha$	$\frac{\alpha}{2}$

$$\therefore \text{ Total moles} = 1 - \alpha + \frac{\alpha}{2} = 1 - \frac{\alpha}{2} \quad \text{or} \quad i = 1 - \frac{\alpha}{2}$$

Now, depression in freezing point (ΔT_f) is given as

$$\Delta T_f = i K_f m \quad \ldots(i)$$

where, K_f = molal depression constant or cryoscopic constant.

m = molality

$$\text{Molality} = \frac{\text{number of moles of solute}}{\text{weight of solvent (in kg)}} = \frac{0.2}{60} \times \frac{1000}{20}$$

Putting the values in Eq. (i)

$$\therefore \quad 0.45 = \left[1 - \frac{\alpha}{2}\right](5.12)\left[\frac{0.2}{60} \times \frac{1000}{20}\right]$$

$$1 - \frac{\alpha}{2} = \frac{0.45 \times 60 \times 20}{5.12 \times 0.2 \times 1000}$$

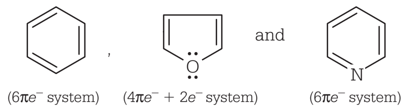
$$\Rightarrow \quad 1 - \frac{\alpha}{2} = 0.527$$

$$\Rightarrow \quad \frac{\alpha}{2} = 1 - 0.527$$

$$\therefore \quad \alpha = 0.946$$

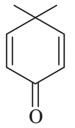
Thus, percentage of association = 94.6%

24. *(d)* Aromatic compounds are stable due to resonance while non-aromatics are not. According to Huckel's rule (or $4n + 2$ rule), "For a planar, cyclic compound to be aromatic, its π cloud must contain $(4n + 2)\pi$ electrons, where, n is any whole number." Thus,



($6\pi e^-$ system) ($4\pi e^- + 2e^-$ system) ($6\pi e^-$ system)

are aromatic and stabilised by resonance.
They follow Huckel's rule.



is non-aromatic, hence, least stabilised by resonance.

25. *(d)* Molarity $(M) = \dfrac{\text{Number of moles of solute}}{\text{Volume of solution (in L)}}$

$\therefore$ Number of moles of complex

$$= \frac{\text{Molarity} \times \text{volume (in mL)}}{1000}$$

$$= \frac{0.1 \times 100}{1000} = 0.01 \text{ mole}$$

Number of moles of ions precipitate

$$= \frac{1.2 \times 10^{22}}{6.02 \times 10^{23}} = 0.02 \text{ moles}$$

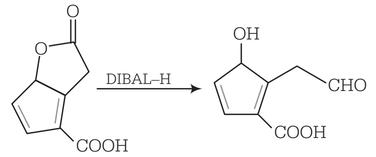
$\therefore$ Number of Cl^- present in ionisation sphere

$$= \frac{\text{Number of moles of ions precipitated}}{\text{Number of moles of complex}} = \frac{0.02}{0.01} = 2$$

$\therefore$ 2 Cl^- are present outside the square brackets, i.e. in ionisation sphere. Thus, the formula of complex is

$$[Co(H_2O)_5Cl]Cl_2 \cdot H_2O.$$

26. *(a)* DIBAL-H (Di-isobutyl aluminium hydride) is a reducing agent with formula. This is generally used for the preparation of aldehydes. Using DIBAL —H, Lactones are reduced directly to aldehydes.



27. *(c)* **NO_3^-** The maximum limit of nitrate (NO_3^-) in drinking water is 50 ppm and its source is fertilisers. If the maximum limit is increased in water it will cause methemoglobinemia (blue baby syndrome.)

SO_4^{2-} The maximum limit of sulphate (SO_4^{2-}) according to WHO is 500 pm and its sources are acid rain, industries. Excess SO_4^{2-} has laxative effect.

F^- The maximum limit of fluoride (F^-) is about 1.5 ppm. Its higher concentration converts enamel to more harder fluorapatite. Concentration (>2ppm) causes brown mottling of teeth and high concentration (>10 ppm) are harmful for bones and teeth.

$\therefore$ SO_4^{2-} (100 ppm) and NO_3^- (50 ppm) in water is suitable for drinking but the concentration of F^- (10 ppm) makes water unsuitable for drinking.

28. *(b)* $\underset{1\text{ g}}{M_2CO_3} + 2HCl \longrightarrow 2MCl + H_2O + \underset{0.01186\text{ mole}}{CO_2}$

Number of moles of M_2CO_3 reacted = Number of moles of CO_2 evolved

$$\frac{1}{M} = 0.01186 \qquad [M = \text{molar mass of } M_2CO_3]$$

$$M = \frac{1}{0.01186} = 84.3 \text{ g mol}^{-1}$$

29. *(a)* The substances which have lower reduction potentials are stronger reducing agents. Therefore, Cr ($E^\circ_{Cr^{3+}/Cr} = -0.74$ V) is the strongest reducing agent among all the other given options.

30. *(a)* Isoelectronic species are those which contains same number of electrons.

Species	**Atomic number**	**Number of electrons**
O^{2-}	8	10
F^-	9	10
Na^+	11	10
Mg^{2+}	12	10
O^-	8	9
Na	11	11
Mg^+	12	11

$\therefore$ Option (a) is correct which contains isoelectronic species O^{2-}, F^-, Na^+, Mg^{2+}.

JEE MAIN

SOLVED PAPER 2018

1. The ratio of mass per cent of C and H of an organic compound $(C_xH_yO_z)$ is 6 : 1. If one molecule of the above compound $(C_xH_yO_z)$ contains half as much oxygen as required to burn one molecule of compound C_xH_y completely to CO_2 and H_2O. The empirical formula of compound $C_xH_yO_z$ is

(a) $C_3H_6O_3$ (b) C_2H_4O (c) $C_3H_4O_2$ (d) $C_2H_4O_3$

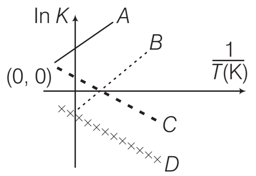
2. Which type of 'defect' has the presence of cations in the interstitial sites?

(a) Schottky defect (b) Vacancy defect
(c) Frenkel defect (d) Metal deficiency defect

3. According to molecular orbital theory, which of the following will not be a viable molecule?

(a) He_2^{2+} (b) He_2^+ (c) H_2^- (d) H_2^{2-}

4. Which of the following lines correctly show the temperature dependence of equilibrium constant, K, for an exothermic reaction?



(a) A and B (b) B and C
(c) C and D (d) A and D

5. The combustion of benzene (l) gives $CO_2(g)$ and $H_2O(l)$. Given that heat of combustion of benzene at constant volume is –3263.9 kJ mol^{-1} at 25° C; heat of combustion (in kJ mol^{-1}) of benzene at constant pressure will be $(R = 8.314\ JK^{-1}mol^{-1})$

(a) 4152.6 (b) –452.46 (c) 3260 (d) –3267.6

6. For 1 molal aqueous solution of the following compounds, which one will show the highest freezing point?

(a) $[Co(H_2O)_6]Cl_3$ (b) $[Co(H_2O)_5Cl]Cl_2 \cdot H_2O$
(c) $[Co(H_2O)_4Cl_2]Cl \cdot 2H_2O$ (d) $[Co(H_2O)_3Cl_3] \cdot 3H_2O$

7. An aqueous solution contains 0.10 M H_2S and 0.20 M HCl. If the equilibrium constants for the formation of HS^- from H_2S is 1.0×10^{-7} and that of S^{2-} from HS^- ions is 1.2×10^{-13} then the concentration of S^{2-} ions in aqueous solution is :

(a) 5×10^{-8} (b) 3×10^{-20}
(c) 6×10^{-21} (d) 5×10^{-19}

8. An aqueous solution contains an unknown concentration of Ba^{2+}. When 50 mL of a 1 M solution of Na_2SO_4 is added, $BaSO_4$ just begins to precipitate. The final volume is 500 mL. The solubility product of $BaSO_4$ is 1×10^{-10}. What is the original concentration of Ba^{2+}?

(a) 5×10^{-9} M (b) 2×10^{-9} M
(c) 1.1×10^{-9} M (d) 1.0×10^{-10} M

9. At 518°C, the rate of decomposition of a sample of gaseous acetaldehyde, initially at a pressure of 363 Torr, was 1.00 Torr s^{-1} when 5% had reacted and 0.5 Torr s^{-1} when 33% had reacted. The order of the reaction is :

(a) 2 (b) 3 (c) 1 (d) 0

10. How long (approximate) should water be electrolysed by passing through 100 amperes current so that the oxygen released can completely burn 27.66 g of diborane?
(Atomic weight of $B = 10.8\ \mu$)

(a) 6.4 hours (b) 0.8 hours
(c) 3.2 hours (d) 1.6 hours

11. The recommended concentration of fluoride ion in drinking water is up to 1 ppm as fluoride ion is required to make teeth enamel harder by converting $[3Ca_3(PO_4)_2 \cdot Ca(OH)_2]$ to :

(a) $[CaF_2]$ (b) $[3(CaF_2) \cdot Ca(OH)_2]$
(c) $[3Ca_3(PO_4)_2 \cdot CaF_2]$ (d) $[3\{Ca_3(PO_4)_2\} \cdot CaF_2]$

12. Which of the following compounds contain(s) no covalent bond(s)?

$$KCl, PH_3, O_2, B_2H_6, H_2SO_4$$

(a) KCl, B_2H_6, PH_3 (b) KCl, H_2SO_4
(c) KCl (d) KCl, B_2H_6

13. Which of the following are Lewis acids?

(a) PH_3 and BCl_3 (b) $AlCl_3$ and $SiCl_4$
(c) PH_3 and $SiCl_4$ (d) BCl_3 and $AlCl_3$

14. Total number of lone pair of electron in I_3^- ion is

(a) 3 (b) 6 (c) 9(d) 12

15. Which of the following salts is the most basic in aqueous solution?

(a) $Al(CN)_3$ (b) CH_3COOK (c) $FeCl_3$ (d $Pb(CH_3COO)_2$

16. Hydrogen peroxide oxidises $[Fe(CN)_6]^{4-}$ to $[Fe(CN)_6]^{3-}$ in acidic medium but reduces $[Fe(CN)_6]^{3-}$ to $[Fe(CN)_6]^{4-}$ in alkaline medium. The other products formed are, respectively.

(a) $(H_2O + O_2)$ and H_2O (b) $(H_2O + O_2)$ and $(H_2O + OH^-)$
(c) H_2O and $(H_2O + O_2)$ (d) H_2O and $(H_2O + OH^-)$

17. The oxidation states of Cr, in $[Cr(H_2O)_6]Cl_3$, $[Cr(C_6H_6)_2]$, and $K_2[Cr(CN)_2(O)_2(O_2)(NH_3)]$ respectively are

(a) +3, +4 and +6 (b) +3, +2 and +4
(c) +3, 0 and +6 (d) +3, 0 and +4

18. The compound that does not produce nitrogen gas by the thermal decomposition is

(a) $Ba(N_3)_2$ (b) $(NH_4)_2Cr_2O_7$
(c) NH_4NO_2 (d) $(NH_4)_2SO_4$

19. When metal '*M*' is treated with NaOH, a white gelatinous precipitate '*X*' is obtained, which is soluble in excess of NaOH. Compound '*X*' when heated strongly gives an oxide which is used in chromatography as an adsorbent. The metal '*M*' is

(a) Zn (b) Ca (c) Al (d) Fe

20. Consider the following reaction and statements :

$$[Co(NH_3)_4Br_2]^+ + Br^- \longrightarrow [Co(NH_3)_3Br_3] + NH_3$$

I. Two isomers are produces if the reactant complex ion is a *cis*-isomer.
II. Two isomers are produced if the reactant complex ion is a *trans*-isomer.
III. Only one isomer is produced if the reactant complex ion is a *trans*-isomer.
IV. Only one isomer is produced if the reactant complex ion is a *cis*-isomer.

The correct statements are

(a) (I) and (II) (b) (I) and (III)
(c) (III) and (IV) (d) (II) and (IV)

21. Glucose on prolonged heating with HI gives

(a) *n*-hexane (b) 1-hexene
(c) Hexanoic acid (d) 6-iodohexanal

22. The *trans*-alkenes are formed by the reduction of alkynes with

(a) H_2-Pd/C, $BaSO_4$ (b) $NaBH_4$
(c) Na/liq. NH_3 (d) Sn-HCl

23. Which of the following compounds will be suitable for Kjeldahl's method for nitrogen estimation?

(a) 
(b) 
(c) 
(d) 
24. Phenol on treatment with CO_2 in the presence of NaOH followed by acidification produces compound *X* as the major product. *X* on treatment with $(CH_3CO)_2O$ in the presence of catalytic amount of H_2SO_4 produces:

(a) 
(b) 
(c) 
(d) 
25. An alkali is titrated against an acid with methyl orange as indicator, which of the following is a correct combination?

	Base	Acid	End point
(a)	Weak	Strong	Colourless to pink
(b)	Strong	Strong	Pinkish red to yellow
(c)	Weak	Strong	Yellow to pinkish red
(d)	Strong	Strong	Pink to colourless

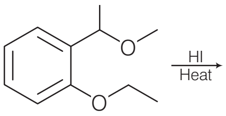
26. The predominant form of histamine present in human blood is (pK_a, Histidine = 6.0)

(a) 
(b) 
(c) 
(d) 
27. Phenol reacts with methyl chloroformate in the presence of NaOH to form product *A*. *A* reacts with Br_2 to form product *B*. *A* and *B* are respectively

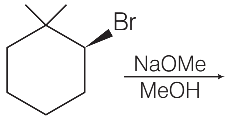
(a)  and 
(b)  and 
(c)  and 
(d)  and 
28. The increasing order of basicity of the following compounds is

I. 
II. 
III. 
IV. 
(a) (I) < (II) < (III) < (IV)
(b) (II) < (I) < (III) < (IV)
(c) (II) < (I) < (IV) < (III)
(d) (IV) < (II) < (I) < (III)

29. The major product formed in the following reaction is



(a) 
(b) 
(c) 
(d) 
30. The major product of the following reaction is



(a) 
(b) 
(c) 
(d) 
Answers

Answer *with* Explanations

1. ***(d)*** We can calculate the simplest whole number ratio of C and H from the data given, as

Element	Relative mass	Molar mass	Relative mole	Simplest whole number ratio
C	6	12	$\frac{6}{12} = 0.5$	$\frac{0.5}{0.5} = 1$
H	1	1	$\frac{1}{1} = 1$	$\frac{1}{0.5} = 2$

Alternatively this ratio can also be calculated directly in the terms of x and y as

$\frac{12x}{y} = \frac{6}{1}$ (given and molar mass of C $= 12$, H $= 1$)

Now, after calculating this ratio look for condition 2 given in the question i.e. quantity of oxygen is half of the quantity required to burn one molecule of compound C_xH_y completely to CO_2 and H_2O. We can calculate number of oxygen atoms from this as consider the equation.

$$C_xH_y + \left[x + \frac{y}{4}\right]O_2 \longrightarrow xCO_2 + \frac{y}{2}H_2O$$

Number of oxygen atoms required $= 2 \times \left[x + \frac{y}{4}\right] = \left[2x + \frac{y}{2}\right]$

Now given, $$z = \frac{1}{2}\left[2x + \frac{y}{2}\right] = \left[x + \frac{y}{4}\right]$$

Here we consider x and y as simplest ratios for C and H so now putting the values of x and y in the above equation.

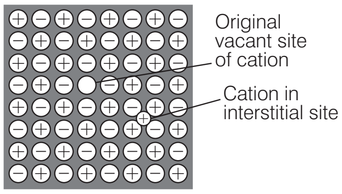
$$z = \left[x + \frac{y}{4}\right] = \left[1 + \frac{2}{4}\right] = 1.5$$

Thus, the simplest ratio figures for x, y and z are $x = 1$, $y = 2$ and $z = 1.5$

Now, put these values in the formula given i.e. $C_xH_yO_z = C_1H_2O_{1.5}$

So, empirical formula will be $[C_1H_2O_{1.5}] \times 2 = C_2H_4O_3$

2. ***(c)*** It is the "Frenkel defect" in which cations leave their original site and occupy interstitial site as shown below.



3. ***(d)*** ***Key Idea*** *According to M.O.T, the viability of any molecule can be judged through the calculation of bond order.*

Electronic	Configuration	Bond order
He_2^+	$\sigma_{1s^2}\sigma^*_{1s^1}$	$\frac{2-1}{2} = 0.5$
H_2^-	$\sigma_{1s^2}\sigma^*_{1s^1}$	$\frac{2-1}{2} = 0.5$
H_2^{2-}	$\sigma_{1s^2}\sigma^*_{1s^2}$	$\frac{2-2}{2} = 0$
He_2^{2+}	σ_{1s^2}	$\frac{2-0}{2} = 1$

The molecule having zero bond order will not be viable hence, H_2^{2-} (option d) is the correct answer.

4. *(a)* From thermodynamics,

$$\ln k = \frac{-\Delta H^\circ}{RT} + \frac{\Delta S^\circ}{R} \quad \ldots\text{(i)}$$

Mathematically, the equation of straight line is

$$y = c + mx \quad \ldots\text{(ii)}$$

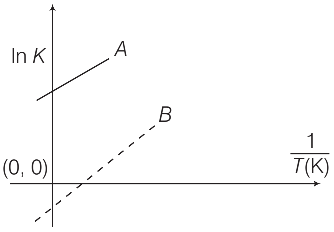
After comparing Eq. (ii) with (i) we get,

slope $= \frac{-\Delta H^\circ}{R}$ and intercept $= \frac{\Delta S^\circ}{R}$

Now, we know for exothermic reaction ΔH is negative (−)ve. But here,

$$\text{Slope} = \frac{-\Delta H^\circ}{R} \text{ is positive}$$

So, lines A and B in the graph represent temperature dependence of equilibrium constant K for an exothermic reaction as shown below



5. *(d)* ***Key idea***

Calculate the heat of combustion with the help of following formula

$$\Delta H_p = \Delta U + \Delta n_g RT$$

where, ΔH_p *= Heat of combustion at constant pressure*

ΔU *= Heat at constant volume (It is also called* ΔE*)*

Δn_g *= Change in number of moles (In gaseous state).*

R *= Gas constant;* T *= Temperature.*

From the equation,

$$C_6H_6(l) + \frac{15}{2}O_2(g) \longrightarrow 6CO_2(g) + 3H_2O(l)$$

Change in the number of gaseous moles i.e.

$$\Delta n_g = 6 - \frac{15}{2} = -\frac{3}{2} \text{ or } -1.5$$

Now we have Δn_g and other values given in the question are

$\Delta U = -3263.9$ kJ/mol

$T = 25°\text{C} = 273 + 25 = 298$ K

$R = 8.314\ \text{JK}^{-1}\text{mol}^{-1}$

So, $\Delta H_p = (-3263.9) + (-1.5) \times 8.314 \times 10^{-3} \times 298$

$= -3267.6\ \text{kJ mol}^{-1}$

6. *(d)* ***Key idea*** *"Addition of solute particles to a pure solvent results to depression in its freezing point."*

All the compounds given in question are ionic in nature so, consider their van't Hoff factor (i) to reach at final conclusion.

The solution with maximum freezing point must have minimum number of solute particles. This generalisation can be done with the help of van't Hoff factor (i) i.e.

Number of solute particles ∝ van't Hoff factor (i)

Thus, we can say directly

Solution with maximum freezing point will be the one in which solute with minimum van't Hoff factor is present

Now, for $Co(H_2O)_6]Cl_3 \rightleftharpoons [Co(H_2O)_6]^{3+} + 3Cl^-$

van't Hoff factor (i) is 4. Similarly for,

$[Co(H_2O)_5Cl]Cl_2 \cdot H_2O \rightleftharpoons [Co(H_2O)_5Cl]^{2+} + 2Cl^-$ 'i' is 3

$[Co(H_2O)_4Cl_2]Cl \cdot 2H_2O \rightleftharpoons [Co(H_2O)_4Cl_2]^+ + Cl^-$ 'i' is 2

and for $[Co(H_2O)_3Cl_3] \cdot 3H_2O$, '$i$' is 1 as it does not show ionisation. Hence, $[Co(H_2O)_3Cl_3] \cdot 3H_2O$ have minimum number of particles in the solution.

So, freezing point of its solution will be maximum.

7. *(b)* Given $[H_2S] = 0.10$ M

$[HCl] = 0.20$ M So, $[H^+] = 0.20$ M

$H_2S \rightleftharpoons H^+ + HS^-,\ K_1 = 1.0 \times 10^{-7}$

$HS^- \rightleftharpoons H^+ + S^{2-},\ K_2 = 1.2 \times 10^{-13}$

It means for,

$H_2S \rightleftharpoons 2H^+ + S^{2-}$

$K = K_1 \times K_2 = 1.0 \times 10^{-7} \times 1.2 \times 10^{-13} = 1.2 \times 10^{-20}$

Now $[S^{2-}] = \frac{K \times [H_2S]}{[H^+]^2}$ [according to the final equation]

$= \frac{1.2 \times 10^{-20} \times 0.1\ \text{M}}{(0.2\text{M})^2} = \frac{1.2 \times 10^{-20} \times 1 \times 10^{-1}\ \text{M}}{4 \times 10^{-2}\text{M}}$

$= 3 \times 10^{-20}$ M

8. *(c)* Its given that the final volume is 500 mL and this final volume was arrived when 50 mL of 1 M Na_2SO_4 was added to unknown Ba^{2+} solution.

So, we can interpret the volume of unknown Ba^{2+} solution as 450 mL i.e.

$$\underset{\substack{Ba^{2+}\\ \text{solution}}}{450\text{mL}} + \underset{\substack{Na_2SO_4\\ \text{solution}}}{50\text{mL}} \longrightarrow \underset{\substack{BaSO_4\\ \text{solution}}}{500\text{mL}}$$

From this we can calculate the concentration of SO_4^{2-} ion in the solution *via*

$M_1V_1 = M_2V_2$

$1 \times 50 = M_2 \times 500$

(as 1M Na_2SO_4 is taken into consideration)

$M_2 = \frac{1}{10} = 0.1$ M

Now for just precipitation,

Ionic product = Solubility product (K_{sp})

i.e. $[Ba^{2+}][SO_4^{2-}] = K_{sp}$ of $BaSO_4$

Given K_{sp} of $BaSO_4 = 1 \times 10^{-10}$

So, $[Ba^{2+}][0.1] = 1 \times 10^{-10}$

or $[Ba^{2+}] = 1 \times 10^{-9}$ M

Remember This is the concentration of Ba^{2+} ions in final solution. Hence, for calculating the $[Ba^{2+}]$ in original solution we have to use

$M_1V_1 = M_2V_2$

as $M_1 \times 450 = 10^{-9} \times 500$

so, $M_1 = 1.1 \times 10^{-9}$M

9. *(a)* For the reaction,

$$CH_3CHO(g) \xrightarrow{\text{Decomposes}} CH_4 + CO$$

Let order of reaction with respect to CH_3CHO is m.

Its given, $r_1 = 1$ torr/sec. when CH_3CHO is 5% reacted i.e. 95% unreacted. Similarly, $r_2 = 0.5$ torr/sec when CH_3CHO is 33% reacted i.e., 67% unreacted.

Use the formula, $r \propto (a - x)^m$

where $(a - x)$ = amount unreacted

so, $\dfrac{r_1}{r_2} = \dfrac{(a - x_1)^m}{(a - x_2)^m}$ or $\dfrac{r_1}{r_2} = \left[\dfrac{a - x_1}{a - x_2}\right]^m$

Now putting the given values

$$\frac{1}{0.5} = \left(\frac{0.95}{0.67}\right)^m \Rightarrow 2 = (1.41)^m \quad \text{or } m = 2$$

10. ***(c)*** Given that, $i = 100$ amp. also, 27.66 g of diborane (B_2H_6)

Molecular mass of $B_2H_6 = 10.8 \times 2 + 6 = 27.6$

Number of moles of B_2H_6 in 27.66 g $= \dfrac{\text{Given mass}}{\text{Molar mass}} = \dfrac{27.66}{27.6} \approx 1$

Now consider the equation

$$B_2H_6 + 3O_2 \longrightarrow B_2O_3 + 3H_2O$$

From the equation we can interpret that 3 moles of oxygen is required to burn 1 mole (i.e. 27.6 g) B_2H_6 completely.

Also consider the electrolysis reaction of water i.e.

$$H_2O \rightleftharpoons 2H^+ + O^{--}$$

$$2H^+ \xrightarrow[\text{Cathode}]{+2e^-} 2H \longrightarrow H_2 \uparrow$$

$$O^{--} \xrightarrow[-2e^-]{\text{Anode}} O \xrightarrow[\text{atoms}]{\text{2 such}} O_2 \uparrow$$

From the above equation it can be easily interpreted that in electrolysis of water for the production of 1 mole of oxygen from 1 mole of H_2O at anode 4 moles electrons are required.

Likewise for the production of 3 moles of O_2 $12 (3 \times 4)$ moles of electrons will be needed.

So, the total amount of charge required to produce 3 moles of oxygen will be $12 \times F$ or 12×96500

We know $Q = it$

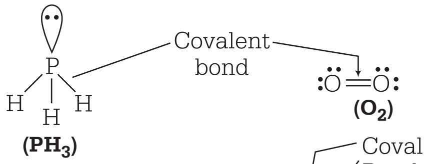
So, $12 \times 96500 = 100 \times t$ in seconds

or $\dfrac{12 \times 96500}{100 \times 3600} = t$ in hours $= 3.2$ hours

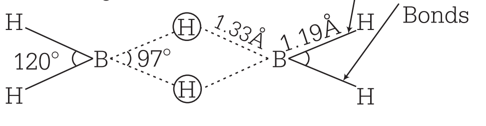
11. ***(c)*** Fluoride ions help in making teeth enamel harder by converting $[3Ca_3(PO_4)_2 \cdot Ca(OH)_2]$ i.e. Hydroxy apatite to $[3Ca_3(PO_4)_2 \cdot CaF_2]$ i.e., Fluorapatite (Harder teeth enamel) *via* following reaction:

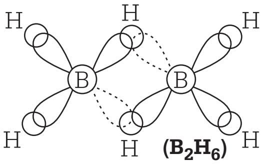
$$[3Ca_3(PO_4)_2 \cdot Ca(OH)_2] + \underset{\substack{\text{From}\\ \text{drinking}\\ \text{water}}}{2F^-} \longrightarrow [3Ca_3(PO_4)_2 \cdot CaF_2] + 2OH^-$$

12. ***(c)*** KCl is the only ionic compound. The structure of PH_3, O_2, B_2H_6 and H_2SO_4 are given below

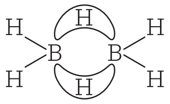


(PH₃) **(O₂)**

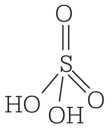




(B_2H_6)



Banana bond



Sulphuric acid

(H_2SO_4)

All bond between S and O atom are covalent bonds.

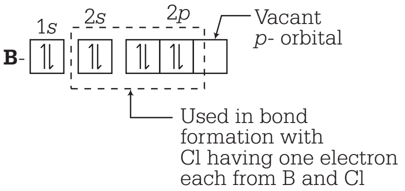
13. ***(d)*** ***Key Idea*** *Lewis acids are defined as,*

"Electron deficient compounds which have the ability to accept atleast one lone pair."

The compound given are

PH_3 -Octet complete although P has vacant $3d$-orbital but does not have the tendency to accept lone pair in it. Hence, it cannot be considered as Lewis acid.

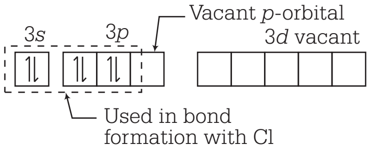
BCl_3 -Incomplete octet with following orbital picture.



Hence, vacant p-orbital of B can accept one lone pair thus it can be considered as Lewis acid.

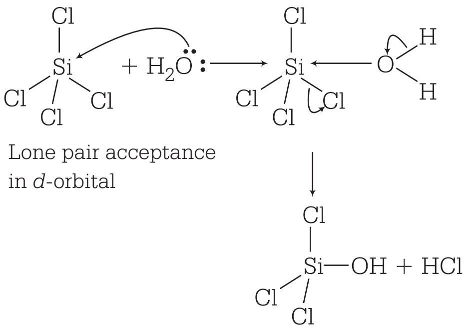
$AlCl_3$ -Similar condition is visible in $AlCl_3$ as well i.e.

Al (Valence orbital only) =



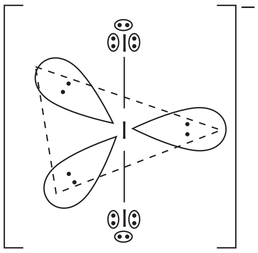
Hence this compound can also be considered as Lewis acid.

$SiCl_4$ - Although this compound does not have incomplete octet but it shows the tendency to accept lone pair of electrons in its vacant d-orbital. This tendency of $SiCl_4$ is visible in following reaction.



Thus option (b) and (d) both appear as correct but most suitable answer is (d) as the condition of a proper Lewis acid is more well defined in BCl_3 and $AlCl_3$.

14. *(c)* The structure of I_3^- ion is



Hence, 9 is the correct answer.

15. *(b)* Among the given salts

$FeCl_3$ is acidic in nature i.e., have acidic solution as it is the salt of weak base and strong acid.

$Al(CN)_3$ and **$Pb(CH_3COO)_2$** are the salts of weak acid and weak base.

CH_3COOK is the salt of strong base and weak acid.

Hence, the solution of CH_3COOK will be most basic because of the following reaction.

$$CH_3COOK + H_2O \rightleftharpoons \underset{\text{(Weak acid)}}{CH_3COOH} + \underset{\text{(Strong base)}}{KOH}$$

16. *(c)* Both reactions in their complete format are written below

(i) In acidic medium,

$$[Fe^{2+}(CN)_6]^{4-} + H_2\overset{-1}{O_2} + 2H^+ \longrightarrow [Fe^{3+}(CN)_6]^{3-} + 2H_2\overset{-2}{O}$$

(ii) In alkaline medium,

$$[Fe^{3+}(CN)_6]^{3-} + H_2\overset{-1}{O_2} + 2OH^- \longrightarrow [Fe^{2+}(CN)_6]^{4-} + O_2 + 2H_2O$$

Hence, H_2O (for reaction (i)) and $O_2 + H_2O$ (for reaction (ii)) are produced as by product.

17. *(c)* Let the oxidation state of Cr in all cases is 'x'

(i) Oxidation state of Cr in $[Cr(H_2O)_6]Cl_3$

$$x + (0 \times 6) + (-1 \times 3) = 0$$

or $x + 0 - 3 = 0$

or $x = +3$

(ii) Oxidation state of Cr in $[Cr(C_6H_6)_2]$

$$x + (2 \times 0) = 0$$

or $x = 0$

(iii) Oxidation state of Cr in

$$K_2[Cr(CN)_2(O)_2(O_2)(NH_3)]$$

$$1 \times 2 + x + (-1 \times 2) + (-2 \times 2) + (-2) + 0 = 0$$

or $2 + x - 2 - 4 - 2 = 0$ or $x - 6 = 0$

hence $x = +6$

Thus, +3, 0 and +6 is the answer.

18. *(d)* The thermal decomposition of given compounds is shown below

$$(NH_4)_2Cr_2O_7 \xrightarrow{\Delta} N_2 + 4H_2O + Cr_2O_3$$

$$NH_4NO_2 \xrightarrow{\Delta} N_2 + 2H_2O$$

$$(NH_4)_2SO_4 \xrightarrow{\Delta} 2NH_3 + H_2SO_4$$

$$Ba(N_3)_2 \longrightarrow Ba + 3N_2$$

Thus, only $(NH_4)_2SO_4$ does not gives N_2 on heating (It give NH_3). While rest of the given compounds gives N_2 on their thermal decomposition.

19. *(c)* Among the given metals Al forms white gelatinous ppt. with NaOH.

Hence, the probable metal can be Al. This ppt. is dissolved in excess of NaOH due to the formation of sodium metal Aluminate. Both the reactions are shown below.

$$Al^{3+} \xrightarrow{\text{NaOH}} \underset{\substack{\text{White gelatinous}\\ \text{ppt. }(X)\text{ of}\\ \text{aluminium}\\ \text{hydroxide}}}{Al(OH)_3} \xrightarrow{\text{Excess of NaOH}} \underset{\substack{\text{Sodium}\\ \text{metaaluminate)}\\ \text{soluble}}}{NaAlO_2}$$

Aluminium hydroxide on strong heating gives alumina (Al_2O_3) which is used as an adsorbent in chromatography. This reaction can be seen as :

$$2Al(OH)_3 \xrightarrow{\Delta} Al_2O_3 + 3H_2O$$

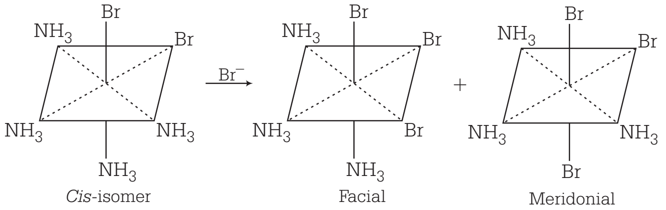
Thus, metal M is Al.

Ca, being below sodium in electrochemical reactivity series, cannot displaces Na from its aqueous solution.

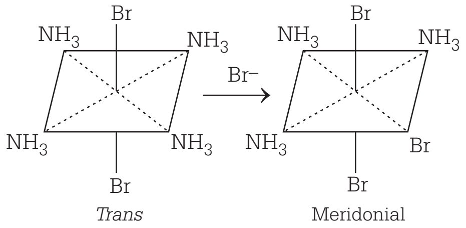
Zn reacts with NaOH to form sodium zincate which is a soluble compound.

Fe reacts with sodium hydroxide to form tetrahydroferrate (II) sodium which is again a soluble complex.

20. *(b)* If the reactant is *cis* isomer than following reaction takes place.

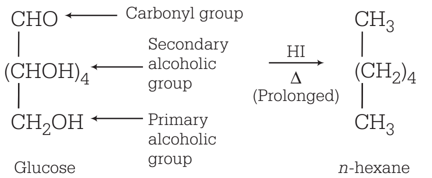


i.e. two isomers are produced. If the reactant is *trans* isomer than following reaction takes place.



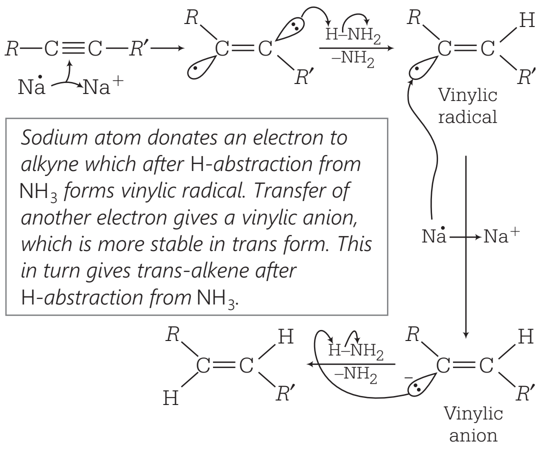
i.e. only 1 isomer is produced. Thus, statement (I) and (III) are correct resulting to option (b) as the correct answer.

21. *(a)* HI is a strong reducing agent. It reduces both primary and secondary alcoholic groups of glucose along with the carbonyl group to produce *n*-hexane as



22. *(c)* Sodium metal in liquid ammonia reduces alkynes with anti stereochemistry to give *trans* alkenes. The reduction is selectively *anti* since the vinyl radical formed during reduction is more stable in *trans* configuration.

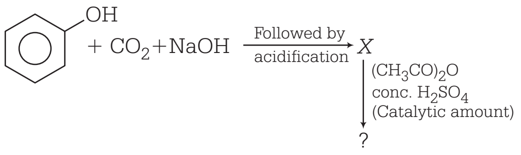
Mechanism



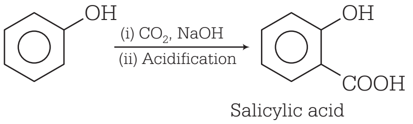
Sodium atom donates an electron to alkyne which after H*-abstraction from* NH_3 *forms vinylic radical. Transfer of another electron gives a vinylic anion, which is more stable in trans form. This in turn gives trans-alkene after* H*-abstraction from* NH_3.

23. *(b)* Estimation of nitrogen through Kjeldahl's method is not suitable for organic compounds containing nitrogen in ring or nitrogen in nitro or azo groups. It is because of the fact that nitrogen of these compounds does not show conversion to Ammonium sulphate $((NH_4)_2SO_4)$ during the process. Hence, among the given compounds only aniline can be used suitably for estimation of nitrogen by Kjeldahl's method.

24. *(a)*

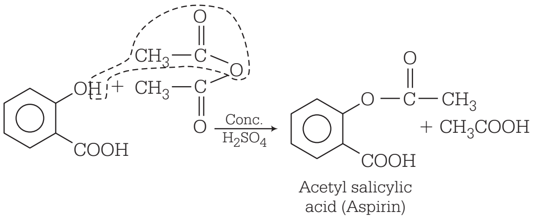


The very first reaction in the above road map looks like Kolbe's reaction which results to salicylic acid as



Salicylic acid
(X)

The salicylic acid with acetic anhydride $[(CH_3CO)_2O]$ in the presence of catalytic amount of conc. H_2SO_4 undergoes acylation to produce aspirin as



Acetyl salicylic acid (Aspirin)

Aspirin is a non-narcotic analgesic (Pain killer).

25. *(c)* Methyl orange show Pinkish colour towards more acidic medium and yellow orange colour towards basic or less acidic media. Its working pH range is

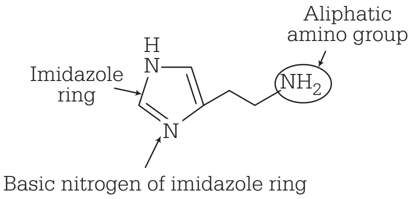
Pinkish Red ← 3.9 –4.5 → Yellow orange

Weak base have the pH range greater than 7. When methyl orange is added to this weak base solution it shows yellow orange colour.

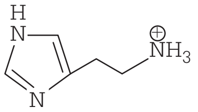
Now when this solution is titrated against strong acid the pH move towards more acidic range and reaches to end point near 3.9 where yellow orange colour of methyl orange changes to Pinkish red resulting to similar change in colour of solution as well.

26. *(d)* Our blood is slightly basic in nature with pH range from 7.35-7.4.

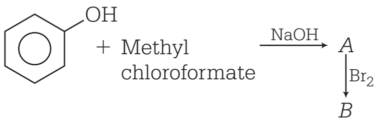
The structure of histamine is given below :



It is produced by decarboxylation of histidine having following structure. It is clearly visible from the above structure that histamine has two basic centres namely aliphatic amino group and basic nitrogen of imidazole ring. The aliphatic amino group has pK_a around 9.4. In blood with pH around 7.4 the aliphatic amino group of histamine become protonated to give a single charged cation as shown below

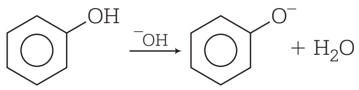


27. *(c)* Given

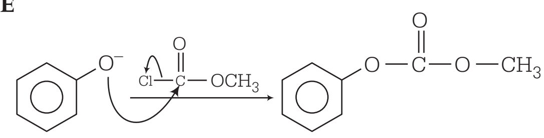


In the above road map, first reaction appears as acid base reaction followed by S_NAE (Nucleophilic substitution through Addition and Elimination). Both the steps are shown below

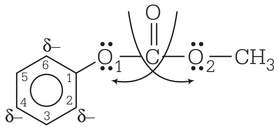
(i) ***Acid base reaction***



(ii) **S_N AE**

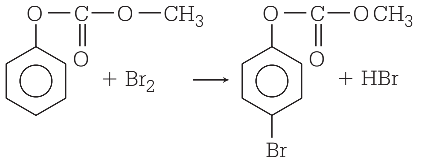


In the product of S_NAE the attached group is *ortho* and *para*-directing due to following cross conjugation



Cross conjugation due to which lone pair of oxygen 1 will be easily available to ring resulting to higher electron density at 2, 4, 6 position with respect to group. However from the stability point of view *ortho* positions are not preferred by substituents as group  $-O-\underset{\underset{O}{\|}}{C}-O-CH_3$ is bulky.

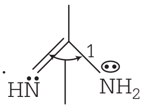
Hence, on further bromination of S_NAE product *para* bromo derivative will be the preferred product i.e.



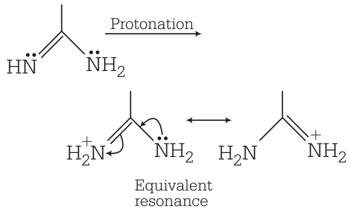
28. ***(c) Key Idea*** *Among the given compounds the basic nature depends upon their tendency to donate electron pair.*

Among the given compounds in  , Nitrogen is sp^2-hybridised. This marginally increases the electronegativity of nitrogen which in turn decreases the electron donation tendency of nitrogen. Thus making compound least basic.

Among the rest  is totally different from others as in this compound lone pair of one nitrogen are in conjugation with π bond i.e. As a result of this conjugation the cation formed after protonation becomes resonance stabilised



In conjugation



This equivalent resonance in cation makes  most basic among all.

Categorisation is very simple between rest two as

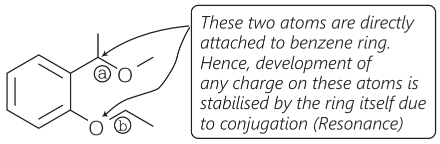
 (primary amine) is less basic than

 (secondary amine)

Hence, the correct order is

(II) < (I) < (IV) < (III) i.e. option ***(c)*** is correct.

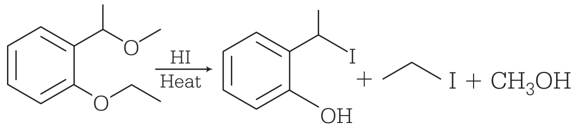
29. ***(d) Key idea*** *The reaction given is a nucleophilic substitution reaction in which cleavage at C—O bond is visible. The product formation can be visualised with the help of following analysis.*



These two atoms are directly attached to benzene ring. Hence, development of any charge on these atoms is stabilised by the ring itself due to conjugation (Resonance)

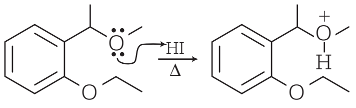
*If any one properly visualise the fact written with figure above, than a conclusion can be made that C—O bonds marked **(a)** and (b) in the figure will undergo heterolysis during the reaction.*

The reaction can be represented as



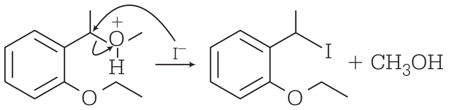
Mechanism

Step I The reaction begins with the attack of H^+ of HI on oxygen to form oxonium ion as

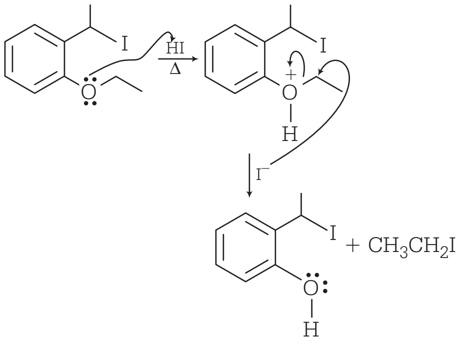


Oxonium ion

Step II This oxonium ion undergoes lysis and addition of $I^-$to form two products as

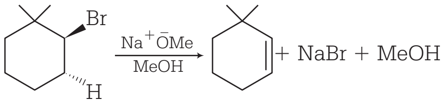


Step III Similar pathway is followed at the other oxygen atom, which can be visualised as



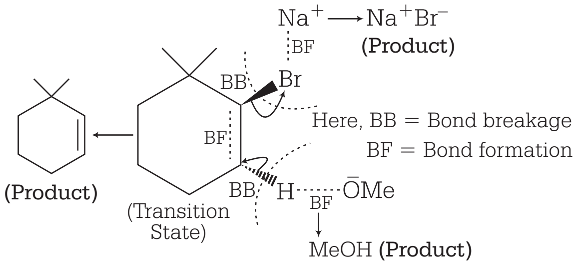
Note *Mechanism of a reaction is always a logical sequencing of events which may occur simultaneously as well.*

30. ***(b)*** Complete reaction can be represented as



Thus, the given reaction is dehydrohalogenation which is a β-elimination proceeding through E_2 mechanism.

Mechanism The reaction proceeds through the formation of following transition state with simultaneous removal of Br and H atoms.



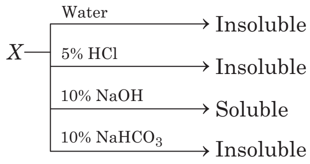
ONLINE QUESTION PAPERS

JEE Main 2019 (April & January Attempt)

APRIL ATTEMPT

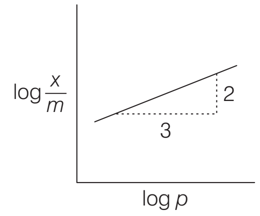
8 April, Shift-I

1 An organic compound X showing the following solubility profile is



(a) o-toluidine (b) oleic acid
(c) m-cresol (d) benzamide

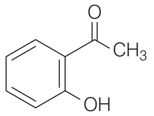
2 Adsorption of a gas follows Freundlich adsorption isotherm. x is the mass of the gas adsorbed on mass m of the adsorbent. The plot of $\log \frac{x}{m}$ *versus* $\log p$ is shown in the given graph. $\frac{x}{m}$ is proportional to



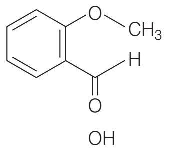
(a) $p^{2/3}$ (b) $p^{3/2}$ (c) p^3 (d) p^2

3 An organic compound neither reacts with neutral ferric chloride solution nor with Fehling solution. It however, reacts with Grignard reagent and gives positive iodoform test. The compound is

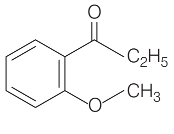
(a)



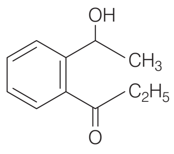
(b)



(c)



(d)

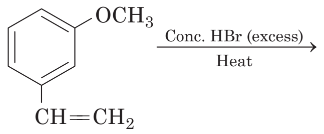


4 The size of the iso-electronic species Cl^-, Ar and Ca^{2+} is affected by
(a) azimuthal quantum number of valence shell
(b) electron-electron interaction in the outer orbitals
(c) principal quantum number of valence shell
(d) nuclear charge

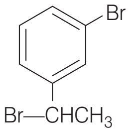
5 In order to oxidise a mixture of one mole of each of FeC_2O_4, $Fe_2(C_2O_4)_3$, $FeSO_4$ and $Fe_2(SO_4)_3$ in acidic medium, the number of moles of $KMnO_4$ required is
(a) 2 (b) 1 (c) 3 (d) 1.5

6 In the following compounds, the decreasing order of basic strength will be
(a) $C_2H_5NH_2 > NH_3 > (C_2H_5)_2NH$
(b) $(C_2H_5)_2NH > NH_3 > C_2H_5NH_2$
(c) $(C_2H_5)_2NH > C_2H_5NH_2 > NH_3$
(d) $NH_3 > C_2H_5NH_2 > (C_2H_5)_2NH$

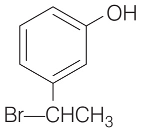
7 The major product of the following reaction is



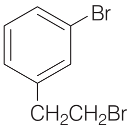
(a)



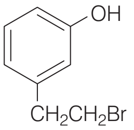
(b)



(c)

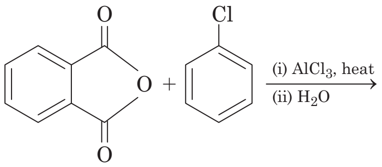


(d)

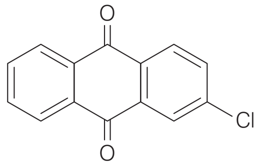


8 The correct order of the spin only magnetic moment of metal ions in the following low spin complexes, $[V(CN)_6]^{4-}$, $[Fe(CN)_6]^{4-}$, $[Ru(NH_3)_6]^{3+}$, and $[Cr(NH_3)_6]^{2+}$, is
(a) $Cr^{2+} > Ru^{3+} > Fe^{2+} > V^{2+}$
(b) $V^{2+} > Cr^{2+} > Ru^{3+} > Fe^{2+}$
(c) $V^{2+} > Ru^{3+} > Cr^{2+} > Fe^{2+}$
(d) $Cr^{2+} > V^{2+} > Ru^{3+} > Fe^{2+}$

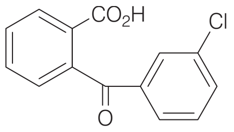
9 The major product of the following reaction is



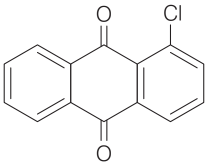
(a)



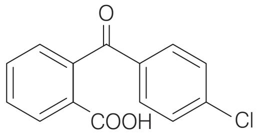
(b)



(c)



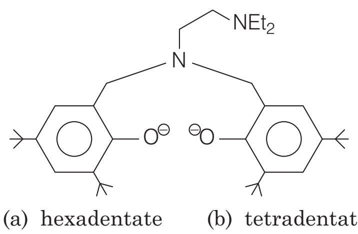
(d)



10 For silver, C_p (J K^{-1}mol^{-1}) = 23 + 0.01 T. If the temperature (T) of 3 moles of silver is raised from 300 K to 1000 K at 1 atm pressure, the value of ΔH will be close to
(a) 62 kJ (b) 16 kJ (c) 21 kJ (d) 13 kJ

11 Which is wrong with respect to our responsibility as a human being to protect our environment?
(a) Restricting the use of vehicles
(b) Avoiding the use of floodlighted facilities
(c) Setting up compost tin in gardens
(d) Using plastic bags

12 The following ligand is



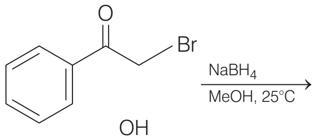
(a) hexadentate (b) tetradentate
(c) bidentate (d) tridentate

13 If solubility product of $Zr_3(PO_4)_4$ is denoted by K_{sp} and its molar solubility is denoted by S, then which of the following relation between S and K_{sp} is correct?

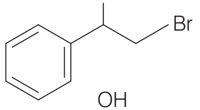
(a) $S = \left(\frac{K_{sp}}{144}\right)^{1/6}$ (b) $S = \left(\frac{K_{sp}}{6912}\right)^{1/7}$

(c) $S = \left(\frac{K_{sp}}{929}\right)^{1/9}$ (d) $S = \left(\frac{K_{sp}}{216}\right)^{1/7}$

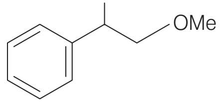
14 The major product of the following reaction is



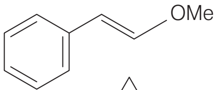
(a)



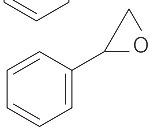
(b)



(c)



(d)



15 Diborane (B_2H_6) reacts independently with O_2 and H_2O to produce, respectively.

(a) B_2O_3 and H_3BO_3
(b) B_2O_3 and $[BH_4]^-$
(c) H_3BO_3 and B_2O_3
(d) HBO_2 and H_3BO_3

16 Which one of the following equations does not correctly represent the first law of thermo- dynamics for the given processes involving an ideal gas ? (Assume non-expansion work is zero)

(a) Cyclic process : $q = -W$
(b) Adiabatic process : $\Delta U = -W$
(c) Isochoric process : $\Delta U = q$
(d) Isothermal process : $q = -W$

17 With respect to an ore, Ellingham diagram helps to predict the feasibility of its

(a) electrolysis
(b) zone refining
(c) vapour phase refining
(d) thermal reduction

18 100 mL of a water sample contains 0.81 g of calcium bicarbonate and 0.73 g of magnesium bicarbonate. The hardness of this water sample expressed in terms of equivalents of $CaCO_3$ is (molar mass of calcium bicarbonate is 162 g mol^{-1} and magnesium bicarbonate is 146 g mol^{-1})

(a) 5,000 ppm (b) 1,000 ppm
(c) 100 ppm (d) 10,000 ppm

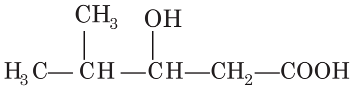
19 Given, that $E^{\ominus}_{O_2/H_2O} = +1.23V$;

$E^{\ominus}_{S_2O_8^{2-}/SO_4^{2-}} = 2.05V$;
$E^{\ominus}_{Br_2/Br^{\ominus}} = +1.09V$,
$E^{\ominus}_{Au^{3+}/Au} = +1.4V$

The strongest oxidising agent is

(a) Au^{3+} (b) O_2 (c) $S_2O_8^{2-}$ (d) Br_2

20 The IUPAC name of the following compound is



$$H_3C—\overset{\overset{\large CH_3}{|}}{C}H—\overset{\overset{\large OH}{|}}{C}H—CH_2—COOH$$

(a) 4,4-dimethyl-3-hydroxybutanoic acid
(b) 2-methyl-3-hydroxypentan-5-oic acid
(c) 3- hydroxy -4- methylpentanoic acid
(d) 4-methyl-3-hydroxypentanoic acid

21 Element 'B' forms ccp structure and 'A' occupies half of the octahedral voids, while oxygen atoms occupy all the tetrahedral voids. The structure of bimetallic oxide is

(a) A_2BO_4 (b) AB_2O_4
(c) A_2B_2O (d) A_4B_2O

22 For the reaction, $2A + B \rightarrow C$, the values of initial rate at different reactant concentrations are given in the table below.

The rate law for the reaction is

$[A]$(mol L^{-1})	$[B]$(mol L^{-1})	**Initial rate** (mol $L^{-1}s^{-1}$)
0.05	0.05	0.045
0.10	0.05	0.090
0.20	0.10	0.72

(a) rate = $k[A][B]^2$ (b) rate = $k[A]^2[B]^2$
(c) rate = $k[A][B]$ (d) rate = $k[A]^2[B]$

23 The lanthanide ion that would show colour is

(a) Gd^{3+} (b) Sm^{3+} (c) La^{3+} (d) Lu^{3+}

24 Maltose on treatment with dil. HCl gives

(a) D-glucose and D-fructose
(b) D-fructose
(c) D-galactose
(d) D-glucose

25 The vapour pressures of pure liquids A and B are 400 and 600 mmHg, respectively at 298 K. On mixing the two liquids, the sum of their initial volumes is equal to the volume of the final mixture. The mole fraction of liquid B is 0.5 in the mixture. The vapour pressure of the final solution, the mole fractions of components A and B in vapour phase, respectively are

(a) 450 mmHg, 0.4, 0.6
(b) 500 mmHg, 0.5, 0.5
(c) 450 mmHg, 0.5,0.5
(d) 500 mmHg, 0.4,0.6

26 Which of the following amines can be prepared by Gabriel phthalimide reaction?

(a) n-butylamine
(b) triethylamine
(c) t-butylamine
(d) *neo* -pentylamine

27 The quantum number of four electrons are given below:

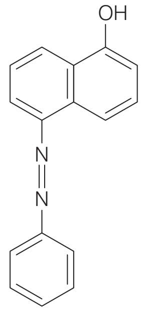
I. $n = 4, l = 2, m_l = -2, m_s = -\frac{1}{2}$
II. $n = 3, l = 2, m_l = 1, m_s = +\frac{1}{2}$
III. $n = 4, l = 1, m_l = 0, m_s = +\frac{1}{2}$
IV. $n = 3, l = 1, m_l = 1, m_s = -\frac{1}{2}$

The correct order of their increasing energies will be

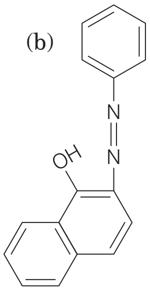
(a) IV < III < II < I
(b) I < II < III < IV
(c) IV < II < III < I
(d) I < III < II < IV

28 Coupling of benzene diazonium chloride with 1-naphthol in alkaline medium will give

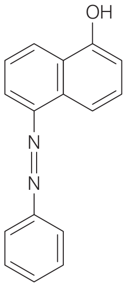
(a)



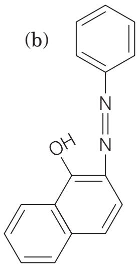
(b)



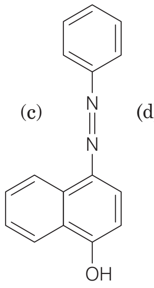
(a)



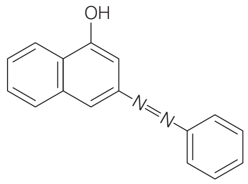
(b)



(c)



(d)



29 **Assertion** (A) Ozone is destroyed by CFCs in the upper stratosphere.

Reason (R) Ozone holes increase the amount of UV radiation reaching the earth.

(a) Assertion and Reason are incorrect.
(b) Assertion and Reason are both correct and the Reason is the correct explanation for the Assertion.
(c) Assertion and Reason are correct, but the Reason is not the explanation for the Assertion.
(d) Assertion is false, but the Reason is correct.

30 The correct order of hydration enthalpies of alkali metal ions is

(a) $Li^+ > Na^+ > K^+ > Cs^+ > Rb^+$
(b) $Na^+ > Li^+ > K^+ > Rb^+ > Cs^+$
(c) $Na^+ > Li^+ > K^+ > Cs^+ > Rb^+$
(d) $Li^+ > Na^+ > K^+ > Rb^+ > Cs^+$

1 Calculate the standard cell potential (in V) of the cell in which following reaction takes place

$Fe^{2+}(aq) + Ag^+(aq) \rightarrow Fe^{3+}(aq) + Ag(s)$

Given that,

$E^\circ_{Ag^+/Ag} = x V, E^\circ_{Fe^{2+}/Fe} = y V$
$E^\circ_{Fe^{3+}/Fe} = z V$

(a) $x + 2y - 3z$ (b) $x - y$
(c) $x + y - z$ (d) $x - z$

2 The compound that inhibits the growth of tumors is

(a) *trans*-$[Pt(Cl)_2(NH_3)_2]$
(b) *cis*-$[Pd(Cl)_2(NH_3)_2]$
(c) *cis*-$[Pt(Cl)_2(NH_3)_2]$
(d) *trans*-$[Pd(Cl)_2(NH_3)_2]$

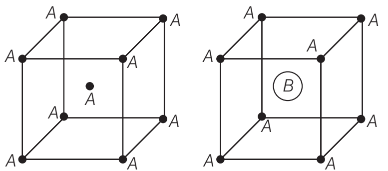
3 The statement that is incorrect about the interstitial compounds is

(a) they are very hard
(b) they have metallic conductivity
(c) they have high melting points
(d) they are chemically reactive

4 The ion that has sp^3d^2 hybridisation for the central atom, is

(a) $[ICl_2]^-$ (b) $[BrF_2]^-$
(c) $[ICl_4]^-$ (d) $[IF_6]^-$

5 Consider the bcc unit cells of the solids 1 and 2 with the position of atoms as shown below. The radius of atom B is twice that of atom A. The unit cell edge length is 50% more is solid 2 than in 1. What is the approximate packing efficiency in solid 2?



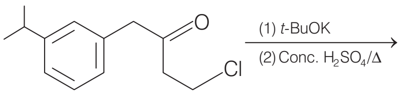
Solid 1 Solid 2

(a) 65% (b) 90%
(c) 75% (d) 45%

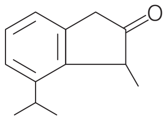
6 Which of the following compounds will show the maximum 'enol' content?

(a) CH_3COCH_3
(b) $CH_3COCH_2COCH_3$
(c) $CH_3COCH_2COOC_2H_5$
(d) $CH_3COCH_2CONH_2$

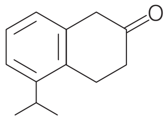
7 The major product of the following reaction is



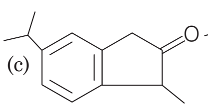
(a)



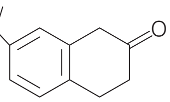
(b)



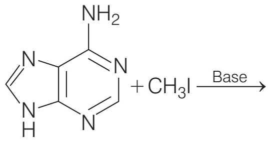
(c)



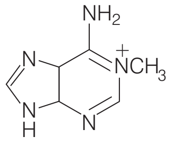
(d)



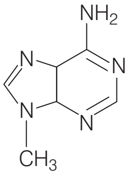
8 The major product in the following reaction is



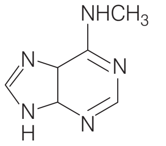
(a)



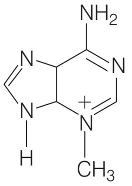
(b)



(c)



(d)



9 5 moles of an ideal gas at 100 K are allowed to undergo reversible compression till its temperature becomes 200 K. If $C_V = 28\ JK^{-1}\ mol^{-1}$, calculate ΔU and ΔpV for this process. ($R = 8.0\ JK^{-1} mol^{-1}$)

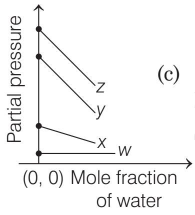
(a) $\Delta U = 2.8\ kJ; \Delta(pV) = 0.8\ kJ$
(b) $\Delta U = 14\ J; \Delta(pV) = 0.8\ J$
(c) $\Delta U = 14\ kJ; \Delta(pV) = 4\ kJ$
(d) $\Delta U = 14\ kJ; \Delta(pV) = 18\ kJ$

10 Which one of the following alkenes when treated with HCl yields majorly an anti Markownikov product?

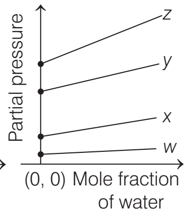
(a) $Cl—CH = CH_2$
(b) $H_2N—CH = CH_2$
(c) $CH_3O—CH = CH_2$
(d) $F_3C—CH = CH_2$

11 For the solution of the gases w, x, y and z in water at 298 K, the Henry's law constants (K_H) are 0.5, 2, 35 and 40 K bar, respectively. The correct plot for the given data is

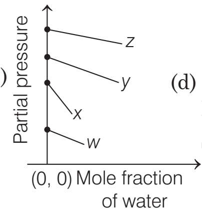
(a)



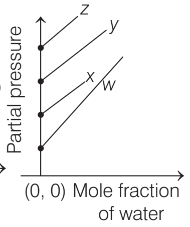
(c)



(b)



(d)



12 The covalent alkaline earth metal halide (X = Cl, Br, I) is

(a) SrX_2 (b) CaX_2
(c) MgX_2 (d) BeX_2

13 0.27 g of a long chain fatty acid was dissolved in 100 cm^3 of hexane. 10 mL of this solution was added dropwise to the surface of water in a round watch glass.

Hexane evaporates and a monolayer is formed. The distance from edge to centre of the watch glass is 10 cm. What is the height of the monolayer? [Density of fatty acid = 0.9 g cm^{-3}; $\pi = 3$]

(a) 10^{-6} m (b) 10^{-4} m
(c) 10^{-8} m (d) 10^{-2} m

14 The percentage composition of carbon by mole in methane is

(a) 75% (b) 20% (c) 25% (d) 80%

15 The maximum prescribed concentration of copper in drinking water is

(a) 5 ppm (b) 0.5 ppm
(c) 0.05 ppm (d) 3 ppm

16 For the following reactions, equilibrium constants are given :

$S(s) + O_2(g) \rightleftharpoons SO_2(g); K_1 = 10^{52}$
$2S(s) + 3O_2(g) \rightleftharpoons 2SO_3(g); K_2 = 10^{129}$

The equilibrium constant for the reaction,

$2SO(g) + O_2(g) \rightleftharpoons 2SO_3(g)$ is

(a) 10^{25} (b) 10^{77} (c) 10^{154} (d) 10^{181}

17 The strength of 11.2 volume solution of H_2O_2 is [Given that molar mass of H = 1 g mol^{-1} and O = 16 g mol^{-1}]

(a) 1.7% (b) 34%
(c) 13.6% (d) 3.4%

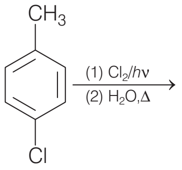
18 If p is the momentum of the fastest electron ejected from a metal surface after the irradiation of light having wavelength λ, then for 1.5 p momentum of the photoelectron, the wavelength of the light should be (Assume kinetic energy of ejected photoelectron to be very high in comparison to work function)

(a) $\frac{4}{9}\lambda$ (b) $\frac{3}{4}\lambda$
(c) $\frac{2}{3}\lambda$ (d) $\frac{1}{2}\lambda$

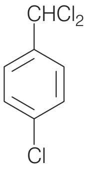
19 The correct statement about ICl_5 and ICl_4^- is

(a) ICl_5 is square pyramidal and ICl_4^- is tetrahedral
(b) ICl_5 is square pyramidal and ICl_4^- is square planar
(c) Both are isostructural
(d) ICl_5 is trigonal bipyramidal and ICl_4^- is tetrahedral

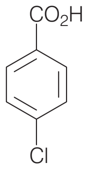
20 The major product of the following reaction is



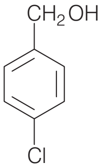
(a)



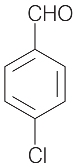
(b)



(c)



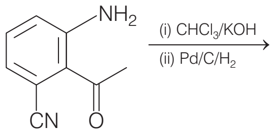
(d)



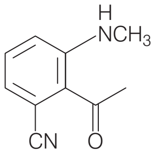
21 The calculated spin only magnetic moments (BM) of the anionic and cationic species of $[Fe(H_2O)_6]_2$ and $[Fe(CN)_6]$, respectively, are

(a) 0 and 4.9 (b) 2.84 and 5.92
(c) 0 and 5.92 (d) 4.9 and 0

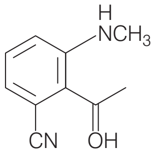
22 The major product obtained in the following reaction is



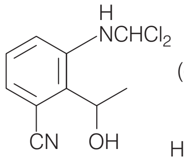
(a)



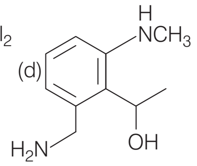
(b)



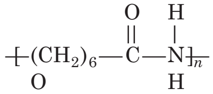
(c)



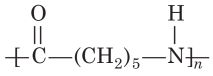
(d)



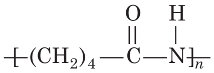
23 The structure of nylon-6 is

(a)


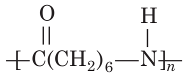
$\left[(CH_2)_6-\overset{O}{\overset{\|}{C}}-\overset{H}{\overset{|}{N}} \right]_n$

(b)


$\left[\overset{O}{\overset{\|}{C}}-(CH_2)_5-\overset{H}{\overset{|}{N}} \right]_n$

(c)


$\left[(CH_2)_4-\overset{O}{\overset{\|}{C}}-\overset{H}{\overset{|}{N}} \right]_n$

(d)


$\left[\overset{O}{\overset{\|}{C}}(CH_2)_6-\overset{H}{\overset{|}{N}} \right]_n$

24 Fructose and glucose can be distinguished by

(a) Fehling's test (b) Barfoed's test
(c) Benedict's test (d) Seliwanoff's test

25 Polysubstitutiion is a major drawback in

(a) Friedel-Craft's alkylation
(b) Reimer-Tiemann reaction
(c) Friedel-Craft's acylation
(d) Acetylation of aniline

26 For a reaction scheme, $A \xrightarrow{k_1} B \xrightarrow{k_2} C$, if rate of formation of B is set to be zero then the concentration of B is given by

(a) $k_1k_2[A]$ (b) $\left(\frac{k_1}{k_2}\right)[A]$
(c) $(k_1 - k_2)[A]$ (d) $(k_1 + k_2)[A]$

27 The IUPAC symbol for the element with atomic number 119 would be

(a) unh (b) uue (c) uun (d) une

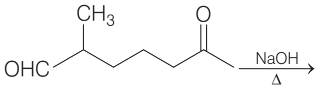
28 The Mond process is used for the

(a) purification of Ni
(b) extraction of Mo
(c) purification of Zr and Ti
(d) extraction of Zn

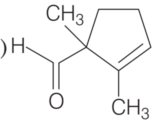
29 Among the following molecules/ions, C_2^{2-}, N_2^{2-}, O_2^{2-}, O_2
Which one is diamagnetic and has the shortest bond length?

(a) C_2^{2-} (b) O_2 (c) O_2^{2-} (d) N_2^{2-}

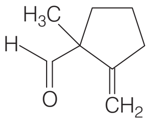
30 The major product obtained in the following reaction is



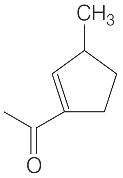
(a)



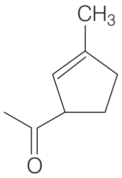
(b)



(c)



(d)



ANSWERS

1. (a)	2. (c)	3. (d)	4. (c)	5. (b)	6. (b)	7. (d)	8. (*)	9. (c)	10. (d)

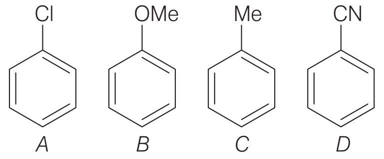
1 The increasing order of reactivity of the following compounds towards aromatic electrophilic substitution reaction is



(a) $A < B < C < D$ (b) $B < C < A < D$
(c) $D < A < C < B$ (d) $D < B < A < C$

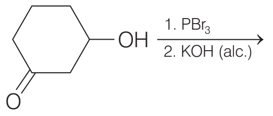
2 The standard Gibbs energy for the given cell reaction in kJ mol^{-1} at 298 K is

$$Zn(s) + Cu^{2+}(aq) \rightarrow Zn^{2+}(aq) + Cu(s),$$
$$E° = 2V \text{ at } 298 \text{ K}$$

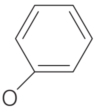
(Faraday's constant, $F = 96000$ C mol^{-1})

(a) 384 (b) 192
(c) –384 (d) –192

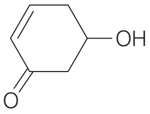
3 The major product of the following reaction is



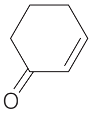
(a)



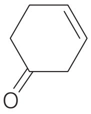
(b)



(c)



(d)



4 Which of the following statement is not true about sucrose?

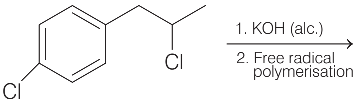
(a) It is also named as invert sugar.
(b) The glycosidic linkage is present between C_1 of α-glucose and C_1 of β-fructose
(c) It is a non-reducing sugar
(d) On hydrolysis, it produces glucose and fructose

5 For a reaction,

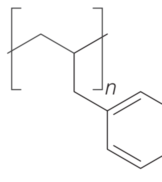
$N_2(g) + 3H_2(g) \longrightarrow 2NH_3(g)$, identify dihydrogen ($H_2$) as a limiting reagent in the following reaction mixtures.

(a) 56 g of N_2 + 10 g of H_2
(b) 35 g of N_2 + 8 g of H_2
(c) 14 g of N_2 + 4 g of H_2
(d) 28 g of N_2 + 6 g of H_2

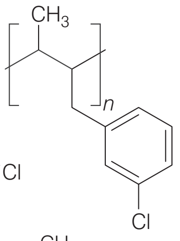
6 The major product of the following reaction is



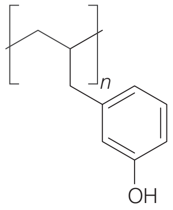
(a)



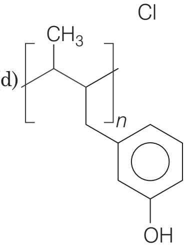
(b)



(c)



(d)



7 Among the following the set of parameters that represents path functions, is

(A) $q + W$ (B) q
(C) W (D) $H - TS$

(a) (A) and (D) (b) (A), (B) and (C)
(c) (B), (C) and (D) (d) (B) and (C)

8 The degenerate orbitals of $[Cr(H_2O)_6]^{3+}$ are

(a) d_{z^2} and d_{xz} (b) d_{xz} and d_{yz}
(c) $d_{x^2-y^2}$ and d_{xy} (d) d_{yz} and d_{z^2}

9 The aerosol is a kind of colloid in which

(a) gas is dispersed in liquid
(b) gas is dispersed in solid
(c) liquid is dispersed in water
(d) solid is dispersed in gas

10 C_{60} an allotrope of carbon contains

(a) 16 hexagons and 16 pentagons
(b) 20 hexagons and 12 pentagons
(c) 12 hexagons and 20 pentagons
(d) 18 hexagons and 14 pentagons

11 The major product of the following reaction is

$$CH_3CH{=}CHCO_2CH_3 \xrightarrow{LiAlH_4}$$

(a) $CH_3CH{=}CHCH_2OH$
(b) $CH_3CH_2CH_2CH_2OH$
(c) $CH_3CH_2CH_2CO_2CH_3$
(d) $CH_3CH_2CH_2CHO$

12 The ore that contains the metal in the form of fluoride is

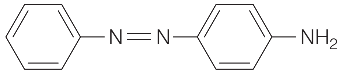
(a) magnetite (b) sphalerite
(c) malachite (d) cryolite

13 The number of water molecule(s) not coordinated to copper ion directly in $CuSO_4 \cdot 5H_2O$, is

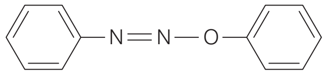
(a) 2 (b) 3 (c) 1 (d) 4

14 Aniline dissolved in dil. HCl is reacted with sodium nitrite at 0° C. This solution was added dropwise to a solution containing equimolar mixture of aniline and phenol in dil. HCl. The structure of the major product is

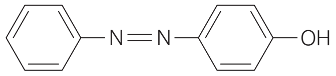
(a)



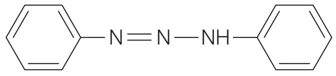
(b)



(c)



(d)



15 The osmotic pressure of a dilute solution of an ionic compound XY in water is four times that of a solution of 0.01 M $BaCl_2$ in water. Assuming complete dissociation of the given ionic compounds in water, the concentration of XY (in mol L^{-1}) in solution is

(a) 4×10^{-2} (b) 16×10^{-4}
(c) 4×10^{-4} (d) 6×10^{-2}

16 For any given series of spectral lines of atomic hydrogen, let $\Delta\bar{\nu} = \bar{\nu}_{max} - \bar{\nu}_{min}$ be the difference in maximum and minimum frequencies in cm^{-1}. The ratio $\Delta\bar{\nu}_{Lyman} / \Delta\bar{\nu}_{Balmer}$ is

(a) 27 : 5 (b) 5 : 4
(c) 9 : 4 (d) 4 : 1

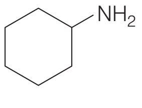
17 The element having greatest difference between its first and second ionisation energy, is

(a) Ca (b) Sc (c) Ba (d) K

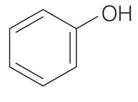
18 The organic compound that gives following qualitative analysis is

Test	Inference
(i) Dil. HCl	Insoluble
(ii) NaOH solution	Soluble
(iii) Br_2/water	Decolourisation

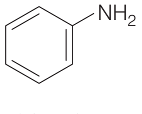
(a)



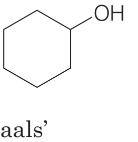
(b)



(c)



(d)



19 Consider the van der Waals' constants, a and b, for the following gases.

Gas	Ar	Ne	Kr	Xe
a/(atm dm^6 mol^{-2})	1.3	0.2	5.1	4.1
b/(10^{-2} dm^3 mol^{-1})	3.2	1.7	1.0	5.0

Which gas is expected to have the highest critical temperature ?

(a) Kr (b) Xe

(c) Ar (d) Ne

20 The major product of the following reaction is

$CH_3C \equiv CH \xrightarrow[\text{(ii) DI}]{\text{(i) DCl (1 equiv.)}}$

(a) $CH_3CD(Cl)CHD(I)$

(b) $CH_3CD_2CH(Cl)(I)$

(c) $CH_3CD(I)CHD(Cl)$

(d) $CH_3C(I)(Cl)CHD_2$

21 Magnesium powder burns in air to give

(a) MgO and Mg_3N_2

(b) $Mg(NO_3)_2$ and Mg_3N_2

(c) MgO only

(d) MgO and $Mg(NO_3)_2$

22 Liquid M and liquid N form an ideal solution. The vapour pressures of pure liquids M and N are 450 and 700 mmHg, respectively, at the same temperature. Then correct statement is

x_M = mole fraction of M in solution;

x_N = mole fraction of N in solution;

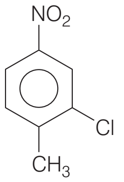
y_M = mole fraction of M in vapour phase;

y_N = mole fraction of N in vapour phase

(a) $\frac{x_M}{x_N} > \frac{y_M}{y_N}$ (b) $\frac{x_M}{x_N} = \frac{y_M}{y_N}$

(c) $\frac{x_M}{x_N} < \frac{y_M}{y_N}$ (d) $(x_M - y_M) < (x_N - y_N)$

23 The correct IUPAC name of the following compound is



(a) 2-methyl-5-nitro-1-chlorobenzene

(b) 3-chloro-1-methyl-1-nitrobenzene

(c) 2-chloro-1-methyl 1-4-nitrobenzene

(d) 5-chloro-4-methyl 1-1-nitrobenzene

24 Excessive release of CO_2 into the atmosphere results in

(a) formation of smog

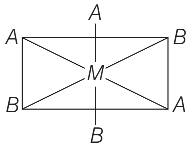
(b) depletion of ozone

(c) polar vortex

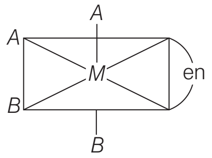
(d) global warming

25 The one that will show optical activity is (en = ethane-1, 2-diamine)

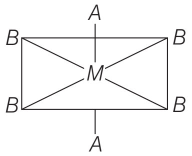
(a)



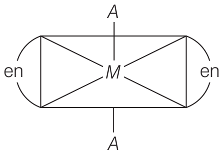
(c)



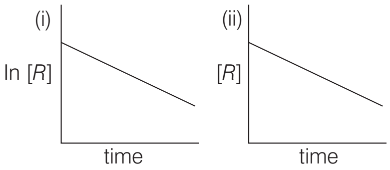
(b)



(d)



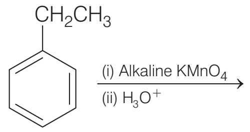
26 The given plots represent the variation of the concentration of a reaction R with time for two different reactions (i) and (ii). The respective orders of the reactions are



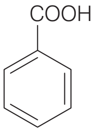
(a) 1, 1 (b) 0, 2

(c) 0, 1 (d) 1, 0

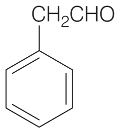
27 The major product of the following reaction is



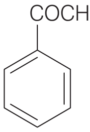
(a)



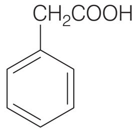
(b)



(c)



(d)



28 Among the following, the molecule expected to be stabilised by anion formation is C_2, O_2, NO, F_2.

(a) C_2 (b) F_2

(c) NO (d) O_2

29 The correct order of the oxidation states of nitrogen in NO, NO_2, NO_2 and N_2O_3 is

(a) $NO_2 < NO < N_2O_3 < N_2O$

(b) $N_2O < NO < N_2O_3 < NO_2$

(c) $O_2 < N_2O_3 < NO < N_2O$

(d) $N_2O < N_2O_3 < NO < NO_2$

30 Match the catalysts Column I with products Column II.

	Column I (Catalyst)		**Column II** (Product)
(A)	V_2O_5	(i)	Polyethlyene
(B)	$TiCl_4 / Al(Me)_3$	(ii)	Ethanal
(C)	$PbCl_2$	(iii)	H_2SO_4
(D)	Iron oxide	(iv)	NH_3

(a) (A)-(ii), (B)-(iii), (C)-(i), (D)-(iv)

(b) (A)-(iv), (B)-(iii), (C)-(ii), (D)-(i)

(c) (A)-(iii), (B)-(i), (C)-(ii), (D)-(iv)

(d) (A)-(iii), (B)-(iv), (C)-(i), (D)-(ii)

ANSWERS

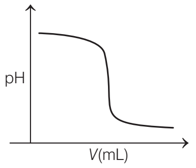
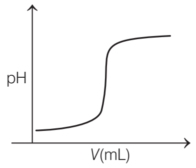
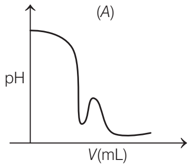
1 In an acid-base titration, 0.1 M HCl solution was added to the NaOH solution of unknown strength. Which of the following correctly shows the change of pH of the titration mixture in this experiment?



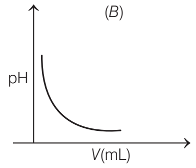
(A)



(B)



(C)



(D)

(a) (D) (b) (A) (c) (B) (d) (C)

2 Among the following species, the diamagnetic molecule is

(a) CO (b) B_2
(c) NO (d) O_2

3 The amorphous form of silica is

(a) tridymite (b) kieselguhr
(c) cristobalite (d) quartz

4 HF has highest boiling point among hydrogen halides, because it has

(a) lowest ionic character
(b) strongest van der Waals' interactions
(c) strongest hydrogen bonding
(d) lowest dissociation enthalpy

5 The structures of beryllium chloride in the solid state and vapour phase, respectively are

(a) dimeric and dimeric
(b) chain and chain
(c) dimeric and chain
(d) chain and dimeric

6 The correct statements among I to III are

I. Valence bond theory cannot explain the color exhibited by transition metal complexes.
II. Valence bond theory can predict quantitatively the magnetic properties of transition metal complexes.
III. Valence bond theory cannot distinguish ligands as weak and strong field ones.

(a) II and III only (b) I, II and III
(c) I and II only (d) I and III only

7 **Assertion** For the extraction of iron, haematite ore is used.

Reason Heamatite is a carbonate ore of iron.

(a) Only the reason is correct.
(b) Both the assertion and reason are correct explanation for the assertion.
(c) Both the assertion and reason are correct and the reason is the correct explanation for the assertion.
(d) Only the assertion is correct.

8 In the following reaction,
Carbonyl compound +

$$\text{MeOH} \overset{\text{HCl}}{\rightleftharpoons} \text{acetal}$$

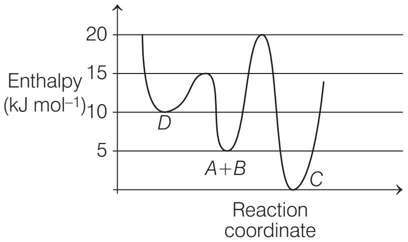
Rate of the reaction is the highest for:

(a) Acetone as substrate and methanol in excess
(b) Propanal as substrate and methanol in stoichiometric amount
(c) Acetone as substrate and methanol in stoichiometric amount
(d) Propanal as substrate and methanol in excess

9 Consider the given plot of enthalpy of the following reaction between A and B.

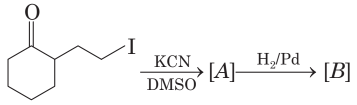
$$A + B \longrightarrow C + D$$

Identify the incorrect statement.



(a) D is kinetically stable product.
(b) Formation of A and B from C has highest enthalpy of activation.
(c) C is the thermodynamically stable product.
(d) Activation enthalpy to form C is 5 kJ mol^{-1} less than that to form D.

10 The major products A and B for the following reactions are, respectively



(a) 
(b) 
(c) 
(d) 
11 Which one of the following about an electron occupying the 1s-orbital in a hydrogen atom is incorrect? (The Bohr radius is represented by a_0)

(a) The electron can be found at a distance $2a_0$ from the nucleus.
(b) The magnitude of the potential energy is double that of its kinetic energy on an average.
(c) The probability density of finding the electron is maximum at the nucleus.
(d) The total energy of the electron is maximum when it is at a distance a_0 from the nucleus.

12 Hinsberg's reagent is

(a) $SOCl_2$ (b) C_6H_5COCl
(c) $C_6H_5SO_2Cl$ (d) $(COCl)_2$

13 The one that is not a carbonate ore is

(a) siderite (b) calamine
(c) malachite (d) bauxite

14 Molal depression constant for a solvent is 4.0 K kg mol^{-1}. The depression in the freezing point of the solvent for 0.03 mol kg^{-1} solution of K_2SO_4 is (Assume complete dissociation of the electrolyte)

(a) 0.18 K (b) 0.36 K
(c) 0.12 K (d) 0.24 K

15 What would be the molality of 20% (mass/mass) aqueous solution of KI? (Molar mass of KI = 166 g mol^{-1})

(a) 1.48 (b) 1.51
(c) 1.35 (d) 1.08

16 The correct statements among I to III regarding group 13 element oxides are:

I. Boron trioxide is acidic.
II. Oxides of aluminium and gallium are amphoteric.
III. Oxides of indium and thallium are basic.

(a) I, II and III (b) I and III only
(c) I and II only (d) II and III only

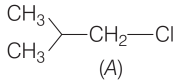
17 During compression of a spring the work done is 10 kJ and 2 kJ escaped to the surroundings as heat. The change in internal energy, ΔU (in kJ) is

(a) 8 (b) –12
(c) 12 (d) –8

18 The layer of atmosphere between 10 km to 50 km above the sea level is called as

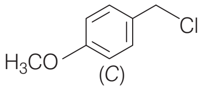
(a) stratosphere
(b) mesosphere
(c) thermosphere
(d) troposphere

19 Increasing order of reactivity of the following compounds for S_N1 substitution is

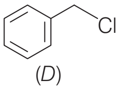


(*A*)

(*B*)



(*C*)



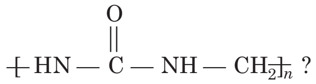
(*D*)

(a) (*A*) < (*B*) < (*D*) < (*C*)
(b) (*B*) < (*C*) < (*D*) < (*A*)
(c) (*B*) < (*A*) < (*D*) < (*C*)
(d) (*B*) < (*C*) < (*A*) < (*D*)

20 Noradrenaline is a/an

(a) antidepressant (c) antihistamine
(c) neurotransmitter
(d) antacid

21 Which of the following compounds is a constituent of the polymer



$$-\!\!\left[HN - \overset{\overset{\displaystyle O}{\|}}{C} - NH - CH_2 \right]_n ?$$

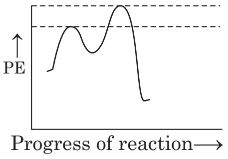
(a) *N*-methyl urea
(b) Methylamine
(c) Ammonia
(d) Formaldehyde

22 A solution of $Ni(NO_3)_2$ is electrolysed between platinum electrodes using 0.1 Faraday electricity. How many mole of Ni will be deposited at the cathode?

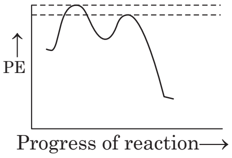
(a) 0.20 (b) 0.10 (c) 0.15 (d) 0.05

23 Which of the following potential energy (PE) diagrams represents the S_N1 reaction?

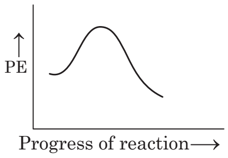
(a)



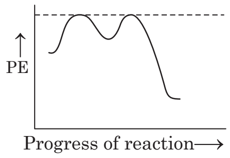
(b)



(c)



(d)



24 The maximum number of possible oxidation states of actinoides are shown by

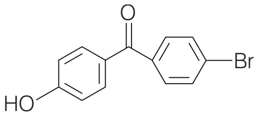
(a) berkelium, (Bk) and californium (Cf)
(b) nobelium (No) and lawrencium (Lr)
(c) actinium (Ac) and thorium (Th)
(d) neptunium (Np) and plutonium (Pu)

25 The peptide that gives positive ceric ammonium nitrate and carbylamine tests is

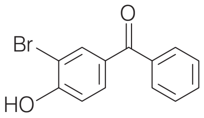
(a) Lys-Asp (b) Ser-Lys
(c) Gln-Asp (d) Asp-Gln

26 *p*-hydroxybenzophenone upon reaction with bromine in carbon tetrachloride gives

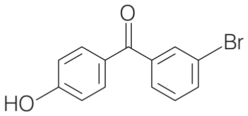
(a)



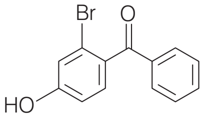
(b)



(c)



(d)



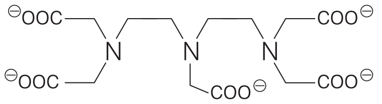
27 At a given temperature *T*, gases Ne, Ar, Xe and Kr are found to deviate from ideal gas behaviour. Their equation of state is given as,

$$p = \frac{RT}{V - b} \text{ at } T.$$

Here, *b* is the van der Waals' constant. Which gas will exhibit steepest increase in the plot of *Z* (compression factor) *vs p*?

(a) Xe (b) Ar (c) Kr (d) Ne

28 The maximum possible denticities of a ligand given below towards a common transition and inner-transition metal ion, respectively, are

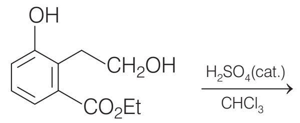


(a) 8 and 8 (b) 8 and 6
(c) 6 and 6 (d) 6 and 8

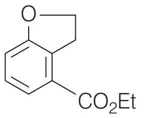
29 10 mL of 1 mM surfactant solution forms a monolayer covering 0.24 cm^2 on a polar substrate. If the polar head is approximated as a cube, what is its edge length?

(a) 2.0 pm (b) 0.1 nm
(c) 1.0 pm (d) 2.0 nm

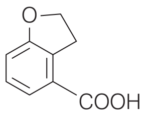
30 The major product of the following reaction is



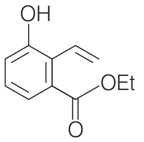
(a)



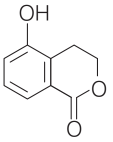
(b)



(c)



(d)



ANSWERS

1. (*b*)	2. (*a*)	3. (*b*)	4. (*c*)	5. (*d*)	6. (*d*)	7. (*d*)	8. (*d*)	9. (*d*)	10. (*c*)

1 Match the refining methods Column I with metals Column II.

Column I (Refining Methods)	Column II (Metals)
I. Liquation	(A) Zr
II. Zone refining	(B) Ni
III. Mond process	(C) Sn
IV. van Arkel method	(D) Ga

(a) I- (C) ; II-(D); III-(B) ; IV-(A)
(b) I- (B) ; II-(C); III-(D) ; IV-(A)
(c) I- (C) ; II-(A); III-(B) ; IV-(D)
(d) I- (B) ; II-(D); III-(A) ; IV-(C)

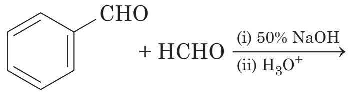
2 Consider the statements S_1 and S_2 :

S_1 : Conductivity always increases with decrease in the concentration of electrolyte.

S_2 : Molar conductivity always increases with decrease in the concentration of electrolyte.

The correct option among the following is
(a) S1 is correct and S2 is wrong
(b) S1 is wrong and S2 is correct
(c) Both S1 and S2 are wrong
(d) Both S1 and S2 are correct

3 Major products of the following reaction are



(a) CH_3OH and HCO_2H

(b) CH_3OH and 
(c) HCOOH and 
(d) 
and 
5 A gas undergoes physical adsorption on a surface and follows the given Freundlich adsorption isotherm equation $\frac{x}{m} = Kp^{0.5}$

Adsorption of the gas increases with
(a) increase in p and increase in T
(b) increase in p and decrease in T
(c) decrease in p and decrease in T
(d) decrease in p and increase in T

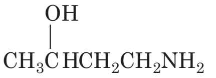
6 Three complexes, $[CoCl(NH_3)_5]^{2+}$ (I), $[Co(NH_3)_5\ H_2O]^{3+}$ (II) and $[Co(NH_3)_6]^{3+}$ (III) absorb light in the visible region. The correct order of the wavelength of light absorbed by them is
(a) II > I > III
(b) I > II > III
(c) III > I > II
(d) III > II > I

7 At 300 K and 1 atmospheric pressure, 10 mL of a hydrocarbon required 55 mL of O_2 for complete combustion and 40 mL of CO_2 is formed. The formula of the hydrocarbon is
(a) C_4H_7Cl
(b) C_4H_6
(c) C_4H_{10}
(d) C_4H_8

8 The isoelectronic set of ions is
(a) F^-, Li^+, Na^+ and Mg^{2+}
(b) N^{3-}, Li^+, Mg^{2+} and O^{2-}
(c) Li^+, Na^+, O^{2-} and F^-
(d) N^{3-}, O^{2-}, F^- and Na^+

9 The principle of column chromatography is
(a) differential absorption of the substances on the solid phase
(b) differential adsorption of the substances on the solid phase
(c) gravitational force
(d) capillary action

10 The major product of the following reaction is



$CH_3\overset{OH}{C}HCH_2CH_2NH_2$

$\xrightarrow[\text{Triethylamine}]{\text{Ethyl formate (1 equiv.)}}$

(a) $CH_3\overset{OH}{C}HCH_2CH_2NHCHO$

(b) $CH_3CH{=}CH—CH_2NH_2$

(c) $CH_3—\overset{OH}{C}H—CH{=}CH_2$

(d) 
11 Consider the hydrated ions of Ti^{2+}, V^{2+}, Ti^{3+} and Sc^{3+}. The correct order of their spin-only magnetic moment is
(a) $Sc^{3+} < Ti^{3+} < Ti^{2+} < V^{2+}$
(b) $Sc^{3+} < Ti^{3+} < V^{2+} < Ti^{2+}$
(c) $Ti^{3+} < Ti^{2+} < Sc^{3+} < V^{2+}$
(d) $V^{2+} < Ti^{2+} < Ti^{3+} < Sc^{3+}$

12 Consider the following statements.

I. The pH of a mixture containing 400 mL of 0.1 M H_2SO_4 and 400 mL of 0.1 M NaOH will be approximately 1.3.
II. Ionic product of water is temperature dependent.
III. A monobasic acid with $K_a = 10^{-5}$ has a pH = 5. The degree of dissociation of this acid is 50%.
IV. The Le-Chatelier's principle is not applicable to common-ion effect. The correct statements are

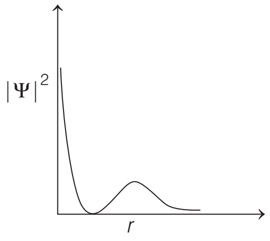
(a) I, II and IV
(b) II and III
(c) I and II
(d) I, II and III

13 The oxoacid of sulphur that does not contain bond between sulphur atoms is
(a) $H_2S_2O_3$
(b) $H_2S_2O_4$
(c) $H_2S_2O_7$
(d) $H_2S_4O_6$

14 At room temperature, a dilute solution of urea is prepared by dissolving 0.60 g of urea in 360 g of water. If the vapour pressure of pure water at this temperature is 35 mm Hg, lowering of vapour pressure will be (Molar mass of urea = 60 g mol^{-1})
(a) 0.027 mmHg
(b) 0.031 mmHg
(c) 0.017 mmHg
(d) 0.028 mmHg

15 The alloy used in the construction of aircrafts is
(a) Mg-Zn
(b) Mg-Mn
(c) Mg-Sn
(d) Mg-Al

16 The graph between $|\psi|^2$ and r (radial distance) is shown below. This represents



(a) 1*s*-orbital
(b) 2*p*-orbital
(c) 3*s*-orbital
(d) 2*s*-orbital

17 Increasing rate of S_N1 reaction in the following compounds is

(A) 
(C) 
(B) 
(D) 
(a) (A) < (B) < (C) < (D)
(b) (B) < (A) < (C) < (D)
(c) (A) < (B) < (D) < (C)
(d) (B) < (A) < (D) < (C)

18 A process will be spontaneous at all temperature if
(a) $\Delta H > 0$ and $\Delta S < 0$
(b) $\Delta H < 0$ and $\Delta S > 0$
(c) $\Delta H < 0$ and $\Delta S < 0$
(d) $\Delta H > 0$ and $\Delta S > 0$

19 During the change of O_2 to O_2^-, the incoming electron goes to the orbital.
(a) $\pi 2p_x$ (b) $\pi^* 2p_x$
(c) $\pi 2p_y$ (d) $\sigma^* 2p_z$

20 The synonym for water gas when used in the production of methanol is
(a) natural gas (b) laughing gas
(c) *syn* gas (d) fuel gas

21 Amylopectin is composed of
(a) β-D-glucose, C_1-C_4 and C_2-C_6 linkages
(b) α-D-glucose, C_1-C_4 and C_2-C_6 linkages
(c) β-D-glucose, C_1-C_4 and C_1-C_6 linkages
(d) α-D-glucose, C_1-C_4 and C_1 -C_6linkages

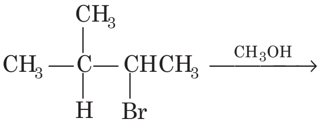
22 Consider the following table.

Gas	*a*/(k Pa dm^6 mol^{-1})	*b*/(dm^{3}mol^{-1})
A	642.32	0.05196
B	155.21	0.04136
C	431.91	0.05196
D	155.21	0.4382

a and *b* are van der Waals' constants. The correct statement about the gases is
(a) gas *C* will occupy lesser volume than gas *A*; gas *B* will be lesser compressible than gas *D*
(b) gas *C* will occupy more volume than gas *A*; gas *B* will be more compressible than gas *D*
(c) gas *C* will occupy more volume than gas *A*; gas *B* will be lesser compressible than gas *D*
(d) gas *C* will occupy more volume than gas *A*; gas *B* will be lesser compressible than gas *D*

23 Which of the following is a condensation polymer?
(a) Nylon-6, 6 (b) Neoprene
(c) Teflon (d) Buna - S

24 The major product of the following reaction is



$$CH_3-\overset{\overset{\large CH_3}{|}}{\underset{\underset{\large H}{|}}{C}}-\underset{\underset{\large Br}{|}}{C}HCH_3 \xrightarrow{CH_3OH}$$

(a) 
$$CH_3-\overset{\overset{\large CH_3}{|}}{C}=CHCH_3$$

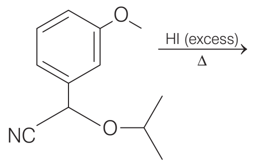
(b) 
$$CH_3-\overset{\overset{\large CH_3}{|}}{\underset{\underset{\large H}{|}}{C}}-CH=CH_2$$

(c) 
$$CH_3-\overset{\overset{\large CH_3}{|}}{\underset{\underset{\large OCH_3}{|}}{C}}-CH_2\,CH_3$$

(d) 
$$CH_3-\overset{\overset{\large CH_3}{|}}{\underset{\underset{\large H}{|}}{C}}-\underset{\underset{\large OCH_3}{|}}{C}HCH_3$$

25 A bacterial infection in an internal wound grows as $N'(t) = N_0 \exp(t)$, where the time *t* is in hours. A dose of antibiotic, taken orally, needs 1 hour to reach the wound. Once it reaches there, the bacterial population goes down as $\frac{dN}{dt} = -5N^2$. What will be the plot of $\frac{N_0}{N}$ *vs t* after 1 hour ?

(a) 
(b) 
(c) 
(d) 
26 The major product of the following reaction is

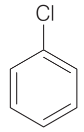


(a) 
(b) 
(c) 
(d) 
27 The species that can have a *trans*-isomer is (en = ethane -1, 2-diamine, ox = oxalate)
(a) $[Pt(en)Cl_2]$ (b) $[Cr(en)_2(ox)]^+$
(c) $[Pt(en)_2Cl_2]^{2+}$ (d) $[Zn(en)Cl_2]$

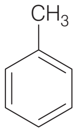
28 Ethylamine ($C_2H_5NH_2$) can be obtained from *N*-ethylphthalimide on treatment with
(a) $NaBH_4$ (b) NH_2NH_2
(c) H_2O (d) CaH_2

29 The correct order of catenation is
(a) C > Sn > Si ≈ Ge (b) Si > Sn > C > Ge
(c) C > Si > Ge ≈ Sn (d) Ge > Sn > Si > C

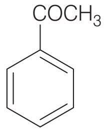
30 The increasing order of the reactivity of the following compounds towards electrophilic aromatic substitution reaction is



(I)



(II)



(III)

(a) III < I < II (b) II < I < III
(c) III < II < I (d) I < III < II

ANSWERS

1. *(a)*	2. *(b)*	3. *(c)*	4. *(b)*	5. *(b)*	6. *(b)*	7. *(b)*	8. *(d)*	9. *(b)*	10. *(a)*

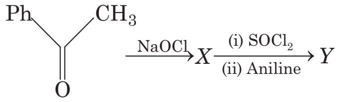
10 April, Shift-II

1 The correct statement is
(a) zone refining process is used for the refining of titanium.
(b) zincite is a carbonate ore.
(c) sodium cyanide cannot be used in the metallurgy of silver.
(d) aniline is a froth stabiliser.

2 For the reaction of H_2 with I_2, the rate constant is 2.5×10^{-4} dm^3 mol^{-1}s^{-1} at 327°C and 1.0 dm^3 mol^{-1} s^{-1} at 527°C. The activation energy for the reaction, in kJ mol^{-1} is ($R = 8.314$ JK^{-1} mol^{-1})
(a) 59 (b) 72
(c) 150 (d) 166

3 In chromatography, which of the following statements is incorrect for R_f?
(a) R_f value depends on the type of chromatography
(b) Higher R_f value means higher adsorption
(c) R_f value is dependent on the mobile phase
(d) The value of R_f can not be more than one

4 The major product Y in the following reaction is

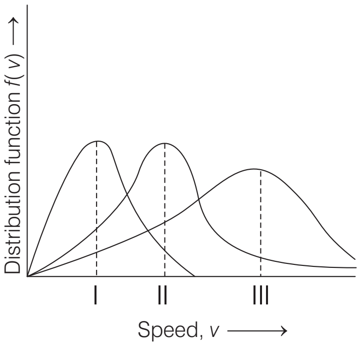


(a) 
(b) 
(c) 
(d) 
5 The correct option among the following is
(a) colloidal medicines are more effective, because they have small surface area.
(b) brownian motion in colloidal solution is faster if the viscosity of the solution is very high.
(c) addition of alum to water makes it unfit for drinking.
(d) colloidal particles in lyophobic sols can be precipitated by electrophoresis.

6 The highest possible oxidation states of uranium and plutonium, respectively, are
(a) 7 and 6 (b) 6 and 7
(c) 6 and 4 (d) 4 and 6

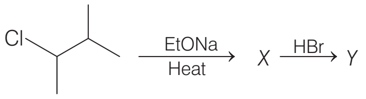
7 Which one of the following graphs between molar conductivity (Λ_m) *versus* $\sqrt{C}$ is correct?

(a) 
(b) 
(c) 
(d) 
8 Points I, II and III in the following plot respectively correspond to (V_{mp} : most probable velocity)



(a) v_{mp} of H_2(300 K); v_{mp} of N_2(300 K); v_{mp} of O_2(400 K)
(b) v_{mp} of O_2(400 K); v_{mp} of N_2(300 K); v_{mp} of H_2(300 K)
(c) v_{mp} of N_2(300 K); v_{mp} of O_2(400 K); v_{mp} of H_2(300 K)
(d) v_{mp} of N_2(300 K); v_{mp} of H_2(300 K); v_{mp} of O_2(400 K)

9 The major product Y in the following reaction is



(a) 
(b) 
(c) 
(d) 
10 The correct order of the first ionisation enthalpies is
(a) Mn < Ti < Zn < Ni
(b) Ti < Mn < Zn < Ni
(c) Zn < Ni < Mn < Ti
(d) Ti < Mn < Ni < Zn

11 A hydrated solid X on heating initially gives a monohydrated compound Y.
Y upon heating above 373 K leads to an anhydrous white powder Z. X and Z, respectively, are
(a) baking soda and soda ash
(b) washing soda and soda ash
(c) baking soda and dead burnt plaster
(d) washing soda and dead burnt plaster

12 Air pollution that occurs in sunlight is
(a) acid rain
(b) oxidising smog
(c) fog
(d) reducing smog

13 The incorrect statement is
(a) the gemstone, ruby, has Cr^{3+} ions occupying the octahedral sites of beryl
(b) the color of $[CoCl(NH_3)_5]^{2+}$ is violet as it absorbs the yellow light
(c) the spin only magnetic moments of $Fe(H_2O)_6]^{2+}$ and $[Cr(H_2O)_6]^{2+}$ are nearly similar
(d) the spin only magnetic moment of $[Ni(NH_3)_4(H_2O)_2]^{2+}$ is 2.83 BM

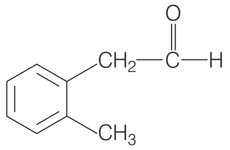
14 For the reaction,
$2SO_2(g) + O_2(g) \longrightarrow 2SO_3(g)$,
$\Delta H = -57.2$ kJ mol^{-1} and
$K_c = 1.7 \times 10^{16}$. Which of the following statement is incorrect?
(a) The equilibrium constant decreases as the temperature increases
(b) The addition of inert gas at constant volume will not affect the equilibrium constant
(c) The equilibrium will shift in forward direction as the pressure increases
(d) The equilibrium constant is large suggestive of reaction going to completion and so no catalyst is required

15 The ratio of the shortest wavelength of two spectral series of hydrogen spectrum is found to be about 9. The spectral series are
(a) Lyman and Paschen
(b) Brackett and Pfund
(c) Paschen and Pfund
(d) Balmer and Brackett

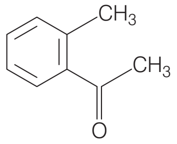
16 Number of stereo-centers present in linear and cyclic structures of glucose are respectively
(a) 4 and 5 (b) 4 and 4
(c) 5 and 4 (d) 5 and 5

17 Compound $A(C_9H_{10}O)$ shows positive iodoform test. Oxidation of A with $KMnO_4/KOH$ gives acid $B(C_8H_6O_4)$. Anhydride of B is used for the preparation of phenolphthalein. Compound A is

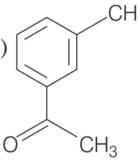
(a)



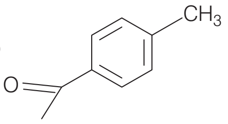
(c)



(b)



(d)



18 1 g of a non-volatile, non-electrolyte solute is dissolved in 100 g of two different solvents A and B, whose ebullisocopic constants are in the ratio of 1 : 5. The ratio of the elevation in their boiling points, $\frac{\Delta T_b(A)}{\Delta T_b(B)}$, is

(a) 5 : 1 (b) 10 : 1
(c) 1 : 5 (d) 1 : 0.2

19 The pH of a 0.02 M NH_4Cl solution will be [Given $K_b(NH_4OH) = 10^{-5}$ and $\log 2 = 0.301$]

(a) 4.65 (b) 2.65
(c) 5.35 (d) 4.35

20 The difference between ΔH and ΔU ($\Delta H - \Delta U$), when the combustion of one mole of heptane (l) is carried out at a temperature T, is equal to

(a) $-4RT$ (b) $3RT$
(c) $4RT$ (d) $-3RT$

21 Which of the following is not a correct method of the preparation of benzylamine from cyanobenzene?

(a) H_2 / Ni
(b) (i) HCl / H_2O (ii) $NaBH_4$
(c) (i) $LiAlH_4$ (ii) H_3O^+
(d) (i) $SnCl_2$ + HCl(gas) (ii) $NaBH_4$

22 The number of pentagons in C_{60} and trigons (triangles) in white phosphorus, respectively, are

(a) 20 and 3 (b) 12 and 4
(c) 20 and 4 (d) 12 and 3

23 The increasing order of nucleophilicity of the following nucleophiles is

(1) $CH_3CO_2^{\ominus}$ (2) H_2O
(3) $CH_3SO_3^{\ominus}$ (4) $\overset{\ominus}{O}H$

(a) (1) < (4) < (3) < (2)
(b) (2) < (3) < (1) < (4)
(c) (4) < (1) < (3) < (2)
(d) (2) < (3) < (4) < (1)

24 Which of these factors does not govern the stability of a conformation in acyclic compounds?

(a) Electrostatic forces of interaction
(b) Torsional strain
(c) Angle strain
(d) Steric interactions

25 The correct match between **Item**-I and **Item**-II is

Item-I	**Item-II**
A. High density polythene	I. Peroxide catalyst
B. Polyacrylonitrile	II. Condensation at high temperature and pressure
C. Novolac	III. Ziegler-Natta catalyst
D. Nylon-6	IV. Acid or base catalyst

Codes

	A	B	C	D
(a)	III	I	IV	II
(b)	IV	II	I	III
(c)	II	IV	I	III
(d)	III	I	II	IV

26 The minimum amount of $O_2(g)$ consumed per gram of reactant is for the reaction (Given atomic mass : Fe = 56, O = 16, Mg = 24, P = 31, C = 12, H = 1)

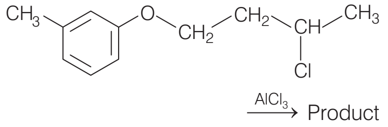
(a) $C_3H_8(g) + 5O_2(g) \longrightarrow 3CO_2(g) + 4H_2O(l)$
(b) $P_4(s) + 5O_2(g) \longrightarrow P_4O_{10}(s)$
(c) $4Fe(s) + 3O_2(g) \longrightarrow 2Fe_2O_3(s)$
(d) $2Mg(s) + O_2(g) \longrightarrow 2MgO(s)$

27 The correct statements among (a) to (d) are:

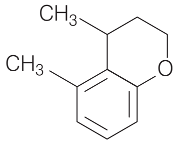
1. Saline hydrides produce H_2 gas when reacted with H_2O.
2. Reaction of $LiAlH_4$ with BF_3 leads to B_2H_6.
3. PH_3 and CH_4 are electron rich and electron precise hydrides, respectively.
4. HF and CH_4 are called as molecular hydrides.

(a) (1), (2), (3) and (4)
(b) (1), (2) and (3) only
(c) (3) and (4) only
(d) (1), (3) and (4) only

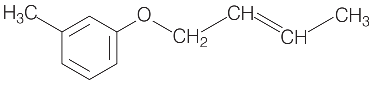
28 The major product obtained in the given reaction is



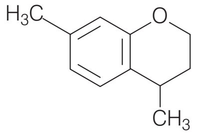
(a)



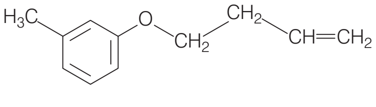
(b)



(c)



(d)



29 The noble gas that does not occur in the atmosphere is

(a) Ra (b) Kr (c) He (d) Ne

30 The crystal field stabilisation energy (CFSE) of $[Fe(H_2O)_6]Cl_2$ and $K_2[NiCl_4]$, respectively, are

(a) $-0.4\,\Delta_o$ and $-1.2\,\Delta_t$
(b) $-0.4\,\Delta_o$ and $-0.8\,\Delta_t$
(c) $-2.4\,\Delta_o$ and $-1.2\,\Delta_t$
(d) $-0.6\,\Delta_o$ and $-0.8\,\Delta_t$

ANSWERS

1. *(d)*	2. *(d)*	3. *(b)*	4. *(b)*	5. *(d)*	6. *(b)*	7. *(c)*	8. *(c)*	9. *(b)*	10. *(d)*

1 An example of a disproportionation reaction is

(a) $2MnO_4^- + 10I^- + 16H^+ \longrightarrow 2Mn^{2+} + 5I_2 + 8H_2O$
(b) $2NaBr + Cl_2 \longrightarrow 2NaCl + Br_2$
(c) $2KMnO_4 \rightarrow K_2MnO_4 + MnO_2 + O_2$
(d) $2CuBr \longrightarrow CuBr_2 + Cu$

2 The mole fraction of a solvent in aqueous solution of a solute is 0.8. The molality (in mol kg^{-1}) of the aqueous solution is

(a) 13.88×10^{-2} (b) 13.88×10^{-1}
(c) 13.88 (d) 13.88×10^{-3}

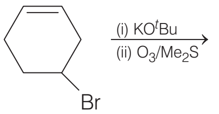
3 An ideal gas is allowed to expand from 1 L to 10 L against a constant external pressure of 1 bar. The work done in kJ is

(a) − 9.0 (b) + 10.0 (c) − 0.9 (d) − 2.0

4 Which of the following is a thermosetting polymer?

(a) Bakelite (b) Buna-N
(c) Nylon-6 (d) PVC

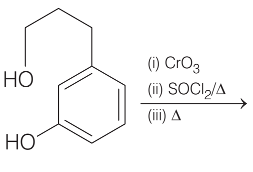
5 The major product(s) obtained in the following reaction is/are



(a) 
(b) 
(c) 
(d) 
6 The metal that gives hydrogen gas upon treatment with both acid as well as base is

(a) magnesium (b) mercury
(c) zinc (d) iron

7 The major product of the following reaction is



(a) 
(b) 
(c) 
(d) 
8 Glucose and galactose are having identical configuration in all the positions except position.

(a) C-3 (b) C-4 (c) C-2 (d) C-5

9 The major product of the following addition reaction is

$H_3C—CH = CH_2 \xrightarrow{Cl_2/H_2O}$

(a) $CH_3—\underset{Cl}{CH}—\underset{OH}{CH_2}$

(b) $CH_3—\underset{OH}{CH}—\underset{Cl}{CH_2}$

(c) 
(d) 
10 Given,

$Co^{3+} + e^- \longrightarrow Co^{2+}; E° = + 1.81 V$
$Pb^{4+} + 2e^- \longrightarrow Pb^{2+}; E° = + 1.67 V$
$Ce^{4+} + e^- \longrightarrow Ce^{3+}; E° = + 1.61 V$
$Bi^{3+} + 3e^- \longrightarrow Bi; E° = + 0.20 V$

Oxidising power of the species will increase in the order

(a) $Ce^{4+} < Pb^{4+} < Bi^{3+} < Co^{3+}$
(b) $Bi^{3+} < Ce^{4+} < Pb^{4+} < Co^{3+}$
(c) $Co^{3+} < Ce^{4+} < Bi^{3+} < Pb^{4+}$
(d) $Co^{3+} < Pb^{4+} < Ce^{4+} < Bi^{3+}$

11 Which of the following statement is not true about RNA?

(a) It controls the synthesis of protein
(b) It has always double stranded αhelix structure
(c) It usually does not replicate
(d) It is present in the nucleus of the cell

12 The group number, number of valence electrons and valency of an element with atomic number 15, respectively, are

(a) 16, 5 and 2 (b) 15, 5 and 3
(c) 16, 6 and 3 (d) 15, 6 and 2

13 The basic structural unit of feldspar, zeolites, mica and asbestos is

(a) $(SiO_3)^{2-}$ (b) SiO_2
(c) $(SiO_4)^{4-}$ (d) $\left(\underset{R}{\overset{R}{Si}} —O \right)_n$ (R = Me)

14 In the following reaction; $xA \rightarrow yB$

$$\log_{10}\left[-\frac{d[A]}{dt}\right] = \log_{10}\left[\frac{d[B]}{dt}\right] + 0.3010$$

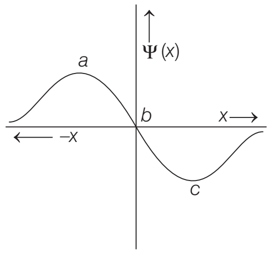
A and B respectively can be

(a) n-butane and iso-butane
(b) C_2H_2 and C_6H_6
(c) C_2H_4 and C_4H_8
(d) N_2O_4 and NO_2

15 The increasing order of the pK_b of the following compound is

(A) 
(B) 
(C) 
(D) 
(a) (A) < (C) < (D) < (B)
(b) (C) < (A) < (D) < (B)
(c) (B) < (D) < (A) < (C)
(d) (B) < (D) < (C) < (A)

16 The electrons are more likely to be found



17 The correct sequence of thermal stability of the following carbonates is

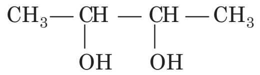
(a) $BaCO_3 < CaCO_3 < SrCO_3 < MgCO_3$
(b) $MgCO_3 < CaCO_3 < SrCO_3 < BaCO_3$
(c) $MgCO_3 < SrCO_3 < CaCO_3 < BaCO_3$
(d) $BaCO_3 < SrCO_3 < CaCO_3 < MgCO_3$

18 The complex ion that will lose its crystal field stabilisation energy upon oxidation of its metal to +3 state is

(Phen = 
Ignore pairing energy

(a) $[Co(phen)_3]^{2+}$
(b) $[Ni(phen)_3]^{2+}$
(c) $[Zn(phen)_3]^{2+}$
(d) $[Fe(phen)_3]^{2+}$

19 But-2-ene on reaction with alkaline $KMnO_4$ at elevated temperature followed by acidification will give

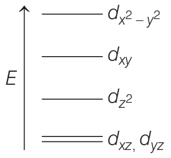
(a)


$CH_3—\underset{OH}{\underset{|}{CH}}—\underset{OH}{\underset{|}{CH}}—CH_3$

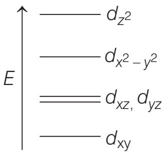
(b) one molecule of CH_3CHO and one molecule of CH_3COOH
(c) 2 molecules of CH_3COOH
(d) 2 molecules of CH_3CHO

20 Complete removal of both the axial ligands (along the z-axis) from an octahedral complex leads to which of the following splitting patterns? (relative orbital energies not on scale).

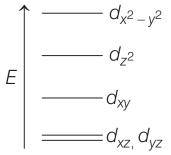
(a)



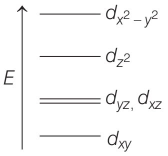
(b)



(c)



(d)



21 An organic compound A is oxidised with Na_2O_2 followed by boiling with HNO_3. The resultant solution is then treated with ammonium molybdate to yield a yellow precipitate.
Based on above observation, the element present in the given compound is

(a) nitrogen (b) phosphorus
(c) fluorine (d) sulphur

22 The correct set of species responsible for the photochemical smog is

(a) N_2, NO_2 and hydrocarbons
(b) CO_2, NO_2, SO_2 and hydrocarbons
(c) NO, NO_2, O_3 and hydrocarbons
(d) N_2, O_2, O_3 and hydrocarbons

23 Peptisation is a

(a) process of bringing colloidal molecule into solution
(b) process of converting precipitate into colloidal solution
(c) process of converting a colloidal solution into precipitate
(d) process of converting soluble particles to form colloidal solution

24 The correct statement among the following is

(a) $(SiH_3)_3N$ is planar and less basic than $(CH_3)_3N$.
(b) $(SiH_3)_3N$ is pyramidal and more basic than $(CH_3)_3N$.
(c) $(SiH_3)_3N$ is pyramidal and less basic than $(CH_3)_3N$.
(d) $(SiH_3)_3N$ is planar and more basic than $(CH_3)_3N$.

25 Enthalpy of sublimation of iodine is 24 cal g^{-1} at 200°C. If specific heat of $I_2(s)$ and I_2(vap.) are 0.055 and 0.031 cal g^{-1} K^{-1} respectively, then enthalpy of sublimation of iodine at 250°C in cal g^{-1} is

(a) 2.85 (b) 5.7
(c) 22.8 (d) 11.4

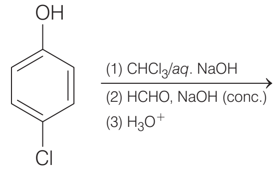
26 An element has a face-centred cubic (fcc) structure with a cell edge of a. The distance between the centres of two nearest tetrahedral voids in the lattice is

(a) $\sqrt{2}a$ (b) a (c) $\frac{a}{2}$ (d) $\frac{3}{2}a$

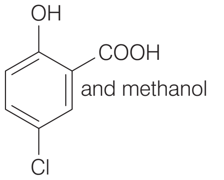
27 What is the molar solubility of $Al(OH)_3$ in 0.2 M NaOH solution? Given that, solubility product of $Al(OH)_3 = 2.4 \times 10^{-24}$

(a) 3×10^{-19} (b) 12×10^{-21}
(c) 3×10^{-22} (d) 12×10^{-23}

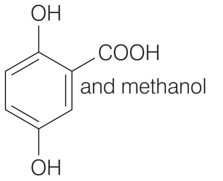
28 The major products of the following reaction are



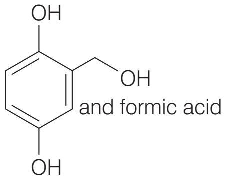
(a)



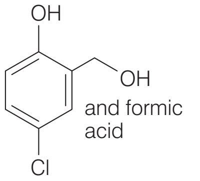
(b)



(c)



(d)



29 5 moles of AB_2 weight 125×10^{-3} kg and 10 moles of A_2B_2 weight 300×10^{-3} kg. The molar mass of $A(M_A)$ and molar mass of $B(M_B)$ in kg mol^{-1} are

(a) $M_A = 10 \times 10^{-3}$ and $M_B = 5 \times 10^{-3}$
(b) $M_A = 50 \times 10^{-3}$ and $M_B = 25 \times 10^{-3}$
(c) $M_A = 25 \times 10^{-3}$ and $M_B = 50 \times 10^{-3}$
(d) $M_A = 5 \times 10^{-3}$ and $M_B = 10 \times 10^{-3}$

30 The idea of froth floatation method came from a person X and this method is related to the process Y of ores. X and Y, respectively, are

(a) fisher woman and concentration
(b) washer woman and concentration
(c) fisher man and reduction
(d) washer man and reduction

ANSWERS

1. *(d)*	2. *(c)*	3. *(c)*	4. *(a)*	5. *(a)*	6. *(c)*	7. *(b)*	8. *(b)*	9. *(b)*	10. *(b)*

12 April, Shift-II

1 Thermal decomposition of a Mn compound (X) at 513 K results in compound (Y), MnO_2 and a gaseous product. MnO_2 reacts with NaCl and concentrated H_2SO_4 to give a pungent gas Z. X, Y and Z, respectively, are

(a) K_3MnO_4, K_2MnO_4 and Cl_2
(b) K_2MnO_4, $KMnO_4$ and SO_2
(c) $KMnO_4$, K_2MnO_4 and Cl_2
(d) K_2MnO_4, $KMnO_4$ and Cl_2

2 NO_2 required for a reaction is produced by the decomposition of N_2O_5 in CCl_4 as per the equation,

$$2N_2O_5(g) \longrightarrow 4NO_2(g) + O_2(g)$$

The initial concentration of N_2O_5 is 3.00 mol L^{-1} and it is 2.75 mol L^{-1} after 30 minutes. The rate of formation of NO_2 is

(a) 4.167×10^{-3} mol L^{-1} min^{-1}
(b) 1.667×10^{-2} mol L^{-1} min^{-1}
(c) 8.333×10^{-3} mol L^{-1} min^{-1}
(d) 2.083×10^{-3} mol L^{-1} min^{-1}

3 The pair that has similar atomic radii is

(a) Mn and Re (b) Ti and Hf
(c) Sc and Ni (d) Mo and W

4 The incorrect statement is

(a) lithium is the strongest reducing agent among the alkali metals.
(b) lithium is least reactive with water among the alkali metals.
(c) $LiNO_3$ decomposes on heating to give $LiNO_2$ and O_2.
(d) LiCl crystallise from aqueous solution as $LiCl \cdot 2H_2O$.

5 The C—C bond length is maximum in

(a) graphite (b) C_{70}
(c) C_{60} (d) diamond

6 A solution is prepared by dissolving 0.6 g of urea (molar mass = 60 g mol^{-1}) and 1.8 g of glucose (molar mass = 180 g mol^{-1}) in 100 mL of water at 27°C. The osmotic pressure of the solution is

($R = 0.08206$ L atm K^{-1} mol^{-1})

(a) 8.2 atm (b) 2.46 atm
(c) 4.92 atm (d) 1.64 atm

7 In comparison to boron, berylium has

(a) lesser nuclear charge and lesser first ionisation enthalpy
(b) greater nuclear charge and lesser first ionisation enthalpy
(c) greater nuclear charge and greater first ionisation enthalpy
(d) lesser nuclear charge and greater first ionisation enthalpy

8 The decreasing order of electrical conductivity of the following aqueous solution is

0.1 M formic acid (A),
0.1 M acetic acid (B),
0.1 M benzoic acid (C).

(a) $A > C > B$ (b) $C > B > A$
(c) $A > B > C$ (d) $C > A > B$

9 What will be the major product when m-cresol is reacted with propargyl bromide ($HC\equiv C—CH_2Br$) in presence of K_2CO_3 in acetone?

(a) 
(b) 
(c) 
(d) 
10 The molar solubility of Cd $(OH)_2$ is 1.84×10^{-5} m in water. The expected solubility of $Cd(OH)_2$ in a buffer solution of pH = 12 is

(a) 1.84×10^{-9} M (b) $\frac{2.49}{1.84} \times 10^{-9}$ M
(c) 6.23×10^{-11} M (d) 2.49×10^{-10} M

11 Benzene diazonium chloride on reaction with aniline in the presence of dilute hydrochloric acid gives

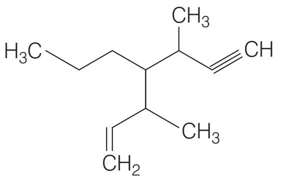
(a) 
(b) 
(c) 
(d) 
12 The correct statement is

(a) leaching of bauxite using concentrated NaOH solution gives sodium aluminate and sodium silicate.
(b) the hall-heroult process is used for the production of aluminium and iron.
(c) pig iron is obtained from cast iron.
(d) the blistered appearance of copper during the metallurgical process is due to the evolution of CO_2.

13 The primary pollutant that leads to photochemical smog is

(a) acrolein
(b) nitrogen oxides
(c) ozone
(d) sulphur dioxide

14 The IUPAC name for the following compound is

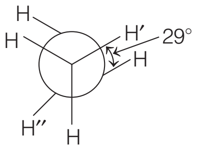


(a) 3-methyl-4-(3-methylprop-1-enyl)-1-heptyne
(b) 3, 5-dimethyl-4-propylhept-6-en-1-yne
(c) 3-methyl-4-(1-methylprop-2-ynyl)-1-heptene
(d) 3, 5-dimethyl-4-propylhept-1-en-6-yne

15 The temporary hardness of a water sample is due to compound X. Boiling this sample converts X to compound Y. X and Y, respectively, are

(a) $Mg(HCO_3)_2$ and $Mg(OH)_2$
(b) $Ca(HCO_3)_2$ and $Ca(OH)_2$
(c) $Mg(HCO_3)_2$ and $MgCO_3$
(d) $Ca(HCO_3)_2$ and CaO

16 In the following skew conformation of ethane, H′—C—C—H″ dihedral angle is



(a) 58° (b) 149°
(c) 151° (d) 120°

17 Among the following, the energy of 2s-orbital is lowest in

(a) K (b) H
(c) Li (d) Na

18 Which one of the following is likely to give a precipitate with $AgNO_3$ solution?

(a) $CH_2=CH—Cl$ (b) CCl_4
(c) $CHCl_3$ (d) $(CH_3)_3CCl$

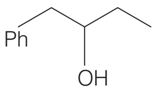
19 25 g of an unknown hydrocarbon upon burning produces 88 g of CO_2 and 9 g of H_2O.

This unknown hydrocarbon contains

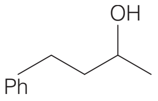
(a) 20 g of carbon and 5 g of hydrogen
(b) 22 g of carbon and 3 g of hydrogen
(c) 24 g of carbon and 1 g of hydrogen
(d) 18 g of carbon and 7 g of hydrogen

20 Heating of 2-chloro-1-phenyl butane with EtOK/EtOH gives X as the major product. Reaction of X with $Hg(OAc)_2 / H_2O$ followed by $NaBH_4$ gives Y as the major product. Y is

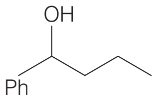
(a)



(b)



(c)



(d)

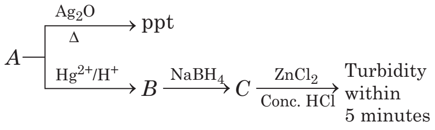
21 The compound used in the treatment of lead poisoning is

(a) D-penicillamine (b) desferrioxime-B
(c) *cis*-platin (d) EDTA

22 Which of the given statements is incorrect about glycogen?

(a) It is straight chain polymer similar to amylose
(b) Only α-linkages are present in the molecule
(c) It is present in animal cells
(d) It is present in some yeast and fungi

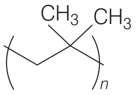
23 Consider the following reactions,



A is

(a) $CH{\equiv}CH$
(b) $CH_3—C{\equiv}C—CH_3$
(c) $CH_3—C{\equiv}CH$
(d) $CH_2{=}CH_2$

24 The correct name of the following polymer is



(a) polyisobutane
(b) polytert-butylene
(c) polyisoprene
(d) polyisobutylene

25 An **Assertion** and a **Reason** are given below. Choose the correct answer from the following options.

Assertion (A) Vinyl halides do not undergo nucleophilic substitution easily.

Reason (R) Even though the intermediate carbocation is stabilised by loosely held π-electrons, the cleavage is difficult because of strong bonding.

(a) Both (A) and (R) are wrong statements.
(b) Both (A) and (R) are correct statements and (R) is correct explanation of (A).
(c) Both (A) and (R) are correct statements but (R) is not the correct explanation of (A).
(d) (A) is a correct statement but (R) is a wrong statement.

26 The ratio of number of atoms present in a simple cubic, body centered cubic and face centered cubic structure are, respectively.

(a) 8 : 1 : 6 (b) 1 : 2 : 4
(c) 4 : 2 : 1 (d) 4 : 2 : 3

27 In which one of the following equilibria, $K_p \neq K_c$?

(a) $2C(s) + O_2(g) \rightleftharpoons 2CO(g)$
(b) $2HI(g) \rightleftharpoons H_2(g) + I_2(g)$
(c) $NO_2(g) + SO_2(g) \rightleftharpoons NO(g) + SO_3(g)$
(d) $2NO(g) \rightleftharpoons N_2(g) + O_2(g)$

28 The coordination numbers of Co and Al in $[CoCl(en)_2]Cl$ and $K_3[Al(C_2O_4)_3]$, respectively, are
(en = ethane-1, 2-diamine)

(a) 5 and 3 (b) 3 and 3
(c) 6 and 6 (d) 5 and 6

29 The incorrect match in the following is

(a) $\Delta G^\circ < 0, K > 1$ (b) $\Delta G^\circ = 0, K = 1$
(c) $\Delta G^\circ > 0, K < 1$ (d) $\Delta G^\circ < 0, K < 1$

30 Among the following, the incorrect statement about colloids is

(a) They can scatter light
(b) They are larger than small molecules and have high molar mass
(c) The osmotic pressure of a colloidal solution is of higher order than the true solution at the same concentration
(d) The range of diameters of colloidal particles is between 1 and 1000 nm

ANSWERS

1. *(c)*	2. *(b)*	3. *(d)*	4. *(c)*	5. *(d)*	6. *(c)*	7. *(d)*	8. *(a)*	9. *(a)*	10. *(d)*
11. *(c)*	12. *(a)*	13. *(b)*	14. *(d)*	15. *(a)*	16. *(b)*	17. *(a)*	18. *(d)*	19. *(c)*	20. *(c)*
21. *(d)*	22. *(a)*	23. *(c)*	24. *(d)*	25. *(c)*	26. *(b)*	27. *(a)*	28. *(d)*	29. *(d)*	30. *(c)*

JANUARY ATTEMPT

9 January, Shift-I

1 The alkaline earth metal nitrate that does not crystallise with water molecules, is

(a) $Ca(NO_3)_2$ (b) $Sr(NO_3)_2$
(c) $Ba(NO_3)_2$ (d) $Mg(NO_3)_2$

2 0.5 moles of gas A and x moles of gas B exert a pressure of 200 Pa in a container of volume $10 m^3$ at 1000 K. Given R is the gas constant in $JK^{-1}\ mol^{-1}$, x is

(a) $\frac{2R}{4-R}$ (b) $\frac{4-R}{2R}$ (c) $\frac{4+R}{2R}$ (d) $\frac{2R}{4+R}$

3 According to molecular orbital theory, which of the following is true with respect to Li_2^+ and Li_2^-?

(a) Both are unstable
(b) Li_2^+ is unstable and Li_2^- is stable
(c) Both are stable
(d) Li_2^+ is stable and Li_2^- is unstable

4 The major product of following reaction is

$$R—C \equiv N \xrightarrow[\text{(ii) } H_2O]{\text{(i) } AlH(i\text{-}Bu)_2} ?$$

(a) $RCHO$ (b) $RCONH_2$
(c) $RCOOH$ (d) RCH_2NH_2

5 The correct decreasing order for acid strength is

(a) $FCH_2COOH > NCCH_2COOH > NO_2CH_2COOH > ClCH_2COOH$
(b) $CNCH_2COOH > O_2NCH_2COOH > FCH_2COOH > ClCH_2COOH$
(c) $NO_2CH_2COOH > NCCH_2COOH > FCH_2COOH > ClCH_2COOH$
(d) $NO_2CH_2COOH > FCH_2COOH > CNCH_2COOH > ClCH_2COOH$

6 The one that is extensively used as a piezoelectric material is

(a) quartz (b) tridymite
(c) amorphous silica (d) mica

7 The ore that contains both iron and copper is

(a) malachite (b) azurite
(c) dolomite (d) copper pyrites

8 For emission line of atomic hydrogen from $n_i = 8$ to $n_f = n$, the plot of wave number (ν) against $\left(\frac{1}{n^2}\right)$ will be (The Rydberg constant, R_H is in wave number unit)

(a) non linear
(b) linear with slope $-R_H$
(c) linear with slope R_H
(d) linear with intercept $-R_H$

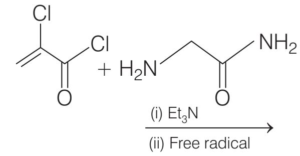
9 Aluminium is usually found in +3 oxidation state. In contrast, thallium exists in +1 and +3 oxidation states. This is due to

(a) lattice effect
(b) lanthanoid contraction
(c) inert pair effect
(d) diagonal relationship

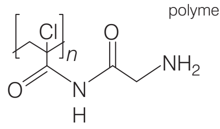
10 A water sample has ppm level concentration of the following metals: Fe = 0.2; Mn = 5.0 ; Cu = 3.0; Zn = 5.0. The metal that makes the water sample unsuitable for drinking is

(a) Cu (b) Fe (c) Mn (d) Zn

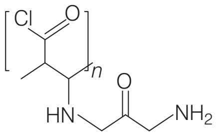
11 Major product of the following reaction is



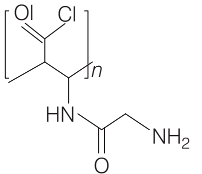
(a)



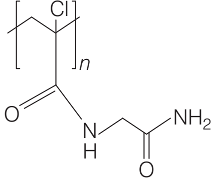
(b)



(c)



(d)



12 Arrange the following amines in the decreasing order of basicity:

(I)

(II)

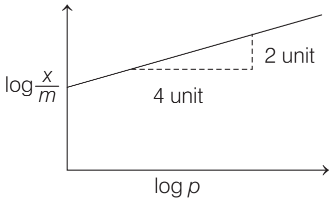
(III)

(a) I > II > III (b) III > II > I
(c) I > III > II (d) III > I > II

13 In general, the properties that decrease and increase down a group in the periodic table, respectively are

(a) electronegativity and atomic radius
(b) electronegativity and electron gain enthalpy
(c) electron gain enthalpy and electronegativity
(d) atomic radius and electronegativity

14 Adsorption of a gas follows Freundlich adsorption isotherm. In the given plot, x is the mass of the gas adsorbed on mass m of the adsorbent at pressure $p \cdot \frac{x}{m}$ is proportional to



(a) p^2 (b) $p^{1/4}$
(c) $p^{1/2}$ (d) p

15 The anodic half-cell of lead-acid battery is recharged using electricity of 0.05 Faraday. The amount of $PbSO_4$ electrolysed in g during the process is (Molar mass of $PbSO_4 = 303 g\ mol^{-1}$)

(a) 11.4 (b) 7.6 (c) 15.2 (d) 22.8

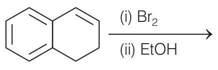
16 The isotopes of hydrogen are

(a) deuterium and tritium only
(b) protium and deuterium only
(c) protium, deuterium and tritium
(d) tritium and protium only

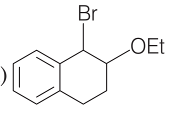
17 A solution of sodium sulphate contains 92 g of Na^+ ions per kilogram of water.
The molality of Na^+ ions in that solution in mol kg^{-1} is

(a) 16 (b) 4 (c) 132 (d) 8

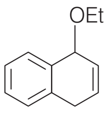
18 The major product of the following reaction is



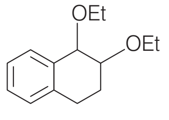
(a)



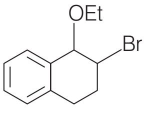
(b)



(c)



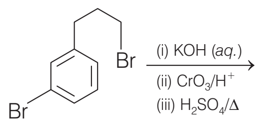
(d)



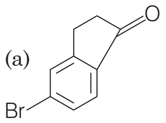
19 Two complexes $[Cr(H_2O)_6]Cl_3$ (A) and $[Cr(NH_3)_6]Cl_3$ (B) are violet and yellow coloured, respectively.
The incorrect statement regarding them is

(a) Δ_o value for (A) is less than that of (B)
(b) both absorb energies corresponding to their complementary colours
(c) Δ_o values of (A) and (B) are calculated from the energies of violet and yellow light, respectively
(d) both are paramagnetic with three unpaired electrons

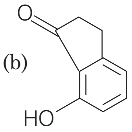
20 The major product of the following reaction is



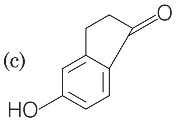
(a)



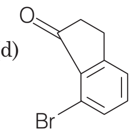
(b)



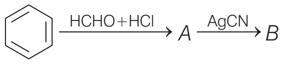
(c)



(d)



21 The compounds A and B in the following reaction are, respectively



(a) A = Benzyl alcohol, B = Benzyl isocyanide
(b) A = Benzyl alcohol, B = Benzyl cyanide
(c) A = Benzyl chloride, B = Benzyl isocyanide
(d) A = Benzyl chloride, B = Benzyl cyanide

22 20 mL of 0.1 M H_2SO_4 solution is added to 30 mL of 0.2 M NH_4OH solution. The pH of the resultant mixture is [pK_b of $NH_4OH = 4.7$]

(a) 9.3 (b) 5.0
(c) 9.0 (d) 5.2

23 Which one of the following statements regarding Henry's law is not correct?

(a) Different gases have different K_H (Henry's law constant) values at the same temperature
(b) Higher the value of K_H at a given pressure, higher is the solubility of the gas in the liquids
(c) The value of K_H increases with increase of temperature and K_H is function of the nature of the gas
(d) The partial pressure of the gas in vapour phase is proportional to the mole fraction of the gas in the solution

24 The correct match between Item - I and Item - II is

Item I (Drug)	**Item II** (Test)
A. Chloroxylenol	P. Carbylamine test
B. Norethindrone	Q. Sodium hydrogen carbonate test
C. Sulphapyridine	R. Ferric chloride test
D. Penicillin	S. Bayer's test

(a) A → R ; B → P ; C → S ; D → Q
(b) A → R ; B → S ; C → P ; D → Q
(c) A → Q ; B → P ; C → S ; D → R
(d) A → Q ; B → S ; C → P ; D → R

25 Correct statements among (I) to (IV) regarding silicones are:

I. They are polymers with hydrophobic character.
II. They are biocompatible.
III. In general, they have high thermal stability and low dielectric strength.
IV. Usually, they are resistant to oxidation and used as greases.

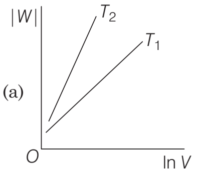
(a) I and II only
(b) I, II, III only
(c) I, II, III and IV
(d) I, II and IV only

26 The highest value of the calculated spin only magnetic moment (in BM) among all the transition metal complexes is

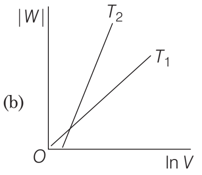
(a) 5.92 (b) 3.87
(c) 6.93 (d) 4.90

27 Consider the reversible isothermal expansion of an ideal gas in a closed system at two different temperatures T_1 and T_2 ($T_1 < T_2$). The correct graphical depiction of the dependence of work done (W) on the final volume (V) is

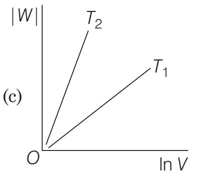
(a)



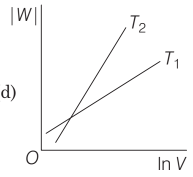
(b)



(c)



(d)



28 The following results were obtained during kinetic studies of the reaction;

$$2A + B \longrightarrow \text{Products}$$

Experiment	$[A]$ (in mol L^{-1})	$[B]$ (in mol L^{-1})	Initial rate of reaction (in mol L^{-1} min^{-1})
I.	0.10	0.20	6.93×10^{-3}
II.	0.10	0.25	6.93×10^{-3}
III.	0.20	0.30	1.386×10^{-2}

The time (in minutes) required to consume half of A is

(a) 5 (b) 10
(c) 100 (d) 1

29 Which amongst the following is the strongest acid?

(a) $CHBr_3$ (b) CHI_3
(c) $CHCl_3$ (d) $CH(CN)_3$

30 The increasing order of pK_a of the following amino acids in aqueous solution is Gly, Asp, Lys, Arg

(a) Asp < Gly < Arg < Lys
(b) Arg < Lys < Gly < Asp
(c) Gly < Asp < Arg < Lys
(d) Asp < Gly < Lys < Arg

ANSWERS

1. *(c)*	2. *(b)*	3. *(d)*	4. *(a)*	5. *(c)*	6. *(a)*	7. *(d)*	8. *(c)*	9. *(c)*	10. *(c)*
11. *(d)*	12. *(d)*	13. *(a)*	14. *(c)*	15. *(b)*	16. *(c)*	17. *(b)*	18. *(d)*	19. *(c)*	20. *(a)*
21. *(c)*	22. *(a)*	23. *(b)*	24. *(b)*	25. *(d)*	26. *(a)*	27. *(c)*	28. *(b)*	29. *(d)*	30. *(d)*

9 January, Shift-II

1 The products formed in the reaction of cumene with O_2 followed by treatment with dil. HCl are

(a)  and CH_3—OH

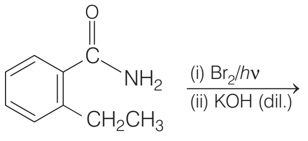
(b) 
(c) 
(d) 
2 Which of the salt-solution is most effective for coagulation of arsenious sulphide?

(a) $BaCl_2$ (b) $AlCl_3$
(c) Na_3PO_4 (d) NaCl

3 In which of the following processes, the bond order has increased and paramagnetic character has changed to diamagnetic?

(a) $O_2 \rightarrow O_2^+$ (b) $N_2 \rightarrow N_2^+$
(c) $O_2 \rightarrow O_2^{2-}$ (d) $NO \rightarrow NO^+$

4 The major product of the following reaction is

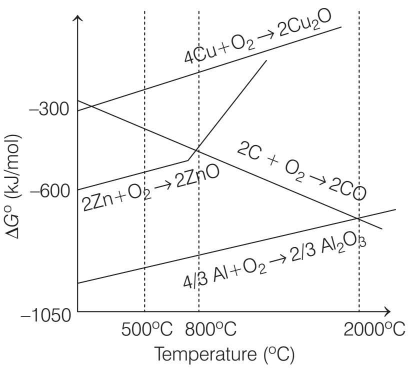


(a) 
(b) 
(c) 
(d) 
5 The correct match between item-I and Item-II is

A. Benzaldehyde	P. Dynamic phase
B. Alumina	Q. Adsorbent
C. Acetonitrile	R. Adsorbate

(a) (A) → (R) ; (B) → (Q); (C) → (P)
(b) (A) → (P); (B) → (R); (C) → (Q)
(c) (A) → (Q); (B) → (P); (C) → (R)
(d) (A) → (Q); (B) → (R); (C) → (P)

6 The correct statement regarding the given Ellingham diagram is



(a) At 800°C, Cu can be used for the extraction of Zn from ZnO
(b) At 1400°C, Al can be used for the extraction of Zn from ZnO
(c) At 500°C, coke can be used for the extraction of Zn from ZnO
(d) Coke cannot be used for the extraction of Cu from Cu_2O

7 What is reason of temporary hardness of water?

(a) Na_2SO_4 (b) $CaCl_2$
(c) NaCl (d) $Ca(HCO_3)_2$

8 Which of the following compounds is not aromatic?

(a) 
(b) 
(c) 
(d) 
9 The tests performed on compound X and their inferences are :

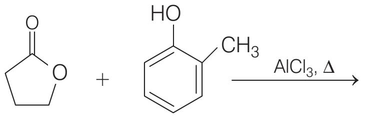
Test	Inference
(a) 2, 4- DNP test	Coloured precipitate
(b) Iodoform test	Yellow precipitate
(c) Azo-dye test	No dye formation

Compound 'X' is

(a) 
(b) 
(c) 
(d) 
10 Good reducing nature of H_3PO_2 is attributed to the presence of

(a) two P— H bonds
(b) one P— H bond
(c) two P— OH bonds
(d) one P — OH bond

11 The major product of the following reaction is



(a) 
(b) 
(c) 
(d) 
12 The complex that has highest crystal field splitting energy (Δ), is

(a) $[Co(NH_3)_5Cl]\,Cl_2$
(b) $[Co(NH_3)_5(H_2O)]Cl_3$
(c) $K_3[Co(CN)_6]$
(d) $K_2[CoCl_4]$

13 The condition for methemoglobinemia by drinking water is

(a) > 50 ppm nitrate (b) > 50 ppm chloride
(c) > 50 ppm lead (d) > 100 ppm sulphate

14 Consider the following reversible chemical reactions,

$$A_2(g) + B_2(g) \overset{K_1}{\rightleftharpoons} 2AB(g) \quad \text{...(i)}$$

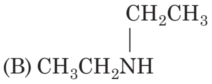
$$6AB(g) \overset{K_2}{\rightleftharpoons} 3A_2(g) + 3B_2(g) \quad \text{...(ii)}$$

The relation between K_1 and K_2 is

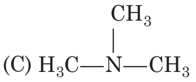
(a) $K_2 = K_1^3$ (b) $K_1K_2 = 3$
(c) $K_2 = K_1^{-3}$ (d) $K_1K_2 = \frac{1}{3}$

15 The increasing basicity order of the following compounds is

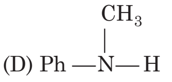
(A) $CH_3CH_2NH_2$



(B) $CH_3CH_2\overset{\overset{\large CH_2CH_3}{|}}{N}H$



(C) $H_3C—\overset{\overset{\large CH_3}{|}}{N}—CH_3$



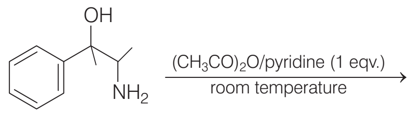
(D) $Ph—\overset{\overset{\large CH_3}{|}}{N}—H$

(a) $(D) < (C) < (B) < (A)$
(b) $(A) < (B) < (C) < (D)$
(c) $(A) < (B) < (D) < (C)$
(d) $(D) < (C) < (A) < (B)$

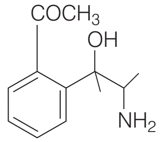
16 When the first electron gain enthalpy $(\Delta_{eg}H)$ of oxygen is – 141 kJ / mol, its second electron gain enthalpy is

(a) a positive value
(b) a more negative value than the first
(c) almost the same as that of the first
(d) negative, but less negative than the first

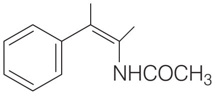
17 The major product obtained in the following reaction is



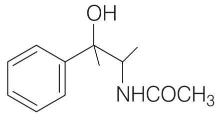
(a)



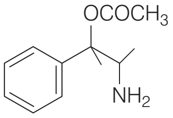
(c)



(b)



(d)



18 For the reaction, $2A + B \rightarrow$ products

When concentration of both (A and B) becomes double, then rate of reaction increases from 0.3 mol L^{-1} s^{-1} to 2.4 mol L^{-1} s^{-1}.

When concentration of only A is doubled, the rate of reaction increases from 0.3 mol L^{-1} s^{-1} to 0.6 mol L^{-1} s^{-1}.

Which of the following is true?

(a) The whole reaction is of 4th order
(b) The order of reaction w.r.t. B is one
(c) The order of reaction w.r.t. B is 2
(d) The order of reaction w.r.t. A is 2

19 The entropy change associated with the conversion of 1 kg of ice at 273 K to water vapours at 383 K is

(Specific heat of water liquid and water vapour are 4.2 $kJK^{-1}kg^{-1}$ and 2.0 kJK^{-1} kg^{-1}; heat of liquid fusion and vapourisation of water are 334 kJ kg^{-1} and 2491 $kJkg^{-1}$ respectively).($\log 273 = 2.436$, $\log 373 = 2.572$, $\log 383 = 2.583$)

(a) 9.26 kJ kg^{-1} K^{-1} (b) 8.49 kJ $kg^{-1}K^{-1}$
(c) 7.90 kJ $kg^{-1}K^{-1}$ (d) 2.64 kJ $kg^{-1}K^{-1}$

20 The transition element having least enthalpy of atomisation is

(a) Zn (b) V (c) Fe (d) Cu

21 For the following reaction, the mass of water produced from 445 g of $C_{57}H_{110}O_6$ is :

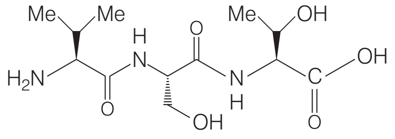
$$2C_{57}H_{110}O_6(s) + 163O_2(g) \rightarrow 114CO_2(g) + 110\,H_2O\,(l)$$

(a) 490 g (b) 495 g (c) 445 g (d) 890 g

22 The metal that forms nitride by reacting directly with N_2 of air, is

(a) Rb (b) K (c) Cs (d) Li

23 The correct sequence of amino acids present in the tripeptide given below is

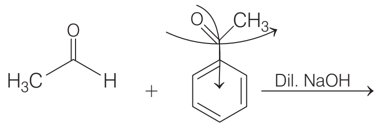


(a) Thr - Ser - Leu (b) Leu - Ser - Thr
(c) Val - Ser - Thr (d) Thr - Ser - Val

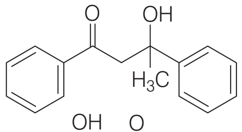
24 A solution contain 62 g of ethylene glycol in 250 g of water is cooled upto –10° C. If K_f for water is 1.86 K kg mol^{-1}, then amount of water (in g) separated as ice is

(a) 32 (b) 48 (c) 64 (d) 16

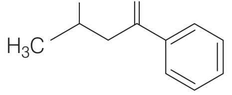
25 The major product formed in the following reaction is



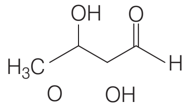
(a)



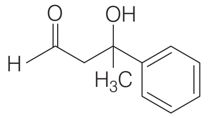
(b)



(c)



(d)



26 If the standard electrode potential for a cell is 2V at 300 K, the equilibrium constant (K) for the reaction,

$$Zn(s) + Cu^{2+}(aq) \rightleftharpoons Zn^{2+}(aq) + Cu(s)$$

at 300 K is approximately

($R = 8\ JK^{-1}mol^{-1}$, $F = 96000\ C\ mol^{-1}$)

(a) e^{-160} (b) e^{160}
(c) e^{-80} (d) e^{320}

27 Which of the following combination of statements is true regarding the interpretation of the atomic orbitals?

I. An electron in an orbital of high angular momentum stays away from the nucleus than an electron in the orbital of lower angular momentum.
II. For a given value of the principal quantum number, the size of the orbit is inversely proportional to the azimuthal quantum number.
III. According to wave mechanics, the ground state angular momentum is equal to $\frac{h}{2\pi}$.
IV. The plot of ψ *vs* r for various azimuthal quantum numbers, shows peak shifting towards higher r value.

(a) I, III (b) II, III
(c) I, II (d) I, IV

28 The pH of rain water, is approximately

(a) 7.5 (b) 6.5
(c) 5.6 (d) 7.0

29 At 100°C, copper (Cu) has FCC unit cell structure with cell edge length of x Å. What is the approximate density of Cu (in g cm^{-3}) at this temperature?

[Atomic mass of Cu = 63.55 u]

(a) $\frac{211}{x^3}$ (b) $\frac{205}{x^3}$
(c) $\frac{105}{x^3}$ (d) $\frac{422}{x^3}$

30 Homoleptic octahedral complexes of a metal ion 'M^{3+}' with three monodentate ligands L_1, L_2 and L_3 absorb wavelengths in the region of green, blue and red respectively. The increasing order of the ligand strength is

(a) $L_1 < L_2 < L_3$ (b) $L_2 < L_1 < L_3$
(c) $L_3 < L_1 < L_2$ (d) $L_3 < L_2 < L_1$

ANSWERS

1 Which of the following is not an example of heterogeneous catalytic reaction?

(a) Haber's process
(b) Combustion of coal
(c) Hydrogenation of vegetable oils
(d) Ostwald's process

2 Hall-Heroult's process is given by

(a) $ZnO + C \xrightarrow{\text{Coke, 1673 K}} Zn + CO$
(b) $Cr_2O_3 + 2Al \longrightarrow Al_2O_3 + 2Cr$
(c) $2Al_2O_3 + 3C \longrightarrow 4Al + 3CO_2$
(d) $Cu^{2+}(aq) + H_2(g) \rightarrow Cu(s) + 2H^+(aq)$

3 The chemical nature of hydrogen peroxide is

(a) oxidising and reducing agent in both acidic and basic medium
(b) oxidising and reducing agent in acidic medium, but not in basic medium
(c) reducing agent in basic medium, but not in acidic medium
(d) oxidising agent in acidic medium, but not in basic medium

4 Consider the following reduction processes:

$Zn^{2+} + 2e^- \longrightarrow Zn(s);\ E° = -0.76\,V$
$Ca^{2+} + 2e^- \longrightarrow Ca(s);\ E° = -2.87\,V$
$Mg^{2+} + 2e^- \longrightarrow Mg(s);\ E° = -2.36\,V$
$Ni^{2+} + 2e^- \longrightarrow Ni(s);\ E° = -0.25\,V$

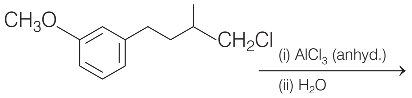
The reducing power of the metals increases in the order

(a) Zn < Mg < Ni < Ca
(b) Ni < Zn < Mg < Ca
(c) Ca < Zn < Mg < Ni
(d) Ca < Mg < Zn < Ni

5 The total number of isomers for a square planar complex $[M(F)(Cl)(SCN)(NO_2)]$ is

(a) 12 (b) 16 (c) 4 (d) 8

6 The major product of the following reaction is



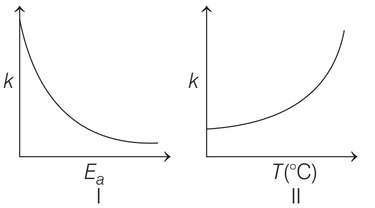
(a) 
(b) 
(c) 
(d) 
7 The correct structure of product '*P*' in the following reaction is

$Asn - Ser + \underset{\text{(Excess)}}{(CH_3CO)_2O} \xrightarrow{NEt_3} P$

(a) 
(b) 
(c) 
(d) 
8 The metal used for making X-ray tube window is

(a) Na (b) Be (c) Mg (d) Ca

9 Consider the given plots for a reaction obeying Arrhenius equation (0°C < T < 300°C) : (k and E_a are rate constant and activation energy, respectively)



Choose the correct option.

(a) Both I and II are wrong
(b) Both I and II are correct
(c) I is wrong but II is right
(d) I is right but II is wrong

10 The values of $\frac{K_p}{K_C}$ for the following reactions at 300 K are, respectively (At 300 K, $RT = 24.62\,dm^3\ atm\ mol^{-1}$)

$N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$
$N_2O_4(g) \rightleftharpoons 2NO_2(g)$
$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$

(a) $1,\ 24.62\ dm^3\ atm\ mol^{-1},\ 606.0\ dm^6\ atm^2\ mol^{-2}$
(b) $1,\ 24.62\ dm^3\ atm\ mol^{-1},\ 1.65 \times 10^{-3}\ dm^{-6}\ atm^{-2}\ mol^2$
(c) $24.62\ dm^3\ atm\ mol^{-1},\ 606.0\ dm^6\ atm^{-2}\ mol^2,\ 1.65 \times 10^{-3}\ dm^{-6}\ atm^{-2}\ mol^2$
(d) $1,\ 4.1 \times 10^{-2}\ dm^{-3} atm^{-1}\ mol,\ 606\ dm^6\ atm^2\ mol^{-2}$

11 The type of hybridisation and number of lone pair(s) of electrons of Xe in $XeOF_4$, respectively, are

(a) sp^3d^2 and 1 (b) sp^3d and 2
(c) sp^3d and 1 (d) sp^3d^2 and 2

12 Liquids *A* and *B* form an ideal solution in the entire composition range. At 350 K, the vapour pressures of pure *A* and pure *B* are 7×10^3 Pa and 12×10^3 Pa, respectively. The composition of the vapour in equilibrium with a solution containing 40 mole percent of *A* at this temperature is

(a) $x_A = 0.76;\ x_B = 0.24$
(b) $x_A = 0.28;\ x_B = 0.72$
(c) $x_A = 0.4;\ x_B = 0.6$
(d) $x_A = 0.37;\ x_B = 0.63$

13 The total number of isotopes of hydrogen and number of radioactive isotopes among them, respectively, are

(a) 2 and 1 (b) 3 and 2
(c) 2 and 0 (d) 3 and 1

14 The decreasing order of ease of alkaline hydrolysis for the following esters is

I

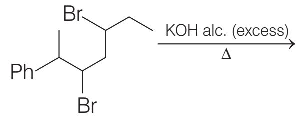
II

III

IV

(a) III > II > IV > I (b) III > II > I > IV
(c) II > III > I > IV (d) IV > II > III > I

15 The major product of the following reaction is

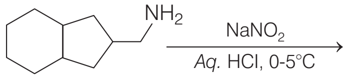


(a) 
(b) 
(c) 
(d) 
16 Which dicarboxylic acid in presence of a dehydrating agent is least reactive to give an anhydride?

(a) 
(b) 
(c) 
(d) 
17 A process has $\Delta H = 200\,\text{J mol}^{-1}$ and $\Delta S = 40\,\text{JK}^{-1}\,\text{mol}^{-1}$. Out of the values given below, choose the minimum temperature above which the process will be spontaneous

(a) 20 K (b) 4 K (c) 5 K (d) 12 K

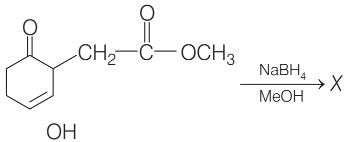
18 The major product formed in the reaction given below will be



(a) 
(b) 
(c) 
(d) 
19 If dichloromethane (DCM) and water (H_2O) are used for differential extraction, which one of the following statements is correct?

(a) DCM and H_2O would stay as lower and upper layer respectively in the S.F.
(b) DCM and H_2O would stay as upper and lower layer respectively in the separating funnel (S.F.)
(c) DCM and H_2O will be miscible clearly
(d) DCM and H_2O will make turbid/colloidal mixture

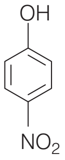
20 The major product '*X*' formed in the following reaction is



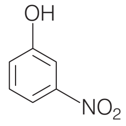
(a) 
(b) 
(c) 
(d) 
21 Which of the graphs shown below does not represent the relationship between incident light and the electron ejected from metal surface?

(a) 
(b) 
(c) 
(d) 
22 The increasing order of the pK_a values of the following compounds is

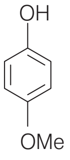
A



B



C



D

(a) $D < A < C < B$ (b) $B < C < A < D$
(c) $C < B < A < D$ (d) $B < C < D < A$

23 A mixture of 100 mmol of $Ca(OH)_2$ and 2 g of sodium sulphate was dissolved in water and the volume was made upto 100 mL.

The mass of calcium sulphate formed and the concentration of OH^- in resulting solution, respectively, are : (Molar mass of $Ca(OH)_2$, Na_2SO_4 and $CaSO_4$ are74, 143 and 136 g mol^{-1}, respectively; K_{sp} of $Ca(OH)_2$ is 5.5×10^{-6})

(a) 13.6 g, 0.28 mol L^{-1}
(b) 1.9 g, 0.28 mol L^{-1}
(c) 13.6 g, 0.14 mol L^{-1}
(d) 1.9 g, 0.14 mol L^{-1}

24 Wilkinson catalyst is

(a) $[(Et_3P)_3RhCl]$
(b) $[(Et_3P)_3IrCl](Et = C_2H_5)$
(c) $[(Ph_3P)_3RhCl]$
(d) $[(Ph_3P)_3IrCl]$

25 Two pi and half sigma bonds are present in

(a) O_2^+ (b) N_2
(c) N_2^+ (d) O_2

26 The effect of lanthanoid contraction in the lanthanoid series of elements by and large means

(a) increase in atomic radii and decrease in ionic radii
(b) decrease in both atomic and ionic radii
(c) increase in both atomic and ionic radii
(d) decrease in atomic radii and increase in ionic radii

27 The electronegativity of aluminium is similar to

(a) lithium (b) carbon
(c) beryllium (d) boron

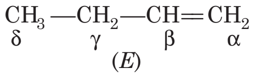
28 Which primitive unit cell has unequal edge lengths ($a \neq b \neq c$) and all axial angles different from 90°?

(a) Hexagonal (b) Monoclinic
(c) Tetragonal (d) Triclinic

29 Water filled in two glasses *A* and *B* have BOD values of 10 and 20, respectively. The correct statement regarding them, is

(a) *A* is more polluted than *B*
(b) *A* is suitable for drinking, wherease *B* is not
(c) Both *A* and *B* are suitable for drinking
(d) *B* is more polluted than *A*

30 Which hydrogen in compound (*E*) is easily replaceable during bromination reaction in presence of light?



$$\underset{\delta}{CH_3}-\underset{\gamma}{CH_2}-\underset{\beta}{CH}=\underset{\alpha}{CH_2}$$

(*E*)

(a) β-hydrogen
(b) δ-hydrogen
(c) γ-hydrogen
(d) α-hydrogen

ANSWERS

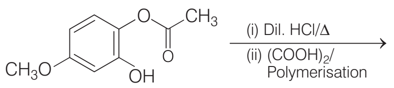
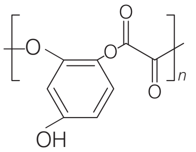
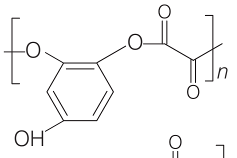
1 The major product of the following reaction is



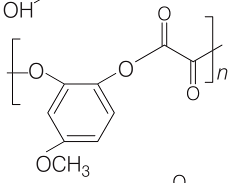
(a)



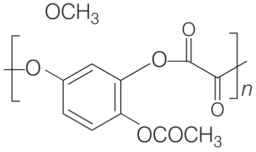
(b)



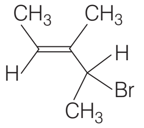
(c)



(d)



2 What is the IUPAC name of the following compound ?



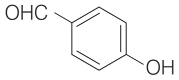
(a) 3-bromo-3-methyl-1,2-dimethylprop-1-ene
(b) 3-bromo-1,2-dimethylbut-1-ene
(c) 2-bromo-3-methylpent-3-ene
(d) 4-bromo-3-methylpent-2-ene

3 A compound of formula A_2B_3 has the hcp lattice. Which atom forms the hcp lattice and what fraction of tetrahedral voids is occupied by the other atoms ?

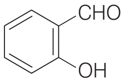
(a) hcp lattice- A, $\frac{2}{3}$ tetrahedral voids-B
(b) hcp lattice-A, $\frac{1}{3}$ tetrahedral voids-B
(c) hcp lattice-B, $\frac{1}{3}$ tetrahedral voids-A
(d) hcp lattice-B, $\frac{2}{3}$ tetrahedral voids-A

4 An aromatic compound 'A' having molecular formula $C_7H_6O_2$ on treating with aqueous ammonia and heating forms compound 'B'. The compound 'B' on reaction with molecular bromine and potassium hydroxide provides compound 'C' having molecular formula C_6H_7N. The structure of 'A' is

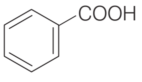
(a)



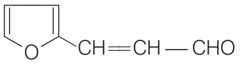
(b)



(c)



(d)



5 In the cell, $Pt(s)|H_2(g, 1\text{ bar})|HCl(aq)|AgCl(s)|Ag(s)|Pt(s)$ the cell potential is 0.92 V when a 10^{-6} molal HCl solution is used. The standard electrode potential of $(AgCl/Ag, Cl^-)$ electrode is

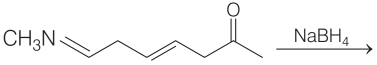
$$\left\{\text{Given, } \frac{2.303RT}{F} = 0.06\text{ V at } 298\text{ K}\right\}$$

(a) 0.40 V (b) 0.20 V
(c) 0.94 V (d) 0.76 V

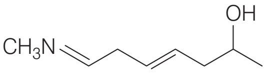
6 For an elementary chemical reaction, $A_2 \underset{k_{-1}}{\overset{k_1}{\rightleftharpoons}} 2A$, the expression for $\frac{d[A]}{dt}$ is

(a) $2k_1[A_2] - k_{-1}[A]^2$
(b) $k_1[A_2] - k_{-1}[A]^2$
(c) $2k_1[A_2] - 2k_{-1}[A]^2$
(d) $k_1[A_2] + k_{-1}[A]^2$

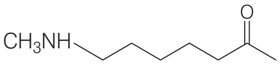
7 The major product of the following reaction is



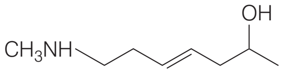
(a)



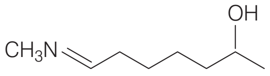
(b)



(c)



(d)



8 The reaction that is not involved in the ozone layer depletion mechanism in the stratosphere is

(a) $CH_4 + 2O_3 \longrightarrow 3CH_2=O + 3H_2O$
(b) $Cl\dot{O}(g) + O(g) \longrightarrow \dot{C}l(g) + O_2(g)$
(c) $HOCl(g) \xrightarrow{h\nu} \dot{O}H(g) + \dot{C}l(g)$
(d) $CF_2Cl_2(g) \xrightarrow{h\nu} \dot{C}l(g) + \dot{C}F_2Cl(g)$

9 The 71st electron of an element X with an atomic number of 71 enters into the orbital

(a) $4f$ (b) $6p$ (c) $5d$ (d) $6s$

10 The amount of sugar $(C_{12}H_{22}O_{11})$ required to prepare 2 L of its 0.1 M aqueous solution is

(a) 17.1 g (b) 68.4 g
(c) 136.8 g (d) 34.2 g

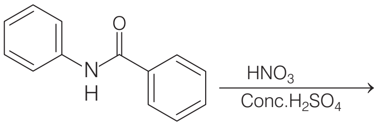
11 The pair that contains two P—H bonds in each of the oxoacids is

(a) $H_4P_2O_5$ and $H_4P_2O_6$
(b) H_3PO_3 and H_3PO_2
(c) $H_4P_2O_5$ and H_3PO_3
(d) H_3PO_2 and $H_4P_2O_5$

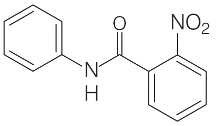
12 An ideal gas undergoes isothermal compression from 5 m^3 to 1 m^3 against a constant external pressure of 4 Nm^{-2}. Heat released in this process is used to increase the temperature of 1 mole of Al. If molar heat capacity of Al is 24 J $mol^{-1}K^{-1}$, the temperature of Al increases by

(a) $\frac{3}{2}$ K (b) 1 K (c) 2 K (d) $\frac{2}{3}$ K

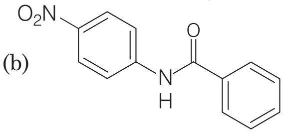
13 What will be the major product in the following mononitration reaction ?



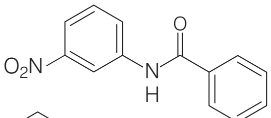
(a)



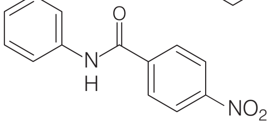
(b)



(c)



(d)



14 Haemoglobin and gold sol are examples of

(a) negatively and positively charged sols, respectively
(b) negatively charged sols
(c) positively charged sols
(d) positively and negatively charged sols, respectively

15 The process with negative entropy change is

(a) synthesis of ammonia from N_2 and H_2
(b) dissociation of $CaSO_4$(s) to CaO(s) and $SO_3(g)$
(c) dissolution of iodine in water
(d) sublimation of dry ice

16 5.1 g NH_4SH is introduced in 3.0 L evacuated flask at 327° C. 30% of the solid NH_4SH decomposed to NH_3 and H_2S as gases. The K_p of the reaction at 327° C is (R = 0.082 atm $mol^{-1}K^{-1}$, molar mass of S = 32 g mol^{-1}, molar mass of N = 14 g mol^{-1})

(a) 0.242×10^{-4} atm^2
(b) 0.242 atm^2
(c) 4.9×10^{-3} atm^2
(d) 1×10^{-4} atm^2

17 In the reaction of oxalate with permanganate in acidic medium, the number of electrons involved in producing one molecule of CO_2 is

(a) 2 (b) 5
(c) 1 (d) 10

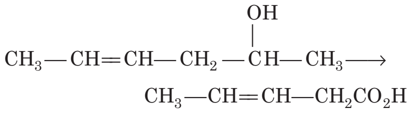
18 Among the following reactions of hydrogen with halogens, the one that requires a catalyst is

(a) $H_2 + Cl_2 \longrightarrow 2HCl$
(b) $H_2 + I_2 \longrightarrow 2HI$
(c) $H_2 + F_2 \longrightarrow 2HF$
(d) $H_2 + Br_2 \longrightarrow 2HBr$

19 Sodium metal on dissolution in liquid ammonia gives a deep blue solution due to the formation of

(a) sodium ammonia complex
(b) sodium ion-ammonia complex
(c) sodamide
(d) ammoniated electrons

20 Which is the most suitable reagent for the following transformation ?



$$CH_3-CH=CH-CH_2-\overset{OH}{\overset{|}{C}}H-CH_3 \longrightarrow CH_3-CH=CH-CH_2CO_2H$$

(a) Tollen's reagent
(b) I_2 / NaOH
(c) Alkaline $KMnO_4$
(d) CrO_2Cl_2 / CS_2

21 The correct match between item 'I' and item 'II' is

	Item 'I' (Compound)		Item 'II' (Reagent)
(A)	Lysine	(P)	1-naphthol
(B)	Furfural	(Q)	Ninhydrin
(C)	Benzyl alcohol	(R)	$KMnO_4$
(D)	Styrene	(S)	Ceric ammonium nitrate

Codes

	A	B	C	D
(a)	Q	R	S	P
(b)	R	P	Q	S
(c)	Q	P	S	R
(d)	Q	P	R	S

22 The difference in the number of unpaired electrons of a metal ion in its high-spin and low-spin octahedral complexes is two. The metal ion is

(a) Mn^{2+} (b) Fe^{2+}
(c) Ni^{2+} (d) Co^{2+}

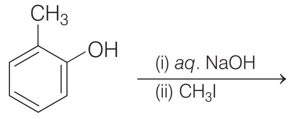
23 The ground state energy of hydrogen atom is -13.6 eV. The energy of second excited state of He^+ ion in eV is

(a) -54.4 (b) -3.4
(c) -6.04 (d) -27.2

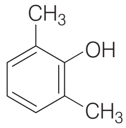
24 A reaction of cobalt (III) chloride and ethylene diamine in a 1 : 2 mole ratio generates two isomeric products *A* (violet coloured) and *B* (green coloured). *A* can show optical activity, but *B* is optically inactive. What type of isomers does *A* and *B* represent ?

(a) Ionisation isomers
(b) Coordination isomers
(c) Geometrical isomers
(d) Linkage isomers

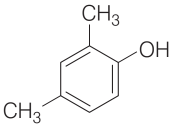
25 The major product of the following reaction is



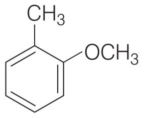
(a)



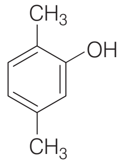
(b)



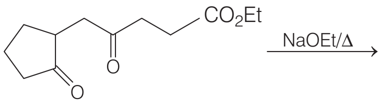
(c)



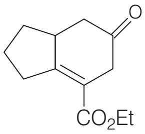
(d)



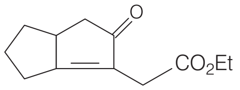
26 The major product obtained in the following reaction is



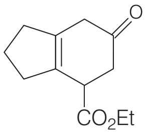
(a)



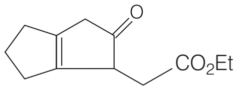
(b)



(c)



(d)



27 The electrolytes usually used in the electroplating of gold and silver, respectively, are

(a) $[Au(OH)_4]^-$ and $[Ag(OH)_2]^-$
(b) $[Au(NH_3)_2]^+$ and $[Ag(CN)_2]^-$
(c) $[Au(CN)_2]^-$ and $[Ag(CN)_2]^-$
(d) $[Au(CN)_2]^-$ and $[AgCl_2]^-$

28 Which of the following tests cannot be used for identifying amino acids ?

(a) Barfoed test (b) Ninhydrin test
(c) Xanthoproteic test (d) Biuret test

29 The number of 2-centre-2-electron and 3-centre-2-electron bonds in B_2H_6, respectively, are

(a) 4 and 2 (b) 2 and 4
(c) 2 and 2 (d) 2 and 1

30 Elevation in the boiling point for 1 molal solution of glucose is 2 K . The depression in the freezing point for 2 molal solution of glucose in the same solvent is 2 K. The relation between K_b and K_f is

(a) $K_b = 1.5\ K_f$ (b) $K_b = 0.5\ K_f$
(c) $K_b = K_f$ (d) $K_b = 2K_f$

ANSWERS

1. (c)	2. (d)	3. (c)	4. (c)	5. (b)	6. (c)	7. (c)	8. (a)	9. (c)	10. (b)

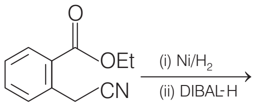
1 An example of solid sol is

(a) gem stones (b) hair cream
(c) butter (d) paint

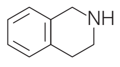
2 NaH is an example of

(a) metallic hydride
(b) electron-rich hydride
(c) saline hydride
(d) molecular hydride

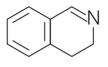
3 The major product of the following reaction is



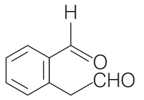
(a)



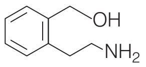
(b)



(c)



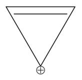
(d)



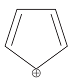
4 The concentration of dissolved oxygen (DO) in cold water can go upto

(a) 14 ppm (b) 10 ppm
(c) 8 ppm (d) 16 ppm

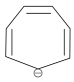
5 Which compound(s) out of the following is/are not aromatic?



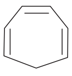
(*A*)



(*B*)



(*C*)



(*D*)

(a) (*B*), (*C*) and (*D*) (b) (*C*) and (*D*)
(c) (*B*) (d) (*A*) and (*C*)

6 An organic compound is estimated through Dumas method and was found to evolved 6 moles of CO_2, 4 moles of H_2O and 1 mole of nitrogen gas. The formula of the compound is

(a) C_6H_8N (b) $C_{12}H_8N$
(c) $C_{12}H_8N_2$ (d) $C_6H_8N_2$

7 Match the metals (Column I) with the coordination compound(s)/enzyme(s) (Column II).

Column I	Column II
(A) Co	(i) Wilkinson catalyst
(B) Zn	(ii) Chlorophyll
(C) Rh	(iii) Vitamin B_{12}
(D) Mg	(iv) Carbonic anhydrase

	A	B	C	D
(a)	(i)	(ii)	(iii)	(iv)
(b)	(iv)	(iii)	(i)	(ii)
(c)	(iii)	(iv)	(i)	(ii)
(d)	(ii)	(i)	(iv)	(iii)

8 A 10 mg effervescent tablet containing sodium bicarbonate and oxalic acid releases 0.25 mL of CO_2 at $T = 298.15$ K and $p = 1$ bar. If molar volume of CO_2 is 25.0 L under such condition, what is the percentage of sodium bicarbonate in each tablet? [Molar mass of $NaHCO_3$ = 84 g mol^{-1}]

(a) 8.4 (b) 0.84
(c) 16.8 (d) 33.6

9 The correct statements among (a) to (d) regarding H_2 as a fuel are :

I. It produces less pollutants than petrol.
II. A cylinder of compressed dihydrogen weights ~ 30 times more than a petrol tank producing the same amount of energy.
III. Dihydrogen is stored in tanks of metal alloys like $NaNi_5$.
IV. On combustion, values of energy released per gram of liquid dihydrogen and LPG are 50 and 142 kJ, respectively.

(a) I, II and III only (b) II, III and IV only
(c) II and IV only (d) I and III only

10 Consider the reaction,

$$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$$

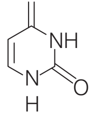
The equilibrium constant of the above reaction is K_p. If pure ammonia is left to dissociate, the partial pressure of ammonia at equilibrium is given by (Assume that $p_{NH_3} << p_{total}$ at equilibrium)

(a) $\dfrac{3^{3/2}K_p^{1/2}P^2}{4}$ (b) $\dfrac{3^{3/2}K_p^{1/2}P^2}{16}$

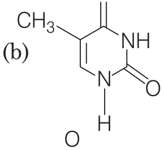
(c) $\dfrac{K_p{}^{1/2}P^2}{16}$ (d) $\dfrac{K_p{}^{1/2}P^2}{4}$

11 Among the following compounds, which one is found in RNA?

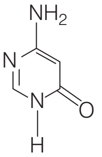
(a)



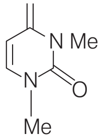
(b)



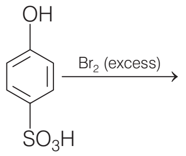
(c)



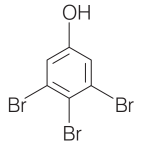
(d)



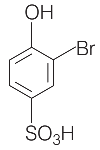
12 The major product of the following reaction is



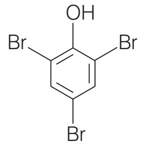
(a)



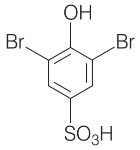
(b)



(c)



(d)



13 Heat treatment of muscular pain involves radiation of wavelength of about 900 nm. Which spectral line of H-atom is suitable for this purpose? [$R_H = 1\times10^5$ cm^{-1}, $h = 6.6\times10^{-34}$ Js, $c = 3\times10^8$ ms^{-1}]

(a) Paschen, 5 → 3 (b) Paschen, ∞ → 3
(c) Lyman, ∞ → 1 (d) Balmer, ∞ → 2

14 The freezing point of a diluted milk sample is found to be –0.2° C, while it should have been –0.5°C for pure milk. How much water has been added to pure milk to make the diluted sample?

(a) 2 cups of water to 3 cups of pure milk
(b) 1 cup of water to 3 cups of pure milk
(c) 3 cups of water to 2 cups of pure milk
(d) 1 cup of water to 2 cups of pure milk

15 The correct order of the atomic radii of C, Cs, Al and S is

(a) C < S < Al < Cs (b) C < S < Cs < Al
(c) S < C < Cs < Al (d) S < C < Al < Cs

16 The amphoteric hydroxide is

(a) $Be(OH)_2$ (b) $Ca(OH)_2$
(c) $Sr(OH)_2$ (d) $Mg(OH)_2$

17 The correct match between items I and II is

Item - I (Mixture)	Item II (Separation method)
A. H_2O : Sugar	P. Sublimation
B. H_2O : Aniline	Q. Recrystallisation
C. H_2O : Toluene	R. Steam distillation
	S. Differential extraction

(a) (A) → (Q); (B) → (R); (C) → (S)
(b) (A) → (Q); (B) → (R); (C) → (P)
(c) (A) → (S); (B) → (R); (C) → (P)
(d) (A) → (R); (B) → (P); (C) → (S)

18 Match the ores (Column A) with the metals (Column B).

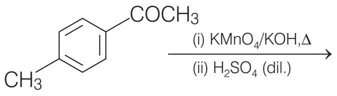
Column A	Column B
Ores	**Metals**
A. Siderite	P. Zinc
B. Kaolinite	Q. Copper
C. Malachite	R. Iron
D. Calamine	S. Aluminium

(a) A - P; B- Q; C - R; D- S
(b) A - R; B- S; C - P; D- Q
(c) A - Q; B- R; C - S; D- P
(d) A - R; B- S; C - Q; D- P

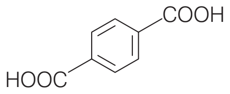
19 The element that usually does not show variable oxidation states is

(a) Sc (b) Cu
(c) Ti (d) V

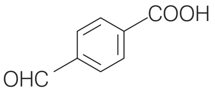
20 The major product of the following reaction is



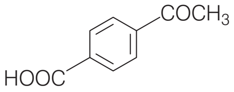
(a)



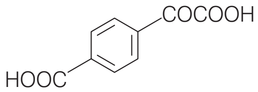
(c)



(b)



(d)



21 The correct match between item (I) and item (II) is

	Item - I		Item - II
(A)	Norethindrone	(P)	Antibiotic
(B)	Ofloxacin	(Q)	Antifertility
(C)	Equanil	(R)	Hypertension
		(S)	Analgesics

(a) (A) → (Q); (B) → (R); (C) → (S)
(b) (A) → (Q); (B) → (P); (C) → (R)
(c) (A) → (R); (B) → (P); (C) → (S)
(d) (A) → (R); (B) → (P); (C) → (R)

22 Peroxyacetyl nitrate (PAN), an eye irritant is produced by

(a) organic waste
(b) acid rain
(c) classical smog
(d) photochemical smog

23 A solid having density of $9\times10^3\ \text{kg m}^{-3}$ forms face centred cubic crystals of edge length $200\sqrt{2}$ pm. What is the molar mass of the solid? [Avogadro constant $= 6\times10^{23}\ \text{mol}^{-1}$, $\pi = 3$]

(a) $0.03050\ \text{kg mol}^{-1}$
(b) $0.4320\ \text{kg mol}^{-1}$
(c) $0.0432\ \text{kg mol}^{-1}$
(d) $0.0216\ \text{kg mol}^{-1}$

24 The chloride that cannot get hydrolysed is

(a) $SnCl_4$ (b) CCl_4
(c) $PbCl_4$ (d) $SiCl_4$

25 For the chemical reaction, $X \rightleftharpoons Y$, the standard reaction Gibbs energy depends on temperature T (in K) as

$$\Delta_r G^\circ\ (\text{in kJ mol}^{-1}) = 120 - \frac{3}{8}T$$

The major component of the reaction mixture at T is

(a) Y if $T = 280$ K (b) X if $T = 350$ K
(c) X if $T = 315$ K (d) Y if $T = 300$ K

26 Two blocks of the same metal having same mass and at temperature T_1 and T_2 respectively, are brought in contact with each other and allowed to attain thermal equilibrium at constant pressure. The change in entropy, ΔS, for this process is

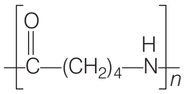
(a) $^2C_p \ln\left[\dfrac{(T_1+T_2)^{\frac{1}{2}}}{T_1T_2}\right]$

(b) $^2C_p \ln\left[\dfrac{T_1+T_2}{4T_1T_2}\right]$

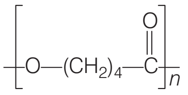
(c) $C_p \ln\left[\dfrac{(T_1+T_2)^2}{4T_1T_2}\right]$

(d) $^2C_p \ln\left[\dfrac{T_1+T_2}{2T_1T_2}\right]$

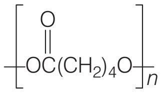
27 The polymer obtained from the following reaction is:

(a)


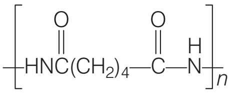
$\left[\overset{O}{\overset{\|}{C}}-(CH_2)_4-\overset{H}{N} \right]_n$

(b)


$\left[O-(CH_2)_4-\overset{O}{\overset{\|}{C}} \right]_n$

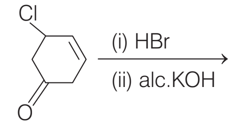
(c)


$\left[O\overset{O}{\overset{\|}{C}}(CH_2)_4O \right]_n$

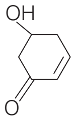
(d)


$\left[HN\overset{O}{\overset{\|}{C}}(CH_2)_4-\overset{O}{\overset{\|}{C}}-\overset{H}{N} \right]_n$

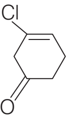
28 The major product of the following reaction is



(a)

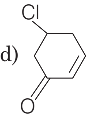


(b)



(c)

(d)



29 If a reaction follows the Arrhenius equation, the plot $\ln k$ *vs* $1/(RT)$ gives straight line with a gradient $(-y)$ unit. The energy required to activate the reactant is

(a) $\dfrac{y}{R}$ unit (b) $-y$ unit
(c) yR unit (d) y unit

30 For the cell, $Zn(s)\,|\,Zn^{2+}(aq)\,||\,M^{x+}(aq)\,|\,M(s)$, different half cells and their standard electrode potentials are given below.

$M^{x+}(aq)/$ $M(s)$	$Au^{3+}(aq)$ / $Au(s)$	$Ag^{+}(aq)/$ $Ag(s)$	$Fe^{3+}(aq)/$ $Fe^{2+}(aq)$	$Fe^{2+}(aq)$ /$Fe(s)$
$E^\circ_{M^{x+}/M}/V$	1.40	0.80	0.77	– 0.44

If $E^\circ_{Zn^{2+}/Zn} = -0.76$ V, which cathode will give a maximum value of E°_{cell} per electron transferred?

(a) $\dfrac{Ag^+}{Ag}$ (b) $\dfrac{Fe^{2+}}{Fe}$
(c) $\dfrac{Au^{3+}}{Au}$ (d) $\dfrac{Fe^{3+}}{Fe^{2+}}$

ANSWERS

1 (a)	2 (c)	3 (b)	4 (b)	5 (a)	6 (d)	7 (c)	8 (a)	9 (a)	10 (b)
11 (a)	12 (c)	13 (b)	14 (c)	15 (a)	16 (a)	17 (a)	18 (d)	19 (a)	20 (a)
21 (b)	22 (d)	23 (a)	24 (b)	25 (c)	26 (c)	27 (b)	28 (c)	29 (d)	30 (a)

1 The relative stability of + 1oxidation state of group 13 elements follows the order

(a) Al < Ga < Tl < In
(b) Al < Ga < In < Tl
(c) Tl < In < Ga < Al
(d) Ga < Al < In < Tl

2 The hydride that is not electron deficient is

(a) AlH_3 (b) B_2H_6
(c) SiH_4 (d) GaH_3

3 The higher concentration of which gas in air can cause stiffness of flower buds?

(a) SO_2 (b) CO
(c) CO_2 (d) NO_2

4 The correct match between Item I and Item II is

Item I		Item II	
A.	Ester test	P.	Tyr
B.	Carbylamine test	Q.	Asp
C.	Phthalein dye test	R.	Ser
		S.	Lys

(a) A → Q; B → S; C → R
(b) A → R, B → Q; C → P
(c) A → R; B → S; C → Q
(d) A → Q; B → S; C → P

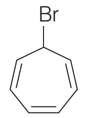
5 The correct match between Item I and Item II is

Item I		Item II	
A.	Allosteric effect	P.	Molecule binding to the active site of enzyme.
B.	Competitive inhibitor	Q.	Molecule crucial for communication in the body.
C.	Receptor	R.	Molecule binding to a site other than the active site of enzyme.
D.	Poison	S.	Molecule binding to the enzyme covalently.

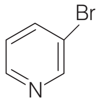
(a) A → P; B → R; C → S; D → Q
(b) A → P, B → R; C → Q; D → S
(c) A → R; B → P; C → S; D → Q
(d) A → R; B → P; C → Q; D → S

6 Which of the following compounds will produce a precipitate with $AgNO_3$?

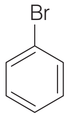
(a)



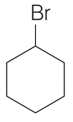
(b)



(c)



(d)



7 The coordination number of Th in $K_4[Th(C_2O_4)_4(OH_2)_2]$ is ($C_2O_4^{2-}$ = Oxalato)

(a) 14 (b) 10
(c) 8 (d) 6

8 The reaction, $2X \rightarrow B$ is a zeroth order reaction. If the initial concentration of X is 0.2 M, the half-life is 6 h. When the initial concentration of X is 0.5 M, the time required to reach its final concentration of 0.2 M will be

(a) 7.2 h (b) 18.0 h (c) 12.0 h (d) 9.0 h

9

$$\underline{A} \xrightarrow{4\,KOH,\,O_2} \underset{\text{(Green)}}{2\underline{B}} + 2H_2O$$

$$3\underline{B} \xrightarrow{4\,HCl} \underset{\text{(Purple)}}{2\underline{C}} + MnO_2 + 2H_2O$$

$$2\underline{C} \xrightarrow{H_2O,\,KI} 2\underline{A} + 2KOH + \underline{D}$$

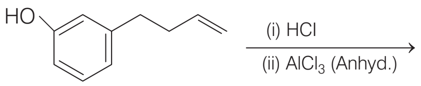
In the above sequence of reactions, $\underline{A}$ and $\underline{D}$, respectively, are

(a) KI and $KMnO_4$
(b) MnO_2 and KIO_3
(c) KI and K_2MnO_4
(d) KIO_3 and MnO_2

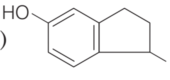
10 25 mL of the given HCl solution requires 30 mL of 0.1 M sodium carbonate solution. What is the volume of this HCl solution required to titrate 30 mL of 0.2 M aqueous NaOH solution?

(a) 75 mL (b) 25 mL
(c) 12.5 mL (d) 50 mL

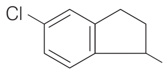
11 The major product of the following reaction is



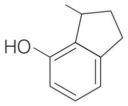
(a)



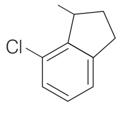
(b)



(c)

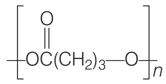


(d)



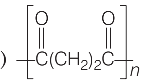
12 The homopolymer formed from 4-hydroxybutanoic acid is

(a)



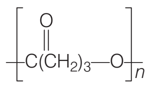
$\left[-O\overset{\overset{O}{\|}}{C}(CH_2)_3-O-\right]_n$

(b)



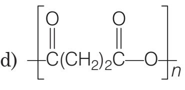
$\left[-\overset{\overset{O}{\|}}{C}(CH_2)_2\overset{\overset{O}{\|}}{C}-\right]_n$

(c)



$\left[-\overset{\overset{O}{\|}}{C}(CH_2)_3-O-\right]_n$

(d)

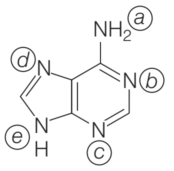


$\left[-\overset{\overset{O}{\|}}{C}(CH_2)_2\overset{\overset{O}{\|}}{C}-O-\right]_n$

13 Among the colloids cheese (*C*), milk (*M*) and smoke (*S*), the correct combination of the dispersed phase and dispersion medium, respectively is

(a) *C* : liquid in solid; *M* : liquid in liquid; *S* : solid in gas
(b) *C* : solid in liquid; *M* : liquid in liquid; *S* : gas in solid
(c) *C* : liquid in solid; *M* : liquid in solid; *S* : solid in gas
(d) *C* : solid in liquid; *M* : solid in liquid; *S* : solid in gas

14 In the following compound,



the favourable site/s for protonation is/are

(a) (*a*) and (*e*) (b) (*b*), (*c*) and (*d*)
(c) (*a*) and (*d*) (d) (*a*)

15 Given the equilibrium constant (K_C) of the reaction :

$$Cu(s) + 2Ag^+(aq) \rightarrow Cu^{2+}(aq) + 2Ag(s)$$

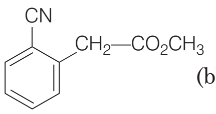
is 10×10^{15}, calculate the E°_{cell} of this reaction at 298 K.

$$\left[2.303\,\frac{RT}{F} \text{ at } 298\text{ K} = 0.059\text{ V}\right]$$

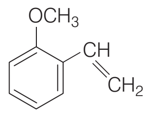
(a) 0.4736 V
(b) 0.04736 mV
(c) 0.4736 mV
(d) 0.04736 V

16 Which of the following compounds reacts with ethyl magnesium bromide and also decolourises bromine water solution

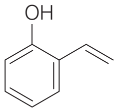
(a)



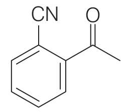
(b)



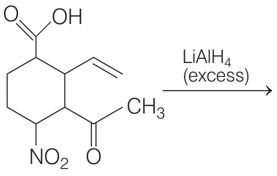
(c)



(d)



17 The major product obtained in the following reaction is



(a) 
(b) 
(c) 
(d) 
18 The reaction, $MgO(s) + C(s) \rightarrow Mg(s) + CO(g)$, for which $\Delta_r H^\circ = + 491.1 \text{ kJ mol}^{-1}$ and $\Delta_r S^\circ = 198.0 \text{ JK}^{-1}\text{mol}^{-1}$, is not feasible at 298 K. Temperature above which reaction will be feasible is

(a) 2040.5 K (b) 1890.0 K
(c) 2380.5 K (d) 2480.3 K

19 Taj Mahal is being slowly disfigured and discoloured. This is primarily due to

(a) water pollution
(b) soil pollution
(c) global warming
(d) acid rain

20 The standard reaction Gibbs energy for a chemical reaction at an absolute temperature T is given by,

$\Delta_r G^\circ = A - BT$

Where A and B are non-zero constants.

Which of the following is true about this reaction?

(a) Endothermic if, $A < 0$ and $B > 0$
(b) Exothermic if, $B < 0$
(c) Exothermic if, $A > 0$ and $B < 0$
(d) Endothermic if, $A > 0$

21 The correct option with respect to the Pauling electronegativity values of the elements is

(a) $P > S$ (b) $Si < Al$
(c) $Te > Se$ (d) $Ga < Ge$

22 The de-Broglie wavelength (λ) associated with a photoelectron varies with the frequency (ν) of the incident radiation as, [ν_0 is threshold frequency]

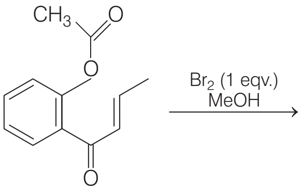
(a) $\lambda \propto \dfrac{1}{(\nu - \nu_0)^{\frac{1}{4}}}$ (b) $\lambda \propto \dfrac{1}{(\nu - \nu_0)^{\frac{3}{2}}}$

(c) $\lambda \propto \dfrac{1}{(\nu - \nu_0)}$ (d) $\lambda \propto \dfrac{1}{(\nu - \nu_0)^{\frac{1}{2}}}$

23 A compound '*X*' on treatment with Br_2 / NaOH, provided C_3H_9N, which gives positive carbylamine test. Compound '*X*' is

(a) $CH_3COCH_2NHCH_3$
(b) $CH_3CH_2CH_2CONH_2$
(c) $CH_3CON(CH_3)_2$
(d) $CH_3CH_2COCH_2NH_2$

24 The major product obtained in the following conversion is



(a) 
(b) 
(c) 
(d) 
25 The reaction that does not define calcination is

(a) $Fe_2O_3 \cdot XH_2O \xrightarrow{\Delta} Fe_2O_3 + XH_2O$

(b) $ZnCO_3 \xrightarrow{\Delta} ZnO + CO_2$

(c) $CaCO_3 \cdot MgCO_3 \xrightarrow{\Delta} CaO + MgO + 2CO_2$

(d) $2Cu_2S + 3O_2 \xrightarrow{\Delta} 2Cu_2O + 2SO_2$

26 K_2HgI_4 is 40% ionised in aqueous solution. The value of its van't Hoff factor (i) is

(a) 1.6 (b) 1.8
(c) 2.2 (d) 2.0

27 The number of bridging CO ligand(s) and Co—Co bond(s) in $Co_2(CO)_8$, respectively are

(a) 2 and 0 (b) 0 and 2
(c) 4 and 0 (d) 2 and 1

28 For the equilibrium,

$2H_2O \rightleftharpoons H_3O^+ + OH^-$, the value of ΔG° at 298 K is approximately

(a) -80 kJ mol^{-1}
(b) 100 kJ mol^{-1}
(c) 80 kJ mol^{-1}
(d) -100 kJ mol^{-1}

29 Match the following items in Column I with the corresponding items in Column II.

	Column I		Column II
(i)	$Na_2CO_3 \cdot 10H_2O$	A.	Portland cement ingredient
(ii)	$Mg(HCO_3)_2$	B.	Castner-Kellner process
(iii)	NaOH	C.	Solvay process
(iv)	$Ca_3Al_2O_6$	D.	Temporary hardness

(a) (i) - (D); (ii) - (A); (iii) - (B); (iv) - (C)
(b) (i) - (B); (ii) - (C); (iii) - (A); (iv) - (D)
(c) (i) - (C); (ii) - (B); (iii) - (D); (iv) - (A)
(d) (i) - (C); (ii) - (D); (iii) - (B); (iv) - (A)

30 The radius of the largest sphere which fits properly at the centre of the edge of a body centred cubic unit cell is (Edge length is represented by 'a')

(a) 0.134 a (b) 0.027 a
(c) 0.047 a (d) 0.067 a

ANSWERS

1. *(b)*	2. *(c)*	3. *(a)*	4. *(d)*	5. *(d)*	6. *(a)*	7. *(b)*	8. *(b)*	9. *(b)*	10. *(b)*

1 What is the work function of the metal, if the light of wavelength 4000 Å generates photoelectron of velocity 6×10^5 ms^{-1} from it?

(Mass of electron = 9×10^{-31} kg

Velocity of light = 3×10^8 ms^{-1}

Planck's constant = 6.626×10^{-34} Js

Charge of electron = 1.6×10^{-19} JeV^{-1})

(a) 4.0 eV (b) 2.1 eV
(c) 0.9 eV (d) 3.1 eV

2 Given, Gas : H_2, CH_4, CO_2, SO_2

Critical temperature/K 33 190 304 630

On the basis of data given above, predict which of the following gases shows least adsorption on a definite amount of charcoal?

(a) CH_4 (b) SO_2
(c) CO_2 (d) H_2

3 $Mn_2(CO)_{10}$ is an organometallic compound due to the presence of

(a) Mn—C bond
(b) Mn—O bond
(c) C—O bond
(d) Mn—Mn

4 The hardness of a water sample (in terms of equivalents of $CaCO_3$) containing 10^{-3} M $CaSO_4$ is

(Molar mass of $CaSO_4$ = 136 g mol^{-1})

(a) 100 ppm (b) 10 ppm
(c) 50 ppm (d) 90 ppm

5 A metal on combustion in excess air forms X. X upon hydrolysis with water yields H_2O_2 and O_2 along with another product. The metal is

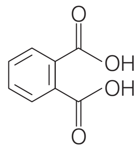
(a) Li (b) Mg
(c) Rb (d) Na

6 Among the following compounds, most basic amino acid is

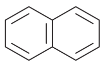
(a) serine (b) asparagine
(c) lysine (d) histidine

7 Among the following four aromatic compounds, which one will have the lowest melting point?

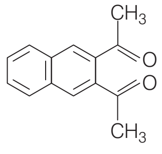
(a)



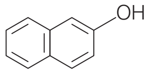
(b)



(c)



(d)



8 The correct order for acid strength of compounds

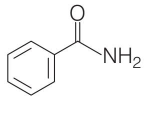
CH ≡ CH, CH_3—C ≡ CH and CH_2 = CH_2 is as follows :

(a) $CH_3—C\equiv CH > CH_2=CH_2 > HC\equiv CH$
(b) $CH_3—C\equiv CH > CH\equiv CH > CH_2=CH_2$
(c) $HC\equiv CH > CH_3—C\equiv CH > CH_2=CH_2$
(d) $CH\equiv CH > CH_2=CH_2 > CH_3—C\equiv CH$

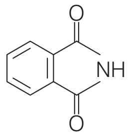
9 Decomposition of X exhibits a rate constant of 0.05 μg/year. How many years are required for the decomposition of 5 μg of X into 2.5 μg?

(a) 20 (b) 25
(c) 40 (d) 50

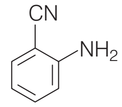
10 The increasing order of reactivity of the following compounds towards reaction with alkyl halides directly is



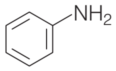
(A)



(B)



(C)



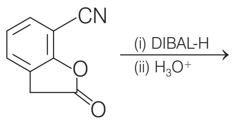
(D)

(a) (A) < (C) < (D) < (B)
(b) (B) < (A) < (C) < (D)
(c) (B) < (A) < (D) < (C)
(d) (A) < (B) < (C) < (D)

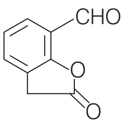
11 The element with Z = 120 (not yet discovered) will be an/a

(a) transition metal
(b) inner-transition metal
(c) alkaline earth metal
(d) alkali metal

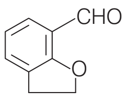
12 The major product of the following reaction is



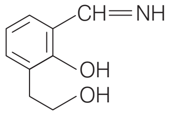
(a)



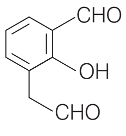
(b)

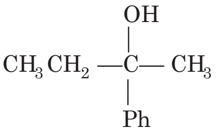


(c)



(d)



13


$CH_3CH_2—\overset{\overset{\displaystyle OH}{|}}{\underset{\underset{\displaystyle Ph}{|}}{C}}—CH_3$ cannot be prepared by

(a) $CH_3CH_2COCH_3$ + PhMgX
(b) $PhCOCH_3$ + CH_3CH_2MgX
(c) $PhCOCH_2CH_3$ + CH_3MgX
(d) HCHO + PhCH(CH_3) CH_2MgX

14 The standard electrode potential $E^\ominus$ and its temperature coefficient $\left(\frac{dE^\ominus}{dT}\right)$ for a cell are 2V and -5×10^{-4} VK^{-1} at 300 K respectively. The cell reaction is

$$Zn(s) + Cu^{2+}(aq) \rightarrow Zn^{2+}(aq) + Cu(s)$$

The standard reaction enthalpy ($\Delta_r H^\ominus$) at 300 K in kJ mol^{-1} is,

[Use, R = 8 JK^{-1} mol^{-1} and F = 96,000 C mol^{-1}]

(a) – 412.8 (b) – 384.0
(c) 206.4 (d) 192.0

15 In the following reaction,

$$\text{Aldehyde} + \text{Alcohol} \xrightarrow{HCl} \text{Acetal}$$

Aldehyde	Alcohol
HCHO	^{t}BuOH
CH_3CHO	MeOH

The best combination is

(a) CH_3CHO and MeOH
(b) CH_3CHO and ^{t}BuOH
(c) HCHO and MeOH
(d) HCHO and ^{t}BuOH

16 The molecule that has minimum/no role in the formation of photochemical smog, is

(a) N_2 (b) $CH_2 = O$
(c) NO (d) O_3

17 Poly-β-hydroxybutyrate-Co-β-hydroxyvalerate (PHBV) is a copolymer of ......

(a) 3-hydroxybutanoic acid and 2-hydroxypentanoic acid
(b) 2-hydroxybutanoic acid and 3-hydroxypentanoic acid
(c) 3-hydroxybutanoic acid and 4-hydroxypentanoic acid
(d) 3-hydroxybutanoic acid and 3-hydroxypentanoic acid

18 In the Hall-Heroult process, aluminium is formed at the cathode. The cathode is made out of

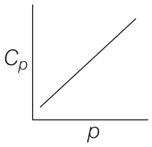
(a) platinum
(b) carbon
(c) pure aluminium
(d) copper

19 Iodine reacts with concentrated HNO_3 to yield Y along with other products. The oxidation state of iodine in Y, is

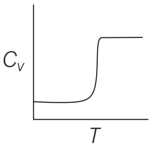
(a) 1 (b) 3
(c) 7 (d) 5

20 For a diatomic ideal gas in a closed system, which of the following plots does not correctly describe the relation between various thermodynamic quantities?

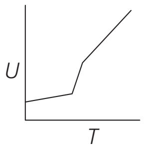
(a)



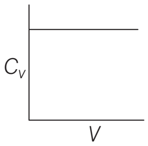
(b)



(c)



(d)



21 Two solids dissociate as follows:

$$A(s) \rightleftharpoons B(g) + C(g);\ K_{p_1} = x\ \text{atm}^2$$
$$D(s) \rightleftharpoons C(g) + E(g);\ K_{p_2} = y\ \text{atm}^2$$

The total pressure when both the solids dissociate simultaneously is

(a) $\sqrt{x+y}$ atm (b) $x^2 + y^2$ atm
(c) $(x+y)$ atm (d) $2(\sqrt{x+y})$ atm

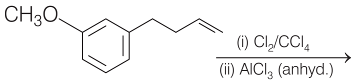
22 The metal d-orbitals that are directly facing the ligands in $K_3[Co(CN)_6]$ are

(a) d_{xz}, d_{yz} and d_{z^2}
(b) $d_{x^2-y^2}$ and d_{z^2}
(c) d_{xy}, d_{xz} and d_{yz}
(d) d_{xz} and $d_{x^2-y^2}$

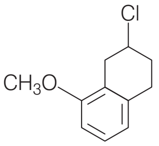
23 Water samples with BOD values of 4 ppm and 18 ppm, respectively, are

(a) clean and clean
(b) highly polluted and clean
(c) highly polluted and highly polluted
(d) clean and highly polluted

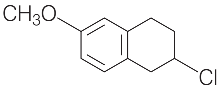
24 The major product of the following reaction is



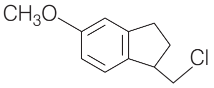
(a)



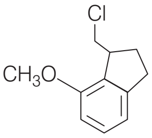
(c)



(b)



(d)



25 50 mL of 0.5 M oxalic acid is needed to neutralise 25 mL of sodium hydroxide solution. The amount of NaOH in 50 mL of the given sodium hydroxide solution is

(a) 40 g (b) 80 g
(c) 20 g (d) 10 g

26 Freezing point of a 4% aqueous solution of X is equal to freezing point of 12% aqueous solution of Y. If molecular weight of X is A, then molecular weight of Y is

(a) 4A (b) 2A
(c) 3A (d) A

27 The pair of metal ions that can given a spin-only magnetic moment of 3.9 BM for the complex $[M(H_2O)_6]Cl_2$, is

(a) Co^{2+} and Fe^{2+}
(b) Cr^{2+} and Mn^{2+}
(c) V^{2+} and Co^{2+}
(d) V^{2+} and Fe^{2+}

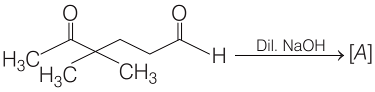
28 In a chemical reaction, $A + 2B \overset{K}{\rightleftharpoons} 2C + D$, the initial concentration of B was 1.5 times of the concentration of A, but the equilibrium concentrations of A and B were found to be equal. The equilibrium constant (K) for the aforesaid chemical reaction is

(a) $\frac{1}{4}$ (b) 16
(c) 1 (d) 4

29 The volume of gas A is twice than that of gas B. The compressibility factor of gas A is thrice than that of gas B at same temperature. The pressures of the gases for equal number of moles are

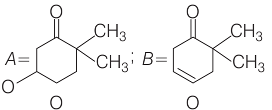
(a) $p_A = 2p_B$ (b) $2p_A = 3p_B$
(c) $p_A = 3p_B$ (d) $3p_A = 2p_B$

30 In the following reactions, products A and B are

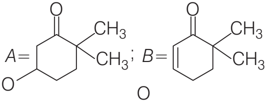


$$[A] \xrightarrow[\Delta]{H_3O^+} [B]$$

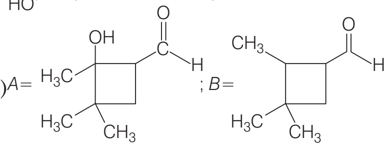
(a)



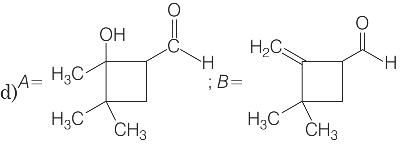
(b)



(c)



(d)



ANSWERS

12 January, Shift-II

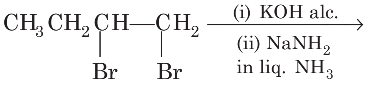
1 The two monomers for the synthesis of nylon 6, 6 are

(a) $HOOC(CH_2)_4COOH$, $H_2N(CH_2)_4NH_2$
(b) $HOOC(CH_2)_6COOH$, $H_2N(CH_2)_4NH_2$
(c) $HOOC(CH_2)_4COOH$, $H_2N(CH_2)_6NH_2$
(d) $HOOC(CH_2)_6COOH$, $H_2N(CH_2)_6NH_2$

2 The volume strength of 1 M H_2O_2 is (Molar mass of $H_2O_2 = 34\ g\ mol^{-1}$)

(a) 16.8 (b) 22.4 (c) 11.35 (d) 5.6

3 The major product of the following reaction is



$$CH_3CH_2\underset{Br}{CH}-\underset{Br}{CH_2} \xrightarrow[\text{(ii) NaNH}_2 \text{ in liq. NH}_3]{\text{(i) KOH alc.}}$$

(a) 
$CH_3CH_2\underset{NH_2}{CH}-\underset{NH_2}{CH_2}$

(b) $CH_3CH=CHCH_2NH_2$
(c) $CH_3CH=C=CH_2$
(d) $CH_3CH_2C\equiv CH$

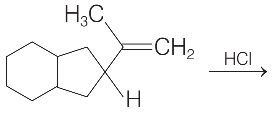
4 The element that shows greater ability to form $p\pi$-$p\pi$ multiple bonds, is

(a) Ge (b) Si (c) Sn (d) C

5 If K_{sp} of Ag_2CO_3 is 8×10^{-12}, the molar solubility of Ag_2CO_3 in 0.1 M $AgNO_3$ is

(a) 8×10^{-12} M (b) 8×10^{-13} M
(c) 8×10^{-10} M (d) 8×10^{-11} M

6 The major product of the following reaction is



(a) 
(b) 
(c) 
(d) 
7 Chlorine on reaction with hot and concentrated sodium hydroxide gives

(a) Cl^- and ClO^- (b) Cl^- and ClO_3^-
(c) ClO_3^- and ClO_2^- (d) Cl^- and ClO_2^-

8 The magnetic moment of an octahedral homoleptic Mn(II) complex is 5.9 BM. The suitable ligand for this complex is

(a) CN^- (b) ethylenediamine
(c) NCS^- (d) CO

9 An open vessel at 27°C is heated until two fifth of the air (assumed as an ideal gas) in it has escaped from the vessel. Assuming that the volume of the vessel remains constant, the temperature at which the vessel has been heated is

(a) 750 K (b) 500 K (c) 750°C (d) 500°C

10 Given :

(i) $C(\text{graphite}) + O_2(g) \rightarrow CO_2(g)$; $\Delta_rH^\ominus = x$ kJ mol^{-1}

(ii) $C(\text{graphite}) + \frac{1}{2}O_2(g) \longrightarrow CO_2(g)$; $\Delta_rH^\ominus = y$ kJ mol^{-1}

(iii) $CO(g) + \frac{1}{2}O_2(g) \longrightarrow CO_2(g)$; $\Delta_rH^\ominus = z$ kJ mol^{-1}

Based on the above thermochemical equations, find out which one of the following algebraic relationships is correct?

(a) $y = 2z - x$ (b) $x = y - z$
(c) $z = x + y$ (d) $x = y + z$

11 The correct structure of histidine in a strongly acidic solution (pH = 2) is

(a) 
(b) 
(c) 
(d) 
12 The compound that is not a common component of photochemical smog is

(a) CF_2Cl_2 (b) 
$H_3C-\underset{\underset{O}{\|}}{C}-OONO_2$

(c) $CH_2=CHCHO$ (d) O_3

13 The pair that does not require calcination is

(a) ZnO and MgO
(b) ZnO and $Fe_2O_3 \cdot xH_2O$
(c) $ZnCO_3$ and CaO
(d) Fe_2O_3 and $CaCO_3 \cdot MgCO_3$

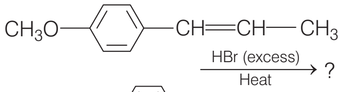
14 The element that does not show catenation is

(a) Ge (b) Sn (c) Si (d) Pb

15 8 g of NaOH is dissolved in 18 g of H_2O. Mole fraction of NaOH in solution and molality (in mol kg^{-1}) of the solution respectively are

(a) 0.2, 11.11 (b) 0.167, 22.20
(c) 0.2, 22.20 (d) 0.167, 11.11

16 The major product in the following conversion is



(a) 
(b) 
(c) 
(d) 
17 Among the following, the false statement is

(a) Tyndall effect can be used to distinguish between a colloidal solution and a true solution
(b) It is possible to cause artificial rain by throwing electrified sand carrying charge opposite to the one on clouds from an aeroplane
(c) Lyophilic sol can be coagulated by adding an electrolyte
(d) Latex is a colloidal solution of rubber particles which are positively charged

18 The correct statement(s) among I to III with respect to potassium ions that are abundant within the cell fluids is/are

I. They activate many enzymes.
II. They participate in the oxidation of glucose to produce ATP.
III. Along with sodium ions, they are responsible for the transmission of nerve signals.

(a) I, and III only (b) I, II and III
(c) I and II only (d) III only

19 The upper stratosphere consisting of the ozone layer protects us from the sun's radiation that falls in the wavelength region of

(a) 600- 750 nm (b) 400- 550 nm
(c) 0.8- 1.5 nm (d) 200- 315 nm

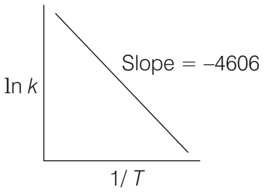
20 The correct order of atomic radii is

(a) Ho > N > Eu > Ce
(b) N > Ce > Eu > Ho
(c) Eu > Ce > Ho > N
(d) Ce > Eu > Ho > N

21 Molecules of benzoic acid (C_6H_5COOH) dimerise in benzene. 'w' g of the acid dissolved in 30 g of benzene shows a depression in freezing point equal to 2 K. If the percentage association of the acid to form dimer in the solution is 80, then w is (Given that K_f = 5 K kg mol^{-1}, molar mass of benzoic acid = 122 g mol^{-1})

(a) 1.8 g (b) 1.0 g (c) 2.4 g (d) 1.5 g

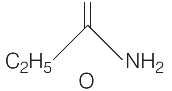
22 For a reaction, consider the plot of ln k *versus* $1/T$ given in the figure. If the rate constant of this reaction at 400 K is 10^{-5} s^{-1}, then the rate constant at 500 K is



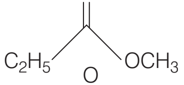
(a) 4×10^{-4} s^{-1} (b) 10^{-6} s^{-1}
(c) 10^{-4} s^{-1} (d) 2×10^{-4} s^{-1}

23 The increasing order of the reactivity of the following with $LiAlH_4$ is

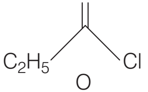
(*A*)



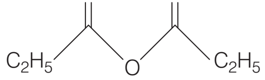
(*B*)



(*C*)



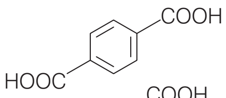
(*D*)



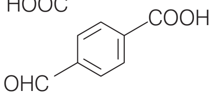
(a) (A) < (B) < (D) < (C)
(b) (A) < (B) < (C) < (D)
(c) (B) < (A) < (D) < (C)
(d) (B) < (A) < (C) < (D)

24 The aldehydes which will not form Grignard product with one equivalent Grignard reagents are

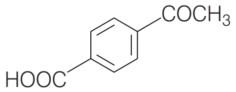
(a)



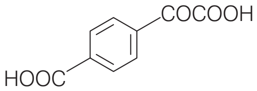
(c)



(b)

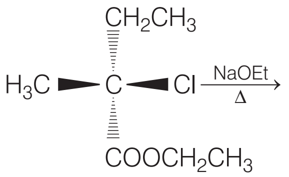


(d)

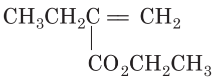


(a) (C), (D) (b) (B), (D)
(c) (B), (C), (D) (d) (B), (C)

25 The major product of the following reaction is

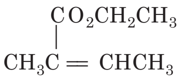


(a)



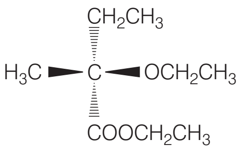
$CH_3CH_2\underset{\substack{|\\ CO_2CH_2CH_3}}{C} = CH_2$

(b)

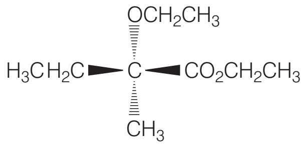


$CH_3\overset{\substack{CO_2CH_2CH_3\\ |}}{C} = CHCH_3$

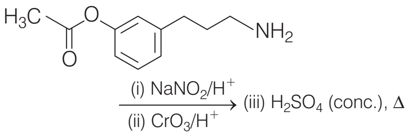
(c)



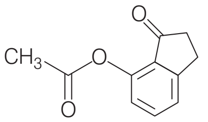
(d)



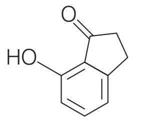
26 The major product of the following reaction is



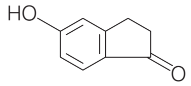
(a)



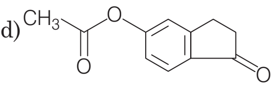
(b)



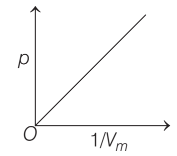
(c)



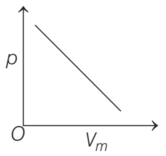
(d)



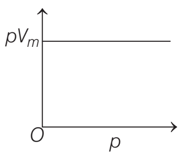
27 The combination of plots which does not represent isothermal expansion of an ideal gas is



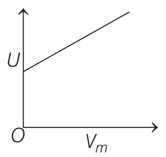
(*A*)



(*B*)



(*C*)



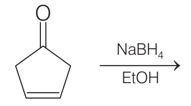
(*D*)

(a) (A) and (C) (b) (B) and (C)
(c) (B) and (D) (d) (A) and (D)

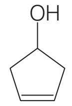
28 If the de-Broglie wavelength of the electron in n^{th} Bohr orbit in a hydrogenic atom is equal to $1.5\ \pi a_0$ (a_0 is Bohr radius), then the value of n/Z is

(a) 1.0 (b) 0.75 (c) 0.40 (d) 1.50

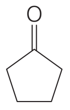
29 The major product of the following reaction is



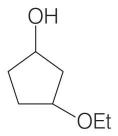
(a)



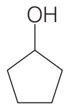
(b)



(c)



(d)



30 Λ°_m for NaCl, HCl and NaA are 126.4, 425.9 and 100.5 S cm^2 mol^{-1}, respectively. If the conductivity of 0.001 M HA is 5×10^{-5} S cm^{-1}, degree of dissociation of HA is

(a) 0.25 (b) 0.50 (c) 0.75 (d) 0.125

ANSWERS

1. (c)	2. (c)	3. (d)	4. (d)	5. (c)	6. (d)	7. (b)	8. (c)	9. (b)	10. (d)
11. (d)	12. (a)	13. (a)	14. (d)	15. (d)	16. (d)	17. (d)	18. (b)	19. (d)	20. (c)
21. (c)	22. (c)	23. (a)	24. (b)	25. (b)	26. (c)	27. (c)	28. (b)	29. (a)	30. (d)
